But as to wild fowl and birds they had great variety both on the land and on the water: They had Eagles, but not so large as those of Europe; Hawks of several kinds, and some sorts that were never seen on this side the Atlantic; but the Spaniards could never bring any of them to fly at game, and therefore imported Spanish Hawks for that sport: The most remarkable bird of prey was that which the Indians call'd the Conder, or Cuntur, many of which with the wings extended measured fifteen or sixteen foot from the extremity of one wing to the other; they are a very fierce voracious fowl, and have feet like a Hen (not talons like the Eagle;) however, they are so strong that two of them 'tis said will set upon a Bull or a Cow if they find them lying down, and rip up their bowels; and some of them have kill'd boys of ten or twelve years of age, and devoured them; they are black and white like a Magpie, and have combs on their heads; and when they rise, or light, their wings make such a humming noise that it astonishes a man; there are but

CHAP. VI. but very few of these terrible animals, but it seems they make no small havock among the cattle where they hunt.

The same writer mentions a kind of large carrion Crows, which devour flesh to that degree, that they can't fly 'till they have disgorg'd it, and says it is one of the diversions of the country to pursue them on horseback, when they spue up the flesh all the way they run 'till they are light enough to fly; but are sometimes taken before they can mount.

Upon the coast of the Pacific-ocean there are such numbers of birds and fowls which prey upon the shoals of fish, that they sometimes darken the sky for two or three leagues, in *DE LA VEGA's* phrase; their rivers and lakes also abound in water-fowl, such as Herons, wild Ducks, wild Geese, Swans, and many other kinds that we never saw in Europe.

They have two sorts of Partridges, and a pretty great plenty of them; one sort as large as Hens, and the other less than European Partridges, both of them of a greyish colour, and delicious food; they have also good store of Wood-pigeons, but had no Dove-house Pigeons 'till they were imported from Spain; there are Turtle-doves of the size and colour of those of Europe, and others no bigger than Larks, that build in the eves of houses, and a great variety of small birds; but they abound more in Parrots than any other, and these are of various sizes and colours, the least of the bigness of Larks, and the largest as big as Pullets; they are green, yellow, blue, and red, and some of them have fine long feathers in their tails, with which the Indians adorn their heads on festival-days.

These Parrots, at the season of the year when the corn is ripe, come from the mountains into the plains in such numbers, that they spoil great quantities of Maize, or Indian-corn.

The South-sea is well replenish'd with all manner of fish (particularly Pilchards) which are a great part of the subsistence of the people upon the Peruvian coast, but their rivers afford scarce any fish, which is ascrib'd to their rapidity, falling with great violence from the high mountains of the Andes, and the shallowness of their channels; and there may be this further reason for it, that most of them are dry at one season of the year, when the fish must perish if there were any in them; at other times they have some fish in their lakes, but scarce any that are good for much, most of them a small long fry not bigger than Sprats and without scales; there is one kind indeed *DE LA VEGA* mentions, that has a broad head like a Toad, which he says are pretty good eating.

CHAP. VII.

Of the Mexican vegetables, viz. of their forest and fruit-trees, corn, herbage, roots, flowers, balm, gums, and drugs.

Vegetable.
Forest-trees.

Kinquina,
or Peruvian-bark.

FOREST or timber-trees are very scarce in Peru, unless in the province of Quito near the Equator, and here they have cedars, cotton-trees, cocoa-trees, palms, mangroves, bamboes, the mahoe-tree, light wood, and many other kinds of wood which have been describ'd in treating of Mexico; but none are more valuable than the tree which furnishes us with the Kinquina, or Peruvian-bark, which grows in the province of Quito, upon the mountains near the city of Loxa (situated in 5 degrees south latitude). Mr. BERNARD informs us, that it is of the size of a cherry-tree, the leaves round and indented, and bears a long reddish flower,

VOL. III. NUM. CXXII.

from whence arises a kind of pod, in which is found a kernel like an almond, cloath'd with a slight rind: That bark which comes from the trees at the bottom of the mountains is thickest, because it receives most nourishment from the earth. It is smooth, of a whitish yellow without, and of a pale brown within; that which comes from the trees at the top of the mountains is abundantly more delicate; but the trees which grow in the middle of the mountains have a bark still browner than the other, and more rugged; all these barks are bitter, but that from the trees at the bottom of the mountains less than the others.

It follows from hence, that the bark of the least virtue, is that which grows in the lowest places; because it abounds more with earthly and watry parts, than that which grows high, which for the contrary reason is better; but the best is, that which grows in the middle of the mountains, because it has not too much or too little nourishment: There is another kind of this bark which comes from the mountains of Potosi (in 21 degrees and a half south latitude) that is browner, more aromatick, and bitterer than the former, but much scarcer than any of the rest.

The qualities we ought to observe in the bark are, that it be heavy, of a firm substance, sound and dry; we ought to reject such as is rotten, and will suck in water presently, and such as flies into dust on breaking, or is dirty and unclean; but we should make choice of little thin pieces, dark and blackish without, with a little white moss sticking to it, and reddish within, and it should be of a bitter disagreeable taste: That which is of a ruflet-colour ought to be rejected; and care should be taken there be no other wood mix'd with it, there being sometimes more of that than of the bark itself.

EMERY describes the Kinquina, or Fever-bark, in the following manner; he says, the tree from whence it is taken is of the size of an ordinary cherry-tree, and that there are two sorts of it, the one cultivated, and the other wild, and that the cultivated is much prefer'd to the other; that the best bark is of the most lively colour, resembling dark cinnamon, most curl'd up, as coming from the smaller branches; of a bitter taste, very astringent, or rough and stiptick upon the tongue, and whitish outwardly: The thick flat dark-coloured is not so good, and if it wants the bitter taste and stipticity, is good for nothing.

Physicians observe, that it is a specifick for all sorts of intermitting fevers and agues, and that it stops catarrhs and fluxes of all sorts; but that it ought not to be given in continued burning fevers, or when the fit is upon the patient: It is prohibited also in obstructions, or where people are costive, and in many other cases; and in short, they would never have it administred without the advice of the learn'd; but to me it seems to be the most innocent medicine that ever was taken, especially if the bark be chew'd: This way I believe it may be taken almost in any case, and at any time, without any danger, and is not near so nauseous as in the powder; and if I may judge by experience, has more effect this way than any other, and a less quantity of it will do than when it is taken in powder; one reason whereof may be, that persons who chew it, usually make choice of the best; whereas the Apothecary crams wood or any thing down the patient's throat, and such rubbish cannot be expected to have the same success as real bark.

Maize, or Indian-corn, which has been describ'd already, may be call'd the staff of life in this country,

CHAP. VIII. try, being as generally eaten as wheat in Europe. They also made their strongest drink of it after they had steep'd and dry'd it, as we do barley; and as the country is for the most part hot and dry as well as mountainous, they were at great pains in collecting the waters and introducing rivulets into their corn-fields, without which this kind of grain will not grow in that hot climate. They throw their fields

Their husbandry.

therefore into level squares, that they may retain the water; and where they meet with a mountain of a tolerable good soil, they cut it into squares, one above another, from the bottom to the top, supporting them with little stone walls; so that they look like hanging-gardens or stairs: And if they can meet with a fountain on the top of the hill, from thence they water all the squares beneath: They used also to make aqueducts and canals, several hundred miles in length, into which they brought all the streams and rivulets they could meet with, and from these every man was allow'd to let water into his grounds, in his turn, to improve both his corn and grafs. So diligent and industrious were the ancient Peruvians in their husbandry. But the Spaniards, we are told, have let most of these aqueducts run to ruin; one reason whereof may be, that the Spaniards have now introduced Wheat and other European grain, which may not require so much moisture: And another reason for this neglect may be, that these countries are not half so populous as when the Spaniards arriv'd there, and consequently less grain is wanting. I can't avoid taking notice here, that the Chinese and the Peruvians seem to agree pretty much in their agriculture, and to have been equally industrious in improving their grounds, cutting their hills into square spots, so as to make them fruitful to the top. Both these distant nations also agreed in this, that human dung was the best compost for some grounds.

By the sea-coast, below Arequipa, for 200 leagues, they use no other dung but that of sea-fowls, of which there are incredible numbers breed on the islands near the coast, and lay such heaps of dung, that at a distance they appear like hills of snow. On other parts of the coast, more to the southward, they dung their lands with a small fish like Pilchards; and it is with infinite labour here, for six or seven hundred leagues along the coast of Peru and Chili, that the natives find a subsistence; for they have no springs or rivers; nor does a drop of rain ever fall on those parch'd sands: The natives therefore near the sea, according to DE LA VEGA, dig through the sand 8 or 12 foot deep, and there meeting with earth which has some moisture in it, plant grains of Maize in holes, at equal distances, and in the same holes put some Pilchards heads, which, without any other dunging or watering, brings the corn to perfection; by which means they get bread enough to sustain the few inhabitants that dwell on that barren part of the coast.

European grain sow'd in Peru.

Wheat and Barley, my author says, were first imported into Peru about the year 1540, by a noble Lady, who had a plantation bestow'd on her by the Spanish Viceroy, for being so great a benefactor to the country; both these kinds of grain thriving well, and yielding a great increase in several parts of Peru.

Vines planted there.

FRANCIS DE CARAVANTES, a Nobleman of Toledo, had the honour of planting the first Vines in Peru, which he imported from the Canaries about the same time. The Spaniards, in a very few years afterwards, made wine there; but it seems the Indians prefer'd their own liquor, made of Indian-corn, to any wine made of Grapes, and liked bread made of Maize better than wheaten bread; such ungentle palates had my country-men, says LA VEGA.

They water their vineyards in all parts of Peru chiefly by turning rivulets through them, or letting in the water from some adjacent river or reservoir; Their for the country is so hot and dry, that their Vines will yield no Grapes if they are not water'd: When they would have them bear fruit therefore, they water the Vines, and they have ripe grapes at what time of the year they please.

The same thing is observ'd of their Maize, or Indian-corn, one man is sowing of it, while his neighbour has it grown up a good height, and perhaps is ready for harvest; that it may truly be said, in great part of the country, they know no difference of seasons.

Olives have been carried over also into Peru, but they do not thrive there so well as other European plants; tho' they are found very agreeable to the soil of Chili. However, Peru, at this day, abounds in Sugar-canes, Oranges, Lemons, Figs, Cherries, Apples, Pears, Quinces, Nectarines, Peaches, Apricots, Plumbs, and Pomgranates; none of which fruits were in Peru before the Spaniards arrived there: But they had Coco-nuts, Cocoa-nuts, Pine-apples, Guava's, Plantains, and most of the fruits enumerated in Mexico.

As to the kitchen-garden, they had neither Lettice, Radishes, Turnips, Garlick, Onions, Beets, Spinage, Asparagus, Melons, Cucumbers, Pease, Beans or Rice; of all which there are now great plenty, as there are also of Roses, Jessamin, and many odoriferous flowers they never saw before the Spaniards imported them. But then they had several sorts of herbs, flowers, fallading and roots that we want, particularly the Cassavi-root, which serv'd great part of North and South-America instead of bread, as has been observed in the description of Mexico: And 'tis observ'd of the fruits and plants that have been carried thither from Europe, that they thrive better, and grow much larger there than they do here. DE LA VEGA relates, that he had seen bunches of Grapes from eight or ten pound weight, Quinces as big as his head, and other fruits proportionably large.

I must not pass over the plants that produce those excellent balms and gums for which this country is celebrated, and particularly that call'd the Balsam of Peru, of which we meet with the following account in the History of Drugs. It proceeds from the trunks and branches of a little tree. There are three sorts of it. The first is call'd the balsam by incision, and is a white liquor; the second is called balsam of the shell, which drops from the ends of the branches that are cut, to which they hang small flasks or baskets, to receive it; and thus they draw it off 'till the tree will yield no more. They expose it some days in the hottest places, where it congeals, and changes to a reddish colour. The third is a black balsam, which is made by boiling the bark-branches and leaves of these little trees in water; and after they have boil'd some time, they take off the fat or scum that swims on the top, which is of a black brown colour, and call'd (as well as the former) Balsam of Peru.

In the second description of this balsam in the History of Drugs, it is said there are three sorts also; but that the first is call'd dry balsam, being a sort of hard, reddish, fragrant rosin, the second a liquid white rosin, and the third a black odoriferous balsam, which is most common, and generally used as well in physick as for perfumes: It ought to be viscous, and of a turpentine consistence; of a blackish-brown colour; a sweet agreeable taste, having some resemblance of Storax. These balsams are proper for the brain

Besides this balm, the country produces Anami, Catanna, Storax, Cassia-festata, Guaiacum, Sarsaparilla, Saffiras, Copal, Liquid-amber, and several other gums and drugs, mentioned already in the description of Mexico.

CHAP. VIII.

Of their minerals and precious stones.

Minerals. **G**OLD and Silver were so plentiful in Peru in the sixteenth century, when DE LA VEGA flourish'd, that he relates, there had been exported from thence to Spain every year, for twenty-five years successively, the value of twelve or thirteen millions (of crowns, or pieces of eight, I presume he means) each year, besides what had passed without account. And observes, that Gold was found in every province of Peru, more or less; some found on the surface of the earth, and wash'd down by torrents, which the Indians gather'd up in baskets and separated from the sand, being usually as small as the filings of steel; tho' sometimes pieces are found of the size and form of Melon-seeds; and some are round, and others oval: And that the gold of Peru is generally about eighteen or twenty quillats (I suppose it should be carats) in goodness; only the gold that comes from the mines of Callavia or Caravana, he says, he has been inform'd is of the fineness of twenty-four carats or better. "And here it may be proper to inform such as are not conversant in these matters, that a carat of gold is of the weight of a scruple, or twenty-four grains, and consequently twenty-four carats make an ounce: And gold that is entirely fine, is call'd of twenty-four carats, because, if you put an ounce of such gold to the proof, it will not be diminished; but if an ounce of gold waste a scruple in the proof, it is gold of twenty-three carats. If it waste two scruples, it is gold of twenty-two carats, and so on. But several Refiners are of opinion, there is no gold of twenty-four carats; for let it be refined never so well, there will remain some light portion of silver in it."

Our author proceeds, and relates, that in the year 1556, there was dug out of the veins of a rock in the mines of Callavia (of the finest sort of gold, being of twenty-four carats) a piece of gold ore as big as a man's head, something resembling a man's lungs in colour and shape, having certain perforations in it from one end to the other; and in all the holes were little kernels of gold, as if melted and dropp'd into them. And some who understood the nature of this mineral were of opinion, that had it remained in the rock, it would all have turn'd into perfect gold in time.

The owner of this valuable piece of ore was carrying it over to Spain, in order to make a present of it to King PHILIP II. but the ship was cast away in the voyage, and he perish'd with his treasure.

Gold, says a certain writer, is the most solid, weighty, compact metal, generated in mines in several parts of the world; but the greatest quantity is brought in bars or ingots from Peru. That which is found in a mass or lump in the mines, is called virgin gold, because it comes pure out of the mine, and needs no farther preparation, and is soft enough to receive the impression of a seal.

CHAP. VIII. The second sort is in grains, not so fine as the first: The third is gold mix'd with other metals; and the marcasite or mineral stone, the gold and the stone being form'd and incorporated together: This is call'd gold-ore. And the fourth is gold-dust, mix'd with sand at the bottoms of rivulets; and there is ten times more gold found in such sands than is acquired all other ways.

All stones, which contain any metal, are called marcasite. But the three principal stones that are called marcasite are, those that contain gold, silver, or copper. The two first are in little balls, of the bigness of a nut, almost round, weighty, and brownish without, but of different colours within; for the first is of the colour of gold, the other of silver, but both bright and shining.

Gold is often found mix'd with silver or copper. That which is mix'd with silver, is of fewer carats than that mix'd with copper. Father FEUILLEE relates, that he was at Lima in Peru in the year 1709, and saw in the cabinet of Don ANTONIO PORTOCARORO, a piece of gold-ore as it came out of the mines, that weigh'd thirty-three pounds, some odd ounces, which was found by an Indian in a brook. The upper part of it was gold of twenty-two carats, and the lowest of seventeen carats and an half, decreasing gradually in its fineness to the bottom.

There are a great many silver mines in several parts of Peru; but those of Potosi, in the province of Charcas, in 22 degrees of southern latitude, are the richest. These were discover'd in the year 1545, about fourteen years after the Spaniards invaded that country. The mountain, in which the mines are, is now entirely undermin'd, such vast quantities of silver having been drawn from it. It is of the form of a sugar-loaf, of a dark red colour, a league in circumference at bottom, and a quarter of a league towards the top, and stands in the middle of a plain, being some mornings cover'd with a cap of snow, for it is exceeding cold here, considering it lies within the Tropics, and never was a more barren country seen for several leagues round; but 'tis observed, wherever the earth is enrich'd with this kind of treasure, there are no fruitful fields or pastures to be met with: At the foot of this mountain, rises another little hill, in which are some mines, and the Spaniards have given it the name of Young Potosi. These mines were never discover'd, or wrought by the Indians, before the arrival of the Spaniards, tho' they had dug those of Porco about 6 leagues distant from Potosi.

Acosta relates, that they were discover'd by mere accident. He says, an Indian, pursuing his game up the mountain of Potosi, and being like to fall, laid hold of a shrub, that grew upon a vein of silver, to save himself; and happening to pull it up by the roots, thereby discovered the rich metal underneath. He kept the thing secret, it seems, 'till he had drawn from it silver enough to enrich himself and his family; but at length it was discovered to the Spaniards, who thereupon parcel'd it out among such adventurers, as would undertake the digging and refining the silver, on such terms as the Government impos'd on them.

That which made the mines of Potosi the more valuable, was, that they were never hinder'd working by water, as they are in other mines, though they had sunk them two hundred fathom deep. Acosta informs us, that the first forty years these mines of Potosi were wrought, there were registered * one hundred two thousand millions of pieces.

* This must surely be a mistake; the hundred at least, ought to have been left out.

CHAP.
VIII.

pieces of eight (or crowns) besides a great deal that had been carried off without paying custom; but according to some late travellers, these mines begin to be exhausted. To proceed:

The same writer gives the following account of the state of the mines of Potosi. In his time, he says, this rock of Potosi then contained four principal veins, all which lay on the east side of the mountain, towards the rising sun; and on the west part there was not any one vein: That the veins run from north to south, the largest of them being six foot over, and the narrowest about a span broad; and there are other ramifications, which branch'd out like the boughs of trees: That in the richest of these veins, there were seventy-eight mines, eighty or an hundred fathom deep, and some two hundred. But at length, instead of digging downwards, they opened the rock at the bottom, and so proceeded horizontally, 'till they met with the silver-veins; but he observes, that the nearer the vein is to the surface of the earth, the richer it is. These vaults, by which they pierc'd into the mountain, were called Soccabous, being eight foot in breadth, and a fathom in height, and by these they easily drew out the metal as they found it; but he says, the rock was so hard, that they work'd between twenty and thirty years in the principal of these Soccabous, before they came at the metal: And as they labour in these subterraneous passages, without receiving either light or heat from the sun, the air is so cold and unwholsome, that a person, at his first entrance into them, is seiz'd with a disorder not unlike that of sea-sickness; as our author himself, who visited them, experienced. The labourers in these mines take it by turns, working alternately night and day, which to them are alike, as they always work by candle-light. The ore is commonly so hard, that they are forced to break it with hammers, and it splits, as if it were flint.

Quick-
silver mines.

Another part of the riches of Peru consists in their Quicksilver, of which they have several mines in the audience of Lima, particularly in the mountains of Oropeza and Guancavilca, near the city of Guamanga. It is found, according to Acosta, in a kind of stone called Cinabar, which likewise yields Vermilion. He observes, that the native Indians had long wrought these mines, before the Spaniards arrived, without knowing what quicksilver was. They sought only for the Cinabar, or vermilion, which they call'd Limpi, esteeming it for the same reason the Romans and Ethiopians did anciently; namely, to paint their faces and bodies on festivals and rejoicing times, and to beautify and adorn the images of their gods.

Nor did the Spaniards discover there was quicksilver in these mines, 'till the year 1567, when HENRIQUES GARCIA, a native of Portugal, happening to meet with a piece of that ore, which the Indians call'd Limpi, and with which they painted their faces, consider'd that this must be the same which they call'd vermilion in Spain; and knowing that vermilion was extracted out of the same ore as quicksilver was, he went to the mines to make the experiment, and found it to be according as he had conjectur'd; and great numbers of labourers were immediately employ'd to draw the quicksilver out of these mines, of which there are many in the above-said mountains; one whereof Acosta describes to be a rock of hard stone, intermix'd with quicksilver, extending above fourscore yards in length, and forty in breadth, and threescore and ten fathom deep; so capacious, that three hundred men

might work in it at a time. They did not begin to refine their silver with mercury, at Potosi, 'till the year 1571, when FERNANDEZ DE VALESCO came thither from Mexico, and put them into this way: Whereupon they convey'd their quicksilver to the port of Arica by sea, and from thence by land-carriage to the mines of Potosi, and by this means they extracted a great deal more silver from their ore, than ever they could do before by fire alone.

Father Acosta proceeds to give us this farther account of the manner of refining, or separating quicksilver from the ore. He says, they take the stone, or hard ore in which it is found, and bearing it to powder, put it into the fire in earthen pots well luted and closed, and the stone being melted by the heat of the fire, the quicksilver separates itself, and ascends 'till it encounters the top of the pot, and there congeals; and if it was suffer'd to pass out, without meeting any hard substance, it would mount 'till it became cold, and then congealing, would fall down again; but as they melt the ore in earthen pots, it congeals at the top of the pots, which they unstop, and draw out the metal when it is cold; for if there remain any fume or vapour, it endangers the lives of the workmen, at least they will lose their teeth, or the use of their limbs.

They put the quicksilver, when it is melted, into skins, for it keeps best in leather; and thus they send it from the quicksilver mines to Potosi, where they spend above seven thousand quintals (an hundred weight) in refining silver, every year, besides what is spent at other mines. The richest ore, 'tis observed, consumes most quicksilver, and the poorest much less: They first beat, or grind the ore very small, and sift it through fine sieves: Then they put it into vessels upon the furnaces, allowing to every fifty quintals of powder'd ore, five quintals of salt, for the salt separates the earth and filth from the metal, and thereupon the silver is the more easily extracted by the quicksilver. "As to the rest, I refer to the description of Mexico, where I have already inserted Acosta's account of refining silver by quicksilver."

In the History of Drugs it is said, that quicksilver is found in the mines after different manners, sometimes inclosed in its own mineral, and sometimes fluid, and of as changeable a figure as we see it: It is found sometimes among earth and stones, and very often embodied in natural cinabar: Those who take quicksilver from its mine, or, more properly, from the places it lies in, make use of great iron retorts to separate it from its mineral, or other hard bodies with which it is joined; and by means of fire, and the fresh water into which it falls, they render it fluid, as we commonly have it: When it is found running, or liquid, in the ground, the slaves, who gather it, have nothing to do but to strain it through shamois-leather to cleanse it from its impurities; and, according to this author, there are but two places in Europe where quicksilver is found, viz. in Hungary and Spain; and though some have asserted it has been found in France, they are mistaken; he admits indeed there was a mine of cinabar lately found in Normandy, but the great charges of working it obliged them to stop it up again. LEMERY observes, that quicksilver is found on the tops of mountains, cover'd with white stones as brittle as chalk, and that the plants which grow upon such mountains are greener and larger than in any other places; but the trees that are near the quicksilver mines rarely produce

CHAP.

fix'd and
running,
found in
the mines.

CHAP. VIII. produce fruits or flowers, and that they usually find a great deal of water about these mines, which is necessary to draw off at the foot of the mountain before they can be wrought.

Quicksilver is so very weighty, that Mr. DE FURETIERE affirms, a solid foot of mercury weighs nine hundred forty-seven pounds, and that a cubical foot of the Seine-water weighs but seventy pounds; so that a vessel that will hold thirty-five pints of that water, will contain nine hundred forty-seven pounds of quicksilver; and it is so exceeding strong as well as weighty, that an hundred and fourscore pounds of quicksilver will bear up an iron weight of fifty pounds, as this writer avers he had seen and experienced.

The properties of quicksilver, says that Gentleman, are so great, that they exceed imagination; into whatever shape you metamorphose mercury, you may make it return to its first state, and that with a very little diminution. BORRICHINS, a Danish Chymist says, that having operated upon mercury for a year together, and reduc'd it into several forms, it took its own shape at last by means of a little salt of tartar: I shall not, say the same writers, pretend to decide the controversy, whether it be cold or hot; but can affirm, it is so cold externally, that it is impossible to hold one's hand in a quantity of quicksilver a quarter of an hour: He adds, that when the Dutch have a mind to make quicksilver portable, they fix it very easily, and put it into all sorts of vessels, even into paper, and send it to their correspondents, who have the secret to make it run again without any charge.

As mercury (says LEMERY) is a very fluid body, so it is more difficult to be found than other metals; for it insinuates itself into earth, and into the clefts of stones, so that you often lose the sight of it, when you think you are just going to take it up; and men cannot work at it many years without having the Palsy; so that few are employ'd in it but criminals (in Europe he means). He adds, that quicksilver is not always taken out of the mine neat and running, but generally mix'd with earth, or reduc'd into a natural cinabar, by some portion of sulphur it has met withal: That which has but a little earth with it, may be separated, by straining it through leather; but when it has a great deal of earth, or other impurities, it must be put into iron retorts, to be purified in the manner above-mentioned.

The best way of purifying quicksilver, says the same author, is to mix together two equal parts of powder of cinabar, and filings of iron, and fill about half, or two thirds of a retort with them; then place it on a reverberating furnace, and fit to it a glass recipient full of water, without luting the joints: Increase the fire to the fourth degree, you will find the quicksilver distill, and fall to the bottom of the recipient: Keep on the fire 'till no more will rise, and you will have thirteen ounces of running mercury from one pound of cinabar, which must afterwards be washed, and dry'd with linnen cloths, and strain'd through a leather, and we may depend upon its purity.

Cinabar, according to LEMERY, is of two sorts; the one natural, call'd Mineral Cinabar, the other artificial, call'd Simple Cinabar: The natural is found form'd in stones that are red, shining, and weighty, in the quicksilver mines.

The natural cinabar hath been sublimated by the subterraneous fires, almost in the same manner as the artificial cinabar; but as in its sublimation it is mix'd with earth, it is not so weighty, pure, or

beautiful as the artificial cinabar, and contains less mercury.

The artificial cinabar is made with three parts crude mercury, and one part sulphur mixed, and put into subliming vessels over a gradual fire. It ought to be made choice of in fair stones, very weighty and bright, with long, clear, and fine points, of a brownish red: Each pound of cinabar has fourteen pounces of mercury to two ounces of sulphur.

Vermilion, says the same writer, is cinabar in Vermilion-stone, ground with urine, or aqua vitæ; it is a most beautiful red, made use of by painters, &c.

As to the medicinal virtues of quicksilver, or mercury and cinabar, I must refer the reader to the History of Drugs for his satisfaction, or rather to advise him never to meddle with them without the directions of the learned; for though they are excellent medicines, a very small mistake in the application of them, I perceive, may be fatal to the patient.

As to the precious stones of Peru, I find they have great plenty of Emeralds here as well as in Mexico; but those having been treated of there, it is needless to describe them again.

They have also Turquoises, which are of a blue, or azure colour, as the Emeralds are of green, but not so much esteem'd; Crystal also is found here: And Pearls they had in greater plenty in South than in North-America, particularly on the coast of Terra-Firma in the North-sea, and in the Bay of Panama in the South-sea; but those fisheries seem to be almost exhausted.

CHAP. IX.

The history, religion, and government, of the ancient Peruvians, before the Spanish conquest.

NOTHING is more uncertain than the original of nations, even in this part of the world, where we have the advantage of letters; perhaps there is not any one country in Europe that can tell from what particular people they are deriv'd, and consequently neither know how, or when it was planted; much less what were the religion, customs, or manners of the first inhabitants; how then can we depend on the accounts they give us of Peru for any number of years before the Spanish conquest, when they had neither letters or characters to record the transactions of preceding ages?

GARCILASSO DE LA VEGA has indeed attempted to give us the history of Peru, even before the Inca's founded that empire, that is, four or five hundred years before the arrival of the Spaniards, and was as well qualified for such an undertaking, as any man could be in such circumstances, being descended, by his mother's side, from the royal family of the Inca's, and bred up among his mother's relations before they were converted to Christianity, or had received the Spanish customs: And by the father's side was descended from a Spaniard of quality, and had the advantage of a liberal education: This Gentleman it seems made it his business for several years to inform himself, from his Indian relations and acquaintance, of the history and customs of their ancestors; and afterwards came over to Spain, where that Court put him upon digesting and methodizing his observations, and making them publick; which he did, under the title of *The Royal Commentaries of Peru*, and wanted no assistance which the Peruvians, or Spaniards could give him in compiling of them; but the Spaniards took care that this history should be so modell'd, as to cast as little reflection

CHAPTER
IX.

reflection on their conduct in subduing Peru as possible; and the historian himself seems to have had a strong bias towards the family of the Inca's, or Peruvian Emperors, from whom he was descended, ascribing the civilizing of that people, and the instructing them in every thing that was useful or excellent, to them. And that he may reflect the greater honour on the Inca's, he represents the people of Peru, before the foundation of that empire, as barbarous as any people on the face of the earth; nay, more savage than the brutes themselves: And he might have this farther view in those horrid accounts he gives us of the ancient Peruvians; namely, to justify the Inca's invasions of their neighbours, and reducing them under their obedience by force, and compelling them to abandon their former way of life, and submit to the laws and government of the Inca's; affecting to give them the title rather of benefactors, than destroyers of mankind, as we find has ever been the practice of both ancient and modern conquerors, in order to palliate the injustice of their invasions on the liberties and properties of their peaceable neighbours.

The savage lives of the ancient Peruvians, according to De la Vega.

DE LA VEGA tells us, that the ancient Peruvians were at best but tamed beasts, and some of them worse than the most savage creatures; and beginning with their religion, he says, every tribe and family had its particular god; that they adored trees, mountains and rivers, and worshipp'd Lions, and Tygers, and all manner of animals; others made stocks and stones the objects of their adoration; and sacrificed not only their enemies, but their children to them, and eat them in great joy and festivity when they had done.

He confirms even that horrid and improbable tale of BLOS VALERAS, who relates, that the inhabitants of the mountains of Andes eat man's flesh, and worshipp'd the Devil, who appear'd to them in the form of a serpent, or some other animal: That when they took an ordinary prisoner in war, they quarter'd him, and divided him among their wives, children, and servants to be eaten; or perhaps sold his flesh in the shambles: If it was a noble captive, they stripp'd him of his garments, and ty'd him to a stake, and, alive as he was, cut him with knives and sharp stones, paring off slices from the more fleshy parts, as from the buttocks, calves of his legs, and the brawny parts of his arms, and sprinkling the principal men and women with part of the blood, drank the remainder, and eat his flesh in haste, before it was half boil'd, lest the miserable wretch should die before he had seen his flesh devour'd, and intomb'd in their bowels; all this was perform'd by way of a religious offering, 'till the man expir'd; and then they compleated the feast, by devouring all the remainder of his flesh and bowels, eating them with silence and reverence, as sacred, and partaking of a deity. "Such, says DE LA VEGA, "was the manner of these brutes, because the government of the Inca's was not received into "their country;" insinuating, that all Peru was peopled with such savages, 'till the Inca's civiliz'd them: But sure such monstrous relations need no confutation, the very repeating them is sufficient to discredit them; human nature could never be thus depraved and degenerated; and thus much we are sure of, that DE LA VEGA could have no certainty of these facts, for they are either related of such people as liv'd five hundred years before he wrote; or of those who inhabited distant and inaccessible countries, which the Inca's never penetrated, or had any commerce.

No foundation for these stories.

However, from such stories as these, which the Peruvians seem to have been very full of, I make no manner of doubt but the Spaniards first took the hint, and represented the Peruvians themselves to be addicted to the same barbarous customs, and made this a pretence for oppressing and enslaving them: And when both Spaniards and Indians contributed to support the truth of such relations, no wonder they were soon propagated all over Europe; and we find it extremely difficult to undeceive the present generation, especially as mankind are frequently delighted with such relations as are most monstrous and unnatural, and seem to wish they might be true.

DE LA VEGA proceeds to represent the ancient Peruvians, as living under no government, and in no societies, but dispers'd over the country in dens and caves, like wild beasts; neither building, planting, or cloathing themselves, but feeding upon such roots and fruits of the earth as grow spontaneously, or upon man's flesh.

That others lived by robbery, or spoil, tyrannizing over their weaker neighbours, and treating them as slaves: That men's carcases were commonly sold in their shambles, and sausages made of their guts: That they eat their own children, and the women they had them by, if they were captives taken in the wars, fattening such children when they came to be ten or twelve years of age, as we do calves or lambs (says DE LA VEGA, and some other Spanish writers) and reserving them as most delicious dishes for their own tables. For all which, however, they have no better authority than tradition, as has been observ'd already, which, with the improbability of the thing, is abundantly sufficient to make any one suspend his belief of such relations, especially, if it be consider'd that there are no such people upon the face of the earth; and many of those nations, that have been represented as barbarous, have proved more humane, gentle, and tractable than their enemies, who found it their interest to dress them up in such shocking colours, particularly the people of Florida, and those who inhabit some mountains and islands in the East-Indies and Africa; daily experience now discovering they have been grossly abused by such misrepresentations.

In the next chapter, DE LA VEGA charges the ancient Indians with sodomy, and with having their women in common, without any regard to kindred or relation; and with practising the arts of poisoning and witchcraft.

But then he comes and relates in his 7th chapter, that all these barbarous customs were abolish'd by the Inca's, when they laid the foundation of their monarchy, and the people reduc'd to a more regular and decent way of living; of which they had in their family the following tradition.

That their father, the Sun (the Inca's giving out that they were the offspring of that glorious planet) beholding mankind in that deprav'd and savage state above related, took compassion on them, and sent a son and daughter of his own from heaven to earth, to instruct them to worship and adore him as their god, and to give them laws and precepts to govern themselves by, to form them into societies, and instruct them in building, planting, and husbandry, that they might live like men, and enjoy the fruits of the earth.

With such instructions, their father (the Sun) plac'd his two children in the great lake of Titicaca, from whence they were to begin their labours for the reformation of mankind, giving them a little wedge of gold, which they were to strike into the ground

The reformation of the Peruvians by the Inca's.

CHAP. IX. ground at every place they slept or rested; and wherever this wedge should sink into the earth, and vanish out of their sight, in that place they were to make their residence, and the people should resort to them to be instructed, their father (the Sun) constituting them Lords and Sovereigns over all men; that should be reduced from their savage way of life by their means.

That travelling northward from the lake of Titicaca, and striking the golden wedge into the earth in the valley of Cusco, there it disappear'd, as had been foretold; and thereupon they agreed to assemble the people there, in order to instruct them in the doctrines committed to them: Accordingly the man and the woman separated, the one going to the north, and the other to the south, declaring to all they met in those wild and uncultivated deserts, that their father (the Sun) had sent them to be their teachers and benefactors, to draw them from that rude and savage way of life, form them into societies, and instruct them in all such arts as might render their lives easy and comfortable.

That the savages, observing these two persons cloath'd and adorn'd, as their father (the Sun) had equipp'd them, and that by the gentleness of their words, and the gracefulness of their countenances, they manifested themselves to be the children of the Sun, they were struck with admiration, and gave them entire credit, adored them as children of the Sun, and obey'd them as their Princes.

Great multitudes being assembled, they led them to that spot of ground where Cusco now stands, laid out the plan of the city, and instructed the people how to prepare materials for building it. In the next place, the Inca shew'd the men how to cultivate their lands, and bring the streams of water into them, while his Queen taught the women to spin, and weave their cotton into garments, to dress their meat, and other parts of housewifery. This colony flourishing extremely, drew in the neighbouring tribes to join them, and be partakers of their happiness: And now the Inca, finding himself in a condition not only to defend himself against the rest of the savages, but able to enlarge his territories by force, taught the people the use of arms; and those, who refused to submit themselves voluntarily, were compell'd, says my author, by force, to relinquish their former vagrant life, and be obedient to the laws of society, the Inca extending his conquests every day, and planting colonies in all parts of the country. This first Inca was named MANCO CAPAC, and his Queen COYA MAMA; and, according to DE LA VEGA's computation, they flourish'd about four hundred years before the arrival of the Spaniards.

Manco Capac, first Inca.

His laws.

MANCO CAPAC did not only teach all his subjects to adore his father (the Sun) but instructed them also in the rules of morality and civility, directing them to lay aside their prejudices to each other, and to do as they would be done by. He ordain'd, that murder, adultery, and robbery, should be punish'd with death: That no man should have but one wife; and that in marriages they should confine themselves to their respective tribes: And over every colony, he plac'd a Caracas, or Prince; or, as they call such a Chief in other parts of America, a Cacique, who govern'd the people under them, as their subjects. He also built a temple to the Sun, taught the people to offer sacrifices, and other religious rites, and erected a cloister for a certain number of select virgins, who were all to be of the blood royal, and dedicated to the Sun.

Religious rites.

Among other institutions, this Inca commanded, that all the males of his family should have their heads

shav'd, which they submitted to, tho' nothing could be more troublesome in their circumstances, having no better instruments than sharp flints to scrape off the hair; infomuch that DE LA VEGA says, it was an observation of one of his Indian friends, "That had the Spaniards introduc'd no other inventions amongst them, than Scissars, Looking-glasses, and Combs, they had deserv'd all the gold and silver their country produc'd." He also ordered them to bore their ears, which they did with a thorn, and afterwards stretched the orifice to such a degree, that it would hold the wheel of a small pulley; and their ear-rings were of that form, which occasion'd the Spaniards to call them Large Ears: They were also order'd to wrap a wreath, or cloth of various colours, four or five times about their heads, in form of a turbant; which three things were to distinguish the royal family of the Inca's from other people; tho' the rest of the people were afterwards indulged so far, as to have their crowns shaved, to wear a black wreath about their heads, and to bore their ears, but not so wide as the family of the Inca's.

Lastly, having reign'd many years, he summon'd a general assembly of the chiefs of his subjects, at the city of Cusco, acquainting them, that he intend'd shortly to return to heaven, and take his repose with his father the Sun; and being now to leave them, as the last testimony of his affection for those who had been his chief ministers, and instruments of reforming that people, he adopted them for his children, conferring on them his own title of Inca, which they and their posterity retain'd ever afterwards.

The Inca being dead, was succeeded by his eldest son, SINCHI ROCA, whom he had by his wife COYA MAMA his sister; he also, after the example of his father, married his eldest sister by the same mother, and this was the practice of all succeeding Inca's in their marriages, to marry their eldest sisters of the whole blood, tho' they did not suffer their subjects to marry their sisters, or near relations: The Inca's also had many wives and concubines that were not of the royal blood, but those never inherited the crown.

Sinchi Roca, second Inca.

The corpse of the first Inca, MANCO CAPAC, was afterwards embalm'd, and placed in the temple of the Sun, where he was worshipp'd by his subjects as a god, as were all the succeeding Inca's: But both the Sun and the Inca's seem to have been worshipped as inferior deities, according to DE LA VEGA; for he assures us, the Peruvians acknowledg'd one almighty God, maker of Heaven and Earth, whom they call'd PACHA CAMAC, PACHA in their language signifying, the Universe, and CAMAC, the Soul: PACHA CAMAC therefore signified him who animated the world: And here he takes notice, that PEDRO DE SIECA supposes, in his 62d chapter, that the Peruvians call'd the Devil by this name; but that he, who was an Indian born, and better acquainted with their language, could assure us, that they never took this name into their mouths, but with the greatest veneration, and signs of devotion; much more than when they mentioned the Sun or their Inca's: And being ask'd who PACHA CAMAC was, they answered, it was he who gave life to the universe, sustain'd and nourish'd all things; but because they did not see him, they could not know him, and therefore seldom erected temples, or offer'd sacrifices to him, but worshipp'd him in their hearts as the Unknown God, tho' there was one temple it seems in the valley, call'd from thence the valley of PACHA CAMAC, dedicated to the Unknown God; which was standing when the Spaniards arriv'd in Peru: DE LA VEGA adds, that

The Peruvians notion of God.

CHAP. IX. that the name by which the Peruvians call'd the Devil, was *Capay*, which they never pronounced but they spit, and shew'd other signs of detestation. He proceeds to inform us, that their sacrifices, and religious rites and ceremonies, were all taught them by the first Inca: That their principal sacrifices to the Sun were lambs, but they offer'd also all sorts of cattle, fowls, and corn, and even their best and finest cloaths, all which they burnt in the place of incense, rendering their thanks and praises to the Sun, for having sustain'd and nourish'd all those things, for the use and support of mankind; they had also their drink-offerings, made of their Maize, or Indian-corn, steep'd in water; and when they first drank after their meals (for they never drank while they were eating) they dipp'd the tip of their finger into the cup; and lifting up their eyes with great reverence to heaven, gave the Sun thanks for their liquor, before they presum'd to take a draught of it; and here he takes an opportunity to assure us, that the Inca's always detested human sacrifices, and would not suffer any such in the countries under their dominion, as they had heard the Mexicans, and some other countries did.

Their Priests of the royal blood.

All the Priests of the Sun that officiated in the city of Cusco were of the royal blood, tho' the inferior Officers were taken out of those who had been adopted into the privileges of the Inca's; the High Priest was either the brother, or uncle of the King, or one of his nearest relations; but the Priests had no vestments to distinguish them from others of the royal family; in other provinces, persons of distinction among the natives were made Priests, but the High Priest was always an Inca; and each province had its cloyster of select virgins, that vow'd perpetual virginity.

All the laws and religious rites their first Inca instituted, were pretended to be the commands of his father the Sun, to give them the greater authority, tho' future Inca's, it seems, frequently took an opportunity of making such improvements and alterations as they saw requisite for the times they liv'd in.

Besides the worship of the Sun, DE LA VEGA informs us, they paid some kind of adoration to the images of several animals and vegetables, that had a place in their temples; and that the Devil enter'd into such images, and spoke to them from thence, their Priests and Conjurers entertaining a familiar conversation with such spirits: Of which kind of idolatry, DE LA VEGA says, he can bear testimony, because he has seen it with his own eyes ("I presume he means he had seen images worshipped in the temple of the Sun, but he does not pretend to say, he heard any voice. This part of the story probably he had from hear-say or tradition"); and these were the images brought from the conquer'd countries, where the people adored all manner of creatures, animate or inanimate; for whenever a province was subdued, their gods were immediately remov'd to the temple of the Sun at Cusco, where the conquer'd people were permitted to pay their devotions to them, for some time at least, for which there might be several political reasons assign'd.

The Peruvians brought the idols of all nations into the temple of the Sun.

The Civil Government of the Inca's.

He proceeds to give some account of the Civil Government, instituted by the first Inca's: He says, the people were divided into Decurions, or Tythings, of which an exact register was kept: That over every Decurion, or ten families, the master of one of the ten was appointed to preside; that over every five of these divisions was another Decurion, who had the command of fifty families, another Of-

ficer was placed over an hundred, another commanded five hundred, and the chief Officer a thousand; but no man was suffered to govern more than a thousand families: The lowest Decurion of ten was to see that those under his command wanted none of the necessaries of life, and was to deliver out to them corn to sow their lands, wool for their cloathing, and materials to build their houses, and to take care of such as were sick and infirm: He was also to be the Censor of their actions, and inform his superiors of any crimes, or immoralities, committed by those under his care, which were to be punish'd by him; but as for trivial offences, the lowest Officer had the correction of them, and the decision of suits and controversies of small moment; and where differences arose between two provinces, these were decided by Commissioners appointed by the Inca himself; and there was a general Censor appointed to inspect the conduct of the chief Officers, and Ministers of State, who were punish'd capitally, if ever they oppress'd the subjects, or betray'd their trusts.

The conduct of parents and masters of families was nicely inspected, and the Decurion, as well as the Father, was answerable for the faults of the children of those under their care: Like the Chinese, they inculcated nothing more than a most resign'd submission and obedience of children to their parents, encouraging a modest behaviour, and the utmost civility and respect, in speaking to and addressing their superiors; and as the Indians were naturally of a gentle and tractable temper, never was more peace and order seen in families, according to DE LA VEGA.

As every family was registered, so the Decurions took care, from time to time, to intimate such alterations as happened on them by births, marriages, or deaths; so that the Inca's were always apprized of the state and condition of their provinces, the numbers of their subjects, and the forces and revenues proper to be required of them upon all occasions, and were inform'd also of such calamities and misfortunes as beset them, whether from floods, fires, unkind seasons, pestilence, and the like; and the Inca's thereupon immediately supplied them with whatever was wanting; so that the Spanish writers themselves observe, they might justly be stiled, Fathers and Guardians of their people; and it seems one of the Inca's titles was, "A Lover of the Poor"; and so dutiful were their subjects, and obedient to the laws, that in this vast empire, which extended upwards of a thousand leagues, it was rare to find one person convicted of a crime within the space of a year, if we may credit DE LA VEGA.

The historian in the next place proceeds to give us some account of the reign of SINCHI ROCA, the second Inca, who answer'd the name that had been given him of a prudent and brave Prince; the word Sinchi signifying Wise, and that of Roca, Valiant.

This Prince having solemnized his father's funeral in a magnificent manner, instead of being crown'd, had a wreath, or coronet, of various colours bound about his temples, such as the supreme Inca's wear; and was no sooner established on his throne, but he propos'd to the Caraca's, or Vassal Princes, the making an expedition in person to the South, to summon the neighbouring nations to come in, and acknowledge the Sun for their god, and the Inca for their Sovereign, and to require them to abandon their former superstition, and savage course of life: The Caraca's expressing their readiness to attend their

CHAP. IX.

A profound submission to parents requir'd.

Other commendable institutions.

Second Inca.

CHAP. IX. their Prince, he set forward at the head of a numerous army, employing Heralds to march before him, and declare the intent of his approach: And the people were so alarmed with the gentleness of his administration, and the happiness they saw his subjects enjoy beyond the rest of mankind, says DE LA VEGA, that they immediately submitted to him, without compulsion; and during his whole reign, which was a long one, he never engag'd in war, or compelled any people to submit to him by force, tho' he considerably enlarg'd his Empire; 'tis very possible, however, that the appearance of so formidable a power was the strongest argument to induce these Indians to resign their liberties, and change their religion for that of the Inca's; for few men part either with their religion, or ancient form of government, how absurd or inconvenient soever, upon choice.

SINCHI ROCA having reign'd many years, in imitation of his predecessor, declared he was going to repose himself with his father the Sun; and dying soon after, was succeeded by LOQUE YUPANQUI, his son by his wife and sister MAMA CORA; having other children by her, but many more by his other wives and concubines, of the blood of the Inca's, all of which were held legitimate; but those he had by other women were looked upon as base born: The Inca's were allowed to multiply and increase their children by any means, it being requisite, says DE LA VEGA, that the posterity of the Sun should be numerous: But the vulgar were confined to one wife a piece.

Third
Inca.

The Inca, LOQUE YUPANQUI, receiv'd his first name from his being left-handed, and the other from his exalted station, that of YUPANQUI being given only to the Sovereign Inca.

He was not altogether so peaceable as his predecessor; for those nations that refused to obey him on his first summons, were invaded, and treated in a hostile manner, 'till they made their submission; and were contented to forsake their former laws and customs, to adore the Sun as their god, and become subjects of the Inca.

He extended his conquests to the southward of the Lake Titicaca, and taught the subdu'd people how to cultivate their grounds, to introduce rivulets into them, to make aqueducts, to build, to plant, and cloath themselves decently; in all which the Peruvians were defective, according to DE LA VEGA, 'till they were instructed by the Inca's; so that he would have us look upon these invasions and conquests to be infinitely to the advantage of the conquered people, and an ample equivalent for all the ravages and devastations of war, tho' there is not much doubt, but the unhappy people, who felt the force of those arms they could not resist, would have been very well contented with their native simplicity and ignorance, rather than have been beaten into better manners: But to proceed; the Inca LOQUE YUPANQUI, having finished a glorious reign, and left a numerous issue of sons and daughters, died in a good old age, and was succeeded by his son MAYTA CAPAC, whom he had by his sister and wife MAMA COYA.

Fourth
Inca.

MAYTA CAPAC, the fourth Inca, enlarg'd his dominions by the conquest of several other nations lying to the southward of the Lake of Titicaca: In one of which, 'tis related, they found several ancient magnificent structures of hewn stone, with variety of statues of human form, excellently well carved; but this, I must confess, I can scarce credit; for if it be true, it confutes what DE LA VEGA so often affirms, that the Inca's first taught the

VOL. III.

Mexicans to build, carve, &c. There is little else remarkable in this reign, unless it be the Inca's making a great bridge or rather float of Oziers, on which he transported his army over great rivers, and invaded his enemies, who thought themselves secured by those waters from all invasions: And that this so astonished those people, that they submitted to the Inca without striking a stroke. He died, according to DE LA VEGA, after a triumphant reign of thirty years, wherein he acquired a great name both in peace and war. But though this author acknowledges, it was very uncertain how many years he reign'd, because they had no registers or letters to record their actions; yet he afterwards says, it is certain he died full of honour, &c. Now if their quippo's or strings were of so little use to them, that they knew not how to mark the number of years a Prince reign'd, much less could they convey down his character, or the history of his actions to posterity. As I look upon the history of the Inca's therefore to be in a great measure fabulous, I shall give but a short abstract of it, 'till I come down to those who reign'd about the time of the Spanish conquest.

CAPAC YUPANQUI, the eldest son of MAYTA CAPAC, succeeded his father, who seems to have been an unactive Prince, there being little said of him.

Inca ROCA, eldest son of the former Emperor, succeeded him. The Spanish writers make this Inca one of the principal Peruvian Law-givers, and have given us some of his most celebrated sayings: As, that upon his viewing and considering the heavens, he would say, "If the heavens be so glorious, which is the throne of the PACHA CAMAC (or great God) how much more resplendent must his person and majesty be who was the Creator of all things. Again, if I was to adore any terrestrial thing, it should be a wife and good man, whose excellency transcends all other creatures." Another saying they ascribe to him is this: "That he that cannot make himself immortal, nor recover life after death, is not worthy of adoration." But these were probably made by some of the Spanish Missionaries; for how they should be informed of the sayings of a Prince who lived two or three hundred years before the Spaniards arrived there, is not easy to conceive.

Inca ROCA was succeeded by his eldest son YAHNCOR HUACAC; in whose reign there was a great rebellion of the Chanca's, inasmuch that the Inca abandoned the capital city of Cusco, leaving it to be defended against the enemy by his son VIRACocha, who gave the Chanca's a great defeat; being miraculously assisted by the Sun, as was pretended, who turned the very stones into men, and formed them into troops in favour of the Inca VIRACocha.

After this victory, VIRACocha became extremely popular; and his father so lost the esteem of his subjects by abandoning his capital city, that it was agreed to depose the old Inca, and advance his son VIRACocha to the imperial dignity; which, 'tis said, the son very readily accepted, and the father was afterwards content to lead a private life in one of his palaces, situated a small distance from Cusco.

This VIRACocha is represented as one of their most victorious Princes, and said to be worshipp'd as a god. And the Indians afterwards, as a testimony of the veneration they had for the Spaniards, gave them the title of Viracocha's, or gods, which this Inca assumed on pretence that he had seen a vision

CHAP. of angelick form, that commanded him to take that title.

It is reported also by the Indians, that the Inca VIRACocha pretending to the spirit of prophecy, foretold that, after the succession of a certain number of Kings, a people should arrive from far distant countries, never seen in those regions before, and cloath'd like the angel in the vision he had seen, who should subvert their religion and empire: Which they held to be fulfilled at the Spanish conquest.

VIRACocha is said to have reign'd fifty years, which DE LA VEGA thinks not improbable; for that he saw his body, which was preserv'd till his time, and the hairs of his head were as white as snow: He was also shewn the bodies of several other Inca's, which he observes were more entire than the mummies of Egypt, wanting neither the hair of the head or eye-brows, or even the eyelashes, which were still visible. But I do not design to impose these things on any readers as articles of faith.

DE LA VEGA adds, that the flesh of these bodies appeared plump and full, and yet were so light that an Indian would easily carry one of them in his arms; and that in his time they used to carry them about to the houses of the Spanish Gentlemen in Cusco, who had the curiosity to see them.

Ninth Inca.

The Inca VIRACocha dying, was succeeded by his eldest son PACHACUTEC, who is represented also as a victorious Prince, and said to have subdu'd many nations by the conduct of his Brother and General CAPAC YUPANQUI; for this Emperor seldom took the field in person, but spent his time chiefly in erecting magnificent temples and palaces, regulating his Civil government, planting colonies, and making improvements in several parts of his empire; and having reign'd, as 'tis said, fifty years with great glory, left this world to dwell with his father the Sun.

Tenth Inca.

YUPANQUI his eldest son succeeded him, and is said to have extended his empire to the eastward beyond the mountains of the Andes 200 leagues and upwards; but it was more by persuasion than force that this people were induced to submit to him, and might be look'd upon as allies and confederates at last, rather than subjects; for as their situation was upon or beyond those vast mountains, the Inca's found it impracticable to lead numerous armies thither. This Inca was unfortunate in an expedition against the nation of the Chirihuana's, which inhabited another branch of the mountains of Andes; and we are told were so barbarous, that they eat both friends and foes, and chose the flesh of men rather than that of any other animal; but this seems to have been a calumny fram'd by the Inca's, because that people refused to submit to their dominion; and were so situated the Inca could not conquer them: But however that was, the Inca YUPANQUI being repuls'd in his attacks on the Chirihuana's, turn'd his arms to the southward, and reduc'd several nations in the country of Chili; in so much that in his time the Peruvian empire is said to have been of a thousand leagues extent from north to south. This Prince also carried on his conquests by his Generals, and seldom took the field in person. He erected several stately edifices, and among the rest the celebrated castle of Cusco, already describ'd, and died at length much beloved and lamented by his subjects, being succeeded by his eldest son TUPAC YUPANQUI the eleventh Inca: He left also between two and three hundred children, more legitimate than illegitimate; and most of the

Inca's had as many, looking upon it as a duty incumbent on them to increase the blood-royal, and render them as numerous as possible: It being for the honour of their god and father the Sun to have a numerous progeny, as they pretended. But this privilege of a plurality of women was never indulg'd to the vulgar.

As the former Inca made conquests to the South, the present Inca TUPAC YUPANQUI carried his arms to the North, as far as the Equator, and subdu'd part of the kingdom of Quitto, one of the richest and most powerful in South America; and having spent two years in this war, sent for his son HUANA CAPAC, to whom he committed the care of finishing that conquest, and return'd to Cusco. It is observable, that these people defending their country very obstinately, and not submitting to the Inca 'till they were subdu'd by pure force, had the misfortune also of having the name of cannibals given them by their conquerors, and to be represented as the most barbarous of mankind.

TUPAC YUPANQUI dying, was succeeded by his eldest son HUANA CAPAC, who spent the first year of his reign in mourning and solemnizing his father's funeral, as their laws requir'd, and then visited the several provinces of his empire. It is related, that at a festival, when his eldest son was to receive his name, he caused a chain of gold to be made of two hundred yards in length, and of the thickness of a man's wrist, which was carried by those that danc'd at that solemnity; for the custom was, for an hundred men, and sometimes two hundred or more, to take hands and dance in a ring together, and instead of joining hands the Inca order'd, that every one of the company should take a link of this chain in his hands and dance as usual, with musick of all kinds: The Spaniards arriving not many years after, made strict enquiry after this invaluable chain, but it was conceal'd from them by the Mexicans, which might be one occasion of the Spaniards using them so cruelly. But however that was, the young Prince receiv'd the name of HUASCAR, or The Chain, from this rich utensil. HUANA CAPAC proceeded like his predecessors to enlarge his territories by his arms, and conquer'd the famous valleys of Tumpez and Pachacamac, with the Island of Puna, at the mouth of the river Guiaquil: The inhabitants of which island, cutting off some of his troops by treachery, after they had submitted, he took a severe revenge of them, putting them to all kinds of deaths. In the mean time, another rebellion broke out in the great province of Chachapayas, on the side of the Andes, but he was so fortunate as to suppress this also with very little loss: After which he turn'd his arms towards the country of Manta, on the sea-coast, in which lies that port to which the Spaniards afterwards gave the name of Porto Veio, or the Old Harbour in 2 degrees of south latitude: Here DE LA VEGA says, the natives ador'd Lions, Tygers, and Serpents, and an Emerald that was as big as an Ostrich's egg; to which the people, at their festivals, offer'd, among other things, smaller Emeralds of less value; which was the occasion of the Spaniards finding such a vast quantity of Emeralds amass'd together when they invaded this country, and made them imagine Emeralds had been as common almost as ordinary stones here.

From Porto Veio, the Inca advanc'd as far as Cape Passao, which lies just under the Equator, reducing all the nations on that coast to his obedience; which was not very difficult, the country being divided into small tribes or families, that had no com-

CHAP. IX. mon Chief or any dependance on each other, and consequently were in no condition to resist so formidable a power as that of the Inca's. DE LA VEGA charges these people with having their women in common, with sodomy, and all manner of vice: In which state he would have us believe all Peru remain'd, 'till reform'd by his ancestors the Inca's: And on this account justifies all their invasions and oppressions of that defenceless people in the same manner as the Spaniards afterwards did their invasions and barbarous usage of the inhabitants of the Inca's dominions.

HUANA CAPAC having conquer'd the province of Passao, which lies under the Equator, determin'd to make this the limits of his empire towards the North: Having new-modell'd the government therefore, and constituted the same laws and customs that were observed in other parts of his dominions, he left garrisons behind him to preserve his conquests, and return'd to his capital city of Cusco.

It is reported of this Prince, that being reproved by the High Priest for looking stedfastly on the Sun, which was deem'd a high profanation by that people, answer'd, "There must be some Being whom our father the Sun esteems superior to him, and more powerful than himself; by whose commands he every day measures the compass of the heavens without intermission, or allowing himself an hour's repose. If he were supreme, and at his own disposal, he would certainly allot himself some time for rest, tho' it were but to please his humour, and for the sake of variety." But I have observed so many sayings put into the mouths of the Indians by the Spanish Missionaries, and then reported as coming originally from those Pagans, that I give the less attention to this, especially since the same authors that report this, allow that the Peruvians acknowledg'd there was one almighty Being, that sustained and governed the universe, whom they called PACHA CHAMAC, and that a temple was dedicated to this PACHA CHAMAC, or the unknown God; tho' he was seldom worshipped, because they knew so little of him, or in what manner he ought to be adored. These historians therefore must forget themselves, when they make HUANA CAPAC, the twelfth Inca, the first of the Mexican Princes that made this reflection. But to return to the history.

HUANA CAPAC, after the completion of the conquest of Quitto, having taken the daughter of that King to his bed, had by her a son, whom he named ATAHNALPA, or ATABILIPA, and is said to have been fonder of him than any of his children: But as none of the sons or daughters of the Inca's were held legitimate, but those who were born of their sisters, or some near relation, and HUASCAR was the eldest legitimate son of this Inca, to whom all his dominions, by the laws of the empire, were to descend on his death; he appeared much disquieted that his beloved son ATAHNALPA, or ATABILIPA, should become a vassal to his eldest brother, and that he could not leave him the dominion of any one province: But his son HUASCAR being acquainted with the reason of his father's uneasiness, generously consented he should settle what part of his territories he pleased upon his beloved son. Whereupon HUANA CAPAC constituted ATAHNALPA King of Quitto (the inheritance of his mother) in his life-time.

It was in the reign of HUANA CAPAC, namely, in the year 1515, that the Spaniards first appear'd with their ships upon the coast of Passao in Peru, which is situated under the Equator. They were

CHAP. IX. commanded by the celebrated VASCO NUNEZ DE BALBAO, who first discovered the South-sea, and would probably at this time have fixed colonies on that coast, had he not been recalled by PEDRARIAS, then Vice-roy of Darien, or Terra-Firma, who, envying his good fortune, recalled VASCO, and caused him to be put to death, under pretence that he was about to set up for himself, and throw off his dependance on the King of Spain his Sovereign: But the true reason was, that the Crown of Spain had made VASCO Adelentado, or Viceroy, of all the lands and territories he should discover in the South-sea; in pursuance of which commission, he had, with indefatigable labour, found out the rich empire of Peru, and was about to reap the fruits of his industry. PEDRARIAS, the Vice-roy of Terra-Firma, therefore, envying his good fortune, recalled him, and put him to death, as has been related, and afterwards employ'd a great many skilful Sailors and Adventurers to follow VASCO's steps, and got possession of the treasures he understood were to be found in those regions; but as the winds are always contrary to those who come to the coasts of Peru directly from the northward, all the Adventurers PEDRARIAS sent out upon this expedition, returned with an account that the voyage was impracticable. Whereupon that discovery was entirely laid aside, and abandoned for fifteen or sixteen years, 'till FRANCIS PIZARRO and ALMAGRO, fired with the repeated advices they received of the riches of Peru, obtained leave from PEDRARIAS, the Viceroy, to pursue that discovery VASCO NUNEZ had begun, at their own expence: Of which enterprize I shall treat, when I have finished the history of the Inca's.

And here, whatever credit is to be given to things of this nature, I cannot avoid taking some notice of the portents and omens the Spanish historians, as well as the Inca DE LA VEGA, entertain us with, which are said to have preceded the fall of the Peruvian empire.

Three years before the Spaniards, under the command of VASCO NUNEZ DE BALBAO, appeared on the coast of Peru, 'tis said a prodigy happen'd, which alarm'd and astonish'd the Court and all the Empire: At their grand annual festival of the Sun, a royal Eagle, call'd in their language Anca, appear'd soaring in the air, and pursued by Hawks of all sizes, which attack'd the royal bird with that fury, that he fell down among the Inca's, or royal family, as they march'd in procession to the temple of the Sun, through the great market-place of Cusco; and that he seem'd to beg their protection, having lost most of his small feathers in the encounter: That they nourish'd this Eagle with all the tenderness imaginable, but notwithstanding their care, the bird died in a few days, which the Inca, his Priests and Diviners interpreted to presage the total ruin of the empire, and of their religion, especially as it was followed by violent earthquakes, that over-turn'd some of the neighbouring mountains. Upon the sea-coast also, the Indians observed the tides, in their ebbings and flowings, did not keep their usual course; and comets and apparitions were seen in the air. The Moon, in the midst of a bright night, was observed to be encompassed with three large haloes, or circles, the first of the colour of blood, the second black, and the third like a fog or smoak; which one of their adepts in magick observing, 'tis said, came weeping into the presence of the Emperor HUANA CAPAC, and declared, that his mother the Moon, like a tender parent, by this

CHAP.
IX.

this phenomena made known to him, that PACHA CAMAC, the creator and sustainer of all things, threaten'd his royal family, and empire, with grievous judgments: That the first bloody circle prognosticated, that after he should be gone to rest with his father the Sun, terrible wars should arise among those of his own family, in which there should be such effusion of blood, that his whole race should be extinguish'd in a few years: That the second black circle threaten'd his subjects with total destruction, and a subversion of their religion and government, occasioned chiefly by the dissensions in his own family: That his empire should be translated to another people, and all his greatness vanish into smoke; which was signified by the third circle; that seem'd to be compos'd of vapours.

The Inca, 'tis said, was astonished at these predictions; but endeavour'd, however, to hide his fears, and bid the Magician be gone; telling him, these were his last night's dreams, which he declar'd to him as revelations and advices from his mother the Moon. Whereupon the Diviner desired him to go out of his palace and behold the three circles with his eyes, which he did, and thereupon assembled all the Magicians and Astrologers of his Court, who confirm'd the interpretation their brother had made of these signs in the heavens.

HUANA CAPAC, however, that his people might not be discouraged, endeavour'd still to conceal his fears, and putting the best face he could upon the matter, told the Magicians, that unless PACHA CHAMAC himself reveal'd this to him, he would not believe it. "Is it possible," said he, my father the Sun should abhor his own blood, and "deliver them up to total destruction!" and then dismissed them from his presence.

Reflecting, however, on what had been said, and considering how it agreed with the predictions of an ancient oracle, that after the reign of twelve Inca's, the empire should be dissolved; and being inform'd at the same time, that a prodigious wooden float, with tall masts and sails (Vasco's ship), from whence issued terrible thunders, fire and smoke, was seen upon the coast; and that the people on board differ'd in their persons and habits from all that had hitherto appear'd in that part of the world, he was, in a manner, confounded, expecting that the dissolution of his empire was approaching. However, he did not entirely despair, and neglect the defence of his people, but assembled an army, and march'd them to the sea-coast, making the best provision he could against the dangers that threaten'd him; but the ship disappearing, and nothing of that kind being seen again in several years, their apprehensions began to wear off. Every thing remain'd quiet, HUANA CAPAC died in peace, and in a good old age, about seven or eight years after VASCO NUNEZ appeared on the coast of Peru, having reigned forty years in great splendor, and made large additions to his empire by many successful wars.

Their fears, however, began to revive, when the Emperor, upon his death-bed, put his subjects in mind of the old prophecy, already mentioned, That after the reign of twelve Inca's, a new nation should arise, that had never been known in those parts, and subdue that empire; which he conjectur'd would happen not many years after his death, he being the twelfth Inca: And advis'd his subjects to submit and serve that people, who were in every respect superior to them; their laws better, and their forces and military skill rendering them invincible. And DE LA VEGA observes, that this

last advice of their dying Inca was not the least inducement to the Peruvians to submit to the Spaniards afterwards. They held, he says, that Heaven had decreed the Spaniards the dominion of those countries, and that all resistance would be in vain; but I am apt to think, the thunder of the Spanish artillery was a much stronger motive for their submission.

The relation of these omens, prodigies, and prophecies, GARCILASSO DE LA VEGA, the Inca, or royal historian, tells us, he received from two Mexican Officers that had serv'd the Emperor HUANA CAPAC, and were, at the time he had this from them, fourscore years of age, being baptiz'd and initiated in the Christian religion by the Spanish Fathers at Cusco: However, as we meet with the like omens recorded by historians, before, every considerable revolution almost that has happened in Europe, whether ancient or modern, I am far from requiring my readers to give entire credit to such relations, but leave every one to pass what judgment he pleases on them.

HUANA CAPAC being dead, his body was embalmed, and carried to the temple of the Sun at Cusco; but his heart, according to his directions, was buried at Quitto, the residence of his favourite son ATAHNALPA.

HUASCAR, the eldest legitimate son of HUANA CAPAC, reign'd in peace at Cusco four or five years, after his father's death, without giving his brother, the King of Quitto, any molestation; but then considering the loss he had sustained by dismembering and yielding up one of the richest provinces of the empire to ATAHNALPA, by which he was prevented extending his dominions further northward; and reflecting also, that his brother was a Prince remarkable for his ambitious and turbulent spirit, and might one day rival him in the rest of his territories, he determin'd to be beforehand with him, and to resume what he had too easily parted from: He sent an Ambassador therefore, or rather a Herald, to his brother the King of Quitto, to inform him, that by the laws of the empire, the territories of the Inca's could not be divided; and though he had been oblig'd by his father to resign Quitto to him, this was what his father could neither legally command, nor he perform: However, since it was the will of his father, he was ready to confirm the cession upon two conditions; 1. That he should not endeavour to make any addition to his territories; and, 2. That he should hold them as a vassal and feudatory of his empire, and actually do him homage for them.

To both which demands ATAHNALPA seem'd readily to consent, and promised in a short time to attend on him at Cusco, with all the Caraca's and Lords of his kingdom, to do him homage in person; with which answer HUASCAR was entirely satisfied, and dismissed the troops he had rais'd to recover Quitto by force; while the subtle ATAHNALPA increased his forces under pretence of doing his homage with greater splendor, and celebrating the exequies of his deceased father at Cusco.

HUASCAR being inform'd, when it was too late, that his brother, instead of summoning his vassals to attend him, had levied an army of thirty thousand regular troops, which were advanced within forty leagues of Cusco, found he had been deceiv'd, and immediately issued his orders to the Governors of the several provinces to rendezvous with their respective forces at Cusco, and form an army for the defence of that capital: But ATAHNALPA having corrupted several of the Caraca's,

CHAP. IX. who join'd his forces in their march; and the rest that obey'd the summons of HUASCAR being new undisciplin'd troops, were not much to be depended on. However, being attack'd by ATAHNALPA's army, they behaved in defence of their Inca, as bravely as could be expected, and the battle lasted a whole day; but in the evening HUASCAR's army was forced to yield to the veteran troops of ATAHNALPA, and a very great slaughter followed, particularly among the Emperor's guards, consisting of a thousand men, who defended their Prince 'till they were almost all cut in pieces, and at length HUASCAR was taken prisoner, and carried in triumph to his brother, who did not march with his army in person, but continued at a distance, 'till he saw what success his Generals would have, who were old Officers, that had served his father in the wars of Quitto, and much superior to those who commanded HUASCAR's army.

HUASCAR being thus unhappily made prisoner, ATAHNALPA gave out, that he had no intention to depose his brother, but to defend his own dominions, which his father had conferr'd on him, against HUASCAR's incroachments; and to limit his prerogative, so as to make the condition of his subjects easy and happy: And thereupon summon'd all the Inca's of the empire to appear at Cusco, that all things might be settled to the mutual advantage of Prince and People. And having, on such pretences, got most of them into his power, he caused a body of his forces to surround them and cut them in pieces, conscious that the people would never willingly obey him, as long as there were any of the legitimate issue of their Inca left.

Nor did his rage stop here; he murder'd all the Caraca's and Officers that appear'd faithful to HUASCAR; and afterwards the women and children of the family of the Inca's, whom he put to death by various tortures, according to DE LA VEGA, who makes this ATAHNALPA, or ATAHNALPA, a monster of cruelty.

However, between five and six hundred of the blood of the Inca's did escape; it seems, by one means or other, and particularly the mother of our author, DE LA VEGA, who was, as he tells us, a daughter of HUANA CAPAC's brother. Two sons of HUANA CAPAC also fled from the rage of their brother, and afterwards married Spanish Ladies; as did several of the daughters and near relations of that Prince. The first Spanish Adventurers, or Conquerors, as they call'd themselves, seem'd to be ambitious of intermarrying with the royal blood of Peru; which was not only an honour to those Gentlemen, but might be thought to give them a better right to the country they had invaded, than they could acquire by the sword.

I should now proceed to the history of the Spaniards conquest of Peru, but beg leave to defer that a little 'till I have given some further account of the religion of the ancient Peruvians.

A further enquiry into the religion of the Peruvians. It is generally said, that the Inca's of Peru acknowledged no other god but their father the Sun, whose offspring they pretended to be: And this possibly may be true of the first Inca's; but some of them afterwards invading that part of the country where Lima (now the capital of Peru) stands, and meeting with a notable opposition, they were oblig'd to indulge that people in the profession of their ancient religion, and the worship of the almighty invisible God, and to promise not to demolish their temples, before they would submit to their dominion (however, they oblig'd them afterwards to erect a temple to the Sun, and adore that planet also).

V O L. III.

This temple stood in a fine valley, a little distance from Lima, and was dedicated to PACHA CAMAC, the invisible or unknown God, who created and sustains all things, and was standing when the Spaniards arrived in Peru; and here they found an in-conceivable treasure of gold, silver, and precious stones, that had been dedicated to the God PACHA CAMAC, whose name was communicated to the valley wherein the temple stood, and is still called "the valley of PACHA CAMAC. Roy. Com. Peru, p. 234."

The Inca's did not only permit this people still to adore their God PACHA CAMAC, but seem to have been convinced, from the time of this conquest at least, that there was one almighty invisible Being that created heaven and earth; and that the Sun was his Viceroy or Lieutenant. Others made two gods of them; the one visible, and the other invisible. And some of the Inca's, particularly HUANA CAPAC (Roy. Com. p. 365.) manifestly look'd upon the Sun as a mere creature, directed and govern'd in all his motions by the supreme God; for had he (says the Inca) any will of his own, and were not under a necessity of performing his annual course, he would sometimes rest or vary, and not always move in one sphere, if it was but to shew liberty of action.

From whence it is natural to infer, that the Inca's, notwithstanding the reformation they pretended to have effected in the provinces they conquer'd, by abolishing the worship of animals and vegetables, and of stocks and stones, and bringing the natives to adore only the Sun, did in some parts of their conquests introduce their own idolatry in the room of the worship of the one only God, or at least, obliged the people to worship the Sun as well as God, and consequently adulterated rather than reformed their religion. And 'tis very possible, that many of the people they subdued might equal, if not surpass, them in their manners, and the innocence and regularity of their lives, as well as in the purity of their religion, and might not be those barbarians the Inca DE LA VEGA has represented them; for I cannot help thinking but people were at least as just, as innocent, and humane, while they were led and govern'd by the Heads of their respective tribes, before large empires or kingdoms were formed by conquest or compact, as they were afterwards; for however we may have improv'd in arts and sciences, the world does not seem to improve much in its morals: For my part, I have found much more innocence and humanity among the unpolish'd inhabitants of unfrequented deserts and mountains, that seem to have been excluded all commerce and intercourse with the rest of mankind, than in the politest nations, who usually look upon such people as barbarians.

Most of the Spanish writers, either out of prejudice, ignorance, or design, have as much misrepresented the religion and morals of the Inca's, as the Inca's did those of the nations they subdued. ACOSTA, tho' in other respects a good writer, when he comes to treat of the religion of Mexico or Peru, is very little to be credited: He charges the Peruvians with sacrificing hundreds of their children at some of their festivals. ANTONIO DE FERERA, and other Spanish writers do the same, while the royal historian, DE LA VEGA, who wrote afterwards, and makes it his business to review and correct the errors of the authors that preceded him, assures us, that the Inca's never suffer'd any human sacrifices while they reign'd in Peru, but had the greatest abhorrence

CHAP. IX. horrence of them; and no man was better acquainted with their rites than DE LA VEGA was.

He also corrects the Spanish writers for giving out, that by PACHA CAMAC was meant the Devil: And that the Devil was worshipp'd in that temple (and indeed this the Spaniards made one pretence for invading and enslaving that unhappy people). Whereas, says DE LA VEGA, had they understood the Indian language, the very name of PACHA CAMAC would have taught them otherwise; the two words of which it is composed signifying, the almighty God, who created and sustains all things, and animates the universe.

The principal festivals of the Inca's.

I proceed, in the next place, to describe the principal rites and ceremonies in the religion of the Inca's. The royal historian informs us, they had four grand festivals annually, besides those they celebrated every moon. The first of their great feasts, call'd Raymi, was held in the month of June, immediately after the summer solstice, which they did not only keep in honour of the Sun, that blest'd all creatures with its heat and light, but in commemoration of their first Inca, MANCA CAPAC, and COYA MAMA OCLO, his wife and sister, whom the Inca's look'd upon as their first parents, descended immediately from the Sun, and sent by him into the world to reform and polish mankind.

At this festival all the Viceroy's, Generals, Governors, Caraca's, and Nobility, were assembled at the capital city of Cusco: And if any of them were prevented coming thither by sickness or the infirmities of old age, he sent his son, his brother, or some near relation to supply his place.

The Emperor, or Inca, officiated at this festival as High Priest; for tho' there was another High Priest of the blood-royal, either uncle or brother of the Inca, to whom it belong'd at other times to officiate, yet this being the chief feast, the Inca himself perform'd that office.

The Nobility, at this time, were crown'd with garlands or coronets of gold, adorn'd with flowers and beautiful feathers, and their garments were in a manner plated with gold. Some appear'd in the skins of Lions, others in vizards and ridiculous habits, playing upon their country musick; some acted the buffoons and madmen, while others shew'd feats of activity, and screw'd themselves into all manner of postures: The Governors of provinces carried the ensigns and colours of their several countries, and march'd at the head of their respective people.

They fasted three days, as a preparative to this feast, eating nothing but unbaked Maize and herbs, and drinking water. The fast being ended, on the eve of the feast, the Priests prepar'd the Sheep, Lambs, and drink-offerings, which were to be offer'd the next day to the Sun, while the virgins or wives of the Sun were employ'd in kneading dough, and making bread of Maize or Indian-corn, for the Inca's. They also dress'd the rest of the provision for the royal family at this solemnity; other women being employ'd to make bread, and dress flesh for the multitude.

The ceremony of adoring the rising Sun.

The morning being come, the Inca, accompany'd by his brethren and near relations, drawn up in order, according to their seniority, went in procession at break of day to the market-place bare-foot, where they remain'd looking attentively towards the East in expectation of the rising Sun, which no sooner appear'd but they fell down and ador'd the glorious planet with the most profound veneration, acknowledging him to be their god and father.

The Caraca's, vassal Princes, and Nobility, that were not of the blood-royal, assembled separately in another square, and perform'd the like ceremony; after which, the King rising upon his feet (while the rest remain'd in a posture of devotion) took two great gold cups in his hands, fill'd with their common beverage made of Indian-corn, and invited all the Inca's, his relations, to partake with him, and pledge him in that liquor.

Then he pour'd the drink out of the bowl in his right-hand into a small stone channel, which convey'd it to the temple; after which, having drank of the bowl in his left-hand, he distributed the remainder to his kindred Inca's, who waited with little gold and silver cups to receive the liquor.

The Caraca's and Nobility drank of another cup of the same kind of liquor, prepared by the wives of the Sun; but this was not esteem'd so sacred as that consecrated by the Inca.

This ceremony being ended, the whole company advanced bare-foot to the gate of the temple, being about two hundred paces distant from the place where they stood; and the Inca and his relations entering the doors, adored the image of the Sun at the east end of the temple, while the Caraca's, who were not indulg'd that privilege, worshipp'd in the great court before the gate of the temple.

The Inca here offer'd the vases or golden bowls, with which he perform'd the ceremony of drinking, and the rest of the royal family deliver'd theirs into the hands of the Priests. Then the Priests went out into the court, and receiv'd from the Caraca's and Governors of the respective provinces their offerings, consisting of gold and silver vessels, and the figures of all manner of animals cast of the same metals.

These offerings being made, great droves of Sheep and Lambs were brought, out of which the Priests chose a black Lamb, and having kill'd and open'd it, made their prognosticks and divinations thereupon relating to peace and war, and other events, from the entrails of the beast; always turning the head of the animal towards the East when they kill'd it.

After the first Lamb, the rest of the cattle provided were sacrificed, and their hearts offer'd to the Sun; and their carcases were flead and burnt, with fire lighted by the Sun's rays, contracted by a piece of Chrystal, or something like a burning-glass, they never making use of common fire on these occasions, unless the Sun was obscur'd. Some of this fire was carried to the temple of the Sun, and to the cloister of the select Virgins, to be preserved the following year without extinction.

The sacrifices being over, they return'd to the market-place, where the rest of the cattle and provisions were dress'd and eaten by the guests; the Priests distributing them first to the Inca's, and then to the Caraca's and their people in their order; and after they had done eating, great quantities of liquor were brought in.

Then the Emperor, being seated on a golden throne, rais'd on a pedestal of the same metal, order'd his relations, the Inca's, to drink in his name with the most celebrated Generals, Governors, and Nobility of the respective provinces, whose actions had render'd them famous in the empire.

The Inca's thereupon carried bowls of liquor from the Emperor to the persons thus distinguish'd, telling them the Capa, or supreme Inca, invited them to drink with him, and they were come to drink with them in his name; whereupon the Generals and Caraca's, each of them taking a cup from the Inca's hands, lift up their eyes to the Sun,

CHAP. IX. as returning thanks for the great favour done them by his offspring, and having drank, return'd the bowls back to the Inca's with the profoundest adoration.

Bowls of liquor also were carried by the Inca's to the rest of the Lords, Caraca's, and great Officers; but to these they drank in their own names, and not in the name of the Emperor.

In return of this compliment, the principal Lords and Caraca's, filling their own bowls, approach'd the throne with the greatest reverence, and in their order drank to the Emperor, who receiv'd it of them, and having drank what he saw fit, gave the rest to the servants and officers that attended him; but it was reckon'd a peculiar mark of respect where the Emperor drank deep, and pledg'd any one of them heartily.

The rest of the Caraca's and Noblemen drank to the royal family of the Inca's, who first drank to them in their own names, and then retiring to their respective stations, the musick play'd, and their dances, masquerades, and every other diversion was practis'd, which were in use among the several nations of Peru. There were frequent pauses and intervals, however, in which they drank very freely, and then return'd to their sports again. This festival was continued in the same manner nine days successively, only there were no offerings or sacrifices after the first. The solemnity being ended, the Governors, Generals, and Caraca's took their leave of the Emperor, and return'd with their people to their respective countries.

Second festival. A second festival was kept every year on the conferring military honours (or knighthood, as the Spanish writers term it) great regard being had to those who behav'd well in their country's service. The principal marks or ensigns those Knights were distinguish'd by, were large ear-rings, the Emperor himself boring their ears with golden nails.

Third festival. Their third festival was in the Spring, when their corn first appear'd, on which occasion Sheep and Lambs were sacrificed, and they pray'd for seasonable weather to bring the fruits of the earth to perfection, concluding the festival with drinking, singing, dancing, and other diversions.

Fourth festival. The fourth was celebrated on the new Moon after the Equinox in September, when they ador'd the Sun as it rose, as at their grand festival; and pray'd him to avert all calamities, whether of war, plague, or famine; and armed men running through the streets, were said to drive away these calamities out of the city: Fires also were made in the streets the succeeding nights, in order to purify them from all nocturnal evils; after which they spent the time in sacrificing, feasting, and dancing, every day during the first quarter of the Moon.

Monthly feasts. Their monthly feasts were celebrated by the Priests within the temple, at which times sacrifices of sheep, lambs, fowls, and other animals, were made to the Sun, but no publick processions: And as for human sacrifices, the royal historian assures us, there were never any such offer'd in the dominions of the Inca's; though ACOSTA, HERRERA, and other Spanish writers have charged them with sacrificing hundreds of children at their grand festivals.

The posture of adoration. I should have observ'd, that the people fell down on their knees and elbows when they ador'd the Sun, covering their faces with their hands; and it is remarkable, that the Peruvians express'd their veneration for the temple, and other holy places, by putting off their shoes, as the Chinese, the people of the East-Indies, and other Asiatics do, though

at the greatest distance from them, and not by uncovering their heads, as the Europeans do at divine service.

I have already mentioned their convents of select Virgins, or Nuns, of which there were two kinds, viz. those in the convent of the capital city of Cusco, and those belonging to the convents in the chief cities of the respective provinces.

The Nuns of Cusco were all of the whole blood of the Inca's, dedicated to the Sun, and call'd the Wives of the Sun. They were admitted into the convent at eight years of age, and taught by the elder Nuns to work with their needles, to spin, and weave the garments offer'd to the sun, and prepare meat and drink for the Inca. They also wove all the garments the Emperor and Empress wore at their solemn festivals. These Virgins were suffer'd to have no interview or intercourse with man or woman, after they enter'd this house; and none but the Empress was allow'd to visit them. If they were engag'd in a love-intrigue; it was punish'd with death; and if any man violated the chastity of one of them, he and his whole family, father, mother, wife, children, and even his flocks, herds, houses and lands, were utterly destroy'd: But these Nuns were never suffer'd to enter the temple of the Sun, or perform any manner of devotions to that planet, or any other god, as I can learn; much less did they assist, or serve the Priests in the temple, as some writers relate; their near relation to the Sun seems to have exempted them from any services of this kind.

The select Virgins in other provinces were either taken out of such families as the Inca's had adopted, and given the privilege to bear the name of Inca's, or out of the families of the Caraca's and Nobility residing in the respective provinces; or such as were eminent for their beauty and accomplishments: These were dedicated to the Inca, and called his wives, and he took them to his bed whenever he saw fit; so that these provincial nunneries were, in effect, but so many seraglio's, appropriated to the use of this grand Monarch, to which no other man might approach on pain of death, the loss of his relations, and all that was dear to him; the penalty of violating one of these being the same as was inflict'd on those who debauch'd a virgin dedicated to the Sun himself.

As to the notions the Peruvians had of a future state, it is evident that they believ'd the soul surviv'd the body, by the Inca's constantly declaring they should go to rest, or into a state of happiness, provided for them by their god and father the Sun, when they left this world. And 'tis probable their subjects had the like notion, that their souls were immortal, and capable of happiness or misery after death: But when the Spanish Missionaries add, that they believed a resurrection of the very same bodies, I doubt they impose upon us; for I question whether any people ever believed the resurrection of the body, till it was revealed by the Gospel. They might, and did believe there was another state, in which the soul should exist; but the resurrection of the same body is surely a doctrine peculiar to Christians. I should as soon believe, that the Peruvians held the doctrine of the Trinity, and every other article of the Catholick faith, as ACOSTA, and some other Spanish writers, aver (telling us, that the Devil had taught them to mimic every the minutest ceremony in the Christian religion, and even all their Popish superstitions) as believe they had an assurance that the same body their souls animat'd in this world should be rais'd again to life eternal.

nal: And what view the Spanish Missionaries had in suggesting, that there was not a doctrine, rite or ceremony held or practised by the Romish church, but were found among the Peruvians, is not easy to conceive.

Oracles. I must not dismiss the head of religion without taking some notice of the Peruvian oracles, mentioned by DE LA VEGA, ACOSTA, and other Spanish writers, and particularly the oracle of Rimac (now Lima, or King's-town).

Rimac. The valley of Rimac, says DE LA VEGA, lies four leagues to the northward of Pacha Camac, and receiv'd its name from a certain idol of the figure of a man, that spoke, and answer'd questions like the oracle of APOLLO at Delphos.

This idol was seated in a magnificent temple, to which the great Lords of Peru either went in person, or enquir'd by their Ambassadors, of all the important affairs relating to their provinces. And the Inca's themselves held this image in high veneration, and consulted it after they conquer'd that part of the country. Roy. Comp. p. 234. In the same chapter DE LA VEGA makes a remarkable concession in relation to the Peruvians worshipping PACHA CAMAC, the almighty invisible God, before the Inca's introduc'd the idolatrous worship of the Sun.

"The Kings of Peru, says that historian, did, by the mere light of natural reason, attain the knowledge of one God, the maker of all things, who sustain'd the universe, whom they call'd PACHA CAMAC: Which doctrine was more ancient than the time of the Inca's, and dispers'd thro' all their kingdoms, both before and after the conquest. They believ'd that he was invisible, and therefore built no temples to him (except that one in the valley of Pacha Camac) or offer'd him any sacrifices, as they did to the Sun; but shew'd, however, the profound veneration they had for him in their hearts, by bowing their heads, lifting up their eyes, and by other outward gestures, whenever his sacred name was mentioned." And as to what he charges them with in other places, namely, the worshipping all manner of animals, and even inanimate creatures, if the truth of this may be depended on, yet may we offer the same excuse for the Peruvians as has been made for the Egyptians, and other ancient pagans, viz. "That they only adored the infinite wisdom of God, manifested in the works of his creation."

CHAP. X.

Of the invasion and conquest of Peru by the Spaniards.

The conquest of Peru.

IT has been related already, that VASCO NUNEZ DE BALBOA first discover'd the South-sea in 1513, for which he was, by the Court of Spain, constituted Adelantado, or Lord-Lieutenant of the lands and islands he should discover in those seas; and that having fitted out some ships, he was so fortunate in the two following years to pass the Equator, and come upon the coast of Passao, the northern limits of Peru, where he was fully informed of the vast riches of that country; but being recall'd, and put to death by PEDRARIAS, then Governor of Terra-Firma, who had a view towards reaping the benefit of the discoveries VASCO had made; he afterwards employ'd several Pilots and adventurers to pursue the same track VASCO had gone, and plant colonies in Peru; but so

extremely difficult and hazardous was that coasting voyage, from the Bay of Panama (from whence they set out) to Peru, before they were acquainted with the winds and currents, that all the people he employ'd were discouraged from prosecuting the discovery of that country, reporting that the voyage was impracticable, or rather impossible, because the winds and currents sat in the very teeth of those that sail'd from North to South-America. Whereupon PEDRARIAS desisted from that enterprize, despairing to overcome the difficulties that had been represented to him; and leaving the town of Old St. Mary's, on the Gulph of Darien, he built another town on the Bay of Panama, which bears the same name, and from thence he pursued his conquests to the north and west in the provinces of Veragua and Costa Rica.

PEDRARIAS having thus entirely abandoned the enterprize on Peru, three bold Adventurers, viz. PIZARRO, ALMAGRO, and DE LUGNE, who then resided in his new town of Panama, desired his leave to attempt the further discovery and conquest of Peru at their own charges, which he readily granted, being of opinion it would come to nothing; and all that were acquainted with the former attempts that had been made, looked upon these Adventurers to be no better than fools and madmen: And though some have related that PEDRARIAS stipulated to have a share in the profit of this adventure, if they made any, it does not appear that he ever claimed any part of their booty afterwards, or that any part of it was reserved for him; only the King's fifth was laid by, the rest the Adventurers shared amongst themselves; but of this hereafter. I now proceed to relate the beginnings and progress made by PIZARRO, ALMAGRO, and DE LUGNE, in the conquest of that vast empire of Peru, which they liv'd to accomplish in a great measure, but never enjoyed the fruits of their labours. PIZARRO, ALMAGRO, and most of the Officers that were employed in this service, perishing by their own intestine divisions, each of them being inspired with an ambition of acquiring the sole dominion of those countries, to the exclusion of their Fellow-adventurers.

FRANCIS PIZARRO, who makes the greatest figure in this triumvirate of Adventurers, was a native of Truxillo in Spain, and the Spaniards will have him to be of a noble family; but if he was, he seems to have been pretty much reduc'd, and to have gone to the West-Indies to recruit his broken fortunes. He served first in the wars in the islands of Hispaniola and Cuba, and afterwards accompanied ALONZO DE OYEDA to the Gulph of Uraba, or Darien, in Terra-Firma Proper, to settle a Spanish colony there. OYEDA returning to Hispaniola for Recruits, left FRANCIS PIZARRO his Lieutenant in Darien; and not coming back within the time he appointed, the colony suffer'd incredible hardships; but by the conduct of PIZARRO they were most of them preserv'd 'till ships arriv'd to their relief, which very much rais'd the reputation of this Captain.

He afterwards attended VASCO NUNEZ DE BALBOA, when he discover'd the South-sea, serv'd under PEDRARIAS, when he fixed a colony at Panama; and was employed by that General in the subduing the province of Veragua, in which expeditions he acquired the reputation of a good Officer, and a fortune sufficient to have satisfied any reasonable man; but this increase of wealth did but increase his thirst after more: And when he might have spent the remainder of his days in peace

CHAP.

Only two months in the year the winds are favourable on this coast, which the first adventurers did not know.

The three principal adventurers in this conquest.

Some account of Francis Pizarro.

CHAP. X. and plenty, he chose, in the decline of life, being upwards of fifty, to enter upon the discovery of unknown regions; the difficulty whereof had baffled the attempts of several Adventurers, rather than sit down and enjoy what he had already acquir'd.

Some account of Almagro.

Of de Lugue.

DIEGO DE ALMAGRO, the second of this triumvirate, was born at Almagro in Spain, a man of a mean and obscure original, but of a genius equally enterprising as the former, and who, in several expeditions in the West-Indies, had amassed a great deal of wealth. These two, residing at Panama, associated themselves with FERDINAND DE LUGNE, an Ecclesiastick of that town, richer than either of them, and who was Proprietor of the island of Tabago, in that bay. This Gentleman had been acquainted with VASCO NUNEZ, as well as the other two, and was pretty well assured that the voyage would answer their expectations, if they could overcome those difficulties of contrary winds and currents that had discouraged others: And though people generally lose their enterprising genius as they grow into years, yet had avarice, ambition or curiosity such an ascendant over these three Gentlemen, that though they were all of them between fifty and threescore years of age, yet did they embark their fortunes, and two of them their persons, in search of those mountains of gold they had received intelligence of.

The contract of the Adventurers.

They enter'd into articles, 'tis said, never to abandon each other for any hazards or disappointments they might meet with in the enterprize, 'till they had made a conquest of Peru: And solemnly took their oaths in publick, for the confirmation of these articles, each of them being assigned a particular part in conducting and executing the scheme.

FRANCIS PIZARRO was to command the first party that went upon the discovery; ALMAGRO was to carry him Recruits, and reinforce him from time to time, and FERDINAND DE LUGNE was to remain at Panama, and lay in ammunition and provisions to support the enterprize; and whatever gold, silver, precious stones, or other effects should be acquired, after the charges, and the Emperor's fifths were paid, were to be divided equally amongst them.

The royal historian having proceeded thus far in his relation, makes some reflections on the great advantages that have resulted from this confederacy of these three Spanish Gentlemen; as that the Christian religion was first introduc'd into that great empire of Peru by their means: That arts and sciences were first introduced there by them, in return for which, Spain, and the rest of Europe, became possessed of an immense treasure in gold, silver, and precious stones.

But if the numberless devastations and oppressions the miserable Indians suffered by the usurpations and tyrannies of the Spaniards, are considered, how many millions were cut off and entirely extirpated, and how many more enslaved; if it be consider'd, that with the Christian religion they introduced the Inquisition with all its terrors; and have so adulterated and corrupted the Christian doctrines, faith and practice, and with them the morals of the Indians, that people possibly have lost more than they have gain'd by the change.

And as to the benefits we receive by the importation of gold and silver from Peru, this, DE LA VEGA himself seems to be of opinion, does not countervail the mischiefs they bring with them; as appears from his commentaries on that part of the history, p. 425.

Such, says this historian, as look on the riches of Peru with more than common eyes, are of opinion.

CHAP. X. nion, that they have rather been hurtful than beneficial to mankind: For riches have been the cause of vice, and not of virtue, having inclin'd men to pride, ambition, gluttony and luxury; for enjoying an affluence of fortune, they have given themselves up to sloth and effeminacy, becoming neither useful members of society in time of peace, nor fit for hardship and labour in time of war; but employing their whole thoughts and time in contriving new dishes and liquors to gratify their appetites, and fantastical fashions for their cloathing. And as the rents of the poor have been raised to maintain the lusts and riotous livings of great persons, so have the poor been oppress'd and reduc'd to rags and famine, to support the pride and luxury of their landlords. The truth is, says DE LA VEGA, the poor are become much more poor than formerly; for the quantity of money being increased, which is heap'd up in the coffers of the rich, hath enhanc'd the price of provisions to that degree, that the poor starve by the abundance of the rich; and tho' the rich have plenty of money, and might, out of their great stores, enlarge their charities and benevolence to their poorer neighbours, yet their alms, and the wages they allow the labouring men, do not answer the price of provisions, which the plenty of money hath raised. From whence it is concluded, that the riches of the new world not having increased the provisions necessary for the support of human life, but rather served to make them dear, to make men effeminate, and to enfeeble their constitutions and understandings, and introduce vicious habits and customs: The generality of mankind is become much worse, and more discontented; and nations heretofore formidable, and dreaded by all the world, are now rendered mean, despicable and effeminate, by the corruption of riches, "which is more applicable to Spain than any other country, that people having declined ever since they have been masters of the treasures of Mexico and Peru; and no doubt DE LA VEGA had his eye principally upon the Spaniards when he made this reflection."

To return to our history. The three Partners having bought a ship, victuall'd and equipp'd her (or as some say, two ships) PIZARRO embark'd about the middle of November, 1525, with fourscore men and four horses (DE LA VEGA makes them 114 men) and setting sail from Panama, sailed to the Pearl-islands, in the middle of that bay, where he took in wood, water, and grass for his horses, and sailed to Port Pinas, or Pineapple, upon the continent, on the south-east side of the bay of Panama. Here PIZARRO went on shore with his soldiers, and endeavour'd to penetrate into the country; but meeting with nothing but bogs, or mountains, overrun with wood and deluges of rain, as they approach'd the Equator; and the people having fled from their habitations, so that no provisions were to be had: PIZARRO ran farther down the coast to the southward, and then landing again, found the country no better, and lost a great many of his men by sickness, want of provisions, or the hardships they suffer'd in their marches and counter-marches. Whereupon he sent the ship to the isles of Pearls for provisions, and in the mean time was follow'd by ALMAGRO with two other ships, and a recruit of sixty men and upwards. These two Captains meeting upon this wretched, rainy, and unwholesome coast, and landing their united forces, had some skirmishes with the natives, in which ALMAGRO lost an eye; but happening, in some of their excursions, to meet with a parcel of gold of the value of fourteen or fifteen thousand crowns, they resolved, notwithstanding

notwithstanding all the difficulties and hazards they underwent, to persist in the enterprize; in which they were the more encouraged by the Pilot De RUYZ, who (while PIZARRO remain'd with the soldiers on shore) ran down as far as Cape Passao, under the Equator, and taking some prisoners, was assured by them, that the treasures of Peru were much beyond any thing that had hitherto been reported of them. Whereupon he return'd to PIZARRO with the agreeable news: In the mean time, that General suffer'd incredible hardships in the absence of ALMAGRO, who was gone to Panama with the gold they had got, to procure another reinforcement of troops and provisions. ALMAGRO, at his return to Panama, found PEDRARIAS removed from his Government, and succeeded by PETER DE LOS RIOS, who permitted him to raise what men he could to reinforce PIZARRO. Whereupon he embark'd again with forty soldiers more, some horses, and arms, cloaths, shoes, provisions, and medicines, and returned to PIZARRO, whom he found in a very miserable condition, great part of his men being sick or dead. They removed therefore from that unhealthful part of the continent, and put their men on shore in the island of Gallo, where they remain'd fifteen days, and then return'd towards the continent again, running along the coast further to the southward; however, they still met with such a drowned country, and bad weather, that it was once propos'd to return back to Panama: Even PIZARRO's heart fail'd him; and the two Commanders, it seems, were upon the point of drawing their swords, so hot was the contest for and against proceeding in the enterprize; but at length it was agreed, that they should go to the island of Gallo again, where PIZARRO should remain with the men 'till ALMAGRO went to Panama for recruits: And great care was taken, that none of the men should write home, and discover their wretched condition; for most of them had shewn an inclination to desert the service whenever they had an opportunity, and threaten'd to apply to the Governor of Panama to be recall'd from an expedition which had consumed such numbers of them; and, if prosecuted, would probably destroy the rest. And notwithstanding all the care their Commanders took, one of them found means to send a paper, subscrib'd by most of the men, desiring to be recalled, which was inclosed in a bottom of cotton-yarn, and thereby concealed from the notice of their Officers. This paper coming to the hands of the Governor of Panama, he was so far from suffering ALMAGRO to levy any more recruits, that he sent a ship, with a Commissary on board, to the island of Gallo, on purpose to bring back all the men that survived. The Commissary arriving, PIZARRO begg'd of him that he would however suffer as many of the men to remain with him as were willing to proceed in the enterprize; which the Commissary consenting to, PIZARRO drew a line with the point of his sword, and haranguing his men, told them they were at liberty to return to Panama, if they thought fit; but it griev'd him that they should now abandon the enterprize, when they were upon the point of reaping the reward of all their sufferings. As for his part, he would perish in the glorious undertaking, rather than desert it; and those that voluntarily remained with him should share with him the treasures of which they had so near a prospect, desiring those that were willing to proceed in the enterprize to come over the line he had drawn: But such were the sufferings of these poor wretches, that much the greatest part of them forsook him; only

thirteen men and a Mulatto came over the line, the rest embarked and returned to Panama with the Commissary.

PIZARRO being thus left on the island of Gallo with only fourteen men, besides some Peruvian men and women they had taken prisoners, remov'd to the neighbouring island of Gorgona, for the benefit of fresh water, and remained there 'till ALMAGRO and RUYZ the Pilot came to him with refreshments and some few volunteers that were still willing to share their fortunes; on whose arrival it was agreed to sail further southward; and having pass'd the Equator, they came to an anchor in the bay of Guiaquil, near the islands of Puna and St. Clara, which lie in 3 degrees south latitude, and going on shore in the island of St. Clara, they found several vessels and utensils of silver plate, with garments made of cotton and fine wool, which were offerings made to some idols in this island, where the natives of Puna came at certain seasons to worship them; but there were no constant inhabitants on the island. It was with infinite labour and difficulty, that our Adventurers proceeded thus far to the southward; they were forced to bear up both against winds and currents, that continually almost sat against them on these shores, insomuch that they spent two whole years in this voyage from the island of Gorgona, in 3 degrees of north latitude, to the bay of Guiaquil in 3 degrees of southern latitude; a voyage that may be perform'd in less than a month, now we are acquainted with the currents, winds and seasons upon the coasts of Popayan and Peru.

While PIZARRO and ALMAGRO lay in the bay of Guiaquil, they took several great floats, or barklogs, with arm'd Indians on board, that were going from Tumbez, on the neighbouring continent, to invade the island of Puna, with which they were at war. From these Indians they learn'd that there was a great town and castle at Tumbez, a magnificent temple, a convent of select Virgins, and abundance of gold and silver vessels, and that the country abounded with corn and fruits. Whereupon PIZARRO treated the Indians with great civility, and gave them their liberty to return to the continent with their floats; and let them know, by his Interpreters, that they came as friends, and did not design any manner of hurt or damage to the natives. These Indians acquainting their Lord, the Cacique of Tumbez, with the wonders they had seen, viz. the ship, the guns, the habit and complexion of those on board; and informing him, that the Spaniards came to visit that coast in a friendly manner, the Cacique sent a Nobleman, or Orejon, on board, with several barklogs loaden with provision; and to invite the Spaniards to come on shore, telling them they were welcome to whatever the country afforded. Whereupon one of the sailors was sent on shore with the Indians, and brought twenty butts of water on board with their floats: The Orejon, 'tis said, enquired of PIZARRO in the mean time, what it was he went in search of, and what was the reason they had for some years been roving about the sea near the Peruvian coast? PIZARRO answered, They came from the most potent King of Spain, to require them to submit to his dominion, and be instructed in the true religion, by which alone they could attain the joys of heaven. At which answer, 'tis said, the Peruvian appear'd a little astonish'd, as he might well, to find the Spaniards making such demands upon so short an acquaintance, and when they were in no condition to compel the Indians to submit to them; and indeed PIZARRO seems to have been a man of more discretion than to have requir'd

CHAP. X. required the Peruvians to obey him when he was in such low circumstances; this could only inspire them with a contempt of his person, and provoke them to use him ill. It is much more probable, that he continued to assure them of his friendship, since the same writers inform us, he sent one of his company and a Negroe on shore with the Peruvian Nobleman, and a present of European animals, an ax, and some glittering trifles, with which the Cacique was extremely pleas'd: And as the Indians were surpriz'd to see so strange a people, and such animals and instruments as they brought with them, the Spaniard, that went on shore, was no less surpriz'd to find a fine palace, and a magnificent temple, and all manner of vessels and utensils form'd of gold or silver; and when the man return'd on board to PIZARRO, he seem'd unable to declare the vast treasures he had seen, and the strength and beauty of the castle where the Cacique resided.

Peter de Candia goes on shore alone, and takes a view of Tumbes. PIZARRO, desirous to be better acquainted with the truth of what the sailor related, PETER DE CANDIA, a man of good judgment, offer'd to go on shore and take a particular view of the place: And as he was of a stature beyond the common size, it was thought that his person would be the more admir'd, and give the Indians the greater opinion of the people that were come to visit them: And to add to the astonishment of the natives, PIZARRO, made him put on a complete suit of shining armour, a shield on his left-arm, a broad sword by his side, and take a fuzee in his hand; and thus equipp'd, he was set on shore with a Negroe to attend him.

The Indians, as it was expected, were amazed to see a man so tall and of proportionable bulk, his body covered with glittering steel, and a long beard on his chin, and immediately fled from the shore to the castle on his landing. PETER, thereupon, with a grave countenance, and true Spanish pace, advanced towards the gates, and giving them to understand by signs that he had no hostile intentions, was conducted to the presence of the Cacique, and received with great civility. The Spaniards, indeed, entertain us with an idle story, endeavouring to make a miracle of the matter, and tell us, that the Indians not daring to engage this gigantick Champion themselves, let out a Lion and a Tyger upon him; and that these animals losing their natural fierceness, fawn'd upon him, which the Spaniards ascribe to the sanctity of the Cross that PETER carried in one of his hands: But they all agree, that the Cacique entertain'd him with great hospitality, shew'd him the Inca's palace, the temple of the Sun, and the house of consecrated Virgins; and afterwards sent him on board with a handsome present of Indian-corn, sheep, and fruits.

PETER DE CANDIA, at his return, related that every thing exceeded what the sailor had reported; that he saw Silver-smiths at work, in forming all manner of gold and silver utensils; that the walls of the temple were wainscotted with gold, and that the Virgins dedicated to the Sun were extremely beautiful, at which the Spaniards were transported with joy; but not being prepared to make themselves masters of the treasures they understood were to be met with on shore at this time, PIZARRO set sail again, and run further down the coast to the latitude of 7 degrees south, where Truxillo was afterwards founded, and discovered a very fruitful country; but then at the importunity of his men he returned back to Panama, being the latter end of the year 1527, in order to make preparations for the entire conquest of Peru.

CHAP. X. PIZARRO, having spent three years in search of these happy countries, and after numberless hazards and hardships succeeded at last, and brought from thence specimens of the wealth that abounded there; with some of the natives, Peruvian cattle, and fine cloth, the people were over-joy'd to see him, and very ready to list in his service; but the Governor of Panama oppos'd it. Whereupon the three principal Adventurers, PIZARRO, ALMAGRO and LUGNE, came to a resolution, that PIZARRO should go over to Spain and procure an authority and recruits equal to so great an undertaking; particularly, that he should solicit for himself the title of Governor, for ALMAGRO that of Adelantado; or the King's Lieutenant, and for LUGNE the Protectorship of the Peruvians, and the first bishoprick in that country. PIZARRO accordingly set sail, and arriving in Spain, resorted to the Court of the Emperor CHARLES V. which was then at Toledo: Here he met with a very gracious reception on his presenting his imperial Majesty with some Peruvians in their proper habits, two or three Peruvian sheep, and several gold and silver vessels and utensils of the fashion of that country. The Emperor was pleas'd to hear him relate the hardships and difficulties he and his comrades had met with in this three years voyage, and in the end recommended the overtures he made to the Council of the Indies, who, having made their report, PIZARRO was authorized to proceed in the conquest of Peru, for the space of two hundred leagues to the southward of Tumbes, which lies at the bottom of the bay of Guayaquil, in 3 degrees south latitude. He procur'd also the title of Governor and Captain-General to be confer'd on him for life, with the offices of Adelantado, or Lord-Lieutenant, and of Alguazil Major, or Chief-Justice. He was also empowered to erect four castles in Peru, where he thought proper, and retain the government and inheritance of them to him and his posterity: He obtain'd for FERDINANDO DE LUGNE, that he should be recommended to the Pope to be made Bishop of Tumbes; and in the mean time, constituted Protector-General of the Peruvians. ALMAGRO was constituted Governor of Tumbes, and a twentieth part of all the profits and revenues of the country, when conquered, were to go to PIZARRO and ALMAGRO, two thirds thereof to the former, and one third to the latter; and ALMAGRO was made a Gentleman, and his bastard son legitimate: The thirteen men that remained with PIZARRO in his distress, on the island of Gallo, were made Gentlemen, if they were not so before, and those that were gentlemen then were ordered to be knighted.

These commissions and powers were executed at Toledo on the 26th of July, 1528; and six Dominican Friars were order'd to go over with PIZARRO, as Missionaries to assist in the conversion of the Peruvians.

PIZARRO, repairing to his native town of Truxillo, spent some months in raising men, and making provisions for his voyage, which having effected, he embark'd at Seville with his four brothers, viz. FERDINAND, JOHN, GONZALO and FRANCIS, in the month of January, 1530, and arrived at Nombre de Dios, on the coast of Terra-Firma, from whence he marched with his people to the city of Panama; but his ingrossing all the honours and commands to himself so disgusted ALMAGRO, that he refus'd to assist in the intended expedition 'till PIZARRO promised to relinquish the title of Adelantado, and to give him an equal share in what ever obtain'd.

ever they should acquire; and upon these concessions ALMAGRO promised to assist him as formerly, and smother'd his resentment for the present, that the service might not suffer; but they were never heartily reconciled, as will appear hereafter.

At length PIZARRO embark'd at Panama in three ships, taking with him one hundred and eighty-five soldiers, thirty-seven horses, and such quantities of arms, ammunition and stores as might enable him to fix colonies on the Peruvian coast; but meeting with the like contrary winds he had done in the first voyage, and finding it very inconvenient, and indeed impracticable, to keep his horses longer on board, he was obliged to land above an hundred leagues to the northward of Tumbez: And now thinking himself strong enough to drive the naked Indians before him, he fell upon them, plunder'd their towns, and made many of them prisoners, without any manner of provocation; whereupon the rest fled from the sea-coasts up into the country; and PIZARRO was afterwards so distressed for want of provisions, and lost so many men by sickness, and hardships, and the fatiguing marches through bogs and thickets of mangroves in this excessive hot climate, that his forces were exceedingly diminished, and he now, too late, perceiv'd his error, in not courting the natives, being in no condition to make a conquest of Peru with the forces he had left.

He took most of the treasure therefore he had plunder'd the Indians of, and sent his ships back with it to Panama to raise more recruits, inviting at the same time some Adventurers from Nicaragua, and other parts of North-America, to come and join him, promising them a share of the vast treasures he was now assured of finding in Peru: And having, with infinite labour, march'd as far as Tumbez, in the bay of Guiaquil, over the mouths of abundance of rapid streams, that fall into the South-Sea, under the Equator, he very fortunately found the Peruvians engaged in a civil war, one part of them adhering to their lawful Prince HUASCAR, and the other to ATAHNALPA, or ATABILIPA, the bastard son of the preceding Emperor HUANA CAPAC, who had made ATABILIPA King of Quitto and the northern provinces of Peru in his life-time. This young Prince finding himself at the head of a great body of veteran Troops and experienc'd Officers, who had been engaged in that conquest, was not insensible of his strength, and in a short time after his father's death discover'd views of usurping the whole empire; this occasioned misunderstandings between him and his brother HUASCAR, the present Emperor, which at length ended in an open rupture, as has been already related. In this war, the inhabitants of the vale of Tumbez adher'd to their lawful Prince HUASCAR; and those of the isle of Puna, a large island in the bay of Guiaquil, consisting of twelve thousand inhabitants and upwards, took part with the bastard ATABILIPA, as their interest led them, carrying on at all times a very gainful trade for their salt and other productions of that island with the kingdom of Quitto, from whom they received woollen and cotton, cloathing, and other merchandize in return.

PIZARRO, as has been intimated already, finding himself not able, at this time, to attempt the conquest of the whole Empire, took part with the Tumbezene, and joining their forces, invaded the island of Puna, which became an easy conquest; and having taken all the Caciques of the island prisoners, he delivered them into the hands of the Tumbez Generals, who immediately cut off their heads. He also releas'd seven or eight hundred Tumbezene

prisoners, and sent them home, by which he imagin'd he had so oblig'd his new allies, that they would not fail to assist him in his future conquests.

In the mean time, ALMAGRO having sent PIZARRO a considerable reinforcement from Panama, and FERDINANDO DE SOTO and other Adventurers arriving with their troops from Nicaragua, he thought himself in a condition to carry on the war upon the continent, especially as he had some reason to expect to be supported by the Tumbezene. Accordingly, having provided a sufficient number of floats, or barklogs, he transported his troops to Tumbez, in which he lost some men in going on shore by the surf of the sea, which runs very high upon that coast, and some of his people were attack'd and cut off by the natives, which was a surprise to him, as he took them to be his friends. The Spanish writers give various reasons for this alteration in the conduct of the natives of Tumbez, who but a very little before profess'd themselves their good allies and confederates. Some relate, that observing the Spaniards had enslaved the natives of the island of Puna, and perfectly subverted their Religion and Government, demolishing their temples and every thing they held sacred, they expected to be treated in the same manner by the Spaniards, and therefore thought fit to oppose their landing in their country.

Others inform us, that while the Spaniards were engaged in the reduction of Puna, a very great alteration happened in the face of affairs upon the continent: ATABILIPA, the bastard, had defeated the forces of his brother HUASCAR the Emperor; cut in pieces most of the inhabitants of Tumbez, and the neighbouring provinces, for adhering to him; and the troops that oppos'd PIZARRO's landing in Tumbez, were those detach'd by ATABILIPA to that province, on purpose to oppose the invasion of the Spaniards.

But whatever was the reason of the Peruvians opposing the descent of the Spaniards, it is evident, that they were put in such confusion by the Spanish horse and artillery, that they fled as the Spaniards advanc'd, and after the slaughter of some thousands of them, were forced to abandon the town and castle, and even the whole valley of Tumbez, leaving behind them all the gold and silver Plate, Emeralds, Pearls, and other rich spoils, which lay heap'd up in the temple of the Sun, and the Inca's palace; being so vast a treasure, that the Spaniards could scarce believe their eyes, when they found themselves so suddenly possess'd of it: And such was the consternation of ATABILIPA, and his whole Court, when the fugitives related what slaughter the thunderers ordnance made amongst them, and how impossible it was to escape the Spanish horses, to which animals their fears had added wings, that they concluded, if the Spaniards were not gods, they at first conjectured they were certainly devils, and that it was not possible for any human force to defend their country against them. Of which PIZARRO receiving intelligence, resolv'd to take advantage of the terror they were in, and march immediately to find out ATABILIPA, while he remain'd under that delusion; but he found it necessary to defer his march, 'till he had erected a slight fortress on the sea-coast (to which he gave the name of St. Michael's) for receiving the recruits that he expected, and to serve him for a place of retreat and security, in case any unforeseen accident should happen.

This was the first Spanish colony planted in Peru, and here the first Christian church was erected in the

CHAP. X. the year 1531; and Father REGINALD DE PEDRAGA was constituted Protector of the Indians, FERDINAND DE LUQUE being unable to execute that employment on account of his indisposition.

PIZARRO, whose business it was to foment the civil wars, and prevent the Peruvians uniting their forces against him, gave out that he was come in the name of the great King of Spain (like a true Spanish Knight Errant) to relieve the oppressed, and do justice to those that were injured, which he soon found had the effect he expected; for the Emperor HUASCAR, having been deposed and imprisoned by the bastard ATABILIPA, and all his friends and faithful subjects that had adhered to him, cruelly oppressed, they immediately sent an embassy to PIZARRO, that he would assist them in delivering their Prince from his captivity, and restore him to the throne of his ancestors; to whom the Spanish General returned a favourable answer. And ATABILIPA, who was yet scarce settled in the throne he had usurped, apprehending he should soon be driven from it again, if the Spaniards joined with the loyal party, endeavoured by all possible ways to gain the favour of PIZARRO, sending a messenger to excuse the hostilities his forces had committed at his landing; and not only promising what satisfaction he should demand, but assuring him he was ready to submit to the commands of that great Prince from whom he came.

Pizarro
marches
to Caxa-
malca.

The Spanish Generals finding they were like to meet with little opposition from either side, but that both parties were ready to make them arbiters of their differences, concluded they should now soon be masters of those immense treasures they understood were heaped up in the capital city of Cusco, and of the gold and silver mines from whence they were drawn. They began their march therefore to Caxamalca, where they understood the Inca then was, in the year 1532, as soon as they had put the town of St. Michael into a posture of defence; and carrying with them a train of artillery, which was drawn by the Indians press'd into their service (there being no horses or oxen, or any other cattle for draught, either in Mexico or Peru, when the Spaniards first arrived there) advanced by slow marches, sending out parties to discover the country, and get intelligence as they went along.

The consternation increasing among the Peruvians, and the Spaniards approaching Caxamalca, ATABILIPA, who looked upon the artificial thunder of the Spaniards as supernatural, and their wing'd horses, as well as themselves, to be of infernal, if not of heavenly, extraction, apprehended there was no safety for him but in his submission; and therefore sent a solemn embassy to PIZARRO, by his brother AUTACHY; together with rich presents of gold and silver plate, and emeralds, corn, fruit, Peruvian sheep and goats, strong liquor, venison, tame and wild fowl, fine cotton and woollen garments of various colours, and whatever his country afforded.

AUTACHY being admitted to the presence of PIZARRO, told him, he was sent by the Inca ATABILIPA to welcome him and the rest of the sons of their common god and father, the Sun, into that empire, desiring he would accept the small present he brought with him for the refreshment of his troops in their march; telling him, that Inca was impatient to see his kindred, whom he understood to be of the like heavenly extraction, and to whom he promised all obedience. After which, the royal historian relates, that AUTACHY made

VOL. III.

CHAP. X. the following formal speech to PIZARRO (which was put into Spanish by PHILIP, a young Peruvian he carried with him to Panama in the former voyage, on purpose to be instructed in that language) viz.

"Inca VIRACOCHE, thou progeny of the Sun, since it hath been my fortune to be put on this remarkable embassy, I presume to entreat, you would be graciously pleased to take my Sovereign, the Inca ATAHUALPA, into the number of your friends, and contract a perpetual peace and alliance with him; and that you would pardon the injuries the Peruvians may, through ignorance of your divine original, have committed against you, moderating that just vengeance, your great god and father VIRACOCHE might justly have inflicted on our people: And having said this, he caused the present to be brought in and set before the Spanish General."

The substance of PIZARRO's answer to that speech, 'tis said was, that the Spaniards were authoriz'd by their High Priest, the Pope, to convert the Peruvians from their idolatry to the Christian religion; and that the great Emperor of the Christians, CHARLES V. had empower'd them to enter into a league of friendship and perpetual peace with the Inca, and were order'd to offer no manner of violence to him, or his subjects, if these overtures were accepted.

The Peruvian Ambassador being dismissed, PIZARRO, to return the compliment, dispatch'd his brother HERNANDO PIZARRO, and HERNANDO DE SOTO, attended by about thirty horse, and PHILIP the Interpreter, as Ambassadors to the Inca ATABILIPA, who was then at one of his palaces in the neighbourhood of Caxamalca: The Inca being inform'd of their approach, ordered a detachment of his army to advance and meet the Spaniards on the way, and conduct them to his presence. This body of Peruvians being come within a little distance of the Ambassadors, fell down and adored them; and having acquainted them, that the Inca waited their arrival with impatience, attended the Ambassadors to the palace; where, upon their alighting, they were conducted to the Inca, whom they found sitting on a chair of gold, in the midst of his Officers and Courtiers. The Emperor arose from his seat to receive them, and said they were welcome to his dominions, and golden chairs were brought for the Ambassadors. After they were seated, the Inca looking stedfastly on them, said to his Courtiers, Behold the very face, countenance, and habit, of our god Viracocha, in the same manner and form as our ancestor the Inca VIRACOCHE describ'd him in his vision; and immediately two royal Virgins brought in each of them two golden cups, filled with the liquor usually drank by the Inca, and bowing, deliver'd one of the cups into the hands of ATABILIPA, and another to HERNANDO PIZARRO; and the Interpreter acquainted them, that the Inca desired to drink with them, which, according to the custom of their country, testified the respect he had for the Christians, and did desire to live in perpetual peace and friendship with them: Whereupon the Inca and HERNANDO drank, and gave away their cups; then the other Virgin deliver'd one of her cups into the hands of the Inca, and the other to HERNANDO SOTO, who had the honour also to drink in like manner with the Emperor.

Then six boys and as many girls brought in green and dry fruits; and one of the Virgins, addressing herself to the Ambassadors, said, Ye sons of CAPAC INCA VIRACOCHE, taste of these things we offer,

22 I

CHAP. X. offer, and it will extremely oblige us : Whereupon the Spaniards tasting of their fruits, were amaz'd, says the royal historian, to find so much civility and politeness among a people they had been taught to look upon as barbarous.

The collation being over, HERNANDO DE SOTO, according to the same author, made the following speech to the Emperor.

Most serene Inca,

YOU are to understand, that in this world there are two supreme Princes ; one is the Pope, who is High Priest, and sits in the place and tribunal of God ; the other is the Emperor of the Romans, called CHARLES V. King of Spain, who having been informed of the blind ignorance in which the natives of these your kingdoms live, despising the true God, who is the Maker of heaven and earth, bestowing the worship due unto him upon his creatures, and upon the Devil himself, who deceives and deludes them, have sent their Governour and Captain-General, Don FRANCISCO PIZARRO, with his Companions, and some Priests, who are the Ministers of God, to teach your Highness, and your subjects, the divine Truth, and his holy Law ; and for this reason it is, that they have undertaken this long journey to your country ; where having received instances of your bounty from your liberal hand, they entered yesterday into Caxamalca, and this day they have sent us to your Highness, with offers of peace and concord, which may endure for ever between us ; that so receiving us under your protection, we may have leave to preach our Law, and that your subjects may hear and understand the Gospel, which will be much to your honour, and conduce to the salvation of your souls."

To which speech the Inca returned the following answer.

The Inca's answer to the Ambassadors.

I AM much pleased, divine Lords, that you and your companions are in my days come into these remote countries, that so I might see those prophecies and prognostications fulfilled, which our ancestors have left us ; though in reality my soul hath much more reason to be sad, when I consider, that the end of our empire approaches, of which, according to ancient predictions, your coming is a forerunner ; and yet I cannot but say, that these times are blessed, in which our god *Uiracocha* hath sent such happy guests, which shall transform the State of our Government into a better condition, of which change and alteration we have certain assurance, from the tradition of our ancestors, and the words of the last testament of our father HUANA CAPAC ; for which reason, though we had certain intelligence of your entrance into our country, and the fortifications you made in it, and of the slaughter you committed in Puna, Tumbez, and other parts, yet neither I, nor my Captains, have entered into any consultations, how, or in what manner, we might expel you from hence, because we hold and believe, that you are the sons of our great god *Uiracocha*, and messengers of the PACHA CAMAC ; for which cause, and in confirmation of what my father delivered to us, we have made it a law, and published it in Cusco, that none shall dare to

CHAP. X. " take up arms against you, or offend you ; wherefore you may do with us as you please, it being glory sufficient for us to die by your hands, whom we esteem the divine messengers of God, by whom you must be sent, considering the actions you have already performed : Only I desire to be satisfied in one doubt : How comes it to pass, as you say, that you come to treat of friendship, and a perpetual peace, in the name of the two before-mentioned Princes, and yet on the other side, without so much as any summons, or sending to treat with us, or know our will and pleasure towards you, you have committed such outrages and slaughters in the countries through which you have passed ? I conceive, that the two Princes which employed you have given you such commission to act with such severity against us, without any fault of ours : And I imagine, that the PACHA CAMAC hath so commanded them to proceed ; wherefore I say again, do your pleasure with us, only I beseech you to have compassion upon my poor relations, whose death and misfortunes will grieve me more than my own."

The Ambassadors were afterwards dismiss'd with large presents of gold and silver plate ; the Inca telling them, he would speedily go to Caxamalca, and visit the sons of his god *Uiracocha*, and messengers of the PACHA CAMAC. And accordingly, the next morning the Inca began his march towards the Christians. Of which PIZARRO having notice, made preparations to receive him, but far different from what the Inca expected : For he chose out a large square in Caxamalca for this interview, surrounded by a wall, in which there were but two gates, and ordered his horse (being sixty in number) to divide themselves, and draw up in three squadrons behind some ruinous buildings out of view. Then he planted his artillery, so as it might do the greatest execution : And on an eminence, in the middle of the square, he stood at the head of his infantry, consisting of an hundred musqueteers, cross-bows and pikes, where he proposed to meet the Inca, commanding his men, that as soon as seven or eight thousand of the Inca's forces were enter'd the square, they should shut the gates, and suffer no more to come in ; and that they should all be ready to fall on, when he gave the signal.

The Inca seem'd to have some suspicion of the mischief that was intended him, and halted a league before he came to Caxamalca, ordering his Generals to encamp there. Whereupon PIZARRO, fearing to be deprived of his prize, sent several messengers to desire him to hasten his march, pretending he expected him that day at a great entertainment he had provided : And the Inca, yielding to his pressing invitations, marched forward, and entering the gates of the square, put himself into the power of his cruel and treacherous enemies. As the Inca was advancing to the eminence where the Spanish foot was drawn up, PIZARRO sent Father VINCENT VALVERDE to meet him, and summon him to submit himself, and his dominions, to the Pope and the Emperor : Whereupon that Father went up to the chair, or couch, on which the Inca ATABILIPA was carried, with a cross in one hand, and a Bible (or Breviary) in the other ; and, according to the royal historian, made the following speech, viz. " It is necessary for you to know, most famous and powerful King, and also for all your him."

CHAP. X. " your subjects, who are desirous to learn the Catholick faith, that you and they both hear and believe the things which follow.

" First, that God, who is three, and yet one, created heaven and earth, and all the things which are in this world. That he gives the reward of eternal life to those that do well, and punishes the evil with everlasting torments. That this God, at the beginning of the world, made man of the dust of the earth, and breathed into him the breath of life, which we call the soul, which God made after his own image and likeness; by which it appears, that the whole man consists of body, and a rational soul. From the first man, whom God call'd ADAM, all mankind, which are in this world, is descended, and from him we take the original and beginning of our nature. That this ADAM sinned, by breaking the commandment of his Creator, and in him all men that have been born since his time are under sin, and so shall be to the end of the world; for neither man nor woman is free from this original sin, nor can be, excepting only our Lord JESUS, who being the Son of the only true God, descended from heaven, and was born from the Virgin MARY, that so he might free and redeem all mankind from the subjection of sin; and finally, he died for our salvation on the Cross, which was a piece of wood, in form of this which I hold in my hands; for which reason, we that are Christians do adore and reverence it. This JESUS, by his own power, arose from the dead, and forty days after he ascended into heaven, where he now sits at the right hand of God, the Father Almighty; after which he left his Apostles upon the earth, who were his successors, who by their words and admonition, and other holy means, might bring men to the knowledge and worship of God, and observation of his laws.

" Of these Apostles St. PETER was constituted the chief, as are also his successors of all other succeeding Apostles, and of all Christians; and as St. PETER was God's Vicar, or Vicegerent, so after him were all the Popes of Rome, who are endued with that supreme authority which God hath given them; and which they have, and do, and shall for ever exercise with much sanctity and care, for propagation of the Gospel, and guiding men according to the word of God.

" For which reason the Pope of Rome, who is the High Priest now living, having understood, that all the people and nations of these kingdoms, leaving the worship of the true Maker of all things, do brutishly worship idols, and the images of devils, and being willing to draw them to the knowledge of the true God, hath granted the conquest of these parts to CHARLES V. Emperor of the Romans, who is the most powerful King of Spain, and Monarch of all the earth; that so he having brought the Kings and Lords, and people of these parts, under his subjection and dominion, and having destroy'd the rebellious and disobedient, he may govern and rule these nations, and reduce them to the knowledge of God, and to the obedience of the church.

" And though our most potent King be employ'd in the government of his vast kingdoms and dominions, yet he received this grant of the Pope, and refused not the trouble for the good and for the salvation of these nations; and accordingly hath sent his Captains and Soldiers to execute his commands, as he did for the conquest

CHAP. X. " of those great islands and countries which are adjoining to Mexico; and having subjected them by force of arms, hath reduced them to the acknowledgment of the true religion of JESUS CHRIST; for the same God hath commanded that so it shall be.

" For which reason, the Emperor CHARLES V. hath chosen for his Ambassador and Lieutenant, Don FRANCISCO DE PIZARRO, who is here present, that so the kingdoms of your Highness may receive all the benefits of religion; and that a firm peace and alliance may be concluded and established between his Majesty and your Highness, on condition, that your Highness, and all your kingdoms, become tributaries to the Emperor, thou mayst become his subject, and delivering up your kingdoms, and all the administration and government thereof, thou shalt do as other Kings and Lords have already done, and have the same quarter and conditions with them: This is the first point. Now as to the second, when this peace and alliance is established, and thou hast submitted, either voluntarily or by constraint, then thou art to yield true and faithful obedience to the Pope, who is the High Priest; and thou art to receive and believe the faith of JESUS CHRIST our God. Thou art also to reject, and totally to abandon the abominable superstition of idols; which being done, we shall then make known unto you the sanctity and truth of our law, and the falsity of yours; the invention and contrivance of which proceeded from the Devil. All which, O King, if thou wilt believe me, thou oughtest to receive with readiness and good-will, being a matter of great importance to thy self, and to thy people; for if thou shouldst deny and refuse to obey, thou wilt be prosecuted with the fire and sword of war, until we have constrained thee by force of arms to renounce thy religion; for willingly or unwillingly thou must receive our Catholick faith, and with surrender of thy kingdom pay a tribute to our Emperor; but in case thou shouldst contend, and make resistance with an obstinate mind, be assured, that God will deliver thee up, as he did anciently PHARAOH, who, with his whole army, perished in the Red-sea; and so shalt thou, and all thy Indians, perish and be destroyed by our arms."

The Spanish writers seem to disapprove this rough speech of the Friar's, as too imperious and assuming, having no mixture of that sweetness or real concern for the temporal or eternal happiness of the poor Indians, as was suitable to a messenger of the Gospel of peace: They lament also that it was ill interpreted by PHILIP the Peruvian, who did not well understand the language of that Court, and had no notion himself of the doctrines of the Christian religion: Infomuch, that when he came to speak of the nature of the Trinity, as that God was three, and yet one, he said, God was three and one, that was four. And when he came to mention the generation of mankind, and original sin by ADAM's fall, instead of saying, That all the world sinn'd in ADAM, he said, All the world heap'd their sins upon ADAM. Speaking of the divinity of CHRIST, he said he was a great person who died for mankind, nor could he find words to express the virginity and purity of the blessed Virgin.

Speaking of the power of the Emperor, and his sending his forces to conquer the world, he express'd it so as if he had been superior to all powers in heaven and earth.

The

CHAP.
X.

The Emperor ATABILIPA apprehending, by the conclusion of the Friar's speech, that he was, by fair means or force, to renounce his sovereignty, and become a tributary Prince by the commands of the Pope and the Emperor, and that the soldiers seemed to threaten him by brandishing their arms, he was extremely dejected, believing that the Spaniards, as God's instruments, were come to take vengeance on him and his people; and fetching a deep sigh, repeated the word *Atar*, which is as much as if he had said, *most unhappy man!* However, recollecting himself, he gave at length the following answer to Father VINCENT's speech.

The Inca's
answer to
the Friar's
speech.

"Tho' you have deny'd me all the requests I made to your messengers, yet it would be a great satisfaction to me, to grant me the favour only to express your selves by a more skilful and faithful interpreter, because the manners and designs of men are better understood by discourse, than by signs or actions; for tho' you may be men endued with extraordinary virtues and abilities, yet unless you make them appear to me by words and discourse, I shall never be capable to understand them by outward signs and gestures: For if there be a necessity of a common language between nations who desire commerce and conversation together, much more is it requisite between people so remote as we are. For indeed, to treat by Interpreters ignorant of both tongues, is like the inarticulate sound of domestick animals; and such, O man of God, seems this discourse thou hast made me by this Interpreter. And now, so far as I understand, methinks this discourse seems very different to what your Embassadors lately propounded, for they treated of nothing else but peace and friendship; but now, all the words of this Indian are hothing but menaces of war, and death, and fire, and sword, with the extirpation and banishment of the Inca's and their progeny; and that I must voluntarily, or by force, renounce a right to my kingdom, and become tributary to another. From whence I collect one of these two things; that either you or your Prince are tyrants, and rove about to plunder the world, and to dispossess others of their kingdoms, killing and spoiling those who owe you nothing, and have never offered you injury or violence; or otherwise, you are the Ministers of God, called by us, *PACHA CAMAC*, whom he hath sent to visit us with vengeance and destruction. And if it be so, both I and my vassals do offer ourselves to death, and to what punishment soever you will inflict upon us; not for fear, nor out of any dread we have of your menaces or arms, but in compliance with the commands enjoined us by my father *HUANA CAPAC*, at the time of his death, which was, that we should serve and honour a nation with beards like yourselves, which were to enter into these parts after his days, and of which he prophesied some years before your ships coasted about our country, and whom he declared to be men of better laws, of more refined customs, more wise and more valiant than ourselves.

"Wherefore, to fulfil the prophecy and testament of my father, we stile you *Viracocha's*, understanding thereby, that you are the Messengers of the great god *Viracocha*, whose will and pleasure, just indignation, arms, and power, we are unable to resist; and yet we are assur'd that he is all goodness and mercy; and for that reason you, who are his Ministers and Execu-

tioners of his will, ought to abstain from such robberies, slaughter and violence as you have committed in *Tumbez* and the adjacent countries.

"In the next place, your Interpreter acquaints me of five great personages whom I am to acknowledge: The first is God, who is three and one, that is four, whom you call the Creator of the universe; which, perhaps, may be the same whom we call *PACHA CAMAC*, and *Viracocha*. The second is the Father of all mankind, on whom all other men have heaped their sins. The third you call *JESUS CHRIST*, who was the only person excepted who did not cast his sins on the first man, but that he died. The fourth you name is the Pope. The fifth is *CHARLES*, who, in comparison with others, you call the most powerful Monarch of the universe, and the supreme Lord of all: But then, if *CHARLES* be the Prince, and the Lord of the world, what need was there for the Pope to give a new grant and another commission to make war upon me, and usurp my kingdoms? For consequently the Pope must be a greater Prince than he, and the most powerful of any in the world. But I most admire at what you say, that I am obliged to pay tribute to *CHARLES* only, and not to others, the which you alledge without giving me any reason; and indeed I cannot conceive on what score I am obliged to pay it; for if I were bound to pay tribute and service to any, methinks it should be to that God who, you say, created all things, and to that first man, who was the father of all mankind, and to that *JESUS CHRIST* who had no sins to impute unto him: And in fine, if tribute were to be given, it should rather be unto the Pope, who hath power and authority to dispose of my kingdoms and my person; and if you say that I owe nothing unto any of these, I should imagine that I owe much less to *CHARLES*, who was never Lord of these countries, nor ever saw them. And if the Pope's grant and concession be obligatory to me, it were just and reasonable to declare it to me, before you threaten me with war, and fire, and sword, and death; for I am not so void of understanding and sense, as not to obey the Pope, in case you can shew me a reason, and justice, and cause for it.

"Moreover, I desire to be informed who that good man *JESUS CHRIST* was, who, you say, never laid his sins on another, but that he died. I would gladly know, whether he died of a natural death, or by the hands of his enemies; and whether he was numbered amongst the Gods before his death, or afterwards.

"And farther, I desire to be informed, whether these five which you highly honour, are adored by you for Gods; for if it be so, you hold more for Gods than we, who acknowledge no other than the *PACHA CAMAC*, who is the supreme, and the Sun, who is inferior to him, and the Moon, who is his sister and wife. In which doubtful questions I heartily desire to be truly resolved by some other more able and faithful Interpreter, that so I may be made more capable thereby to know and obey your will and commands."

DE LA VEGA says, he had seen the speech made by the Friar to the Inca, and we may be assur'd of its being genuine; but it is not possible he should be so well assured what the Inca's answer was, there being no body present, I presume, that could take

is

CHAP. X. it verbatim; however, he seems to be of opinion, that it was much of the tenour we find it in the Spanish writers.

But after all, what are these speeches and summons's of the Spaniards to the Indians to change their religion but mere grimace? It is evident PIZARRO's eyes were altogether fix'd upon the plunder, and he was prepared to massacre and cut the Peruvians in pieces, before he knew what answer would be given the Missionaries: He drew the unwary Indians into an ambuscade, from whence it was impossible they should escape, or carry off their Prince, on whose captivity he knew depended the fate of that empire; closely following the precedent CORTÉZ had set him, in seizing MONTEZUMA, Emperor of Mexico.

Had the Spaniards entertained christian or pacifick views, they could not have expected that ignorant men, who never heard of the Christian religion, should immediately comprehend its doctrines, or obey its precepts, before they could possibly make any reflection on what was proposed to them; and yet this was the constant practice of the Spaniards in that new world, to give the natives a short summons, and if they refused to obey it, immediately to plunder and enslave them. But to proceed:

The Spaniards, says DE LA VEGA, weary of this long discourse, began to advance and attack the Indians, and plunder them of their gold, silver, and jewels; for they had put on their richest ornaments that day to receive the embassy sent them (as they believ'd) from the universal Monarch of the world; and some of the Spaniards climb'd a tower to seize one of the Peruvian idols, adorned with gold and precious stones, which outrage occasioned a great noise and tumult among the Indians; but the Emperor called out to his people to be quiet, and make no resistance whatever violences the Spaniards committed. Some writers say, that Friar VINCENT encouraged the soldiers to attack the Indians, because ATABILIPA threw the Bible, or Breviary, upon the ground, which that Friar presented him; but DE LA VEGA assures us, this was not true; that the Friar indeed, being surpris'd at the sudden cry of the Indians, as he was discoursing with the Inca, run away and dropp'd his book and the cross upon the ground; but that he was so far from encouraging the soldiers to fall upon the Indians, that he called out to them to do no manner of violence: However, whether Father VINCENT encouraged the slaughter of the Indians or not, or whether PIZARRO acquainted him with his intentions, or concealed them from him, nothing is more evident

The Indians massacred, and their Inca made prisoner. than that this General drew the Indians within those walls on purpose to massacre and plunder them, and make the Inca his prisoner; for the conference between the Inca and the Friar was scarce ended, before he made the appointed signal for the great guns to fire among the thickest of the Indians, and his horse to attack and trample them under their feet, and the dogs to be let loose at them, while he, at the head of his infantry, march'd up to the golden chair, or throne, on which ATABILIPA was carried, and made him prisoner. The poor Indians, 'tis said, when they saw what the Christians chiefly aim'd at, threw themselves between the Spaniards and their Prince, to prevent his being taken, but not a man of them offer'd to lift up a weapon to defend himself, their Emperor having commanded the contrary: The poor people therefore were slaughtered like so many sheep, 'till PIZARRO having made his way through, or rather over the heaps of the slain, pull'd down the Emperor from his chair with his

VOL. III.

own hands, and took him prisoner, in which action he received a slight wound from one of his own soldiers that struck at the Inca; and the General was the only Spaniard that was hurt, tho' five thousand Peruvians were killed that day with their arms in their hands; which amounts to a demonstration that the Peruvians made no resistance: And that this brave action the Spaniards boast of so much, may more properly be stiled a barbarous butchery than a victory; and I cannot help thinking, that CERVANTES had some of these Spanish heroes, that subdued the West-Indies, in his eye, when he introduced that inimitable champion DON QUIXOT, arm'd cap-a-pce, charging a flock of sheep with his lance. Let any one consult the Spanish Historiographer, ANTONIO DE HERERA, BLAS VALERA, and the rest of the Spanish authors who write of this conquest, and they will see I do their countrymen no wrong in this relation.

HERERA informs us, that PIZARRO, before ATABILIPA and his Indians entered the square, commanded his musketeers to take post upon a signal given them; that the Captains FERDINANDO PIZARRO, FERDINAND DE SOTO, SEBASTIAN DE BALCAZAR, and CHRISTOPHER DE MENA, who commanded the cavalry, should fall upon the Indians, and the foot should do the like; and directed them, before the execution began, that they should permit a certain number of the enemy (as they call'd them) to enter the gates, which they should afterwards take special care to shut and secure: That Father VINCENT having made his speech to the Inca, told PIZARRO he was treated with contempt; and that the tyrant demanded restitution of the gold and silver the Spaniards had plunder'd his subjects of.

Whereupon, says HERERA, PIZARRO did not think fit to lose more time: "for he had before resolved what to do;" being a man that had served twenty years in the West-Indies, and knowing the victory depended on seizing the persons of the Sovereigns: He lifted up the white Cloth, which was the appointed signal for executing the orders he had given, and thereupon PETER DE CANDIA fir'd the great guns, and the musketeers their pieces, to the amazement of the Indians, and the more so, because it was unexpected: Then the drums beat, the trumpets sounded, the horse fell in three several ways among the Indians, while the infantry made a slaughter of them with their cross-bows, pikes and swords: And PIZARRO in person, with fifteen chosen men, march'd up to the chair on which ATABILIPA was carried, and killing those that supported it, with many more that crowd'd to supply their places, after a very great slaughter of the Indians, seized the Inca, and pull'd him down from his chair; after which, the Peruvians fled, and were pursued by the Spaniards, who did not leave off killing them 'till the fugitives broke down part of the wall of the square, by which means some of them escap'd.

BLAS VALERA, whose father was in this action also, relates that five thousand Indians were kill'd, (viz.) three thousand five hundred by the sword, and the rest, who were for the most part old men, women and children, who came only to gaze, were trampled under foot by the horse.

LOPEZ DE GOMARA, chap. 113, says, Notwithstanding the Indians were arm'd, not a man lifted up his hand; probably, says he, the surprize was so sudden, and their terror so great, occasion'd by the sound of trumpets, the roaring of the cannons, firing of the small arms, the rushing of the horse

C H A P. X. horse upon them, and the clattering of the Spanish armour, things unknown to that defenceless people, that they were confounded, and lost the use of their reason; declaring that great numbers perish'd with their arms in their hands, rather than they would fight and defend themselves.

DE LA VEGA indeed observes, that the Spanish Generals pretended the Indians were treacherous; that ATABILIPA had formed a design to surprize the Spaniards, and put them all to the sword; and that Father VINCENT complained to the General they refused his invitation to become Christians, and treated him and the Cross with contempt, and thereupon incited the General to fall upon them.

But in these accounts, says DE LA VEGA, the General and Captains were not sincere: They endeavoured to put the best gloss upon their actions, leaving out of the narrative they sent to the Court of Spain, all their cruel and unjustifiable proceedings; and adding whatever had a fair appearance. "It being confirmed (says that historian) by several other writers, that ATABILIPA commanded his subjects not to resist the Spaniards." For if the Inca had not commanded them not to fight, certainly, says he, they would never have endured to see their Prince overthrown and taken, having weapons in their hands: They would rather have all died in his defence, as many of them did in endeavouring to support his chair, and not have suffered an hundred and sixty Spaniards, whom they were able to have subdued with stones, to commit such outrages. Whereas there was not one Spaniard either killed or wounded, unless FRANCIS PIZARRO the General, who received a little hurt in his hand by one of his own men, as he went to seize on ATABILIPA. The truth is (says he) the Indians did not fight, because they held every command of the Inca to be a part of their religion, and of the divine law, tho' it were to lose their lives and estates: Indeed our author describes it to a miraculous providence that the Inca should give these orders; but these, and abundance of miracles more of the same stamp, which the Spaniards relate in their histories of their invasions and usurpations in the West-Indies, are but little credited probably by hereticks, whatever they may be by those of their own persuasion.

The spoils of the field.

To proceed to the history. PIZARRO having seized the Inca, and convey'd him to his own quarters, directed the spoils of the field to be collected and brought to him, which were exceeding great, consisting of large gold and silver vessels, and utensils, fine garments of various colours, jewels and ornaments belonging to the Inca, the royal family, and great officers. There were taken also several Ladies, wives of the Caciques and Orejons, and some of the Mamacona's, or consecrated Virgins: And tho' all mankind must look upon this action as one of the most treacherous and barbarous massacres that ever was committed by Christians, yet had PIZARRO the confidence to command a solemn thanksgiving to God to be observed that very day, being the third of May, 1533, (the festival of the Exaltation of the Holy Cross) and in that very field where the ground was cover'd with the dead bodies of the miserable Indians they had thus murder'd and plunder'd. Next day he sent out a detachment of his forces to plunder the Inca's camp, where he met with another rich booty; tho' 'tis said the Peruvian Generals had carried off three thousand loads (Porter's burdens) of gold and silver before the Spaniards arrived there; therefore, in order to induce the Indians not to carry off or conceal any more of

their treasures, he caused it to be proclaimed that their Inca was alive, and that they were at liberty to come and attend him, and perform their usual services. Whereupon several of the Indian Generals and great Officers returned to Caxamalca to attend their captive Sovereign; he also caused the Inca's women to be brought to him, and suffered him to be served in the same manner he used to be before this misfortune; tho' he still kept him in fetters, which made the Inca apprehensive they would take away his life in the end, unless he could find some way to obtain his liberty: Having observed, therefore, the insatiable thirst of the Spaniards after gold and silver, he promised to give them as much of those precious metals as a great room in the castle of Caxamalca would hold, for his freedom; and that the Spaniards might not doubt the performance of what he offer'd, he proposed their sending some Spanish officers with his people to Cusco, to the temple of PACHA CAMAC, and other places, to bring the treasures repositied there to Caxamalca, and at the same time issued his orders, that the Spaniards who were dispatched to these places should be hospitably entertained in the countries through which they pass'd, and receive all the assistance his subjects could give them.

The Inca offers vast treasures for his liberty.

In the mean time, JAMES DE ALMAGRO having lifted an hundred and fifty men in his service at Panama, embarked with them for Peru, to reinforce PIZARRO; but was obliged, by contrary winds, to land at Cape FRANCISCO, to the northward of the Equator, where he was joined by another party of Spaniards that were going to share PIZARRO's fortunes, making together a body of between two and three hundred men; but being obliged to pass so many morasses and mouths of rivers, and march through continual rains under the Equator, he lost thirty or forty of his men, and fell sick himself; however, surmounting all these distresses and difficulties, he arrived at length at the new Spanish colony of St. Michael's, near the Bay of Guayaquil, and there he understood that PIZARRO had made the Emperor ATABILIPA prisoner, and possessed himself of a vast treasure. Whereupon, 'tis said, ALMAGRO consulted with his Officers, whether they should join PIZARRO or go upon some further discoveries independent of him, if he refused to let them share the treasure he had got; and ALMAGRO's Secretary, it seems, sent PIZARRO intelligence, that his master had no good intentions towards him: But PIZARRO, either believing that he should not be able to keep so large an empire as Peru in subjection with the few troops that were with him, or that ALMAGRO having more forces than he commanded, might join a party of the Indians and take his booty from him, and set up for himself, sent very obliging messages to ALMAGRO, inviting him to advance and join him, and at the same time acquainted him with the arts that were used to set them at variance, and thereby ruin their enterprize on Peru, which was not to be carried on but by their united forces and endeavours; and particularly he acquainted ALMAGRO with the treachery of his Secretary, who thereupon ordered him to be hang'd up, and immediately began his march towards Caxamalca.

Almagro brings a great reinforcement to Peru.

The Inca ATABILIPA receiving advice that another body of Spaniards was arrived upon the coast, began to reflect that this would not probably be to his advantage; for PIZARRO would now no longer be under a necessity of carrying matters fair with him, being enabled by this reinforcement, to maintain his conquests by pure force: He hasten'd therefore

CHAP. X. therefore the bringing in the treasure he had offer'd for his ransom, that he might obtain his liberty before PIZARRO was joined by ALMAGRO; but another accident happened about the same time, which he apprehended would be still more fatal to him. The three Spanish officers that were sent with his people to Cusco happening to pass through the town where HUASCAR his brother, the lawful Emperor, was prisoner, went to see him, and acquainting HUASCAR with what ATABILIPA had offered for his ransom, that Prince acquainted them how unjustly he had been depos'd and imprisoned by ATABILIPA, his bastard brother, who had no right to the empire or the treasures he had promis'd: And as he understood one principal design of this expedition of the Spaniards was "to relieve the distressed, and to do justice to those that were oppress'd," he did not doubt but they would release him from his captivity, and restore him to his throne; which he should not only gratefully acknowledge, but would furnish them with much more treasure than the Usurper could possibly do; for his loyal subjects had buried most of their gold and silver plate after the battle wherein he was made prisoner, to conceal it from the rebels, but would readily produce it again, and pay it to the Spaniards for his ransom, if he required it.

PIZARRO's three messengers seem'd to listen to these overtures, and promised the Inca HUASCAR that justice should be done him; but left that Prince however in prison, and continued their journey to Cusco; and advice being immediately carried to ATABILIPA of this conference between the Spanish officers and his brother, he soon saw that he should be undone unless HUASCAR was dispatched out of the way, knowing that the greatest part of the Empire were still in his interest; and as they would infallibly be supported by the Spaniards, to whom his brother had discover'd his treachery, and promised such mountains of gold and silver, they would certainly sacrifice him to their avarice, if they had no regard to the justice of his brother's cause.

But then reflecting, if he should order his brother to be put to death, the Spaniards might make this a pretence for taking away his own life, he resolv'd in the first place to sound how PIZARRO stood affected towards HUASCAR, which he did by feigning he had received intelligence that the officers who had his brother in their custody had put him to death without his knowledge, for which the Usurper express'd a very great concern; but finding PIZARRO was not moved at the relation, and that he only said, This was the fortune of war, the lives of captives were at the conqueror's disposal, ATABILIPA dispatched an express for putting HUASCAR to death, and his orders were immediately executed; tho' it remains very uncertain in what manner he died; for some writers affirm he was burnt, and others he was drowned, and some that his body was cut in small pieces, that his subjects might not pay those honours to the corpse of their deceased Inca as was usual.

However, the Peruvians mourned, and made great lamentations for him as soon as his death was known, crying to heaven for vengeance on his murderers, and entreated the Spaniards to revenge it on the cruel usurper ATABILIPA.

In the mean time, the three officers that were sent to Cusco being arrived there, were adored by that people as the true descendants of the Sun; but the Spaniards lament that they were men of mean parts and education, who knew not how to preserve that respect and veneration the Peruvians had

conceived of them, which was then so necessary to facilitate their future attempts. The Indians, we are told, soon perceiv'd they must deduce the original of the Spaniards from some baser fountain than that of the Sun; and the esteem and affection they at first entertained for the Christians, on the mighty professions they made of their justice and honour, was, on a sudden, converted into dread and aversion: They were afflicted to find so vicious and profligate a race of men, who trampled on every thing that was sacred, and whose avarice seem'd to exceed all bounds, should become masters of their country, and from that time meditated how they might throw off that intolerable yoke which they found the Spaniards were about to impose on them; however, they durst not disobey the commands of their Inca ATABILIPA, but having amass'd a considerable quantity of treasure, they loaded it on the backs of their Tamenes, or Porters, and conveyed it to Caxamalca, with a view possibly of asserting their liberties to greater advantages, when they should have procured the release of the Inca.

But the most valuable treasure, consisting of gold, silver, and emeralds, being lodged in the temple of PACHA CAMAC, the invisible God, as PIZARRO was informed, he dispatched his three brothers thither with the Peruvian officers ATABILIPA deputed to fetch it to Caxamalca; but the Priests of PACHA CAMAC, receiving advice how the temple of Cusco had been riled by the Spaniards that went thither, to prevent the like misfortune, sent away four hundred loads of gold, silver, and jewels, before the PIZARROS arrived, which were buried in the earth, or carried to such a distance that the Spaniards could never discover what became of them: However, FERDINAND PIZARRO found as much plate in this temple as amounted to ninety thousand crowns, besides what the soldiers embazzel'd, and returned with it to Caxamalca.

The Marshal ALMAGRO being advanced by this time into the neighbourhood of Caxamalca, PIZARRO the General went out to meet him and congratulate his arrival, received him with all the marks of affection and esteem imaginable, and offer'd him such a share of the spoils as made him perfectly easy. But his soldiers, who expected to divide the booty with those that served under PIZARRO were told, they were entitled to no part of it, as not having been present in the action when the Inca ATABILIPA was made prisoner, which was near creating a mutiny amongst them; but they were pretty well appeas'd when PIZARRO agreed to distribute an hundred thousand ducats among the men which came with ALMAGRO; the rest of the plunder, after the Emperor's fifth was deducted, was divided by PIZARRO among his officers and soldiers in such proportion as he saw fit, in which he pretended to have a great regard to the merit of the respective Adventurers: And 'tis said, he at this time, after he had reserved the Inca's golden chair to himself, distributed as much gold and silver plate amongst the soldiers as amounted to 1500000 crowns and upwards, which, considering the value of gold and silver at that time, was more than fifteen millions at this day.

The soldiers being possessed of this prodigious wealth, fell into all manner of excesses, raising the price of things to a very great rate, by offering any sums to gratify their appetites or fancies, and never was gaming at a higher pitch; which, 'tis said, their officers conniv'd at, or rather encouraged, that the soldiers, having lost their money, and becoming dependant on them again, might be more under command.

The Inca Huascar put to death by Atabilipa's order.

CHAP. X. The Peruvians lose their esteem for the Spaniards.

CHAP.

mand. And now PIZARRO thought it a proper time to send over the fifth part of the treasure to the Emperor, as he had stipulated, and with it his brother FERDINANDO PIZARRO, to solicit for such reinforcements as might establish the dominion of the Spaniards in Peru; and to petition that his government might be extended still further to the southward; (the General having probably heard by this time, that the chief silver mines lay farther south than 200 leagues, beyond which his patent did not extend). The Marshal ALMAGRO also employ'd his agents to represent to the Court of Spain with what expence and application he had sent and carried reinforcements, and supplied the General with ammunition and provisions from time to time, to enable him to make his conquest, and to desire that all that part of South-America which lay to the southward of the lands granted to PIZARRO, might be put under his government: And with these agents, sent by the General and the Marshal, return'd several Adventurers, to the number of fifty or threescore, who having obtain'd thirty or forty thousand ducats a-piece for their respective shares of the spoils, were perfectly satisfied with it, and chose to enjoy what they had got the remainder of their lives in their own country, rather than undergo more hazards and difficulties to increase their fortunes. These men knew how to set some bounds to their desires; but as for the Generals and many more of those that remain'd in Peru (who were about four hundred men) it appears nothing was capable of satisfying their avarice and ambition; most of them perished in the pursuit of wealth and unbounded power, after they were possessed of more than would have made most men happy, or at least easy in their circumstances. But to proceed:

Miracles
pretended
to.

DE LA VEGA and the rest of the Spanish historians relate abundance of miracles that were wrought in their favour on their introducing Christianity into Peru; and that their conversion of the Peruvians might resemble the planting of the Christian religion by the Apostles in this part of the world, they tell us, that all the idols and oracles of those Pagans became dumb on the consecration of the host, as perform'd in the mass; but surely heaven could never countenance such cruelty, injustice and oppression as was exercis'd by the Spaniards on that unhappy people. They compared the Indians indeed to the Egyptians; but who gave them authority to plunder and murder the Indians, and take their country from them? Can it be imagined that God would by miracles set his seal, as it were, to such flagrant enormities, and countenance facts that none but infernal powers could approve? Was it thus the Apostles and primitive Christians propagated Christianity? Or did these Reformers copy after MAHOMET, and plant their superstition in this new world by the sword, the halter, and the bow-string, and such unparallel'd villainies as MAHOMET would have blush'd to commit; of which their treatment of ATABILIPA will ever remain a tragical instance.

A formal
process
drawn up
against
Atabilipa.

ATABILIPA, the royal prisoner, having offered PIZARRO a prodigious treasure for his liberty, and actually paid great part of it if not all (as some of their historians admit) PIZARRO, notwithstanding, determin'd to take away his life, pretending that he encourag'd the Indians to attempt his rescue and cut off the Spaniards: And that he might justify his conduct in this proceeding, he caused a formal process to be drawn up against him, consisting of the following articles, (viz.)

I. That HUASCAR Inca being his eldest brother and lawful Sovereign, and himself a bastard, he had caused HUASCAR to be depos'd and imprisoned, and afterwards usurped his throne.

CHAP.
X.
The arti-
cles.

II. That he had caused his said brother to be murder'd, since he became a prisoner to the Spaniards.

III. That the AATBILIPA was an idolater.

IV. That he caused his subjects to sacrifice men and children.

V. That he had rais'd unjust wars, and been guilty of the blood of many people.

VI. That he kept a great many concubines.

VII. That he exacted taxes and tribute of the Peruvians since the Spaniards possess'd his country, and consumed and embezzel'd the publick treasure.

VIII. That he had incited the Indians to rebel and make war against the Spaniards since he had been their prisoner.

The last article being chiefly insisted on, the Inca absolutely denied that part of the charge, and complain'd of the treachery of PIZARRO, who, after he had extorted such a ransom from him, now broke his faith, and would put him to death under a colour of law; and desired he might be sent over to Spain, and try'd before the Emperor: He urg'd that he had never offended the Spaniards, but greatly enrich'd them; and that they could not without great injustice take away his life. However, the Spaniards proceeded to examine witnesses against him on these articles, whose testimony being interpreted by PHILIP the Peruvian, whom the Spaniards admit was an enemy to the Inca, and PIZARRO and ALMAGRO sitting as his Judges, they made no difficulty to condemn him to be burnt; and Friar VINCENT VALVERDE, 'tis said, approved the sentence under his hand, that it might give the greater satisfaction to the Court of Spain: The Friar also took great pains to induce the Inca to turn Christian and receive baptism before he died, which he consented to, 'tis said, upon condition that the execution might be changed from burning to strangling; and he was accordingly strangled, the Friar having first given him absolution, and assign'd him a seat in heaven, notwithstanding the many crimes they had charg'd him with.

Atabilipa
is con-
demned to
be burnt.He is bap-
tized.And after-
wards
strangled.

Many of the Spaniards, it seems, protested against these proceedings, and the putting the Inca to death had almost occasion'd a mutiny; but those who were for saving him, finding themselves the smaller number, and it being represented that their quarrels at this time would not only be fatal to themselves, but be the loss of Peru probably, they thought fit to acquiesce in the determination of the greater number.

But notwithstanding I have no great opinion of PIZARRO's justice or humanity, it would not be fair to conceal what his friends say in his favour, who tell us, that the Indians themselves were really the occasion of this Prince's death; that the party of HUASCAR were perpetually suggesting, that the Spaniards could never expect to possess Peru quietly as long as he lived, and produced several witnesses at the trial, who positively testified that ATABILIPA was conspiring to raise an army to destroy the Spaniards; and that the Peruvian Generals had actually assembled their troops in several parts of the empire, and particularly in Quitto, the province the Spaniards were now in, and which was most devoted to this Inca; and that if PIZARRO had not cut him off, he would have hazarded the loss of all his conquests. They relate also, that an amour between PHILIP the Interpreter,

Pizarro's
apology
for this
proceed-
ing.

CHAP. X. terpreter, and one of the Inca's women, did not a little contribute to ATABILIPA's ruin: For PHILIP despairing of enjoying his mistress while the Inca liv'd, was perpetually bringing stories to PIZARRO of the disaffection of the Indians, and their conspiracies to cut off the Spaniards, and rescue their Prince out of prison. They relate also, that PHILIP gave the worst turn to the evidence he could, when he was called to interpret it, representing things much worse than they were, which induced the General to believe he was really in danger, and that he could not be safe while ATABILIPA lived; and under such a persuasion, he could not be blam'd for putting the Inca to death, who had forfeited the protection that was promis'd him, by his plots.

The answer to Pizarro's apology.

On the other hand it is answered, that admitting the charge had been true, the Inca might have been as well secur'd against his doing the Spaniards any mischief, by sending him over to the Emperor (who would have been a much more proper Judge of his actions than PIZARRO) as by putting him to death: And as to ATABILIPA's being a usurper, and having dethroned and murdered his brother and sovereign, it is demanded, who gave PIZARRO authority to judge and condemn a sovereign Prince for these offences: Had PIZARRO acted up to the character he assumed, of a protector and deliverer of the distressed, and rescued and protected HUASCAR, the lawful Emperor, against the Usurper; or, after the death of HUASCAR, had caused his lawful successor to be proclaimed, and established on his throne; either of them might have called ATABILIPA to account for his usurpation and tyranny, and done justice upon him; but PIZARRO could have no better authority to judge and condemn this Prince, or even his subjects, than Pirates and Banditti have to take away the lives of the unhappy captives they make: And his doing it under colour of law, was but an aggravation of the offence. Had he put him to death as an enemy taken in war, without a formal trial, his insolence had been more pardonable; but a man of PIZARRO's rank to erect a tribunal for the trial of a King, was alone a most audacious usurpation of sovereign power, over a Prince that could have no dependance on him. There are some Spanish writers also that suggest, there was a great deal of pique and resentment in the affair: That ATABILIPA, who in a manner adored PIZARRO at first as the General and Commander of these sons of the Gods, observing his rapine and avarice, and other mean and sordid actions, and that many of the private men that served under him seemed to excel him in many respects, he began to loose his esteem for PIZARRO, and not treat him with that profound reverence he did at first; particularly they relate, that ATABILIPA, admiring nothing more than that faculty of writing and reading which he apprehended was natural to the Spaniards, and born with them, proposed it to a soldier to write the word God (they so often repeated to him) upon his thumb-nail; and then calling another soldier to him, he demanded what those characters signified; to which he answered God. Then he called a third, who gave him the same answer; but afterwards, demanding of PIZARRO if he knew what it meant, he answered he could not tell; for it seems PIZARRO could neither write nor read; at which answer the Inca was amaz'd. He thought it impossible their Commander could be ignorant of what most of his soldiers were well versed in: This being directly the reverse of what he had observed among his own people, where the qualifications of their Magistrates and Officers were usually

VOL. III.

superior to those of the common people; nor did he reckon much amiss when he applied this rule to the Christians, who usually make choice of men that are best qualified to supply the greatest posts: And this instance would incline men to believe, that PIZARRO made but a mean figure in Europe, and was not of that quality the Spanish writers pretend he was; there being but few posts a man could be qualified for, even in Spain, who could neither write nor read.

But whatever was the real occasion of the Inca's death, some of the articles preferred against him were exceeding ridiculous; as that he was an idolater, and kept concubines, which was the case of most of the heathen world, and could be no crime in him 'till he was better inform'd: They also charged him with presuming to receive the revenues of his empire, and meddling with the publick money, after they had set up their claim to his dominions: But whatever title ATABILIPA might have to the empire, or the publick money, it is very certain the Spaniards could have no title to either; and if he deserved death for possessing himself of them, much more the Spaniards who could have no right to them, either by inheritance or the consent of the subject.

PIZARRO, however, did not carry his resentment so far, but after he had killed and taken possession, he thought fit to treat the corpse of the Inca with the respect due to a sovereign Prince: He celebrated the Inca's funeral with great solemnity, and went into mourning for him; but he soon discovered how detestable this murder rendered him among the natives. The two factions immediately united against him, under HUANA CAPAC, the brother and heir of HUASCAR, whom they proclaimed Emperor of Cusco: Whereupon PIZARRO proclaim'd TOPARPA (a son of ATABILIPA) Emperor, caus'd him to wear the imperial coronet, and to be treated with the same honours his father had been; issuing such orders in his name, as might best serve the interest of the Spaniards; but this Inca died soon after: And now PIZARRO, conjecturing that nothing could tend to establish the Spanish dominion in Peru, more than his possessing himself of the capital city of Cusco, he began his march thither with all his forces, consisting of near four hundred men, besides confederate Indians.

In the mean time ATAUCHI, brother to the late Emperor ATABILIPA, having collected a great quantity of treasure to purchase his brother's ransom, brought it to Caxamalca; but finding ATABILIPA murdered, and the Spaniards marched from thence, determined to be revenged of them; and joining his forces with some other Peruvian Generals, surprized the Spaniards upon their march to Cusco, killed some of them, and made several prisoners, and amongst the rest SANCHE DE CUELLAR, who had drawn up the process against the late Inca ATABILIPA, and attended his execution. With these prisoners the Indian Generals retired again to Caxamalca, where they strangled SANCHE the Spaniard, at the very same post where their Emperor was put to death; but understanding that FRANCIS DE CHAVES, FERDINANDO DE HARO, and some of the rest of their prisoners, had protested against the Inca's death, they resolved to give them their lives and liberties, entering into the following articles of peace and friendship with the captive Spaniards, before they dismissed them, viz. That neither party should for the future offer any violence to the other; and particularly, that the Spaniards should not attempt to depose MANCO CAPAC, who had been proclaimed at Cusco, and was the lawful heir of the Inca HUANA CAPAC: That both sides should re-

leave their prisoners, and that the Spaniards should not treat the Indians as slaves, but freemen: That the laws of their country should be observed inviolably, when they were not repugnant to those of Christianity; and that this treaty should be ratified by the Spanish General, and his Sovereign the Emperor of the Romans.

The Spaniards insisted, on their parts, that the Indians should profess the Christian religion; that a part of the country should be assign'd them for their subsistence, and that they might retain the Indians as hired servants, tho' not as slaves: Which the Indians agreed to, and dismissed their prisoners with rich presents: Put PIZARRO and ALMAGRO at first positively refus'd to ratify the articles, and would hear of nothing but an absolute submission, and an entire surrender of their country and their persons to the will of the Christians, which occasion'd long and bloody wars afterwards: Whereas the Spanish historians admit, they might have established Christianity in Peru without spilling a drop of blood, if the ambition and avarice of the Adventurers had not prevented it. The people were as well disposed, they observe, to receive the Christian faith, as could be wished, and ready to have acknowledg'd the King of Spain their Sovereign; and that their Inca should hold his dominions of him, if they might have been treated as subjects and freemen ought to be; and the Inca would have assign'd lands and revenues to the Spaniards, provided his subjects might have been allow'd to have had any property in the residue; but this would not satisfy the views of the rapacious Spaniards, they could not have plunder'd their temples and palaces, usurp'd whole provinces, enslaved the natives, and arrived at sovereign power, if they had cultivated a friendship, and entered into an alliance with the natives. What zeal-soever therefore the Spaniards might pretend for propagating the Christian religion, it is evident wealth and power were the only deities these Adventurers ador'd, as has been already observed in the conduct of their brethren in Mexico. But to return to the history of Peru.

Cusco abandoned by the Indians.

The Spaniards enter Cusco.

Some account of their plundering that capital.

The General PIZARRO, continuing his march towards Cusco, was again attack'd by several parties of the Indians, at some difficult passes in the mountains; but finding themselves unable to resist the fire-arms and horses of the Christians, they fled, after a feint resistance, to the capital city; declaring, that it was in vain for any human force to oppose the Spaniards, who were arm'd with thunder and lightning, and could kill their enemies at so many hundred yards distance. Whereupon the people of Cusco, without offering to defend their walls, or that impregnable castle already describ'd, fled with their wives and children, and what was most valuable to them, to the woods and mountains; and PIZARRO entered the city without opposition in the month of October 1532, where he met with a prodigious booty, notwithstanding the citizens had so much time to carry off their best goods and treasure.

GOMARA, a Spanish writer, relates, "That the next day after the Spaniards enter'd Cusco, they fell to work, some to unrip the gold and silver from the walls of the temple; others to dig up the jewels and vessels of plate, which were buried with the dead; others pillaged and rifled the idols, and sack'd the houses, and the fortrefs, where still great quantities of gold and silver were preserved, which had been there amass'd and laid up by HUANA CAPAC. In short, there was more gold and silver found in this city, and in the parts about it, than was produced at Caxamalca by the ransom of ATABILIPA. However, the

CHAP.

X.

"particular share belonging to every individual person, did not amount to so much as the former dividend, by reason that the number was greater which was to partake thereof, nor was the same of this action so loud as the first, which publish'd the triumph of riches, with the imprisonment of a King. A certain Spaniard entering into a vault, found there an entire tomb of silver, so thick and massy that it was worth fifty thousand pieces of eight, or crowns; others had the fortune to find such as were of less value; for it was the custom of rich men of those countries to be buried in this manner up and down the fields, and there be laid in state, like idols. Nor were the Spaniards contented with this prize, but still thirsting after greater riches, were hot in the pursuit of the treasures of HUANA CAPAC, and of others hidden by the ancient Kings of Cusco; but neither then, nor afterwards, were all those treasures discovered, tho' they tortured the poor Indians to make them discover the places where their Great men were interred.

"It is certain, says GOMARA, that for the space of seven or eight years after the Spaniards had remained in quiet possession of that empire, several treasures were discovered both within and without the city; and particularly within the precincts of that palace call'd Amuruchancha, which, upon the division made, fell to the lot of ANTONIO ALTAMIRANO; where it happened that a horse, galloping round a court-yard of that Palace, struck one of his feet into a hole, which they supposed at first to be some old sink, or drain for water from the house; but looking more narrowly, they found the hole opening to a jar of gold, weighing above two hundred pounds weight; for the Indians make greater or less of these as their occasions require, using them to boil their drink and liquor in. With this great jar they found others of gold and silver, and tho' they were not so large, yet they were valued at about eighty thousand ducats. Moreover, in the convent of the Select Virgins, and particularly in that part which fell to the share of PEDRO DEL BARCO, and afterwards came to the possession of HERNANDO DE SEGOVIA, who was an Apothecary, and with whom I had an acquaintance; this HERNANDO altering his house, and removing some part of the foundation, found a treasure of seventy-two thousand ducats, with which, and with above twenty thousand ducats more, which he had gain'd by his practice, he returned into Spain, where I saw him at Seville; where in a few days after his arrival he died for mere grief and sorrow that he had left Cusco, as several others had done, whom I knew in the same condition."

A ducat is about a noble.

PIZARRO having thus possessed himself of the capital city of Peru, from whence the Inca MANCO CAPAC and the greatest part of the inhabitants were fled, thought fit to invite them to return to their dwellings; apprehending, if they were made desperate, that the whole Power of Peru would assemble against him, and might reduce him to great straits, by cutting off his provisions, tho' they durst not meet him fairly in the field. The Indians accepting PIZARRO's invitation, returned to their houses in Cusco, and even the Inca made some overtures to him, intimating that he should be content to embrace the Christian religion, and hold his dominions of the Emperor of the Romans, provided that neither he nor his subjects should be molested for the future in their persons or estates: And being encouraged by PIZARRO to believe he should have the terms he demanded,

CHAP. X. demanded, the Inca came in person to Cusco, and had an interview with the Spanish General, who caused him to be crown'd and invested in the empire, by binding the royal wreath, or coronet, about his head, and proclaiming him Inca in the same manner his successors used to be inaugurated into that dignity, and assur'd the Inca he would strictly observe the capitulation made by FRANCIS DE CHEVES, and the rest of the Spanish prisoners with his people.

A peace between Pizarro and the Inca Manco Capac.

These pacific measures the Spaniards found themselves under a necessity of taking at this time, not only because they saw all the southern provinces of Peru assembling against them under the Inca MANCO CAPAC, but because RUMMINAVI, QUISQUIS, and other Peruvian Generals had assembled a very great army in the northern provinces, and possess'd themselves of Quitto, which obliged him to send a considerable detachment of his forces under the command of SEBASTIAN BELALCAZAR, to reinforce the new colony at St. Michael's, and to make head against the Peruvian Generals in Quitto.

Don Pedro de Alvarado lands in Peru.

BELALCAZAR thereupon marching into Quitto, made himself master of the capital city, and was in a fair way of reducing the rest, when advice was brought, that Don PEDRO DE ALVARADO was come upon the coast of Peru with a considerable fleet, and had landed seven or eight hundred men intending to take the government of Peru upon him, and expel PIZARRO and ALMAGRO from thence; at which news these two Adventurers were thunder-struck, apprehending they should be dispossest of all the spoils they had taken, and perhaps sent prisoners to Spain, to give an account of their conduct in murdering the late Inca ATABILIPA, and massacring his people; they continued therefore to cultivate a good understanding with the Indians of the southern provinces, and treated the Inca and his subjects as their friends and allies, promising to perform punctually whatever they had promis'd, knowing how great an advantage it must be to have the country in their interest, if they were oblig'd to contend with ALVARADO for the possession of it.

A detachment under Almagro sent against him.

The next precaution PIZARRO took, was to detach an hundred Spaniards under the command of his confederate ALMAGRO, towards the sea-coast, to join with BELALCAZAR, and observe the motions of ALVARADO; for they were determin'd not to resign easily what they had obtain'd with so much labour and hazard. And here it will be necessary to enquire who this ALVARADO was, and what title he had to assume the government of Peru. If the reader pleases to turn to chap. VII. pag. 195. of Mexico, he will observe that Don PEDRO DE ALVARADO was one of the principal Generals that accompanied CORTEZ in the conquest of Mexico, and obtain'd the government of Guatimala, one of the most considerable provinces of that empire. This Gentleman was become vastly rich by the spoils of the Mexicans, and his government in extent was little inferior to that of Spain; here he exercised an unlimited command, treating the natives rather like slaves than subjects; but understanding there was greater plenty of gold and silver in Peru than was to be found in North-America, and his ambition and avarice increasing with his acquisitions, some say he obtained a commission from the Emperor CHARLES V. to be Governor of so much of Peru as was not actually conquer'd by PIZARRO and ALMAGRO. Others relate, that Don ALVARADO undertook this expedition by his sole authority, without the consent of the Emperor, believing that as he was an elder

Alvarado one of the conquerors of Mexico.

General, and one of the first that was employ'd in the conquest of America, PIZARRO and ALMAGRO would have submitted to him on his allowing them to share that country with him; or if they should refuse, he determined to carry such a force with him as should compel them to share it with him: But however that was, it is agreed, ALVARADO equipp'd a good fleet in the harbours of Guatimala on the South-sea, where he embark'd seven or eight hundred men, most of them cavalry (and amongst them several persons of quality, and old officers that had serv'd in the conquest of Mexico, who were induc'd to engage in this enterprize, by the fame of the Commander, and the vast wealth they expected to find in Peru) and with these he set sail from Guatimala for the coast of Peru, in the year 1535; in which voyage he endur'd very great hardships for want of provisions, having been kept at sea longer than they expected, by contrary winds; and he was at last forced to land at Cape St. Francis, one degree north of the Equator, and march over almost impassable bogs and mountains, where he lost a great many of his men and horses: However, he arrived at length near the Spanish colony of St. Michael's, having got a much greater body of troops left than were under the command of PIZARRO and ALMAGRO.

He embarks for Peru. His hardships at sea, and his fatiguing march afterwards.

GOMARA and CARATE, two Spanish writers, relate some occurrences that happen'd in this march of ALVARADO's, that are scarce credible; and DE LA VEGA seems to attest the truth of them: As first, that ALVARADO and his men pass'd over a mountain cover'd with snow, under the Equator, where sixty of their number were frozen to death; of which I must suspend my belief, because I have no where seen or heard of snow, much less mountains covered with snow, under the Equator. I have indeed been as cold near the Equator, as in the frozen regions of Europe; but this has proceeded from the rains, and not from frost or snow, when we have been forced to lie in the fields in the night-time during the rainy season, with our wet cloaths on, our people have shook with extreme cold; perhaps we were more sensible of the coldness of the depending rains in that hot climate than in a cold country, as a man who goes into a river in the middle of the day in summer, is more sensible of the coldness of the water, than he that bathes in the evening: And some writers, possibly hearing ALVARADO's soldiers complaining of the cold they endur'd on the mountains near the Equator, concluded that could only proceed from the frost and snow, and thought fit to give us their own conjectures, rather than the facts, as they heard them: Had they laid the scene near either of the Tropicks, instead of the Equator, I should have made no scruple to believe them. We know that there are mountains cover'd with snow in the latitude of 22 and 23, when the Sun is in the opposite Tropic; but none of our travellers of late years pretend to have seen snow under the Equator.

An enquiry into the truth of some of the particulars related here.

Secondly, Another particular mentioned by the Spanish authors, who give an account of ALVARADO's march, is, that passing over a sandy desert several days journey, where there was no water, they should infallibly have perish'd, if they had not met with large groves of Bamboe canes, bigger than a man's leg, which between the joints were filled with good water, of which they had enough both for their horses and themselves: To which it is objected, that though we find Bamboe canes of this bigness in several hot countries, we see none

CHAP.
X.

none of them replenished with water, as it is reported these Peruvian canes were: I am apt to believe therefore, that this also is a mistake.

If it had been said, that ALVARADO's men had met with groves of Coco-nut-trees, which are very common near the Equinoctial, and had quench'd their thirst with the milk, or water, that is lodged in the inside of the young Coco-nuts (of which each nut holds near a pint) the story would have had nothing very improbable in it; but the changing the Coco-nut into a cane, is that which shocks my belief; and I am very well satisfied, many such mistakes are made by the writers of voyages and travels, especially where they have their accounts at second hand, which they must have in many instances; it being impossible for any man to see with his own eyes every thing the country affords which he travels through.

But to return to ALVARADO: Whatever were the hardships and losses he suffer'd in his march, ALMAGRO was in a terrible consternation upon the advices he received of his approach, especially when he understood he had surpriz'd a party of horse ALMAGRO had sent out to get intelligence of his motions, and made them prisoners; but the men returning to his camp soon after, and telling him that ALVARADO treated them handsomely, and set them at liberty, he began to entertain hopes that their respective pretensions would be adjusted by a treaty, without coming to an open rupture with them: And this he was confirm'd in, when ALVARADO was pleas'd to invite him to a conference; which ALMAGRO accepting, the following articles were agreed on between them, viz. that PIZARRO and ALMAGRO should pay ALVARADO an hundred thousand Peso's (or Nobles;) that such of the Officers and soldiers who came with ALVARADO, as desir'd it, should serve under PIZARRO in Peru, and be provided for as their own troops were: And that thereupon ALVARADO should return to his government of Guatimala in Mexico; but being oblig'd to wait some time to receive the treasure promised him ALVARADO proposed to visit PIZARRO at Cusco, and take a view of that famous capital, of which he had heard such surprising accounts; all which ALMAGRO took care to advise PIZARRO of; who apprehending that ALVARADO might alter his mind upon seeing the rich city of Cusco, sent him a compliment, that he would not give him the trouble of taking so long a journey, but would meet him in the valley of Pacha Camac, and bring the sum with him ALMAGRO had promised; and accordingly, leaving Cusco to the care of the Inca and his brothers, he set out with a party of horse, and a detachment of Indians, and arrived at the valley of Pacha Camac, where he met with ALVARADO and ALMAGRO; and to ingratiate himself with the former, gave him the command of all the troops while he remain'd there, commanding all the officers to obey Don ALVARADO's orders, and acknowledge no other General while he continued in Peru; and was so much better than his word, that he paid ALVARADO twenty thousand Peso's more than he had stipulated, for the expences of his journey, besides a great number of turquoises, emeralds, and vessels of gold for that General's particular use: Whereupon ALVARADO returned to Mexico, entirely satisfied with his reception and the treasure he had acquir'd; especially when he saw all the gentlemen that had accompanied him in this enterprize well provided for: However, it is conjectur'd that he found PIZARRO and ALMAGRO better established in Peru than he expected, or he would

not have quitted that country so easily, which he had undergone such hazards and expences to visit.

CHAP.
X.

Certain it is, PIZARRO and ALMAGRO reap'd great advantages by the troops ALVARADO brought with him. The Indians seeing so considerable a reinforcement arrive and join PIZARRO, and expecting more every day, despair'd of ever throwing off a foreign yoke, and generally submitted to the Spaniards; so that ALVARADO richly deserv'd all the money they had paid him. And possibly they would have advanced as much more, rather than he should not return to Mexico; for though the troops he brought with him, as it happened, established their conquest of Peru, the same troops were in a condition to have driven them from thence when ALVARADO arrived; or at least, both sides would probably have perish'd in contending for the possession of that country, and by that means the Peruvians would have recovered their liberties. But since so much has been said of Don PEDRO DE ALVARADO, I shall take the liberty of relating what happened to him, after his return to his government of Guatimala; and it seems he was a Cavalier of such an enterprizing or ambitious spirit, that he knew not how to live out of action. Tho' he was now grown old in war, and enjoy'd as much wealth and power as most Princes of his time; it having been proposed by the Viceroy of Mexico, to make some conquests to the northward, our Hero, Don PEDRO DE ALVARADO, took upon him to command the army; and pursuing some Indians, that were retired to a Precipice, with a party of horse, when he was advanced about half way up, it proved so steep, that one of his trooper-horses (or, as others say, part of the rock) fell upon him, and carried him to the bottom, by which he was so bruised, that he died a day or two after. But to return to Peru.

Soon after the signing the treaty between PIZARRO and Don ALVARADO, ALMAGRO was detach'd with part of the troops that arrived with ALVARADO to Cusco, whilst PIZARRO applied himself to the building of towns, and settling colonies upon the coast: Particularly he founded the capital city of Lima, in 12 degrees and a half south latitude, on the bank of a river, about six miles from the South-sea, and as much from the island and harbour of Callao: This city, DE LA VEGA observes, was built in the year 1534, and not in the year 1530, as some writers relate: For says DE LA VEGA, all authors agree, that it was in the year 1525, when PIZARRO, ALMAGRO and DE LUONE, did first enter into articles. Three years afterwards were spent in the discovery before they arriv'd at Tumbez (in 3 degrees south latitude) the first time. Two years more passed in PIZARRO's return to Panama, and his voyage to and from Spain. In the year 1531, the Adventurers invaded the island of Puna and Tumbez on the continent. And in December, the same year, they took the Inca ATABILIPA prisoner; and in March following, anno 1532, the Inca was put to death. In October, the same year, PIZARRO and ALMAGRO took possession of the capital city of Cusco, where they resided 'till April 1533, when advice came of the arrival of ALVARADO upon the coast, and ALMAGRO was detach'd with an hundred men to observe his motions. And in September, the same year, was the interview between PIZARRO and ALVARADO, when PIZARRO paid that General the money he had promised him: And in the beginning of the year 1534, viz. the 6th of January, 1533, being Twelfth-day in the Catholic account, but the 28th of December, 1533, according to our account,

Lima
founded.A piece of

gy.

CHAP. account, the city of Lima was built; to which PIZARRO gave the name of Ciudad de les Reyes; or, The City of Kings; because on that day, the Kings or Princes of the East made their presents to our Saviour; but this name is now disused, and the city is call'd by the name of Lima, from the valley wherein it stands; the Indians calling the valley Rimac, which the Spaniards corruptly call Lima. However, to commemorate the day, PIZARRO order'd the arms of the city to be three Crowns, with a Star shining over them. It was built, as has been already observed, after the Spanish model, a large square in the middle, and wide streight streets centering in the square, so that from every corner of the streets the whole town and neighbouring fields may be seen. On the north lay the river, from whence canals were cut for watering their lands, and supplying the houses with water. The city being laid out, PIZARRO divided the country about it among his Officers and Soldiers, and other Spanish Adventurers that came to reside in it, with the native Indians upon those lands, who held what the Spaniards were pleas'd to allow them by the basest tenures of villinage, viz. to cultivate, dung, and manure their lands, grounds, carry burthens, and perform other vile offices in their fields or houses. And when any Spaniards purchased any of these lands of another, the Indians upon such lands were transferred with them, as trees, deer and fish are with us, upon conveying away an estate; so that all the natives became absolute slaves to the Spaniards, and were us'd accordingly, many of them perishing in the insupportable drudgery they impos'd on them: Indeed, part of the Peruvians were in a manner slaves to their Emperors and Caraca's (Lords of the soil) before, being oblig'd to carry burthens, and draw carriages like horses, when they were commanded; but then that service was far from being so grievous as the service the Spaniards exacted from them. For first, they serv'd their native Lords by turns certain days in the year, and were never oblig'd to work more than five or six hours in a day. They had also food and raiment deliver'd to them by their Lords, and were always taken care of by them when they were sick, old and infirm; whereas the Spaniards had no compassion on them, but made them work in the mines, fish for pearls, build houses and ships, carry burthens, and manure their fields, exacting their labour with such rigour, and allowing them so little food, that they perished by hundreds and thousands, and the country in a few years was almost depopulated: Neither did the Spaniards make much distinction between those that were freemen, and those that were slaves and villains, but put them all to the like drudgeries; and if the Nobility and Gentry were distinguished by any thing, it was by tortures, to make them discover where their treasures were hid; and when they could not produce what was expected from them, they frequently expired in torments. But to return to PIZARRO: This General having built the city of Lima, and divided the country about it among part of his followers, he advanced further northward along the sea-coasts, and founded another city on a good harbour, in eight degrees, odd minutes, south latitude, which he named Truxillo, from the city of that name in Spain, of which it is said he was a native; and here also he made a division of the lands and Indians upon them, in the country about it, among his Fellow-adventurers, or first Conquerors, as they were call'd, to whom he assigned that city and its district; and thus the Spaniards

proceeded in every part of Peru, where they plant- ed colonies of Europeans.

While PIZARRO remained at his new city of Truxillo, advice came from Spain, that his brother FERDINANDO had in a great measure succeeded in his negotiations at that Court; for whereas Don FRANCIS PIZARRO had petitioned his Imperial Majesty to extend his government 200 leagues further southward, to grant him the province of ATABILLIOS in Peru, with the revenues thereof; the perpetual vassalage of twenty thousand Indians, and the title of Marquis; his brother wrote word, that the Emperor had confer'd on him the title of Marquis of that province, and enlarg'd his government considerably to the southward; but as to the command he desired over the Indians, he would inform himself of the customs of that country; and what damage or prejudice such a concession might prove, and then he would shew him all the grace and favour in that particular, as was consistent with justice: And as to ALMAGRO, the title of Marshal of Peru was confirm'd to him, and a government of two hundred leagues extent of country confer'd on him, to the southward of the country assigned to the Marquis PIZARRO.

ALMAGRO residing at the city of Cusco at this time, and receiving advice that the government of the country which lay south of the Marquis's government was confer'd on him; and observing that Cusco was not within the limits assigned to Don FRANCIS PIZARRO, he immediately took upon him the title of Governor of Cusco, and the district belonging to it, in his own name, and no more acted in subordination to the Marquis.

On the other hand, JOHN and GONZALO PIZARRO, brothers to the Marquis, oppos'd this usurpation of ALMAGRO, as they call'd it; and their differences arose to that height, that they enter'd into a formal war with ALMAGRO at Cusco, and several were killed on both sides; of which the Marquis receiving intelligence, caus'd himself to be carried in a hammock on the shoulders of the Indians to Cusco, who relieving one another at proper stages, carried him thither with such expedition, that he arriv'd at Cusco before he was expected by either side: And representing to both parties that these feuds would probably end in the destruction of themselves and their enterprize, if they were not speedily accommodated, he enter'd into a treaty with ALMAGRO for adjusting all their differences; And first he observ'd, that ALMAGRO was mistaken in his opinion that Cusco was without the limits of his (the Marquis's) government, for the Emperor had made him a new grant of the country, which lay south of that confer'd on him by the first grant: The Marquis also suggest'd to ALMAGRO, that the country which lay to the southward of the district of Cusco was richer in gold and silver than any that had been yet discover'd, of which he was contented Don ALMAGRO should take the government upon him; and that he should march at the head of best part of their united forces, and possess himself of it; and in the mean time he would apply to the Emperor to get him confirm'd in that government, to which they gave the name of Toledo, extending it from the district of Cusco to the country of Chili, which lies south of Peru: The Marquis also stipulated, that if the Emperor did not think fit to confer that government on ALMAGRO, he would divide that of Peru with him; with which overture Don ALMAGRO and his party were then pretty well satisfied, and immediately made preparations for an expedition to the south-

ward. About the same time another detachment of Spaniards and Indians were sent to reinforce Don BELLALCÁZAR in Quito, to enable him to finish the conquest of that province; and a third body march'd to the north-east, to reduce some provinces bordering on the mountains of the Andes.

ALMAGRO began his march for Chili in the year 1535, at the head of five hundred Spaniards, and fifteen thousand Indians, part of them armed and serving for his vanguard, and the rest to carry his baggage and bring him in provisions. The Inca, MANCO CAPAC, also sent with him his brother the Inca PAULLA, and the High Priest VILLA OMA, that he might meet with no impediments in his march, but receive all possible assistance from the Indians subject to the Inca in the provinces thro' which he passed. The Spaniards also took a great many Negroe slaves along with them; and that all the officers and soldiers might be well equipped and provided for this long march, ALMAGRO lent them the value of two hundred thousand crowns, taking only a note from the soldiers he lent any money to, for re-payment of it out of the spoils they expected in this expedition.

ALMAGRO advanced as far as the province of Charcas, two hundred leagues to the southward of Cusco, without meeting with any thing to obstruct his designs, the country being all under the dominion of the Inca, and supplying him with provisions as he went; but finding the Charcas a wretched barren country, and being ignorant of the rich mines it contained, he resolv'd to proceed forward to the kingdom of Chili; tho' had he known the invaluable mines of Potosi were situated in this barren country, he would certainly have set up his rest here; for in this mountain was afterwards found more silver than any, or perhaps all the countries in the old world produced at that time.

The Indians informed ALMAGRO that there were two ways to approach the kingdom of Chili, both extremely difficult and hazardous: The first was over a branch of the mountains of the Andes, or Cordelera's, that at this time (being winter) were cover'd deep in snow, and so cold that no Indian could live on the tops of them (tho' this was much the shortest passage, if it could be performed;) the other way was over a sandy desert by the sea-side, in which they should be in danger of perishing by the excessive heat and the scarcity of water; intimating, they were averse to the journey either way, but most dreaded that over the mountains of the Andes: However, ALMAGRO resolv'd to move forward, took the way of the mountains, as being the shortest, and more agreeable to the constitutions of his Europeans than the parching sands; and having gather'd what provisions the country afforded, and laid it on the shoulders of the Indian porters, he began to ascend the hills; but had not advanced far before he found the snows so deep that they were forced to dig their way through them, the Indians dying by hundreds with the intense cold; the Spaniards also were almost starved, and many of them perished with their horses on those mountains either by cold or want; and some of the men lost their fingers and toes, who escaped with their lives. However, ALMAGRO himself, with between three and four hundred Spaniards, the Inca PAULLA, the High Priest, and about five thousand Indians, reach'd the other side of the mountain, and came into a fine, temperate, and plentiful country; and at the command of the Inca PAULLA, the natives immediately brought all manner of provisions and refreshments into the camp: The people of Chili be-

ing informed that the Spaniards were Miracocha's CHAP. descended from their god the Sun, and that their X. Inca MANCO CAPAC order'd they should bring them all those tributes they had laid up during the late civil wars between HUASCAR and ATABILIPIA, they presented the Spaniards with gold and silver vessels to the value of two hundred thousand ducats, or nobles; and not many days after, collected the value of three hundred thousand more, and presented to ALMAGRO; whereupon the Marshal did not only give up and cancel all the bonds and notes his soldiers had given him, but distributed part of the treasure amongst them.

ALMAGRO having rested and refreshed his weary troops, propos'd to the Inca PAULLA the advancing farther into Chili, and subduing those parts that were not subject to the Inca: To which he consented; and assembling several thousand Indians to reinforce the Marshal, they march'd with their united forces against the natives of the more southern parts of Chili, with whom they had several smart encounters; but at length had the good fortune to reduce those provinces under their subjection: And being joined about this time by RUIZ DIAS and JOHN DE HARADA, with upwards of an hundred Spaniards more, would have extended their conquests much farther, if ALMAGRO had not taken a resolution of returning to Peru, to take possession of his government of Cusco, which he was now assured belonged to him by virtue of the Emperor's commission, which JOHN DE HARADA brought him when he joined the Marshal with the recruits above-mentioned.

This commission, it seems, confer'd on ALMAGRO the government of such provinces in Peru as lay south of those granted to PIZARRO, for the space of two hundred leagues; and as Cusco was above three hundred leagues south of the Equator, which was the utmost extent of PIZARRO's government, ALMAGRO's friends were of opinion that Cusco belonged to him; and that it ought not to be tamely parted with, being the capital city of the empire, and so well situated to command the southern provinces: His Officers therefore were unanimous in their opinion, that they should march back and possess themselves of Cusco, after which all the countries in the south would fall under their dominion of course.

The resolution therefore being taken of returning to Peru, the next thing to be considered was, which way they should march; and both Spaniards and Indians had suffered so much in their passage over the mountains, that it was unanimously determin'd to take the way of the plain by the sea-side; and to provide as well as possible against the want of water, Indians were sent before to open and cleanse the wells in the great desert, that had been choak'd up with sand during the civil wars, and to draw water for the Spaniards, which might stand some time in calabash-bowls and goat-skins, to settle and purify; for these waters, it seems, were thick and unwholesome, and scarce drinkable, when first drawn.

And as there was no enemy to be expected in this country, it was resolv'd to march in small parties over this desert, that they might be more easily supply'd with water and provisions in their march: However, with all these precautions, says my author, the hardships the Spaniards suffer'd in this scorching desert, being upwards of two hundred miles extent, was little inferior to what they sustain'd on the frozen mountains, of which the Spaniards give us many surprizing relations; particularly they tell us, that GEROMMO DE ALDE-

Almagro resolves to return to Cusco.

RETTE,

CHAP. X. **RETTE**, being Governor of Chili many years afterwards, and observing that those mountains at certain seasons of the year were clear of snow, made a journey over them in search of the plate and rich baggage that had been lost there when **ALMAGRO** pass'd it; and that they found there a Negroe leaning against a rock, holding a horse by the reins, both of them having been frozen to death, and that they stood upon their feet, dried and stiff, as if their skins had been stuffed with straw. But I must leave **ALMAGRO** on his march over the great desert, which lies between Chili and Peru, and observe what happened in the mean time at Cusco.

Manco Inca revolteth.

The Inca **MANCO CAPAC** observing that the Marquis **PIZARRO** only gave him the title of Inca, or Emperor, and that in reality he had very little command even in the capital city of Cusco, where he resided, put the Marquis in mind of his promise of restoring him to his empire, and performing the capitulations that had been agreed on between them; but **PIZARRO** put him off from time to time, telling him he must wait with patience 'till he heard those capitulations were ratified by his Sovereign the Emperor of the Romans, which he expected to receive every day by his brother **FERDINANDO**, and was going to Lima, in hopes of meeting him there; desiring that the Inca, during his absence, would reside in the castle, and not stir from thence. The Inca finding they would make him prisoner by force, if he did not voluntarily submit to this confinement, disguised his resentment, and immediately went to the castle, declaring that he should cheerfully submit to any thing that the Spaniards apprehended to be for their advantage, since they were pleased to acknowledge his title to the empire.

The Emperor demands great sums of the Pizarro's.

But the Indians were far from taking this imprisonment of their Inca patiently, they only waited for a favourable conjuncture to obtain his liberty, and revenge themselves on the Spaniards, which was offered them not long after; for **FERDINANDO PIZARRO** returning from Spain with his brother's new commission and the patent for the title of Marquis, brought some orders with him that were not acceptable to the Marquis or his people; particularly he informed them, that the Emperor expected they should be accountable to him for all the treasure they had received as the ransom of **ATABILIPA**, his Imperial Majesty alone being entitled to it; or at least that they should raise him a good round sum, and send over to Spain in lieu of it; but the Marquis and his Officers reply'd, This was neither reasonable nor possible: As they had hazarded their lives, and made a conquest of the country at their own expence, without any charge to his Imperial Majesty, they ought to reap the fruits of their labour; and besides, that money had been long since spent in supporting the conquest, building towns, and planting colonies, to preserve what they had gained, which would all redound to the honour and profit of his Majesty, who by that means was confirmed and established in the sovereignty of that rich country: And **FERDINANDO PIZARRO** representing that his Imperial Majesty was in great distress for money, having exhausted his treasury in his wars against the Turks, his expedition to Tunis, &c. and that he had promised him a supply from Peru, which the Court of Spain were apprized abounded with gold and silver; the Marquis reply'd, It was not to be expected a country so lately conquer'd, and not yet settled, should do more than maintain itself; and therefore he must not insist on the soldiers refunding the spoils, but find out some other way to per-

form his promises to his Imperial Majesty. Whereupon **FERDINANDO** desired his brother would confer on him the government of the capital city of Cusco, and he did not doubt but he should soon have it in his power to raise a sum of money to gratify the court of Spain; which the Marquis consenting to, his brother **FERDINANDO** immediately repair'd to his government of Cusco; where observing that several Officers had been greatly enriched by presents **MANCO Inca** had made them, in order to be kindly used, he apply'd himself also to the Inca, giving him to understand that he would be restored to his dominions; and all demands granted, if he could procure a considerable sum for the Court of Spain; and suffered the Inca to come out of the castle to his palace in the city again, and to be treated with the honours of a sovereign Prince: Whereupon the Inca sent expresses to several parts of his dominions, directing them to bring him their usual tribute of gold and silver plate, as the most probable means of delivering him out of the hands of the Spaniards. Accordingly a great deal of treasure was brought in, which the Inca presented to **FERDINANDO PIZARRO**, who still entertained him with promises of restoring him to his empire, in hopes of drawing more treasure from him: But the Inca finding he was still in a manner a prisoner, and not suffered to stir out without a guard of Spaniards, concluded they intended him no good; but that as soon as they had squeezed what they could out of him, would put him to death, as they had done the Inca **ATABILIPA**: He was perpetually meditating therefore how he might deceive the deceivers, and get out of the hands of his treacherous keepers; and at last hit upon the following stratagem. He informed **FERDINANDO PIZARRO**, that in the valley of Yuca, 2 or 3 leagues distant from Cusco, where the Inca's bowels used to be interred when their bodies were embalmed, there were several rich tombs, and in one of them a statue of solid gold of one of his ancestors, as big as the life, which he believed he could find if he might be permitted to go thither with his usual guard of Spaniards, for he could not direct any one to it without going in person. This being a prize which the Governor **FERDINANDO** had set his heart upon, he consented that the Inca should go thither with a Spanish guard, having no suspicion of a general conspiracy to rescue their Prince out of his hands; for neither the Inca or any of his subjects had yet discovered the least uneasiness at the tyranny of the Spaniards, how insupportable soever: But **MANCO Inca** having ordered several thousand Indians to rendezvous on the adjacent mountains on a day prefixed, and having obtained leave of the Governor to resort to the valley of Yuca, and remain there till the evening, he found means to escape from his guard, and get to his forces in the mountains; and the night coming on, before morning he was conducted beyond the reach of the Spaniards, who, instead of getting the golden statue they expected, lost a much more valuable prize, and were within an ace of losing all their conquests.

The Inca escapes from the Spaniards.

The Inca being now at liberty, and having summoned a council of his Nobility and Generals, represented the treachery and perfidiousness of the Spaniards, who performed none of their articles or capitulations, but had, on the contrary, imprisoned and laid him in irons in the castle of Cusco. He said, he had been long apprized of their falseness and treachery, observing how they divided the lands of Peru among themselves, both in the territories

stories of Cusco and Lima; from whence it was evident they had no intentions to restore his empire; and if he had dissembled a compliance with their measures, it was only for the security of his person, and that he might one day be in a condition to assert his own and his country's rights: And as he was now determined to vindicate their liberties by force of arms, he desired they would assist him with their advice at this great and important crisis, that the war with these cruel and ungrateful strangers might be carried on to advantage, without whose expulsion they were now convinced they could never expect to enjoy any thing they had in quiet: If they suffered him or his subjects to live, they must be slaves to these usurpers; a state more to be dreaded than death itself. To which, it is said, a leading man of the Council answer'd:

"It was never, Sir, the advice of your Council that your Majesty should put your royal person into the hands of strangers, or trust to them for the restitution of your empire: However, they were willing to comply and concur with your Majesty's sentiments, whom they found inclin'd to maintain that peace which was concerted with them by your brother TITU ATAUCHI, from which we can now expect little benefit, if we take our measures from the treatment of your brother ATABALIPA; who having contracted for, and paid his ransom, was afterwards put to death. And we must attribute it to the mercy and providence of the PACHA CAMAC, that they treated not your royal person (when in their power) in the same manner as they had done your brother. As to your restoration to the empire, there is little to be expected from a nation so entirely given over to avarice; for it is not to be imagined that those that are greedy of the fruit should restore the tree unto the true proprietor; but it is more probable they should destroy, and put him and his out of the way, lest they should aspire to that empire which they resolve to enjoy. Wherefore, since the Spaniards themselves have given just cause to suspect and doubt the performance of their promises, your Majesty ought immediately, without delay, to raise as many soldiers as possible, and make such other provisions as are necessary for war, wherein no time is to be lost; for that they now being divided into several parties, may be more easily defeated than when united in one body: In the management of which design, we must agree to attack them all at the same time in several places, so that they may not be able to assist or succour each other. We must also secure the passes, stop and hinder all intercourse and correspondence between them: And in regard your soldiers are so numerous, that their multitudes may easily overwhelm such a handful as the Spaniards, and are able to throw the very mountains upon them, if your Majesty so commands; nay, if they refuse to grant them succours only and provisions, they must necessarily perish with famine, being as it were besieged by your subjects, who encompass them on all sides: But this resolution is to be speedily executed, for the success of the whole design depends thereupon; of which we need not doubt, if we consider the justice of our cause."

A general
insurrec-
tion of the
Indians.

An insurrection being thus resolved on, expresses were dispatched to every province of the empire, requiring the respective Governors and Officers to raise what forces they could, and in one day endeavour to surprize the Spaniards in their quarters; and

three great armies were accordingly assembled in an instant, one whereof was intended to cut off AL-MAORO and his forces in Chili; a second invested the city of Lima; and the third, consisting of two hundred thousand men, commanded by MANCO Inca in person, attacked the city of Cusco, took the castle, and drove the Spaniards into the grand square in the middle of the town; but here the artillery, being pointed to the several streets, mowed them down by hundreds and thousands, and the horse charging them while they were in this confusion, the Indians were forced to retire to the castle, having first set fire to the greatest part of the city and burnt it, except the temple of the Sun, the convent of Select Virgins, and some other publick buildings the Spaniards remain'd possess'd of: But notwithstanding the Spanish horse and artillery were always too hard for the Indians, yet as the latter were masters of the open country, and could cut off their provisions from time to time, the Spaniards must have been reduced in a short time, if they had not been joined by great numbers of the common people of Peru, who being slaves to the rest, adhered to the Spaniards in these wars; whereby they did not only obtain their freedom, and gain the superiority of their masters, but shared the plunder of their estates and fortunes with the Christians; and without the assistance of these Indian slaves, the Spaniards could never have made a conquest of Peru, without employing a much greater force. But now liberty being proclaimed to all the vassal Indians that would join the Spaniards, they resorted to the assistance of the besieged in such numbers, that the Inca's troops were entirely driven out of Cusco again, and even out of the castle; in the storming of which, however, JOHN PIZARRO, brother to the Marquis, lost his life.

The siege, or rather blockade, of Cusco continu'd nine or ten months, in which the Indians were so remiss, or so unable to resist the Spaniards united with the vassals, that the Christians made excursions to a very great distance, and brought in several thousand head of cattle, with all manner of provisions; nor did the Inca ever think fit to make any farther attempts upon the city, but contented himself with surprizing some small parties of the Spaniards now and then, from whom having taken their horses and armour, and being instructed by some of their prisoners how to make use of them, the Peruvians were seen sometimes charging the Christians with their own weapons. DE LA VEGA gives us an account of one brave Indian that fought three celebrated Spanish officers, armed cap-a-pee, successively, and was too hard for every one of them singly: An Indian Captain (says the royal historian) posting himself in the middle of the road which leads from Cusco to Caxiao, attending the coming of a certain Cavalier (whom I knew) as he was making up to him on horseback with a lance in his hand, the Indian with a fierce countenance, like an undaunted soldier, stood ready with his bow drawn to receive him; and at the same time that the Spaniard made a thrust at him with his lance, he struck the point of it down to the ground, and catching hold of it, forced it from his hands. Another gentleman of my acquaintance standing by, and observing a single combat between a Spaniard and an Indian, did not concern himself, because they were one to one, until he saw that the Indian had wrested the lance out of the hand of the Spaniard; and then he thought it time to take part with his companion, and so made at him with his lance; but the Indian bearing off the blow with what he

very of an
Indian.

had

CHAP. X. had in his hands, wrested also the spear from this Spaniard, and defended himself from both of them at the same time; their names I shall conceal out of respect to their posterity; one of which was a scholar with me at the grammar-school. GONZALO PIZARRO, who was engaged in another place, and had put his enemy to flight, happened to come in at the same time and be a spectator of this action, and seeing how matters passed, he cried out with a loud voice, Out, for shame! what, two to one! The Spaniards knowing the voice of GONZALO PIZARRO, made a stop, till he himself came up to make trial whether he could deal better with him than they had done: The Indian seeing another horse-man come upon him, setting a foot on the first lance he had gained, with the other he encountered the third Cavalier, and almost threw his horse back upon his haunches; but the Indian finding himself hardly beset, quitted his lance, and caught hold of that in the hand of PIZARRO, intending to wrest it from him, as he had done from the others; but PIZARRO keeping fast hold thereof with his left-hand, drew his sword with his right, to cut off the hands of the Indian; whereupon he let go the lance, and caught up the other which was under his feet. And now the two Cavaliers, which were spectators, thought it time to dally no longer, but to come in, and without compliment to kill the Indian; but GONZALO PIZARRO cried out against it, saying, It was pity so brave a man should die; and that he deserved rather honour and reward than death. The Indian observing, that the two other Cavaliers were restrained by the words of PIZARRO, and that he had saved his life, he immediately threw away his lance, and in token of submission went to him and kissed his right leg, saying, Henceforth thou shalt be my Inca, and I will be thy servant; and for ever afterwards he served him with great fidelity.

And it is certain, both in the East and West-Indies, we meet with some brave fellows so dextrous at their weapons, that they will singly engage any of our men; and yet it is as certain, that a body of five hundred Europeans will drive ten thousand Indians before them, only by observing a little order.

The Spaniards pretended miracles.

The Spaniards usually ascribe their success in raising the siege of Cusco to miracles. They tell us, that in some sallies their champion St. JAGO, or St. JAMES, appeared on a white horse fighting for them; and that at other times the blessed Virgin, with our Saviour in his arms, appeared over the Spanish quarters, and protected them from the flames, the fiery arrows were shot into the roofs of their houses, that were composed of thatch and other combustible matter: But it is evident, that the Spanish horse and artillery, with the revolt of the Indian slaves at this critical juncture, were abundantly sufficient to defend that city against MANCO Inca and his naked subjects, without the help of miracles. Indeed, we ever find the bigotted Spaniards ascribing their success both in Peru and Mexico to such pretended miracles as these; insinuating that heaven fought for them, and gave them possession of the countries, as formerly God gave the land of Canaan to the Israelites. They would have us believe, that all their usurpations, oppressions, and tyranny, those innumerable murders and robberies they committed in these countries, were approved and countenanced by heaven. But surely heaven never wrought miracles in so vile a cause; however, for wise reasons, providence might permit the cruel rapacious Spaniards to insult and trample on

VOL. III.

the poor naked Indians, who never offended them. **CHAP. X.** But to give some account of the success of this insurrection of the Indians in other places: The Marquis PIZARRO, who was at his new city of Lima at this time, finding all communication and intercourse on a sudden cut off with the city of Cusco, suspected there was some mischief intended, and was soon after informed by the Yanacuna's, or Indian slaves, in the Spanish interest, that Cusco was actually invested, and that the Indian Generals were marching with another army to besiege Lima. Whereupon he immediately dispatched expresses to Panama, Mexico, Nicaragua and Hispaniola, for reinforcement of troops to prevent the loss of Peru: He commanded also all the detachments he had sent out to extend his conquests, to return and join him for the defence of Lima; and at the same time ordered a body of an hundred horse, and foot, under the command of his cousin DIEGO PIZARRO, to march towards Cusco, and get intelligence in what condition his brothers, and the garrison he had left in that capital, were.

The Indians permitted this detachment to march unmolested, till they advanced 60 or 70 leagues in their way to Cusco; but having drawn them at length into a narrow passage between the rocks and mountains, they rolled down great Stones upon them, which so disordered the Spaniards, that they were all killed or made prisoners by the Indians. Two or three parties more, that were sent out successively to get intelligence, met with the like misfortune; inasmuch that it is said, between three and four hundred Spaniards were cut off in this manner, besides as many more who were dispersed, at the mines, or at their plantations, about the country; imagining that the Indians would have tamely submitted to their usurpation, and never have made an attempt to recover their liberties, notwithstanding the oppressions they suffered.

Nor did the Indians only defend the passes in the mountains, but being flushed with this success, advanced to the very walls of Lima; which they block'd up for a considerable time, tho' they could not take it. The Spanish horse were always too hard for them, when they sallied out into the plains about that city, and the artillery upon the walls obliged them in a short time to remove to a great distance: However, they still continued the blockade of Lima, where I shall leave them at present, and enquire after ALMAGRO, whom we left in the sandy desert of Atacama, in his return from Chili.

MANCO Inca, it seems, had dispatched expresses as far as Chili, to acquaint his subjects with his design of throwing off the Spanish yoke, requiring them to rise, and fall upon those foreigners, and endeavour to expel them. He acquainted also his brother PAULLA, the High Priest, and the rest of the Indians, who marched with ALMAGRO into Chili, with his intentions; whereupon the High Priest left ALMAGRO's camp privately, and returned to the Inca MANCO CAPAC, who was then encamped before Cusco. The High Priest was assisted in his escape by PHILIP the Interpreter, who being about to follow him, was apprehended by ALMAGRO, and put to death, and confessed at his execution, that his testimony against the Inca ATABILIPA was false, and that he had given evidence against him, that he might enjoy one of that Inca's wives, with whom he had an intrigue.

As to PAULLA, he always remained faithful to ALMAGRO, in which possibly he had a view to his own interest; for ALMAGRO no sooner heard of the

22 N

CHAP. X. the revolt of MANCO Inca, but he proclaim'd PAULLA Inca, or emperor of Peru, and caus'd his head to be bound with the imperial wreath or coronet : Whereupon PAULLA and the confederate Indians continued to espouse ALMAGRO's cause, and return'd with him into Peru.

The siege of Cusco rais'd on the return of Almagro.

When MANCO Inca heard of the approach of ALMAGRO, he thought fit to quit the siege of Cusco, and retire with a small part of his troops to the mountains of the Andes, ordering the rest of his forces to disperse, and return to their dwellings; for as he was not able to drive the Spaniards out of Cusco, when they were not two hundred men, he despair'd of doing it after they should be joined by the five hundred Spaniards which ALMAGRO had under his command : Nay he determin'd, 'tis said, at this time, to abandon the government, and lead a private life; for he heard his army before Lima also was repuls'd; that fresh supplies of Spaniards arriv'd there every day from Mexico and Panama; and that the Marquis PIZARRO was about to send another body of Spaniards to join with those already in Cusco : But had he known what feuds and divisions there were among the Spanish generals, he would surely have suspended that resolution a little longer : And some of his Officers, 'tis said, advis'd that prince to wait with patience, and foment those divisions among the Spaniards, for the weakest side would probably invite the Indians to their assistance, and give them an opportunity of re-establishing their Inca upon his throne. To whom, 'tis said, the Inca reply'd, he was not ignorant of the misunderstandings among the Spanish generals, but as long as they saw such armies of Indians on foot, he was confident they would lay aside their private quarrels, and all unite to maintain their footing in his dominions : And that the disbanding his forces was the readiest way to divide these rapacious foreigners, who would fall out about their plunder and the division of the lands they had usurp'd, when they imagin'd themselves secure, and saw no enemy in the field; and when they had weaken'd their forces by civil dissensions and encounters with each other, then the Indians might assemble again, and attack them with more success than they could hope for at present; but upon whatever motives MANCO Inca proceeded, certain it is, he commanded all his subjects about this time to quit the sieges of Cusco and Lima, and return to their respective dwellings.

And now ALMAGRO being arriv'd before the walls of Cusco, and finding the Indians drawn off, sent a summons to Don FERDINANDO PIZARRO, the Spanish Governor, to deliver up that capital to him, as being included in that grant the Emperor CHARLES V. had made him : But FERDINANDO answer'd, he held that city by virtue of a commission from his brother the Marquis, and should not deliver it up to any man without his orders, especially as he knew it to be within the limits of his brother's government; and immediately proceeded to put the place in a posture of defence, in order to prevent a surprize; but part of the garrison being friends to ALMAGRO, and holding a correspondence with him, introduc'd his forces into the town at midnight; and FERDINANDO and GONZALO PIZARRO were surpriz'd in their beds, and made prisoners; whereby ALMAGRO became possess'd of Cusco with little or no bloodshed, and most of the troops which had served the PIZARRO's enter'd into his pay.

Almagro surprizes Cusco, and makes Ferdinand Pizarro prisoner.

In the mean time the Marquis PIZARRO hearing no news from his brothers at Cusco, and concluding all the parties he had hitherto sent to reinforce them

had been cut off by the Indians, determin'd to send such a body of troops thither, as should be able to force their way thither against all the opposition the Indians could make; and having assembled five hundred Spanish horse and foot, gave the command of them to Don ALONZO DE ALVARADO, with orders to march with all expedition to Cusco. PETER DE LERMA was order'd also to march with this detachment as a private Captain of a troop of horse, tho' he was an older officer than ALVARADO, and had done great service in those wars; which so disgusted DE LERMA, that he from this time meditated the ruin of the enterprize, as is suppos'd by the Spanish writers.

ALONZO DE ALVARADO continuing his march with the utmost diligence, most of the Indians that were press'd to carry his baggage, amounting to upwards of five thousand, perish'd in the first part of the journey, either by the intolerable fatigue, being loaded and driven beyond their strength, or starv'd for want of food, of which their lords the Spaniards took but little care to provide them; inasmuch that ALVARADO was forced to halt, 'till he could press some thousands more of the Indians to supply the places of those he had lost.

ALMAGRO receiving intelligence at Cusco, that Don ALONZO DE ALVARADO was advancing towards that city, sent some Spaniards of quality to him to represent, that Cusco belong'd to his government, according to the division the Emperor had made of Peru between him and the Marquis PIZARRO, and therefore advis'd him to retire to Lima again, 'till he and the Marquis should adjust the limits of their respective governments : But ALVARADO was so far from entertaining any pacifick thoughts, that he made all the gentlemen prisoners that were sent to treat with him. Whereupon ALVARADO took the field, constituting Don ORGONNEZ his Lieutenant-General; and having made a party of ALVARADO's horse prisoners, understood by them that great part of his troops were better affected to him than they were to the PIZARRO's; particularly he understood that PETER DE LERMA, with a great many of his friends, would desert ALVARADO the first opportunity.

He advanc'd, therefore, as far as the bridge of Abancay, on the other side whereof ALVARADO lay encamp'd; so that there was nothing but a small river that parted their forces : They remain'd quiet however, without attempting to attack each other all day; but in the night-time ORGONNEZ fording the river at the head of ALMAGRO's horse, put ALVARADO's forces into great confusion, and giving PETER DE LERMA and the rest of their friends by this means an opportunity to join them, ALMAGRO gain'd an easy victory with very little bloodshed, making Don ALONZO DE ALVARADO his prisoner, with whom he return'd in triumph to Cusco. This battle was fought on the 12th of July, 1537.

ALMAGRO holding a council of war on his arrival at Cusco, was advis'd by his General ORGONNEZ to improve his victory by marching immediately to Lima, and taking possession of that city before the Marquis DE PIZARRO was re-inforc'd; for he had but a slender garrison after the detachment he had made under the command of Don ALONZO DE ALVARADO to Cusco. He also advis'd him to take off the heads of FERDINANDO PIZARRO and his brother GONZALO, men who had always express'd the utmost malice and prejudice against him, and done him all manner of ill offices both in the Court of Spain and in Peru; and who would, he suggested, infallibly take his life if ever they had him in

CHAP. X. Marquis Pizarro sends Alonzo de Alvarado to the relief of Cusco and his brothers.

Almagro defeats Alonzo de Alvarado, and makes him prisoner.

CHAP. X. in their power. He represented also, that as the Marquis PIZARRO was master of Lima and all the ports and shipping upon the coast, he would daily receive fresh forces and supplies from Mexico, Panama, and other places; whereas ALMAGRO not being master of one port or ship could receive no recruits, or indeed have any communication either with Europe or North-America, and consequently must soon become much inferior to his rival the Marquis, if he did not lay hold of the present happy conjuncture, and open himself a way to the sea.

These overtures appear'd so reasonable, that ALMAGRO at first resolv'd to follow the advice of ORCONNEZ; but JAMES DE ALMAGRO, another of his Generals, on whose advice he usually rely'd, having contracted a friendship with FERDINANDO PIZARRO during his imprisonment at Cusco, dissuaded ALMAGRO from putting the two PIZARRO's to death that were his prisoners; and ALMAGRO being himself, 'tis said, averse to the shedding of blood, and still retaining some friendship for the Marquis their brother, refused to listen to the advice ORCONNEZ had given him in that particular: Nor did he approve of attacking Lima, because that undoubtedly belong'd to the Marquis by the Emperor's grant, and he must be deem'd a rebel to his Prince if he encroach'd on the territories his Imperial Majesty had conferr'd on another.

Almagro marches to the sea-coast.

However, it was generally agreed, that it was absolutely necessary to open a communication with the sea, that they might have some harbours where the recruits that were sent them from North-America might land and join them, and from whence they might have a correspondence both with Mexico and Old Spain: And accordingly ALMAGRO having assembled a body of five hundred Spanish horse and foot, and being join'd by some thousand confederate Indians, began his march towards the valley of Chinca on the sea-coast, taking with him his prisoner FERDINANDO PIZARRO, but he left ALONZO PIZARRO and ALONZO DE ALVARADO prisoners in the city of Cusco.

In the mean time, the Marquis DE PIZARRO hearing no news from ALONZO DE ALVARADO, and imagining the Indians might have possess'd themselves of the passes in the mountains, and thereby cut off his communication with that General, march'd in person at the head of three or four hundred Spaniards towards the mountains to gain intelligence: And after some day march, receiv'd advice that the Indians had rais'd the siege of Cusco; that ALMAGRO was return'd from Chili, had possess'd himself of that capital, and made his brothers FERDINANDO and ALONZO prisoners; and that his other brother JOHN PIZARRO was kill'd during the siege of Cusco; and a day or two after, had news brought him of the defeat of Don ALONZO DE ALVARADO. Whereupon he thought fit to retire again to Lima, and fortify himself there, 'till he should receive a reinforcement of troops, which he expected every day from North-America; and to divert ALMAGRO from taking advantage of his present weakness, and putting his brother to death, he dispatch'd several Spaniards of quality to attend him, and offer him any terms he should insist upon to procure his brothers liberty; but according to some historians, he had no intention to observe any treaties with ALMAGRO any longer than he should be in a condition to break them with advantage. These Commissioners arriving in ALMAGRO's camp, he refused at first to be amused by any fallacious treaties; told them, he would order Commissioners to treat with those of the Marquis on the frontiers of their respective governments; and continued his march as far as Nasca,

The Marquis makes overtures of accommodation to Almagro.

within 40 leagues of Lima, where he heard that ALONZO DE PIZARRO, ALONZO DE ALVARADO, and a hundred Spanish prisoners more he left behind him had made their escape from Cusco. Whereupon ORCONNEZ again press'd him to put FERDINANDO PIZARRO to death, but he still refused it; and having planted a colony near the coast of the South-sea, in the vale of Chinca, he sent Commissioners to treat with the Marquis; but, either by the orders of the Marquis or without, these Commissioners were seiz'd and made prisoners by one of his Generals, and their dispatches broke open; which being represented to the Marquis as a very great outrage, he denied his having any knowledge of it, order'd the Commissioners to be set at liberty, and their effects restor'd them, proposing an interview with ALMAGRO in the field, with only twelve horsemen to attend each of them; which ALMAGRO agreeing to, contrary to the advice of his Generals, was very near falling into an ambuscade that ALONZO PIZARRO had laid for him; of which receiving some notice, while he was at the conference with the Marquis, he made his escape with some difficulty.

Almagro plants a colony near the sea-coast.

The treachery of the Pizarro's.

The Marquis, however, pretended that he had no intention to surprize ALMAGRO, and that he had been mis-inform'd, and Commissioners were agreed on to adjust their differences.

It seems, the Bishop of Panama (or Terra-Firma Proper) had been appointed in the year 1536, by the Emperor, to go to Lima, and settle the limits between PIZARRO's and ALMAGRO's governments, being directed to assign PIZARRO all that part of Peru extending from the Equator to the Southward, two hundred and seventy leagues; and to ALMAGRO two hundred leagues more; to commence where PIZARRO's government ended; but PIZARRO apprehending that Cusco belong'd to the division which was allotted to ALMAGRO, kept him ignorant of the Emperor's grant, and persuaded ALMAGRO to undertake the expedition to Chili above-mentioned; and when the bishop arriv'd at Lima, dissuaded him from taking that tedious journey to Cusco to execute his commission: Whereupon the Bishop return'd to Panama without doing any thing; but ALMAGRO, on his return from Chili, finding how he had been abused by the PIZARRO's, who had usurp'd part of his government, surpriz'd the city and castle of Cusco, and made FERDINANDO and GONZALO PIZARRO prisoners, as has been related already.

Arbitrators being again chosen to settle the limits between the two Generals, and not being able to come to any agreement, Father BOVADILLA was made umpire of their difference, who thought fit to allot the capital city of Cusco to the Marquis PIZARRO; against which award ALMAGRO appeal'd to the Council of the Indies, and resolv'd to maintain by force what he was possess'd of, 'till he should receive the determination of that Council.

Whereupon the Marquis, in order to procure his brother FERDINANDO's liberty, pretended he was content that both parties should keep what they were possess'd of, 'till the court of Spain should determine otherwise; and that he would furnish ALMAGRO with a ship, by which he might send over his Commissioners to Spain to manage his cause there: And upon these terms ALMAGRO consented to set FERDINANDO PIZARRO at liberty.

The Marquis and Almagro agree upon terms.

The Marquis having obtain'd what he wanted, viz. his brothers liberty, and a great supply of troops from North-America, sent a Herald to ALMAGRO, requiring him to deliver up Cusco to him, and all

CHAP. X. all his conquests in Peru, insisting that his (PIZARRO's) government extended from the Equator to the Straits of Magellan: And upon ALMAGRO's refusing to resign his government, immediately declar'd war against him, sending his brothers FERDINANDO and GONZALO at the head of seven hundred Spanish horse and foot to surprize the city of Cusco in the absence of ALMAGRO; of which that General receiving intelligence, march'd with the utmost diligence to reach that city before them; though, 'tis said, his General ORGONNEZ again advis'd him to turn back and attack the city of Lima now the garrison was so much diminish'd; observing, that if he once possess'd himself of that city, the recruits which came from North-America would all join his troops, and soon make him superior to his competitor; of which ALMAGRO was sufficiently convinced, but absolutely refused to encroach upon that government which had been granted to the Marquis by his Sovereign. He continued therefore his march towards Cusco; and being better acquainted with the country than the PIZARRO's, and his troops more used to that climate, got between the enemy and Cusco, when advice was brought him that most of the Spaniards under the command of the PIZARRO's, being lately come from Spain, were fallen sick in the mountains, and that if he would return back and fall upon 'em, they would very easily be defeated; and of this opinion was ORGONNEZ, and several other officers; but whether ALMAGRO did not credit this advice, or imagin'd he should have a greater advantage of the enemy if they laid siege to Cusco with so small an army, he continued his march thither: And 'tis highly probable, the PIZARRO's would never have been able to have taken Cusco, if ALMAGRO had remain'd within those walls upon the defensive, especially as the PIZARRO's had no cannon with them, and the garrison would have been almost as numerous as the besiegers: But the officers under ALMAGRO confiding in the bravery and experience of their forces, wav'd all the advantages they had in their walls, and no sooner heard the enemy approach'd, but they prevail'd on their old General ALMAGRO, contrary to his own opinion, to suffer them to march out and give the Pizarrists battle; and ALMAGRO, being very old and infirm, was carried on a couch into the field, rather to see the battle than to command in it, having constituted ORGONNEZ his General.

The first oversight the Almagrians committed, 'tis said, was in attacking the Pizarrists when they were drawn up among the Salina's, or Salt-pits, where their horse, in which they had the superiority, could be of little or no use to them: They were much deceiv'd also, it seems, in the forces they were to engage, and in their arms; for they imagin'd they were most of them new rais'd undisciplin'd men, and no better arm'd than themselves; whereas they had been bred up in Flanders, the best school of war in that age, and consisted chiefly of musketeers, of which there were but very few in ALMAGRO's army. But the greatest misfortune was, their General ORGONNEZ being wounded by a musket-shot in the beginning of the battle, when he was engag'd with FERDINANDO PIZARRO, the enemy's General, and had unhors'd him, the personal courage of ORGONNEZ contributed much to the loss of the day; for he was engag'd in this single combat when he should have been giving his orders, and commanding the army; and the Almagrians imagining he was dead, thought of nothing but a retreat: ALMAGRO himself fled to the castle of Cusco, and the Pizarrists entering the city pell-mell

Almagro defeated and made prisoner, and Cusco taken by the Pizarrists.

with the fugitives, the slaughter was very great; ORGONNEZ and PEDRO DE LERMA being cover'd with wounds, were kill'd after quarter given them, and a great many officers more upon private pique and resentment, no wars being so cruel as those between countrymen and exasperated friends; but poor old ALMAGRO was taken prisoner, and reserv'd to be murder'd by the forms of law.

After he had remain'd prisoner some months in Cusco, the Lawyers were employ'd to draw up articles against the old General; the principal whereof were, That he had seiz'd on Cusco by force; that he had enter'd into a secret treaty with the Inca; that he had encroach'd on the government granted to the Marquis by the Emperor; that he had broken his articles with the Marquis, and fought two battles with the Emperor's forces under the command of the Marquis, the one at the bridge of Abancay, and the other at the Salina's; and his enemies sitting in judgment on him, he was capitally convicted and condemned to die, tho' he appeal'd to the Emperor, and apply'd in very moving terms to FERDINANDO PIZARRO to save his life: He bid him remember that he had spar'd his life, and ever refused to put to death any of his relations, on account of the friendship between him and the Marquis; that he would do well also to remember how instrumental he had been in enabling his brother to make those conquests, and raising him to the honours he possess'd; desired the PIZARRO's would consider he was an old gouty man, who could not live many years, and suffer him therefore, after the innumerable hardships and hazards he had sustain'd, to die a natural death; but the Pizarrists looking upon their old companion and fellow-soldier as the only obstacle to their glory and ambition, and believing by his death they should obtain the sole dominion of Peru without a rival, they were deaf to his entreaties, and having order'd him to be strangled privately in prison, they afterwards caused his head to be cut off on a scaffold in the great square of Cusco. His body lay all day expos'd almost naked on the scaffold, his friends not daring to bury him, lest they should incur the displeasure of the merciless FERDINANDO PIZARRO, and his enemies not thinking it worth while to give themselves any trouble about his funeral; but towards the evening, a poor Negroe, who had been slave to the deceas'd, brought a coarse sheet, and with the help of some Indians, who had been servants likewise to that General, wrapp'd up the corpse, and carried it to the church of the Merceds, where the Friars buried him under the high-altar.

This act of cruelty rais'd the PIZARRO's a great many enemies even amongst their own people: They did not forbear to call them tyrants, and threaten revenge. The Indians wept, and lamented the loss of him, declaring they had never been abused by this Commander. The mourning for him, 'tis said, was almost universal both among Spaniards and Indians. He was sixty-three (some say seventy-five) years of age, of a low stature, his countenance not very agreeable, especially after he lost his eye. He was brave and enterprising, the most patient of fatigue of any man living, of a sweet disposition, discreet, generous, and a friend to all good men; but as to his family, it is generally agreed, that he was a foundling, and ignorant who his parents were; neither was his education extraordinary, for he could neither write or read. He may justly therefore be stil'd the forger of his own fortunes, when under these disadvantages he possess'd

Almagro tried for his life.

And put to death.

A character of Almagro.

CHAP. X. possess'd himself of more wealth and power than any private man ever did before him. He had one son by an Indian woman, when he dwelt at Panama, to whom he gave his own name, and made him joint heir of his fortunes with the Emperor his sovereign **CHARLES V.** constituting **JAMES DE ALVARADO** guardian to his son: But notwithstanding all these precautions to secure part of his wealth for his son, the Marquis detain'd the young **ALMAGRO** prisoner at Lima, and seiz'd the father's treasure, together with his government.

The Pizarro's detach forces every way to enlarge their conquests.

But the **PIZARRO**'s observing that this unjust and tyrannical conduct created them many enemies, and render'd them generally detested among the soldiery; in order to get rid of those that seem'd least affected to them, they made several detachments of their forces to enlarge their conquests; **PEDRO DE VALDIVIA** was commanded to invade Chili; **PERO DE CANDIA** was sent to the westward to subdue the countries beyond the mountains of the Andes; **PERA DE VEROARA** was sent against the Bracamores, and other Commanders to other distant parts: And to support their interest at the Court of Spain, it was resolv'd that **FERDINANDO PIZARRO** should resort thither, and carry a vast treasure with him, to be apply'd as he should judge most to their advantage; for **JAMES DE ALVARADO**, who was appointed guardian to young **ALMAGRO**, was already gone over to Spain, to petition the Emperor to do justice to his Ward.

Ferdinando Pizarro imprisoned in Spain.

And notwithstanding **FERDINANDO PIZARRO** brib'd almost every Grandee in the Court of Spain with the gold and silver of Peru, yet so notorious were the outrages, murders, and devastations that he and his brothers had committed, that his friends could not save him from being condemn'd and imprison'd: And had not his prosecutor **JAMES DE ALVARADO** died suddenly, suppos'd to be poison'd by **PIZARRO**'s agents, **FERDINANDO** had probably lost his head: As it was, he remain'd three and twenty years a prisoner in the city of Medina del Campo before he obtain'd his liberty.

The Indians rise in arms again.

But to return to Peru. The Indians observing the divisions among the Spanish Generals, had recourse to arms again: And tho' the Spaniards in Peru now amounted to two thousand men and upwards, they found it more difficult to maintain their ground at this time, than they did at first, when their forces did not amount to four hundred men; for the terror the Indians were under at first from the fire-arms and horses, which they had never seen before, was in a great measure worn off; and they had learn'd of the Spaniards to ride and handle their arms pretty dextrously; and having taken some horses, were not afraid to fight the Spaniards at their own weapons: Nor did there want instances of some parties of Spaniards being defeated by them: And had not the Indian slaves and vassals stuck close to the Spaniards, discover'd the passes and places of strength, and from time to time brought them both provisions and intelligence, probably **PIZARRO** would have been oblig'd to abandon his conquests at last.

Los Charcas and the mines of Potosi reduced.

The most considerable acquisition the **PIZARRO**'s made after the death of **ALMAGRO** was the conquest of the Charcas, in which lay the invaluable mines of Potosi, whose treasures drew such multitudes of Adventurers thither, that the Indians of that province were at length compell'd to submit, and become slaves to the Spaniards: But they were not so successful in Chili, that brave people disputed the ground with the Spaniards by inches; nor could they ever make themselves entirely masters of it, as

VOL. III.

CHAP. X. will be observ'd in the future history of that country; and even in the province of Los Charcas, **GONZALO PIZARRO** and his forces were so surrounded and distress'd by the Indians, that the Marquis was forced to march in person with the garrison of Cusco to his relief; and the Spaniards ascrib'd the victory they obtain'd at that time to a miracle that was wrought in their favour.

The conquest of Los Charcas being finish'd, the Marquis founded the town of La Plata (so named from the neighbourhood of the mountain Porco, and other silver mines) and divided the city and country about it, with the Indians that inhabited it, among the conquerors. To his brother **FERDINANDO PIZARRO**, who was then in Spain, he allotted a very large share; and to his brother **GONZALO**, another part of the country, in which some time after the silver mines of Potosi were discover'd: **FERDINANDO PIZARRO** also had a share in these mines, as a citizen of the city of La Plata; and a particular part of it being assign'd to his officers, they discover'd so rich a vein, that, 'tis said, they digg'd from it the finest silver without any alloy.

La Plata founded, and the lands and Indians divided among the Spaniards.

This division of the country was made in the year 1538 and 1539. And now the Marquis found himself possess'd of a territory seven or eight hundred leagues in length, viz. from the Equinoctial to the south part of Los Charcas, in which were more rich mines than in all the world besides; and yet was not his ambition or avarice satisfy'd, but in an extreme old age he employ'd his brother **GONZALO** in the conquest of other Nations. **GONZALO**, who was now Governor of Quitto and all the northern provinces of Peru, was commanded to undertake an expedition to the eastward, the Marquis being inform'd that those countries not only afforded plenty of gold, but yielded spice very much resembling cinnamon, and for that reason the country to the eastward of Quitto obtain'd the name of Canela, or the Cinnamon province.

GONZALO PIZARRO had not march'd many miles before he arriv'd at this country of Canela; he also met with some gold in the rivulets; but this province lying under (or near) the Equinoctial, he found it so wet and full of marshes, woods and bogs, that he lost most of his Spaniards, and four thousand Indians he had press'd to carry his baggage, and reap'd very little benefit from this expedition, unless the discovery of the great river Amazon; on which having built a sloop, and put all his treasure and baggage on board, he sent one of his officers, named **ORELLANA**, with sixty men down the river, to make further discoveries, and then return to him; but **ORELLANA**, having sail'd two hundred leagues farther down this river, and finding it very difficult to return against the stream, which was very rapid, sail'd to the mouth of it, and then coasting along to the northward, came to the Spanish island of the Trinity, from whence he embark'd for Spain; of whose voyage I shall give a more particular account when I come to describe the country of the Amazons.

Orellana's voyage down the river Amazon.

As to **GONZALO PIZARRO**, their General, he having been compell'd by famine to eat up his horses, lost most of his men, and endur'd incredible hardships for two years and upwards; he return'd at length to Quitto, where he receiv'd advice of the misfortunes of his brother the Marquis, which I come in the next place to relate.

The Marquis, in the absence of his brothers, seem'd more intent on suppressing the party of **ALMAGRO** than any thing else. He made large remittances grans.

CHAP.
X.

mittances to the Court of Spain for that end, and would not suffer any of the officers or soldiers, that shew'd any affection to the family of ALMAGRO, to enjoy either lands or offices in Peru (these were usually call'd Chili-men, because they had attended the deceas'd ALMAGRO in the conquest of that country) and as to young ALMAGRO, he remain'd a prisoner at large in the city of Lima, but was never suffered to stir from thence. Thus the Almagrians being neither permitted to return to Spain, lest they should carry fresh complaints thither against the Marquis, nor to enjoy any thing in the Indies, they were dispers'd all over the country to get a poor subsistence, or liv'd on the benevolence of their countrymen, 'till the cruel PIZARRO publish'd an edict, that no body should relieve them; which soon reduc'd the Chili-men to a starving condition, and inspir'd them with thoughts of revenge, or rather put them upon desperate measures to preserve themselves from starving; which they could think of no better way to prevent, than by cutting off the Tyrant; and he, conscious how much he was hated not only by the Chili-men, but also by his own people, for his oppression and cruelty, seldom stirr'd out of the city, or even of his palace, without a strong guard to protect him.

The Almagrians form a conspiracy against the Marquis.

The Almagrians therefore, singly, or two or three at a time, resorted privately to the capital city of Lima, where they did not want friends who conceal'd them in their houses, 'till they found they amounted to two or three hundred men, all brave veteran soldiers, and several experienc'd officers amongst them, who resolv'd to attack the Marquis as he came to the great church on Midsummer-day, 1541; but he having some intelligence of the design, did not go out of his palace that day; and the conspirators, upon this disappointment, had resolv'd to wait for the arrival of VACA DE CASTRO, whom they understood the Emperor had sent over to adjust all differences between the Pizarrists and Almagrians; for advice came about this time, that VACA DE CASTRO was actually arriv'd upon the coast of Peru.

But the Almagrians being inform'd afterwards that their plot was discover'd, and they would suddenly be sacrific'd to the fury of the Marquis, if they did not prevent it by some bold attempt, twelve of them (or as some say nineteen) met at the house of young ALMAGRO, which stood on one side of the great square in Lima, on Sunday the 26th of June, at noon-day, and with their swords drawn march'd cross the market-place to the palace of the Marquis PIZARRO, crying out, "Long live the King! but let the Tyrant die." Nor were they oppos'd by any man, tho' there were not less than a thousand people assembled in the square; nay, not a man stirr'd to give the Marquis intelligence of it; insomuch, that the conspirators found the gates of the palace and all the doors open, and the first notice the Marquis had of their approach was by one of his pages, after the Almagrians had enter'd the house. Whereupon he order'd some doors to be shut, imagining he should be able to defend himself 'till assistance came in; but Lieutenant-General FRANCIS DE CHAVES, who was then with the Marquis, neglecting to fasten the door, and believing it had been some ordinary tumult that would have been easily suppress'd by his presence, went out, and meeting the conspirators upon the great stair-case, demanded the reason of that insolence, which they answer'd only by several mortal wounds they gave him; and rushing forward, the servants, and all the company that were with the Marquis,

fled, except his brother-in-law Don FRANCIS DE ALCANTARA, and two of his pages, who defended the door-way of the drawing-room, whither the Marquis was retir'd for some time; but at length the conspirators broke through, and kill'd the Marquis, his brother, and the two pages, who behav'd themselves however very bravely, and desperately wounded four of the Almagrians before they fell.

The Marquis is assassinated.

Then the conspirators went out into the market-place again, declar'd the Tyrant was dead, and proclaim'd the young ALMAGRO Governor of Peru; for all the Almagrians immediately assembled, when the twelve attack'd the Marquis in his palace, securing his guards, and preventing any assistance coming to him. They also secur'd all the horses and arms in the city, and commanded all the inhabitants that refus'd to join them, not to stir out of their houses without leave. They also plunder'd the houses of the Marquis, of his brother FRANCIS DE ALCANTARA, of his Secretary PIZADO, and some others of the principal Pizarrists, wherein they found an immense treasure. In the Marquis's palace alone, 'tis said, they found to the value of a million of crowns in gold and silver; but did not meddle with the rest of the furniture, leaving it standing for the use of the young ALMAGRO, whom they carried thither after they had proclaim'd their Governor.

Young Almagro proclaims'd.

Thus fell Don FRANCIS PIZARRO in the capital city of Lima, which he had founded ten or eleven years before, and was privately buried by his servants, by the young ALMAGRO's permission, no person of any figure daring to attend his funeral, lest it should give offence to the prevailing party. And here the Spanish writers take an opportunity of drawing a parallel between those two celebrated Adventurers Don FRANCIS PIZARRO and Don DIEGO DE ALMAGRO the elder, who resembled each other in many particulars.

And first they observe, that they were both basely born, and had very mean education, neither of them being able to write or read. GOMARA relates, that FRANCIS PIZARRO was the son of GONZALO PIZARRO, a Captain in the province of Navarre; that his mother laid him in a church-porch, and he suck'd a sow several days, 'till another nurse was provided for him; that when he grew up, he was employ'd in keeping swine; and having lost some of them one day, was afraid to return home, whereupon he went in the company of some strollers to Seville, where he embark'd for the Indies; and here, it seems, he was instrumental in fixing a Spanish colony at Darien, attended VASCO NUNEZ DE BALBOA in the discovery of the South-sea, and afterwards went with PEDRARIAS from St. Mary's of Darien to Panama; and in these expeditions having enrich'd himself, he took up his residence at the town of Panama, where ALMAGRO, who had rais'd his fortune in the same manner, likewise resided; and here they entered into that memorable partnership with DE LUONE the Priest, which ended in the reduction of that vast empire of Peru, wherein they met with those inexhaustible mines of gold and silver that have been already describ'd, and became the most powerful men, if not monarchs, that ever appear'd in that part of the world, and superior in wealth to the richest Princes of Europe.

A parallel between Pizarro and Almagro.

They carry the parallel farther, and observe, that both ALMAGRO and PIZARRO were well advanc'd in years before they undertook this enterprise; that neither of them ever married, but had children

CHAP. X. children by their Indian concubines; particularly they relate, that one of the Marquis's concubines was the daughter of the Emperor HUANA CAPAC, and another the sister or daughter of the Emperor ATABILIPA; the last of which was baptized, and call'd Donna BEATRICE.

They observe also, that though both these Adventurers were in their lives so immensely rich, they left nothing behind them; and that they were both obscurely buried by their servants. Give me leave to observe farther, that notwithstanding all their failings and imperfections, they must be allowed to be possessed of some very great virtues; such as courage, fortitude, patience and temperance, to a very great degree, or they had never made themselves masters of the treasures of Peru. What men would have struggled so many years against winds and seas, endured the extremities of heat and cold, travers'd countries almost impassable and impenetrable, and that when they were in a manner totally deserted by their people, if they had not been endu'd with more than ordinary patience? Though it must be confessed, that this virtue seems in a manner common to the natives of Spain; and I am apt to think, scarce any other European nation would have persisted with that indefatigable industry in prosecuting these discoveries, and brought the Americans under their power, if the Spaniards had not done it. It is true, they had some advantage of the rest of Europe in their situation, not only as they lay the farthest westward of any country in the old world, but that their climate had a nearer resemblance to that of Peru, than the countries of their northern neighbours. They were also, at that time, the greatest maritime powers in Europe; but still I ascribe their success more to their natural patience and perseverance, and their abstemious way of life, than to all their other advantages.

There was one thing these two Conquerors, as the Spaniards stile them, too well agreed in, and that was, their ill usage of the hospitable and defenceless Indians; who offering to submit to them, and to become subject to the crown of Spain, were nevertheless treated as enemies and slaves, their country taken from them, and their persons worn out and destroyed by cruel bondage; they were compelled to carry burthens, to draw their carriages, dig the mines, and put upon other rigorous and intolerable hardships; insomuch, that they perished by thousands and ten thousands, and whole countries became in a manner depopulated; but ALMAGRO appearing the most compassionate of the two, obtain'd the character of a merciful Prince amongst the Indians; though it seems no less than ten thousand Indians, who carried his baggage, lost their lives in his expedition to Chili: However it came to pass, the life of a dog, or any brute animal, appears to have been more valued than that of an Indian; but this does not seem to be a fault peculiar to these two Adventurers, or even to the Spanish nation; for the whole Popish world at that time were taught, that Heathens and Hereticks deserv'd no mercy, and indeed were not entitled to enjoy any thing in this world, but both their persons and estates were the property of the first Christian that could seize them, especially if they were authoriz'd to do it by the Pope, whose Bull the Spaniards had in their favour: Insomuch that the Christian religion, which should have inspired these Adventurers with tenderness and compassion, or at least have taught them justice in their commerce with the world, was made a pretence for their turning barbarians, and for all the outrages, cruelty and injus-

CHAP. X. tice that men could commit. Thus men first divest themselves of their humanity, under pretence of zeal for religion, and then make that an excuse for becoming wolves and tygers, or even worse, devourers of their own species.

As for their generosity, ALMAGRO is said to be most eminent for this virtue: But what sort of generosity is that where a man only distributes the plunder of those he has robbed and murdered, among the villains his accomplices?

But to give the Devil his due, before I conclude the character of these two Adventurers, it must be acknowledged, that they were diligent in building towns, planting colonies, and introducing the fruits, the husbandry, the manufactures of Europe in Peru; we find the most considerable towns in South-America were founded, or at least rebuilt by them, after the Spanish manner; such as Lima, Quitto, Arequipa, Cusco, La Plata, &c. But PIZARRO was much the more considerable Planter, having assumed the government of Peru to himself, while he sent ALMAGRO upon that hazardous enterprize against Chili, in which he was in great danger of perishing: Probably ALMAGRO was over-reached by PIZARRO, when he undertook that war. The Pizarrists imagined they had then happily got rid of him, and should never have seen him more: And tho' he had the good fortune to survive, and get back to Cusco, they never ceas'd plotting against him, till he fell a sacrifice to their malice and ambition; which piece of barbarity was now retaliated upon them in kind, and the Marquis lost his life by a conspiracy of the Almagrians, as old ALMAGRO was destroyed by the Cabals of the the Pizarrists; which brings me to resume the thread of the Peruvian history.

The Marquis was no sooner dead, but Lima, Cusco, and most of the principal towns, declar'd for Don DIEGO DE ALMAGRO, the natural son of old ALMAGRO. Some places however refus'd to acknowledge ALMAGRO's authority, but expected the coming of VACA DE CASTRO with the Emperor's commission; in which they were encourag'd by PEDRO ALVARES HOLGUIN, and other Generals and Officers, friends to the Pizarrists, who assembled a good body of troops, and took possession of Cusco again, which they gave out they would hold for the Emperor; and declared war against ALMAGRO. ALONZO DE ALVARADO assembled another body of troops between Lima and Quitto, and declared also for the Emperor; and these two Generals preparing to unite their forces, ALMAGRO marched out of Lima at the head of six hundred horse and foot towards Cusco, with an intent to retake Cusco, or give battle to PEDRO DE HOLGUIN, before he should be join'd by ALONZO DE ALVARADO.

In the mean time, VACA DE CASTRO arriving in Quitto, and finding the Marquis was dead, declar'd himself Governor of Peru, by virtue of the Emperor's commission, requiring the submission of all the Spanish towns, and constituting such Governors and Officers as he saw fit; particularly he authoriz'd FRANCIS DE BARIONOVO and GERMINO DE ALIAGA, to take upon them the government of the city of Lima, to whom the Mephtates immediately submitted, in the absence of ALMAGRO, who was marched towards Cusco, as hath been related; and VACA DE CASTRO soon after arrived in person at Lima, and was proclaimed Governor of Peru; having been joined in his march from Quitto by ALONZO DE ALVARADO and HOLGUIN, with their forces.

Almagro
possesses
himself of
Cusco.

In the mean time ALMAGRO continuing his march to Cusco, took possession of that city, and new modelled the Magistracy there: His next business was to furnish himself with a train of artillery, which he cast in the founderies there, copper being plentiful in that province: He also made great quantities of excellent gun-powder; and the famous MANCO Inca, who always hated the PIZARRO's for having imprisoned him and treated him with indignity, also joined the Almagrians with several thousands of his Indians.

But ALMAGRO was unfortunate in the loss of his General JOHN DE RADA, who died on the march to Cusco; for the command of the army being afterwards divided between CHRISTOPHER DE SOTELA and GARCIA DE ALVARADO, they quarrelled to such a degree, that GARCIA killed SOTELA in the market-place of Cusco, and had laid a design to assassinate ALMAGRO himself, but was killed in the attempt.

ALMAGRO afterwards constituted JOHN BALSA the General of his forces, and PETER DE ONATE his Lieutenant-General; and receiving advice that the Governor VACA DE CASTRO was advancing towards Cusco, he marched out of the capital at the head of seven hundred Spaniards and several thousand Indians, with a good train of artillery, in order to give the Governor battle, if he could not obtain equitable conditions for himself and his friends; and receiving advice, that the Governor was not many leagues distant from him, he dispatched LOPEZ DE YDIAQUEZ and JAMES NUÑEZ to represent to him how eminently and successfully his father had served the Crown of Spain, and how unjustly and treacherously the PIZARRO's had dealt with him in usurping the government of Cusco and New Toledo, which his Majesty had conferred on him; that he was determined to serve the King with the same fidelity his father had done, and hoped the Governor would not espouse the party of PIZARRO's, whose oppressions and disloyalty were so notorious.

The commanding Officers also sent letters to VACA DE CASTRO, complaining of his partiality in rejecting their services, as if they opposed their Sovereign, affirming that the King had not more loyal subjects in Peru than they were; and desiring that all misunderstandings might be amicably adjusted, that they might unite their forces in the service of their King and country: And, lastly, it was proposed that ALMAGRO might continue to command in Cusco, the capital of Peru, Toledo being his father's government; and the Governor should command in Lima, the capital of New Castile, till the King's pleasure was known.

But VACA DE CASTRO, instead of treating above-board with ALMAGRO, endeavour'd privately to corrupt his Officers, and induce them to desert him; which ALMAGRO discovering, both parties prepared for battle, and drew up their troops in the vale of Chupas: These little armies were both composed of veteran officers and soldiers: The Governor had the advantage in point of numbers, his troops consisting of seven hundred Spaniards besides Indians, and ALMAGRO's of five hundred Spaniards; but then the latter had the advantage of a train of artillery and of the ground, and would probably have gained the victory, if all his officers had been true to him; for his artillery was so pointed, that the enemy could not approach his camp on any side without considerable loss: However, to his amazement, when the great guns were fired they did no manner of execution, and the enemy advanced as if

they had nothing to fear from the artillery; where-
upon ALMAGRO rode up to PEDRO DE CANDIA, who commanded the great guns, and suspecting treachery, killed him with his own hands; and levelling one of the cannon himself, cut off a whole rank of the Governor's troops, putting them in some disorder. But the enemy were now advanced too near his train of artillery to suffer from them, and his men had quitted the ground, where they were so advantageously drawn up to meet the enemy, which occasioned the loss of the battle, tho' it was fought with great obstinacy till two hours with-in night; when ALMAGRO finding his troops over-powered retired out of the field with MANCO Inca, and three or four Spanish officers, intending to have taken refuge in the mountains with the Inca and his Indians, till he should meet with a favourable opportunity of recovering his government; but taking Cusco in his way, with a design to carry off his treasure, and such of his effects as would have been most useful to him in his exile, the very men in whose hands ALMAGRO had put the government of that city, hearing he had lost the battle, apprehended him, and delivered him up to the victorious Governor, to make their own peace with him; and young ALMAGRO, who was not much above twenty years of age, was formally tried, condemned, and executed in the same place, and much in the same manner his father had been; and was afterwards buried by the Friars of the convent of Merced, in the same grave with his father, having obtained a much greater character for his humanity, parts and education, tho' his conduct and experience in war could not be supposed equal to his father's; and, indeed, it was unfortunate he was so young and unexperienced, and consequently had so little influence and command of his troops, every officer almost imagining he merited the chief command in the army, and that ALMAGRO was infinitely obliged to him for taking his part; while others were contriving to purchase their own peace by betraying their General: This is frequently the case of malecontents, they all aspire to be commanders, and none think themselves obliged to obey their superior officers any further than they see fit, especially where they find them young and unexperienced; and this being the case of ALMAGRO, tho' he is allowed to have been a gallant man, we cannot much wonder at his ill success: Nor had the Governor more compassion on the officers and soldiers than on their commander, giving scarce any quarter in the field, and hanging up those few that were made prisoners; so that the party of ALMAGRO was now totally extirpated, and never heard of more. Whereupon the Governor dismissed most of his forces, and apply'd himself with all imaginable diligence to the regulating the Civil government, and particularly he ordered the Tambo's, or magazines upon the great roads to be stored with provisions for the convenience of travellers, prohibiting the Spaniards to quarter upon the Indians, as they had hitherto done in their journeys and expeditions, to the ruin of the natives where they came. He also endeavoured the conversion of the Indians to the Christian faith, and prevailed with the Inca PAULLA to be baptized, giving him the name of CHRISTOPHER: He also erected schools in several towns, ordering the sons of the Caciques and Caraca's to be educated there, and instructed in the principles of the Christian religion: He commanded the Spaniards also to use their Indian servants with humanity, and not to oppress or abuse any Indian whatever. Whereupon the Indians who had fled to the moun-
tains

Civil go-
vernment.

CHAP. X. tains many of them, return'd and dwelt in Cusco, Lima, and other Spanish towns, under the protection of the government. He also regulated the distribution of the lands and Indians which had been made very extravagantly, and restor'd many of the Indian lords their lands and vassals, checking the licentiousness of the soldiery, and advising them to marry, and apply themselves to traffick, or some honest employments, and not spend their whole time in gaming and excesses, and oppressing the poor Indians to maintain their extravagances, as was frequently the practice of the first Conquerors; by which he engag'd the affections of the Indians, but made himself a great many enemies among the Adventurers and military men, who came into Peru with no other view but to advance their fortunes, and live at discretion among the natives, whom they look'd upon as made only to be subservient to their pleasures. He also enquir'd into the conduct of the King's officers, whom he observ'd had amass'd together monstrous estates, by oppressing the Indians and defrauding the Crown.

Gonzalo Pizarro becomes a malecontent. GONZALO PIZARRO arriving at Cusco while these regulations were making, found abundance of malecontents there, who being us'd to live at large, and treat the natives as their slaves, were not easily restrain'd from their former practices; and looking upon himself as very much wrong'd, by VACA DE CASTRO's assuming the government, which he apprehended belong'd to him as his brother's successor, he associated with the malecontents there, and, 'tis said, had form'd a design of deposing, if not assassinating, the governor at that time; of which VACA DE CASTRO having some intimation, order'd PIZARRO immediately to resort to the province of Los Charcas, where his estate lay, and not stir from thence: And PIZARRO not being then in a condition to dispute his commands, obey'd them, and the more readily as he understood there were several rich silver mines lately discover'd in those lands, in the working and improving whereof GONZALO employ'd himself, 'till he found a better opportunity of putting his ambitious projects in execution, which happen'd not long after.

Complaints still of the oppressions of the Indians. Thus VACA DE CASTRO made some attempts towards relieving the poor Indians from the oppressions of his countrymen the Spaniards; but still grievous complaints daily came over to Spain of their being destroy'd in the mines, and other rigorous services; and particularly by their being remov'd out of their native air and climate, which occasion'd the death of multitudes, while the women and children in those countries from whence their husbands and fathers were taken and carried to the mines, perish'd by thousands, having no care taken for their subsistence, insomuch that it was truly represented to the court of Spain, that the West-Indies would in a short time be depopulated, if a stop was not put to these outrages: And thereupon the Emperor CHARLES the Vth caus'd certain orders to be drawn up, which he requir'd should be strictly observ'd in America under severe penalties: Some of the principal whereof were, "That the Indians should not be compell'd to carry burthens, or dig in the mines, or be employ'd in buildings, or carried out of their respective countries, tho' they were really slaves: And that none should wrongfully be made slaves, the master was oblig'd to carry his servants before a Magistrate, to be examin'd, before he should use them as such (for it seems, part of the Indians were slaves to the great Lords, or Caciques, before the Spanish conquest; and

CHAP. X. "where an estate was allotted to a Spaniard, he became the proprietor of all the slaves upon it, as well as of the lands). It was also provided, that the Indians might be proprietors of gold and silver mines as well as the Spaniards, and be allow'd to sell their goods in the markets for the best price they could get; and that every Spaniard, who had an estate, should take care the Indians upon it were instructed in the Christian religion. It was also ordain'd, that the Visitors who were deputed to redress the grievances of the Indians, should repair in person to their respective towns, and not send Commissioners thither, with a great many other regulations in favour of the Indians."

The Emperor also resolv'd to send over a Governor to Peru, who should see these orders duly executed; and accordingly he made choice of BLASCO NUÑEZ VELA, who arriv'd at Panama in the year 1544; and meeting with several Spaniards there, who had rais'd great sums by the sale of Indians to the mines in Peru, he order'd them to be prosecuted, and the money they had made by this kind of traffick to be seiz'd. He also releas'd all such Indians as has been brought thither out of Peru, and oblig'd the Commanders of ships to carry them back again: And to set a good example when he arriv'd in Peru, he would not suffer his baggage to be carried by Indians, but on mules; and when he was inform'd there were not mules sufficient, he order'd that such Indians as were employ'd should carry but moderate burthens, and be paid for their labour, with which the Indians were extremely pleas'd; but the Spaniards immediately took a prejudice against the Vice-roy for insisting on these regulations, and began to grow very mutinous, pretending their Indians were their property as much as any other part of their estates, and they might use them as they pleas'd; nor was it possible to work their mines, or to build and improve their plantations but by their labour, which they represented to the new Vice-roy, and desired he would suspend the execution of these ordinances; but the Vice-roy answer'd, they must petition the Court of Spain if they expected any alteration in them; and in the mean time, as he had promised his Majesty, he was resolv'd to see them put in execution; and when some of the Caciques, or Indian Lords, complain'd that their vassals had been taken away by the Spaniards, he order'd them to be set at liberty, telling the Caciques, that it was the King's pleasure they should be treated as subjects, and not as slaves.

This conduct so enrag'd the Spaniards, that most of the great towns appear'd ripe for an insurrection; even the capital city of Lima made some difficulty to permit the Vice-roy to enter within their walls, and when they did think fit to receive him, were guilty of very rude and threatening language, and he found an inscription in the room where he was about to sit down to dinner, of the following tenor; "I will take the life of him who comes to take away my estate:" However, the person being discover'd who wrote it, he forgave him: But the disaffection appear'd almost universal; the Spaniards being determined not to submit to the new regulations, sent Deputies from all the great towns to GONZALO PIZARRO at La Plata, desiring he would be their protector, and deliver them from the oppressions of the Vice-roy, as they call'd them; and that they might have a pretence to assemble in arms, they declar'd war against MANCO Inca, who was assembling an army of Indians, as they gave out, to besiege Cusco again.

CHAP.

X.

Gonzalo Pizarro appears at the head of the male contents.

PIZARRO, pleas'd to find the Spaniards so well inclin'd to him, amass'd all the treasure he could get at the mines of Potosi, which were then newly open'd, and came to Cusco; where having consulted his friends, he beat his drums, and list'd two or three hundred Spaniards in his service; and having constituted FRANCIS DE CARVAL his Major-General, resolv'd to march to Lima, under pretence of petitioning the Vice-roy in behalf of the principal towns, to suspend the putting in execution the new regulations; and prevail'd on the Magistrates of Cusco to constitute him Chief-Justice of Peru, by colour of which office he assum'd the civil government of the province, as well as the command of the militia.

In the mean time MANCO Inca, who was always an enemy to the PIZARRO's, on account of their insolent treatment of him when they had him in their power, sent one of the Spaniards, who had fled to him for refuge after the defeat of ALMAGRO, to acquaint the Vice-roy that he was ready to take the field against GONZALO PIZARRO, and would serve the Court of Spain to the utmost of his power; with which message the Vice-roy was extremely pleas'd, looking upon it as a great point gain'd to have the natives in his interest: But there happening a quarrel about this time between one of those refugee Spaniards in the mountains and the Inca as they were playing at bowls, the Spaniard beat out the Inca's brains with a bowl, whereupon the Indians fell upon the remaining five Spaniards, and kill'd them every man. And now MANCO Inca being dead, the Vice-roy was deprived of that assistance he might have expected from those Indians in the mountains, who had hitherto preserv'd their liberties.

The Vice-roy was still more unfortunate in having a misunderstanding with the four Judges of the royal Court that came over from Spain with him to administer the Civil government. These gentlemen carry'd their resentment so far, that they actually favour'd the cause of GONZALO PIZARRO; and when the Vice-roy would have rais'd forces against PIZARRO, they oppos'd it, and proceeded so far as to make the Vice-roy prisoner, who escap'd from them however to the city of Quitto, where he was join'd by some hundreds of loyal Spaniards; PIZARRO receiving advice that the Vice-roy had been forced to fly from Lima, immediately advanced thither with his army, where he put to death or imprison'd all who were not in his interest, and prevail'd on the Judges to sign a commission, constituting him Governor of Peru. After which he dispatch'd TEJADA the Judge most devoted to his cause, into Spain, to give a favourable account of his conduct, and represent that he was in a manner compell'd to take the chief command upon him, and had accepted it with no other view than to serve his Majesty, and prevent a general revolt, which he suggest'd was very near affected by the Vice-roy's rigorous administration.

PIZARRO also proceeded to seize all the ships upon the coast, whereby he became master of the South-sea, and put in new Governors and Magistrates in the chief towns, discarding some and hanging up others who had appear'd for the Vice-roy, making the civil powers submit to the military, or acting without their concurrence whenever he saw fit: To maintain his forces, he exacted of the Spaniards a third part of all the rents or tributes they receiv'd from the vassal Indians; seiz'd the gold and silver belonging to the Crown, and apply'd it to the same uses; and by his cruelty in murdering and

destroying those who appear'd to have any remains of loyalty left, it was evident he design'd to cast off all dependance on the Crown of Spain, and become the sole Sovereign of the empire of Peru.

Having constituted MACHICO his Admiral, he commanded him to attack the city of Panama, and take all the shipping he found in that bay; which orders were punctually executed, and MACHICO now commanded a fleet of twenty-six sail. He had also a good number of land-men on board, and with these soldiers committed great outrages in the town of Panama, though the Governor had assembled six or seven hundred soldiers to defend that place.

In the mean time, PIZARRO having divided his land-forces, detach'd part of them under his General CARVAJAL, to the city of Plata, and the southern provinces, where he understood CENTENO and some other loyal gentlemen had declar'd for the King, and cut off several of his adherents; and with the other part of his forces he pursued the Vice-roy to Quitto, who being join'd by BELALCAZAR, had collected a body of three or four hundred men, with whom he defended himself bravely against all the stratagems of PIZARRO for some time; but his officers proving treacherous, he was at length defeated and kill'd in an engagement, on the 19th of January 1546, near the walls of Quitto. PIZARRO's General, CARVAJAL, was no less successful in the southern provinces, dispersing the Royalists there, and forcing CENTENO their General to fly the country; after which he plunder'd the city of La Plata, and put to death many of those that had appear'd for the King. And now PIZARRO finding there were no enemies left in Peru that durst oppose him, dismiss'd part of his forces, and return'd to Lima in triumph, looking upon himself as sole monarch of South-America, and was flatter'd as such by his party; whereupon he made HINOJOSA Admiral of the South-sea, and commanded his fleet to sail again to the bay of Panama, where the Admiral landed his men, and sent a detachment cross the Isthmus, under the command of FERDINANDO MEXIA, and surpriz'd Nombre de Dios, so that HINOJOSA was in a manner master of the North and South-sea, or at least was in a condition to prevent any supplies being sent to the assistance of the Royalists either from Old or New Spain.

PIZARRO, however, apprehensive that the times might turn, thought it expedient to keep fair with the Court of Spain, and pretend at least that he had no thoughts of throwing off his allegiance, and acting independently of his Sovereign: He dispatch'd LAURENCE DE ALDANA therefore to Old Spain, as commission'd from all the cities and towns of Peru, to petition that he (PIZARRO) might be continu'd their Governor, and that his Majesty would send them a pardon for all that was past; on which conditions they promised to make good whatever had been expended of the King's treasure, and to advance a considerable sum as a free gift to his Majesty.

The Spanish Ministry having been already acquainted with GONZALO PIZARRO's usurpation, gave all Peru for lost, 'till the arrival of ALDANA; for though it was propos'd in the Council of Spain to subdue that Usurper by force, yet the difficulty of sending an army into that remote part of the world sufficient for such an enterprize, made that advice look'd upon as impracticable. But laying hold of these overtures made them by PIZARRO and the chief towns of Peru, it was resolv'd to send

The President Gasca sent to Peru.

send over Gasca, a subtil Lawyer, with the title only of President of the royal Court; but with full powers to act as he should judge most for the advantage of the government when he arrived there. This gentleman was authoriz'd to grant a general pardon to all delinquents, or to as many as he saw fit; to promise to repeal those ordinances which prohibited their enslaving the Indians, or levying money upon them; to confirm all men in their possessions, however wrongfully obtained; and to constitute PIZARRO himself Vice-roy of Peru, if that rich province could not be recovered to the Crown of Spain by any other means; for as some observed in the Council of Spain, "It were better to let the Devil to be Vice-roy than the Crown should lose so invaluable a prize as Peru appeared to be about this time, when the inexhaustible mines of Potosi were discovered." And such a confidence had the Court of Spain in the loyalty and dexterity of GASCA, that they did not only confer on him an unlimited authority in Peru, but all Vice-roys, Governors, Magistrates, Generals and Officers in America were commanded to support him and obey his orders. He carried also letters of various kinds from his Majesty to PIZARRO, to be sent or suppress'd, as the President should judge proper on his arrival in America; in one of which the Emperor tells that Usurper, that he still confided in his loyalty, and was not offended at any of the measures he had taken.

The Court of Spain wheedle Pizarro.

The President GASCA arriving at Cartagena, in Terra-Firma, received advice there that Nombre de Dios was possessed by a garrison commanded by FERDINANDO MEXIA, whom HINOJOSA, PIZARRO's Admiral, had sent thither. However, the President proceeded in his voyage to Nombre de Dios, and so cunningly insinuated himself into the good opinion of MEXIA, that he agreed to desert PIZARRO's service, and hold that place for his Sovereign the Emperor; and coming afterwards to Panama, on the 13th of August 1546, he prevailed on HINOJOSA the Admiral and the whole fleet to revolt from PIZARRO and declare for his Majesty.

Pizarro's Admiral and fleet revolt to Gasca.

Affairs succeeding thus far to the President's wish, he dispatch'd PANIAGUA, a gentleman of great penetration and address, to Lima with a letter from the Emperor, and another from himself to PIZARRO.

The Emperor's letter to Pizarro.

The Emperor in his letter tells PIZARRO, that having been informed of the commotions that had happen'd in Peru by the late Vice-roy's putting the ordinances too rigorously in execution, and believing that whatever had been done by PIZARRO and his adherents was intended for his Majesty's service, he had dispatch'd the Lieutenant GASCA, in quality of President, with full power and instructions to put an end to the divisions that had happen'd there, and to do whatever might contribute to the improvement of those provinces and the welfare of his subjects, whether planters or natives, requiring PIZARRO to assist him in whatever the President should judge proper for his Majesty's service, concluding, that his Majesty would ever remember the services that he and his brother the Marquis had done to the advantage of their children and families.

Gasca's letter to Pizarro.

The President, in his letter to PIZARRO also, seems to lay the blame of the late insurrections on the Vice-roy, and says, his Majesty believed that their opposition to the Vice-roy did not proceed from any motive to disobedience or disservice to his Majesty, but merely from a principle of self-preservation,

which induced them to oppose that severity the Vice-roy used in the execution of the new laws:

CHAP.

X.

That the king had therefore sent him to quiet the minds of the people by a revocation of those laws, and to publish a general pardon for all offences of what kind soever: And, lastly, to take the opinion and direction of the people of the country concerning the methods that were most likely to conduce to the advancement of religion, and the common good and welfare of the inhabitants. Wherefore he entreated PIZARRO that he would consider these things, and like a gentleman and loyal subject, and with that affection and good will which he had shew'd for the welfare of his country, sincerely yield obedience to his Majesty, and comply with his commands, who had so favourably interpreted his actions, acquitting him of rebellion and disloyalty.

Then he advises PIZARRO not to flatter himself with an opinion that he was so well established as to be able to resist the forces of so great a Prince as his Sovereign the Emperor was, who compell'd the Grand Signior to retire from Vienna when he was at the head of three hundred thousand men, and had obtain'd so many memorable victories over the infidels and the rest of his enemies.

When these letters were read in the Usurper's Council, some were for receiving the President and accepting the terms that were offer'd immediately, observing that the Court of Spain had granted every thing they demanded, as a revocation of the ordinances, a general pardon, and a confirmation of their estates and possessions. But others, inspir'd with ambition, or dreading the vengeance they knew was due to their crimes, represented, that if the President was once admitted, he would soon insinuate himself into the affections of the people, and dispose of them and their fortunes at pleasure; and therefore urg'd that it was neither politick nor safe to admit the President amongst them. In the mean time PANIAGUA, GASCA's agent, found means to feel the pulse of the principal citizens of Lima, who seem'd ready to desert the Usurper as soon as they had an opportunity. They were weary of his oppressions and arbitrary dominion, who had of late given the reins to his passions, putting several considerable men to death, seiz'd their possessions, and made free with their wives and daughters. Understanding therefore from PANIAGUA, that a pardon was offer'd them, and whatever else they had demanded, they found means to assure this agent that they were ready to return to their duty, notwithstanding PIZARRO had threatened that agent to put him to death as soon as he arriv'd, if he tamper'd with any of the citizens: Nor was the revolt of the fleet, which PANIAGUA inform'd them of, one of the least motives that induc'd them to make their submission to his Majesty.

Gasca's agent prepares the citizens of Lima for a revolt.

PIZARRO, still ignorant of this general disaffection, tho' it was a secret to very few besides, resolv'd not to admit the President; but imagining his fleet at Panama to be still faithful to him, order'd the admiral to provide a ship and send the President back to Spain; however, he gave PANIAGUA a letter for him, when he return'd, of the following tenour.

He desir'd the President to consider him as a person naturally devoted to his Majesty's service, and to remember how he and his brothers had been these sixteen years employ'd in augmenting the territories and revenues of the Crown of Spain: That they had reduced countries of a vast extent, and abounding with more gold and silver than all the kingdoms of the world produc'd besides, and this at their own charges,

Pizarro's answer to the President Gasca.

CHAP. X. charges, without putting his Majesty to the expence of a single crown, and without gaining any thing for themselves but the reputation of serving their Prince and country; for whatever treasure they had obtain'd was laid out in settling colonies, and supporting these conquests: They had not the inheritance of an acre of land assigned them (the Court of Spain granting only estates for lives to the Adventurers.) And notwithstanding these neglects, they remained immoveable in their loyalty, and had no need to be put in mind of their duty to their Sovereign by arguments drawn from his power and success against his enemies.

He proceeds to shew, that it was the rigorous and impolitick administration of the late Vice-roy that had been the occasion of all the mischiefs and disturbances that had happened, and justifies his own usurpation, by observing, that he was chosen Agent-General by all the cities and communities of that empire, and empower'd by the Judges of the royal Court to drive the Vice-roy from thence, having transacted nothing but by their warrant and concurrence.

PIZARRO also sent several agents of considerable quality to the Court of Spain to justify his conduct, and get his command confirmed to him; but these all deserted him, making their peace with the President when they came to Panama, and accepting employments from him. Whereupon the President commanded the Governors of the Mexican provinces, those of St. Martha, Cartagena, New-Granada and Popayan, to levy forces with all expedition, and send to his assistance. He also order'd **LAURENCE DE ALDANA** to sail with four stout ships to the coast of Peru, who landing small parties in several places, were joined by great numbers of deserters: And at the same time **JAMES DE MORA** assembled four or five hundred men in the inland parts of Peru, and declar'd for the King, appointing the general rendezvous of his Majesty's forces to be at Caxamalca.

Pizarro deserted by great numbers.

He prepares to defend his usurpation

And now **PIZARRO** receiving advice of the revolt of his fleet and the approach of his enemies, apply'd himself with great diligence to raise forces in order to defend his usurpation, and in a short time muster'd upwards of nine hundred men in the city of Lima only, all veteran troops well armed, and the horse well mounted; nor was there a foot-soldier but had his pad to ride on, and slaves to attend him, so that his infantry might be looked upon as horse or dragoons at least, engaging either on foot or horseback, as there was occasion, and had a great advantage in marching with expedition from one part of the country to the other without much fatigue: Besides the forces **PIZARRO** had in Lima, he sent strong detachments to Cusco, La Plata, and other places, causing it to be published every where, that the President **GASCA** had exceeded his commission in levying forces against him; that the King had not empower'd the President to take the government from him, but only to endeavour to establish peace, and preside in the royal Court; and that the people were no less concern'd than himself to oppose his encroachments; for if the President prevail'd, they must expect to be plundered, and dispossessed of all they had gained with so much labour and hazard, and perhaps meet with a halter instead of a reward.

He also order'd process to be begun in the Courts of law against the President, and against **HINOJOSA** the Admiral of the fleet, and all the Officers who had deserted him, procuring them to be condemn'd to death and declar'd traitors by the Judges at Lima: But still the desertion continu'd, the people were well satisfy'd that the President **GASCA** was sufficiently

CHAP. X. authoriz'd to make war upon **PIZARRO**, and grant them such conditions as he saw fit on their submission; and were not only weary of the Usurper's tyrannical administration, but evidently foresaw he would not be able to support himself against the power of Spain, and that great disaffection that was observ'd amongst all sorts of people in Peru.

LAWRENCE DE ALDANA being now arriv'd with his ships at the port of Callao, two leagues from Lima, **PIZARRO**'s soldiers took frequent opportunities of deserting to him; which induced the usurper to abandon that city, and march to the southward as far as Arequipa; of which **ALDANA** receiving advice, landed his men, and took possession of the city of Lima for the King; soon after which the President arrived upon the coast of Peru with the remainder of the fleet, and a good body of land-forces, and constituted the Admiral **HINOJOSA** General as well by land as sea: But he did not think fit to take the field till he had assembled an army abundantly superior to that of the enemy, and sufficient to secure the reduction of that empire to the Crown of Spain. This Minister appears to have proceeded with abundance of caution and deliberation, and to have effected more by sly insinuation and artifice, than could possibly have been effected by open force, and at the same time kept at a distance from danger, never undertaking anything, or advancing a single step, till he was morally sure of success.

Pizarro abandons Lima.

Aldana takes possession of it for the President.

In the mean time **GONZALO PIZARRO** receiving advice that **CENTENO** had raised eight hundred or a thousand men in the Charcas for the Crown, possess'd himself of the cities of La Plata and Cusco, and kept in awe all the southern part of Peru with his forces; he marched towards Cusco, with a design to give that General battle; and **CENTENO** being no less forward to engage, a battle was fought in the valley of Guarina, in October 1547, and **PIZARRO** obtaining a complete victory, most of **CENTENO**'s soldiers, that were taken prisoners, list'd themselves in the service of the rebels; and some few days after, **PIZARRO** entered the city of Cusco in triumph. From Cusco **PIZARRO** sent a detachment of his forces to take possession of the city of La Plata, where they seiz'd six hundred thousand crowns, and hang'd up several that were well affected to the royal cause; and at the same time his General **CARVAJAL** plunder'd the town of Arequipa and other places on the sea-coast, whereby they amass'd a prodigious treasure.

Pizarro marches towards Cusco.

Defeats **Centeno**.

Seizes the King's treasure at the mines.

The President **GASCA**, receiving repeated advices of **PIZARRO**'s success, at length began his march towards Cusco at the head of sixteen hundred veteran Spaniards, and several thousand Indians, attended by a fine train of artillery, and arrived in the valley of Sacfahnana, within four leagues of Cusco, in the beginning of April 1548. Upon the approach of the royalists, it was debated in **PIZARRO**'s council, whether he should advance and fight the President, or retreat? His General **CARVAJAL**, it seems, advis'd him to retire to certain inaccessible mountains, a little to the southward of Cusco, where it would have been very difficult to attack him, and he would have sav'd a rich country in his rear, that would have furnish'd him with plenty of provisions: But **PIZARRO** insist'd it was dishonourable to retreat, and confiding in the goodness of his troops, march'd out of Cusco at the head of nine hundred men, to the valley of Sacfahnana, where he resolv'd to give the enemy battle, but was deserted by almost all his men on the day of battle, who laid hold on the pardon the President **GASCA** had order'd to be proclaimed. They saw the roy-

Pizarro deserted by all his forces.

CHAP. X. royalists so much superior to them, and so advantageously posted, that there was very little prospect of success, and could not suppose they should ever meet with such another opportunity of securing their lives and estates.

Surrenders himself a prisoner. PIZARRO stood amazed for some time at this general desertion, but at length thought fit to surrender to the first officer he met with. His Lieutenant-General CARVAJAL fled, and was made prisoner soon after; and both of them were carried in triumph by the President into the city of Cusco, which open'd her gates to the Conqueror.

Pizarro condemned. Two or three days after, PIZARRO, CARVAJAL, and several other rebels were formally tried and convicted of their treason and rebellion against their Sovereign. PIZARRO was condemned to be beheaded, his houses demolished, and the ground sow'd with salt, and a pillar was order'd to be erected with this inscription, "These were the dwellings of that traitor GONZALO PIZARRO." In pursuance of his sentence, he was set upon a Mule, and led to the place of execution, carrying in his hands the image of the blessed Virgin, to whom he pray'd with great devotion, but in the way exchange'd this image for a crucifix, which a Priest gave him that attended him; on this he fixed his eyes till he came to the scaffold, where he made the following speech to the soldiers and Spanish inhabitants.

GENTLEMEN,

His speech at his execution. "YE know that our family, my brothers and myself, have subdued this empire. Many of you are possessed of baronies and lands, which my brother the Marquis conferred on you, and many of you here present have received the like estates from me. There are also many of you owe me money, which I have freely lent you, and others have received considerable gifts and gratuities from me.

"I, for my part, die poor and destitute of every thing; not so much as the cloaths on my back are my own, but the fees of the executioner, for the service he doth in cutting off my head; so that I have nothing to give for the good of my soul. Wherefore I beseech you, gentlemen, as many of you as owe me money, bestow the same on masses for my soul; for I have full assurance in God, that through the meritorious death and passion of our Lord JESUS CHRIST, and with the assistance of your charity, all my sins shall be pardon'd, and I shall be received to mercy."

He is beheaded. Then kneeling down before the crucifix, which was placed on a table on the scaffold, the executioner came to bind a handkerchief about his eyes, but he said that was unnecessary, he had often look'd death in the face; and seeing the hangman draw his sword to cut off his head, he said, "Honest JACK, do thy office handsomely." The fellow promising it should be done according to his wish, took the prisoner by his beard with his left-hand, and with a back stroke, cut off his head at one blow, with the same ease (says my author) as he would have sliced off the leaf of a lettuce. DIEGO CENTENO paying the executioner for his cloaths, he was buried in them in the cloister of the Mercenarian Friars in Cusco, in the same grave where DIEGO DE ALMAORO the elder, and ALMAORO the younger, his son, had both been buried upon charity, after they were executed in the same place. After the fury of the war was over, the Spanish cities of Peru caused masses to be said for the soul of GONZALO PIZARRO, whose faults seemed all to have been buried in

CHAP. X. his grave, and only his conquests and heroick actions, remembered in the next generation. The Spaniards, who possess'd those mountains of treasure, and that extensive country which the PIZARRO's conquered, could do no less than applaud their actions, and set them in the fairest light; for if those countries were unjustly obtain'd, they were as unjustly possess'd and enjoy'd by those who succeeded the PIZARRO's. What title could the King of Spain give any of his subjects to the estates and persons of the Indians? Their King, therefore, was the great usurper and oppressor. The PIZARRO's truly observed, if conquest gave a right, they had the best title to Peru, who conquer'd it at their own expences, without putting the Crown of Spain to any charge. But in truth, neither the Kings of Spain, or the Adventurers, could have a better right to that country than what pirates or highwaymen have to their acquisitions; however, nothing is more common in this world, than to see one usurper and oppressor sit in judgment upon another, and take upon him to dispose of men's lives and fortunes, to which neither the Judge, or the person he condemns for seizing them have any right.

PIZARRO was condemned for usurping the government of Peru: But was not the King of Spain the greatest usurper, who unjustly countenanc'd the invading of that country, made advantage of all the wrongs and outrages the PIZARRO's had committed, and possessed himself of those very spoils and territories which were ravish'd from the Inca's and their subjects; and continue their unjust possession by force and violence to this very day? But to proceed in the history.

The President GASCA having made large promises to the officers and soldiers that assisted him to reduce PIZARRO, was perpetually sollicitous to make them good after that war was at an end. His people expected that all the lands possessed by the adherents of PIZARRO should have been divided among them; and this, no doubt, the President intended to have done, if PIZARRO's troops had not deserted him; but the President had made equal promises, it seems, to those who should forsake PIZARRO and come over to him; and these by abandoning their General, had finished the destruction of that usurper without his running the hazard of a battle, so that the President had scarce any lands to divide among the numerous claimants; however, he made a distribution of such lands as were confiscated, and left the instrument, allotting to every man his share, seal'd up, when he returned to Lima, ordering the Archbishop of that province to repair to Cusco and publish it; and the clergy were commanded to exhort the officers and soldiers in their sermons to submit to this partition, which was all that could possibly be done at this time. But the petitioners were so far from acquiescing in this division, that they began to grow very mutinous, till some of them were apprehended and made examples of, and others made easy by promises of a further partition in their favour. The most dangerous of all the pretenders was HERNANDEZ GIRON, whom the President could find no means to satisfy, but by granting him a commission to resort to Cusco and raise forces, in order to attempt new conquests; and this was thought to be a very desperate remedy, to put arms into the hands of a man whose disaffection and ambition was but too manifest: Nor was he long at Cusco, before he gave the Government very great disturbance, tho' he did not break out into actual rebellion till some time afterwards.

Some remarks of the usurpations of the Spaniards in Peru.

The Spanish soldiers discontented.

Several Commanders sent upon new conquests.

CHAP.
X.

Another detachment of troops was sent under the command of the celebrated PETER DE VALDIVIA, to finish the conquest of Chili; under whom a great many of the disaffected Spaniards listed themselves, in hopes of making their fortunes there, which they now despair'd of doing in Peru: And this seems to have been the conduct of most of the Governors of Peru, when they could not satisfy the pretensions of the Spanish officers and soldiers (every one of which imagin'd he merited a province by his services) to give them commissions to enter upon new conquests, which they assur'd them should be shar'd among the Adventurers. The President GASCA, however, found there were still a great many that remained unsatisfy'd, even those to whom he had assign'd lands and Indians that produced upwards of an hundred thousand crowns a year were not contented, and he was compell'd to promise them a further division to increase their shares, which he took care however, should not be publish'd 'till he was gone to Europe, for fear of a tumult; and an order coming from Spain at the same time to release the Indians from their personal services, or rather slavery, he suppress'd that also for the same reason, 'till he left the country. And having fleec'd and plunder'd both Spaniards and Indians, 'till he had amass'd together two or three millions of crowns for his master the Emperor, he set sail with it for the bay of Panama, well knowing that so vast a treasure would cover all faults, and render his administration approv'd by the Court of Spain, tho' he suppress'd and oppos'd the repeated orders that were sent over for giving the Indians their liberty.

Gasca returns to Panama with a vast treasure.

The Treasure seiz'd by the rebels at Panama.

The President arriving in the bay of Panama, did not think fit to make any stay in the city which gives name to that bay, but immediately cross'd the isthmus, and arriv'd at Nombre de Dios (which stood near Porto Bello) on the North-sea, leaving most of the treasure to be brought after him, and was very near losing it; for FERDINAND and PETER DE CONTRERAS, the two sons of PEDRIAS, who reduc'd the province of Veragua, being turn'd out of their father's government, and dispossest of all his lands, had a little before broke out into open rebellion: And having seiz'd several ships in the South-sea at this time, attack'd Panama, where great part of the royal treasure was lodg'd, and made themselves masters of it as well as of the town, and might with ease have carried it all off, but could not be satisfy'd without making the President their prisoner. They sent part of their forces therefore cross the isthmus in pursuit of the President GASCA, who was now at Nombre de Dios on the North-sea, of which the citizens of Panama taking the advantage, fell upon the remainder of the rebels forces that were left behind, cut most of them in pieces, and recovered the treasure again. Upon advice whereof, the party that was sent after the President dispers'd themselves, very few of them making their escape back to Veragua; and the two brothers, FERDINAND and PETER DE CONTRERAS, were both of them kill'd; which put an end to this rebellion, that would otherwise probably have been fatal to Spain: For the rebels propos'd, after they had made themselves masters of both sides the isthmus of Darien, so that no relief could come over from Old Spain, to have assembled a fleet, and join'd the malecontents of Peru, whereby they might have reduc'd that province under their power, and perhaps laid the foundation of another empire; but their dividing their forces defeated all the hopeful projects they had form'd, and ended in the destruction of the two brothers and their fol-

lowers; and the President GASCA could not but bless himself, when he understood how narrowly he had escap'd with his treasure, which he had the good fortune to recover and carry over safe to Spain, to the infinite joy of that Court, which was in the utmost distress for money to support the various enterprizes the Emperor CHARLES the Vth, was engaged in at that time.

CHAP.
X.

Gasca recovers the treasure again, and arrives with it in Spain.

I return now to Peru, where the Judges of the royal Court, in whom the administration was lodg'd, publish'd the second partition the late President had made of the lands, which gave as little satisfaction as the former. These Judges also put in execution the decree of the Court of Spain for releasing the Indians from personal service, and would not suffer the poor natives to be press'd to dig in the mines, to carry burthens, or to do any other laborious work, but what they willingly agreed to do, and were paid for; which occasion'd an insurrection in Cusco, and the disaffected made choice of HERNANDEZ, or HERNANDO GIRON, for their Chief, who was still in that city, where he had rais'd two hundred men for the making of new conquests. This tumult was suppress'd with great difficulty, and GIRON sent prisoner to Lima; but so general was the disaffection, that the Judges did not think fit to punish this notorious officer, and in a short time gave him his liberty again; even the General HINOJOSA was supposed to foment these disorders, for he had an estate in the Charcas, where Potosi and the best silver mines lie, of the value of two hundred thousand crowns per ann. and these mines could not be work'd without Indians, for they had no Negroes, or but very few, in America, at that time.

Another insurrection in Cusco suppress'd.

The royal Court therefore, to bring over the General HINOJOSA to their party, made him Governor of the Charcas; and this for a time kept that part of the country quiet.

In the mean time, DON ANTONIO DE MENDOZA arriv'd in Peru, in quality of Vice-roy; whose administration was generally lik'd; but being of a weakly constitution, he did not live two years. What was most remarkable in his government was his sending his son through all the provinces, to take a particular account of them; who brought back with him draughts of every place that was worth the taking, and especially of the mountain of Potosi with all its silver veins delineated, and an estimate of the treasure that might annually be drawn from thence; with which draughts the Vice-roy sent his son into Spain in the year 1552, and died soon after.

Mendoza made Vice-roy.

The royal Court, after the death of the Vice-roy, taking the administration of the government into their hands, and reviving the decree for releasing the Indians from their personal service, occasion'd great disturbances again; but no where more than in the Charcas, where Indians were so much wanted to work their mines: And here also were great numbers of disaffected people and disbanded soldiers assembled, upon a supposition that HINOJOSA would have set up for himself, having given out many dark and dubious speeches (which were interpreted that way) while he remained at Lima. But this gentleman, being now made Governor of the country, and possess'd of one of the greatest estates in it, had alter'd his mind, it seems, if ever he had any thoughts of disturbing the Government formerly. He endeavour'd therefore, by fair words, to divert the soldiers from their design; telling them, he expected a commission every day to extend their conquests farther eastward, and then they would infallibly be provided for: But finding themselves disappointed from time to time, and that the General

(being

CHAP.

rection at
the silver
mines.

(being perfectly easy in his own fortunes) had now no intention of engaging with them, to bring about another revolution, they made choice of Don SEBASTIAN CASTILLA for their Chief, and determined to assassinate HINOJOSA; and tho' he had frequent intimations of the conspiracy, and was entreated by his friends to take measures for the security of his person, he too much slighted their advice: He could not believe that the soldiers among whom he had been so popular, and who had hitherto appeared devoted to him, could ever enter into a conspiracy to destroy him. He was also fearless in his temper, a plain open-hearted man, not apt to suspect the worst (or perhaps was so far of CÆSAR'S mind, that it was better to die once, than to be always terrify'd with the fears of death; or that it was time to die when his friends wish'd him dead). But however that was, he neither provided guards to defend his palace, or to attend him when he went abroad; and ten or twelve of the conspirators entering his house one morning, soon after the gates were open, went directly to his apartment, where they found him in his morning-gown, and stabb'd him with their swords and daggers, without giving him time to send for his Confessor, which was all he ask'd of them when he found they were resolved to imbrue their hands in his blood.

The re-
bels assas-
sinate Hi-
nojosa, the
Governor
of the
Charcas.

The assassins afterwards went out into the market-place, where they found the rest of their accomplices, and cry'd out, "The tyrant is dead, long live the King!" They also murder'd several of the principal citizens, and plunder'd their houses; then, beating their drums, required all the inhabitants to rendezvous in the market-place, and take up arms in their service; declaring Don SEBASTIAN their General, and Chief-Justice of the province. They also took upon them to appoint other officers and magistrates, both civil and military; but still pretended all was done with an intent to serve the King.

They
make Don
Sebastian
their Ge-
neral.

The conspirators, within a day or two, made themselves masters of the town of Potosi, where they seiz'd a million and a half of silver, which belong'd to the King or private persons. They also sent a detachment to surprize the city of Vera Paz, and murder the Marshal ALVARADO, who commanded there: But before this could be effected, a sudden turn happen'd; part of the soldiers who had murder'd their General HINOJOSA, believing they should merit of the Government, and obtain not only their pardon but a reward, if they should murder their new General Don SEBASTIAN, and declare for the King, assassinated the unhappy wretch, and declared VASCO GODINEZ their General. Like the Romans, they frequently murder'd the very men they set up, and the reign of the man they elect'd sometimes was not of a week's duration.

And after-
wards
murder
him.The re-
bels elect
Vasco Go-
dinez their
Chief.

VASCO GODINEZ compell'd the Magistrates and citizens of La Plata to constitute him Lord Chief-Justice as well as General of the Charcas (the silver country); under colour of which office he imprison'd and put to death whom he pleas'd, and among the rest caused many of those to be murder'd who had assist'd him in assassinating the Governor HINOJOSA; pretending now an extraordinary zeal for the King's service, and that he had himself been forced into that rebellion: Nor did he spare his most intimate friends and accomplices, being induced to take off many of them, lest they should discover his complicated treasons, and defeat him of those rewards he expected for murdering Don SEBASTIAN; for he had seiz'd on the great estate of the General HINOJOSA, and expected the Govern-

great ma-
ny people.

ment should have confirm'd it to him, in consideration of his merit, in declaring for the King against Don SEBASTIAN.

CHAP.
X.

The royal Court, being well appriz'd of the treachery and double-dealing of this wretch GODINEZ, in order to put a speedy end to the insurrection, dealt with the traitor in his own way: They pretended they were convinced of the services he had done the Government in taking off that usurper and rebel Don SEBASTIAN, and declaring for his Majesty; and caused it to be intimated to him, that they design'd to constitute him General of their forces, and assign him a very great estate in the Charcas; advising him to unite his forces with Don ALONZO DE ALVARADO (Governor of the city of La Paz) against the rebels. At the same time they privately made Don ALVARADO Generalissimo and Governor of the Charcas, and commanded all that were well-affected to the King to obey his orders: Whereupon the General assembled a good body of troops, and began his march towards the city of La Plata, where GODINEZ expected him, flattering himself that Don ALVARADO was coming to put him into possession of those estates and offices that were in a manner promised him by the Government: But the General no sooner got him into his power, than he made GODINEZ and his accomplices prisoners, and proceeded to try and condemn them; and when GODINEZ was, to his great surprize, condemn'd and led to execution, the following proclamation was made before him, viz. "This man, having been a traitor to God, his King, and his friends, is sentenc'd to be hang'd, drawn, and quarter'd:" And so many were involved in the same crimes, that, 'tis said, many of the rebels were executed every day the succeeding month; when another insurrection happening at Cusco, (which I am next to give an account of) a stop was put to these executions, and a pardon publish'd, in order to prevent a general revolt of those countries, which the Government began to be apprehensive of.

General
Alvarado
surprizes
Godinez,
and puts

with many
more of
the disaf-
fected.

The former rebellion of SEBASTIAN CASTILLA and VASCO GODINEZ was fomented and encourag'd by some of the principal citizens of Cusco, the mines of Potosi, in which they had a large share, remaining unwrought while the Indians were freed from their personal service; but the most active among the disaffected citizens was HERNANDEZ GIRON, already mention'd, who only waited to see what success the insurrections in the Charcas would have before he declared himself; and being inform'd, that General ALVARADO kept a correspondence with GILES RAMIREZ, Governor of Cusco, and that they were concerting measures how to surprize him and his friends, he resolv'd to be beforehand with them, and put it out of their power to hurt him.

Another
rebellion
by Her-
nandez
Giron.

GIRON therefore, summoning his friends together, let them know the danger they were all in; that General ALVARADO threaten'd, as soon as he had lopp'd off the branches in the Charcas, he would strike at the root of all these disturbances, by extirpating the citizens of Cusco, who incited and supported them: He exhorted them therefore, for their own preservation, to come to some speedy resolution, and not tamely suffer themselves to be massacred, under a colour of law, as their friends in the Charcas had been; especially since it was the common cause of all the Spanish planters, who could make no advantage of their mines, or the rest of their estates, if their Indians were taken from them; and consequently they should find them all ready to

join

CHAP. X. join with them, as soon as it was known they had taken up arms for a redress of these grievances.

As this assembly consisted either of citizens who were proprietors of the mines, or soldiers who were in expectation of making their fortunes by fresh commotions, there was very little persuasion necessary to induce them to join in the insurrection: They agreed therefore to take the opportunity of a great wedding which was to be solemniz'd at Cusco on the 13th of November 1553, to seize on the Governor and some of the principal Magistrates, who were invited to it; and accordingly HERNANDEZ GIRON, with ten or twelve of his accomplices, in armour, rush'd into the bridegroom's house on the evening of the wedding-day, where the Governor and threescore of the principal citizens were at supper; and some of the company thereupon rising from the table in a great fright, GIRON bid them not stir or be afraid, for they were all engaged in the same conspiracy; which speech terrifying the Governor still more, he ran away and hid himself in a remote part of the house among the women: Two or three other Magistrates were kill'd by the conspirators on the spot; but the rest of the company, whether in the plot or not, were suffer'd to return unmolested to their houses.

The conspirators, having continued their search two or three hours, at length found the Governor hidden in the women's apartment; and carrying him to prison afterwards, resorted to their friends in the market-place, where they made proclamation for all men to assemble, and take up arms in defence of their liberties: Then they seiz'd upon the King's treasure, and all the hories and arms they could find; and having muster'd about an hundred and fifty soldiers, they appointed officers to command them, and list more into their service; the rebels declaring, that what they had undertaken was for the publick good, and in order to inform his Majesty of their grievances, the royal Court rejecting all petitions of this kind.

And such was the influence GIRON had over the Magistrates of the city, that (either for fear or favour) they constituted him Chief-Justice and Captain-General; and several other great towns, such as Guamanga and Arequipa, congratulated him on his exaltation, and promised to support him with their forces.

The royal Court, receiving advice of this formidable rebellion, immediately suspended the execution of the decree for freeing the Indians from their personal service, which they were sensible was the principal occasion of these commotions, and constituted the Marshal ALVARADO Captain-General of their forces against HERNANDEZ GIRON in the southern parts of Peru; and the Archbishop of Lima, and SANTILLAN (one of the Judges of the royal Court) took upon them to command the forces that were assembled in the neighbourhood of Lima, from whence they prepared to march and attack the rebels at Cusco: They also issued a proclamation, pardoning all those who were engaged in the rebellions of PIZARRO and DON SEBASTIAN, to prevent their joining with HERNANDEZ GIRON, who was by this time become so strong, that he march'd out of Cusco towards Lima, with an intent to give the royalists battle.

GIRON, being advanced as far as the valley of Pachacamac, received intelligence that the enemy were not far from him, and prepared to engage them; but finding his men desert in great numbers, he thought it prudent to retire farther off: Whereupon PAUL DE MENESES, one of the Generals

of the royalists, was detach'd with an hundred and fifty horse, to insult his rear, and keep the rebels in play 'till the rest of the army could come up; but MENESES was unfortunately defeated before the army could come to his assistance; and there afterwards happen'd such divisions among the Generals of the royalists, that GIRON had leisure to augment his forces, and form a regiment of Negroes.

In the mean time, Marshal ALVARADO, having assembled an army consisting of a thousand Spaniards, and ten thousand Indians, began his march from the Charcas; and advancing as far as Cusco, took possession of that capital for the King, in the absence of HERNANDEZ GIRON, who was at this time in the plains of Nasca, on the sea-coast, about fifty or threescore leagues to the northward of Lima.

The Marshal did not make any long stay in Lima; but having augmented his European forces to twelve hundred men, by the several parties of royalists that came to join him in Cusco, he march'd towards the sea-coast, in search of the rebels, who seeming to contemn and lessen the number of the royalists, their General HERNANDEZ GIRON bid them not flatter or deceive themselves but stand upon their guard, and behave themselves like men whose fortunes depended on the points of their swords; for he assured them there were a thousand veteran well-arm'd Spaniards, besides Indians, advancing towards them from Lima, and a more numerous body under the command of Marshal ALVARADO, approaching their camp from Cusco: However, if he had but four hundred men, on whose valour and fidelity he could rely, he told them, he did not doubt but to come off victorious: and immediately began his march to possess himself of an advantageous camp near Chuquinca, on the road in which the enemy was marching; and such was the situation of the post he had chosen among woods, rocks, and precipices, that he wished for nothing more than that the royalists would attack him here: But their Generals, having view'd the ground (tho' their forces were treble the number of GIRON's) thought it was not practicable to engage him in this place; they determined therefore to surround the rock with their Indians, and cut off his provisions on every side; by which means the rebels must have been obliged to surrender in a very short time, or have been starved. But an officer deserting over from the rebels to the royalists, and informing them that GIRON intended to retire in the night, and that his men were in a miserable condition, and by no means able to defend that post, if they were briskly attack'd, the Marshal alter'd his resolution, and commanded his officers to prepare to give the enemy battle; and the attack was begun early the next morning, at the only two places it was possible to approach the rebels; at one of which the royalists were obliged to pass a rapid river almost up to their necks; and the other pass was so narrow, and encumber'd with rocks and bushes, that forty men might defend it against ten thousand. GIRON, the General of the rebels, had so judiciously drawn up his men to defend both these avenues, that the royalists were cut off as fast as they advanced by the fire of the small arms; and tho' they renew'd their attacks several times, and were led on by the Marshal in person, they were at length totally defeated, and put into the utmost confusion, two-thirds of the royalists being kill'd, or taken prisoners; and the rest, with their General at the head of them, escaping with great difficulty out of the battle, left the plunder of their camp to the enemy, which was the

Giron des-
seats Ge-
neral Al-
varado.

CHAP. X. the richest that had been known, even in that rich country; the wealthiest Merchants and Planters from the silver mines of the Charcas and Cusco having taken the field with the Marshal in most splendid equipages, and with numerous retinues of servants, all their arms, furniture and accoutrements being adorn'd with gold, silver, and precious stones, with which this part of Peru abounds.

HERNANDEZ GIRON, having obtained this important victory, remained five or six weeks in his impregnable camp, from whence he sent out strong parties to Cusco, Arequipa, the city of Peace (or La Paz) and other great towns, which they plunder'd of an immense treasure. He also listed great numbers of the prisoners he had taken, and by other means augmented his forces to upwards of a thousand Spaniards, besides Indians and Negroes; and being sensible he still wanted a train of artillery, to be upon the level with the royalists, he took several of the bells out of the churches of Cusco, and with them he cast six field-pieces, on which he engraved the word **LIBERTY**, the rebels motto; and then began his march towards that capital.

He converts the bells of Cusco into great guns.

Miserable was the condition both of Spaniards and Indians at this time; it was but a very little before that the royalists had done justice, as they call it; that is, plunder'd and murder'd the adherents of **HERNANDEZ GIRON**, and now that rebel retaliated the injury he conceived was done him, both upon Spaniards and Indians that had declared for the royal cause, and especially on such as had betray'd or deserted him; and, as he was conscious he had by these outrages exasperated the citizens of Cusco, he did not think fit to trust himself amongst them. The clergy were no less provok'd (by taking the bells out of their churches) than the citizens were by giving up the town to the plunder of his soldiers. Having therefore sent for his wife and family, and all that he valued, out of Cusco, he advanced to the delightful vale of Yuca, about two or three leagues from that city; where he refresh'd his troops, and spent his time in rural sports, 'till he receiv'd advice that the royalists (having increased their forces to two thousand men, besides Indians, and a fine train of artillery) were marching towards Cusco; and then he thought fit to retire to a pass about forty leagues to the southward of that city, where he posted his army, that it was impossible to force his camp; and at the same time had a plentiful country in his rear, which supply'd him with plenty of provisions. By taking this pass he also cover'd the province of Charcas, in which were the principal silver mines; so that he could never want treasure to pay his troops while he remain'd there.

In this happy situation he waited for the enemy, expecting that their superiority in numbers would have encouraged them to attack him, as they had done at Chuquinca; but they were grown wiser by their misfortunes, and chose to entrench themselves in a plain not far from him, where their cavalry might be of use to them; for they had more horse than the rebels. Thus the two armies lay looking upon one another for a considerable time, only some skirmishes happened between small parties, in which it was observed the rebels had generally the advantage; and this encouraged **HERNANDEZ GIRON** to think of attacking the royalists, since there appear'd little likelihood of their advancing nearer him: He might reasonably expect also, that the royal army would be daily increased by the arrival of fresh forces from Old or New Spain; and was under some apprehensions, probably, that his people might desert him, and make their peace with the

VOL. III.

CHAP. X. Government, if he remained unactive much longer: He laid a design therefore to surprize the royalists in their camp, which seems to have been admirably well concerted; nor did his officers and soldiers want resolution to have it put in execution, if the project had not been betray'd to the enemy by two deserters the very evening before the attempt was made.

The moon going down about two o'clock, **HERNANDEZ GIRON** had order'd his regiment of Negroes, with fourscore or an hundred Spaniards, to conduct and animate them to attack the enemy's camp in front, as soon as the moon was set, while he, with the rest of his army, should fall upon the rear; and he order'd his men to be cloath'd in white, that they might be able to distinguish each other in the dark: But the enemy (being acquainted with the scheme by the deserters above-mention'd) march'd their army out of their trenches, and drew up upon a spot of ground, from whence they intended to have attacked them in their retreat, or when they were busy in plundering their camp.

Giron attacks the camp of the royalists, but is forced to retire.

The Blacks very bravely attack'd the enemies trenches, and to their surprize enter'd them with little opposition, there being very few left to defend them; and these were order'd to retire on the approach of the enemy: Whereupon the Negroes fell to plundering the camp (as was expected) while the royalists attack'd **GIRON**, and the main body of his forces, before they came near the trenches. However, the rebels defended themselves so well, that they made their retreat in pretty good order, and with very little loss from the fire of the enemy; but suffer'd extreamly by the desertion of two hundred of their company at the time the retreat was made. 'Tis probable, the deserters apprehended their army was totally defeated, and that their General would never be able to make head against the royalists again; and therefore thought it prudent to save their lives by a timely surrender.

HERNANDEZ GIRON however (having muster'd his men, and observed there were scarce any missing besides the two hundred that had deserted) still thought himself in a condition to maintain his post against all the power of the royalists; but two or three days afterwards, **THOMAS VASQUEZ**, who had been one of the forwardest in promoting this rebellion, and one of the most popular men amongst the malecontents, deserting over to the enemy, with ten or twelve officers more, on whom **GIRON** principally relied, he was confounded, expecting every hour to be betray'd, and deliver'd up to his enemies: Therefore (without communicating his suspicions to his wife, or any mortal) he fled by himself to the mountains in the night-time, leaving his forces to shift for themselves. His departure was no sooner known, but his Lieutenant-General, with an hundred more that were devoted to his service, went in search of him; but taking a different way, were all surprized by **MENEZES**, one of the Generals, of the royalists, who hang'd up most of the officers upon the spot: But another of the rebel Generals, with great part of his forces, had the good fortune to go over in time to the royal camp, before the escape of **GIRON** was known, and were allow'd the benefit of the pardon that had been publish'd for the present; but many of these also were hang'd up afterwards for this very rebellion by a succeeding Vice-roy.

Giron deserted.

Flies to the mountains.

As to **GIRON** himself, he wander'd about the mountains some weeks, with fourscore or an hundred of his friends, who had found the way after him; but was at length taken prisoner and carried to Lima, where he was condemn'd and executed as a

Giron taken and executed.

22 R

traitor;

CHAP. X.

The rebellion entirely suppress'd.

traitor; which put an end to the rebellion: And from this time (viz. from the month of November 1554, in the reign of PHILIP II.) the Spaniards may be said to have been in the peaceable possession of Peru; the subduing the first Adventurers, who endeavour'd to render themselves independent of the Crown of Spain, having proved a much more difficult task than the conquest of the defenceless Indians. And tho' the Spaniards are by no means to be justified in their invasions of this country, yet their last wars, which were carried on by them for restoring the natives to their liberty, and rescuing them from the oppressions of the first planters, must be approved by all the world: Had they gone one step farther, and restored the Inca's (the Sovereigns of that country) to their dominion, they had perform'd the most just, and consequently the most glorious act that ever was recorded in history; but this was too great a piece of self-denial to be expected, that they should part with a country replenish'd with mountains of gold and silver, after they were once in possession of it.

The Spaniards have also this to say for themselves, that the Prince they found upon the throne (namely, ATABILIPA) had no more right to that kingdom than themselves; nay, that none of the Inca's could pretend any other right to any part of Peru, but what they had gain'd by unjust invasions and usurpations; and since it was next to an impossibility to discover who was the lawful Sovereign of any part of it, they who had gain'd the possession of this country by the same forcible means the Peruvian Princes had done, did no body any wrong by maintaining their possession. Some of the future Vice-roys, however, seem to have been of opinion, that the Inca's had a better right than the Kings of Spain, by their putting to death, or banishing to remote countries, all the blood of the Inca's, and even the issue of the Spanish officers who had match'd with any of the Princesses of that family; tho' I must do that justice to King PHILIP II. that he reprov'd and punish'd the Vice-roy that was guilty of that piece of barbarity, telling him, "He did not send him over to extirpate those Princes, but to protect them."

CHAP. XI.

Of their women, marriages, children, slaves and funerals; and of the navigation and shipping of the Peruvians.

CHAP. XI.

Of the marriages of the Peruvians, &c.

HOWEVER it comes to pass, we find great part of the world entertain a very high opinion of a single life. This whimsey prevails in the new world as well as the old. Mexico and Peru have their cloister'd Virgins, to whom they pay uncommon honours; and there are others who devote themselves to a single life without confining their persons to a convent; and these also, both sexes have in great veneration. I have already mentioned the nunnery in the capital city of Cusco, where there were five hundred Ladies of the royal blood, who neither went abroad, or were visited by any of their relations, except the Queen: These were called the wives of the Sun, and it was sacrilege to touch them; but if any man was so prophane as to attempt their chastity, he drew upon himself and his whole family the severest punishments that could be inflict'd; and even his houses, lands, flocks and herds, and all that he had in the world were destroyed with him.

In every province also there was a convent of Nuns, consisting of the daughters of noblemen, and

those of the first quality, and these were not to be approached by any but the Inca; and as the former were call'd the wives of the Sun, these were stil'd the wives of the Inca, though he never saw them, or had any commerce with them; however, they had all a possibility of being his wives in a literal sense, for he sent for them to Court whenever he pleas'd, and took them to his bed; so that they seem to have been nurseries for the royal Seraglio; the violating the chastity of one of these was as penal as an intrigue with one of the former. As to the marriages of the Peruvians, it appears that their Princes and Nobility were allow'd a plurality of wives and concubines; though their first King and Law-giver decreed, that no private man should have more than one; their Kings thought it incumbent upon them to increase their families by all possible ways. In this they apprehended they fulfilled the commands of their father the Sun, and were benefactors to the world; but this does not consist with the honours they paid to a state of celibacy; for, by the same rule, those that kept their virgin vows, and did what lay in them to put a stop to the propagation of their species, were to be honour'd, those who endeavour'd to people the world should have been despis'd, so inconsistent were they with themselves; and full as inconsistent are we with ourselves in this part of the world. We rejoice when a man is born, and we admire the virgin that vows there shall be no more born if she can help it; but how these unnatural and impious vows came to be encouraged and approved either there or here, is not easy to conceive. To proceed in the account of their marriages.

The laws of Peru did not only permit, but command the Emperor to marry the eldest sister of the whole blood; though it prohibited all other brothers and sisters to marry; however, they were all obliged to marry in their respective tribes or families like the Jews, and their marriages were solemnized by the chief magistrate of the province. Those of the tribe or family of their Inca's or Kings were married by the King himself. Once a year, or once in two years at most, the King's officers were commanded to make a list of all the young men of his family above twenty years of age, and of all the virgins above eighteen, and bring them before him, when he match'd them as he saw fit, the ceremony being no more than this: The Inca, standing between the couple that were to be married, call'd each of them by their names, and then joining their hands, sent them home to the bridegroom's father's, where the wedding was kept for several days, with feasting, musick, dancing and drinking, as in this part of the world. I don't find there were any previous addresses, or that the parties had any knowledge of each other 'till they came before the Prince, or that he made any judgment how suitable the match was like to be, in any other respects than as to their persons, their respective ages, and their quality. Here was no such thing as courtship; no consent demanded, either of the parties or their parents; but the Inca disposed of both as he saw fit: And in the provinces of the empire at a distance from Cusco, the vassal Princes perform'd the ceremony, as the Inca did in the capital city; but as to the King himself, and the Princes of the several provinces, they took what women they pleas'd for their wives and concubines, without any manner of ceremony.

And if the common people were not allow'd more wives than one, they had a liberty however to entertain a commerce with other women (besides their

Common women.

CHAP. XI. their wives) who lived in poor huts in the fields, or in the suburbs of great towns, but were never suffer'd to dwell or appear among honest people, and were generally esteem'd infamous. These stewes, according to DE LA VEGA, were conniv'd at by the Government, to prevent greater inconveniences, such as adultery and sodomy; and this it is that induces the Pope, 'tis said, to indulge his subjects in the like liberties, whose constitutions are as warm as the Peruvians.

When any of the royal family of the Inca's married, the vassal Indians of that province immediately built houses for the new-married people, which were furnish'd by the fathers of the bride and bridegroom, and every one of their relations brought some present for the new-married couple, and came and rejoiced with them on the occasion: And when any of the common people married, their neighbours were oblig'd to assist in the building their houses, and raising a little plantation of fruits, roots and herbs; and every married man had a portion of food and cloathing assign'd him every year out of the royal magazines and store-houses, in proportion to the bigness of his family. None were suffer'd to starve for want of necessaries, as they are in some Christian countries; neither were any people suffer'd to live idly, but all were busied in husbandry, or some mechanick employment; and the wives of their Nobility and Gentry carried their work with them, even upon visits; for the women spun and wove all their cloathing, tho' they had slaves and vassals who were oblig'd by their tenures to do every thing of that kind for them.

The laws of descent and inheritances.

As the Emperor or Inca was oblig'd to marry his eldest sister, and if he had no issue by her, the next, and so on; and if he had issue by none of his sisters, to marry his next nearest relation; so none but the eldest son of such marriages could inherit the throne; and thus the crown descended to twelve Inca's successively, 'till the last Inca, ATABILIPA the bastard, or rather the son of a foreign Princess, (viz. the Princess of Quitto) usurp'd the throne and deposed his brother HUASCAR.

If the Inca or Emperor had no son, he was succeeded by his eldest brother, or his next male relation; but DE LA VEGA observes, that the Spanish historians were mistaken, who related that the brother succeeded before the son of the deceas'd Emperor.

The laws of inheritance were not the same in every province. In some, the eldest son did not inherit unless he was the most deserving; for the vassals had the choice of the succession, provided they elected him out of the family of the Caraca's, or Lords of the district; and they were at liberty to take the youngest, or any other son they apprehended would make the best Governor, without any regard to their seniority: But in others the eldest son inherited, as with us; and if there were no sons, the estate went to the eldest uncle. I don't find the daughters ever possess'd their lands or real estates.

Widows and orphans provided for.

The Peruvians, however, seem to have had a particular regard for widows and orphans: Their lands were plough'd and cultivated at the charge of the publick, and were prefer'd to the lands belonging to the temple of the Sun and those of the Inca; but it was look'd upon as infamous for a widow to marry a second husband, especially if she had children, and as infamous for a man to marry such a widow; so that such matches were very rare, and the widows liv'd in great esteem as long as they kept single.

The management of their children.

Their children were weaned at two years of age, when they shav'd their heads and gave them their

names, at which there was great feasting and rejoicing, and the relations all made presents to the infant; some brought cloathing, others cattle, some presented him with arms, and others with cups and vessels of gold or silver plate, according to their quality: This was the custom at the weaning of the eldest son, but no great notice was taken of the weaning the rest of the children, whether sons or daughters.

CHAP. XI.

All their children were bred up very hardily, wash'd with cold water as soon as born, and the mother bath'd in some cool stream as soon as she was brought to bed, if we may credit the concurrent testimony of all the Spanish historians; and they continued to wash their children every day with cold water, 'till they were grown up and able to bathe themselves; which may be one reason that the plunging a lying-in woman into cold water was attended with no ill consequences; for if a European lady, who never used to bathe in cold water, was to make the experiment in that condition, she would not come off so well as the Americans, it is presum'd.

DE LA VEGA relates also, that they never took their children into their laps or arms, unless it were to dress them, but stoop'd down to the cradle where the infant lay to give it the breast, and this only three times a day, keeping them to their set meals, from the time they were born, saying, They would cry in expectation of it all day long, if they were humour'd in it every time they cry'd; and that the gorging them with milk was the way to make gluttons and drunkards of them when they grew up.

The Ladies of the first quality always suckled their own children, and never put them out to wet-nurses; and though the ordinary time of their sucking was two years, the women never came near their husbands beds 'till that time was expir'd, nor had the child any other food 'till it was wean'd, if the mother's milk did not fail. When the child could stand alone it was taken out of its wooden cradle, to which it used to be bound down hard with filletting, and set in a little pit, made in the middle of the floor, which reach'd to the breast of the child, and was lin'd or hung with linnen or woollen, and the play-things set about the verge of the pit or basin; so that they were never troubled to carry their children about or sit with them in their laps, as our nurses and good women are. DE LA VEGA adds, that the Peruvian women had never any occasion for midwives, but there was usually an old hag of a witch, or enchantress, that attended the labour, who muttering over some charms, was supposed to facilitate the birth, and contribute to the good fortune of the infant by the superstitious ceremonies she perform'd.

As to their funerals, the bodies of their Inca's or Emperors (it has been observ'd) were embalm'd and placed in the temple of the Sun, where divine honours were paid them, but their hearts and bowels were solemnly interr'd at a country palace of the Inca's, about two or three leagues from Cusco, where magnificent tombs were erected, and great quantities of gold and silver plate and other treasures buried with them: And at the death of the Inca's and Caraca's, or great Lords, their principal wives, favourites and servants, either kill'd themselves or made interest to be buried alive with them in the same tomb, that they might accompany them to the other world, says DE LA VEGA, and renew their immortal services in the other life, which, as their religion taught them, was a corporeal and not a spiritual state. And here he corrects the errors of those

Their funerals.

CHAP.
XI.

those historians who relate, that these people were kill'd or sacrificed by the successors of the deceased Prince, which he seems to abhor as a most detested piece of tyranny and cruelty; and observes further, that there was no manner of occasion for any law or force to compel them to follow their benefactors or masters to the other world; for when they were dead, they crouded after them so fast, that the Magistrates were forced sometimes to interpose, and by persuation, or their authority, to put a stop to these self-murders, representing that the deceased had no need of more attendants, or that it might be time enough to offer him their service when death should take them out of the world in a natural way.

Their belief of another state.

However, it is evident from hence, that the Peruvians believ'd another state after this, where they were to live and enjoy their friends to all eternity, and that they were to be cloath'd with flesh and blood there as well as here; though they must imagine the bodies they were to assume would be of a more heavenly constitution, to render them immortal, and free from infirmities. Nor could they believe they would be the same bodies rais'd again, and reën'd, because these were embalm'd, or remain'd in their tombs, while they expected to be translated to those regions of pleasure immediately, and to be cloath'd with bodies on their arrival there: And in that case it could be of no service to them to receive their former bodies again, after some thousand years were elaps'd. But to proceed in their funerals.

Mourning.

The first month after the death of their Prince, the whole city of Cusco bewail'd their loss with loud cries and lamentations, and every ward, or division, of the city assembled and march'd out into the fields in procession, carrying the trophies of their late Sovereign with them; namely, his shield, his offensive arms, his cloaths, and the treasures that were to be buried with his bowels; and in songs repeated his heroic actions in the wars, the most remarkable instances of his justice, and other virtues. After the first month they commemorated the death of the Inca at every new and full moon 'till the end of the year, the last day whereof was observ'd with more solemnity than any of the former. Nor was this done only in the capital city of the empire, but in the chief town of every province, how far distant soever. They went out in procession to all places, where they remembered their Inca had ever been a journey, or upon any other occasion, and there in mournful songs recited his great actions, and bewail'd their loss: And the vassal Princes, or Noblemen, had much the same honours paid them on their decease, in their respective provinces and lordships, by their vassals; and this bids me to say something of the condition of the Peruvians, in relation to their liberties and properties, when the Spaniards arriv'd there. The Inca's were absolute Sovereigns, restrain'd by no laws or compacts, but valued themselves most, it seems, in being the Protectors and Fathers of their people.

The state of the Peruvians when the Spaniards arrived there.

Every province had its Caracas, or prince, as absolute in his territories as the Inca in the empire, and only accountable to him; and in every province were a great many Caciques, or Lords, who had the command of their vassals, as the Caracas had of them; and as for the common people, they were all tenants, or rather slaves to their Lords, both their persons and estates being in their power to do whatever they would with them; for these tenants cultivated and manur'd their Lords lands,

built and repair'd their houses, carried them on their shoulders when they went abroad, and serv'd them both at home and abroad, without any other wages than the produce of their little tenements and plantations, and were sold and transferr'd from one Lord to another, whenever the lands they lived upon were sold or alienated.

CHAP.
XI.

Whenever the Inca, or Emperor, had any particular service to do, he commanded the vassal Prince of the province to see it done, and he again issued his orders to the Nobility under his government, who sent their tenants, or slaves, to perform what was requir'd, or march'd at the head of them in person, if they were commanded to the wars; so that the whole country, like Britain anciently, was divided between the Lords of the soil and their Slaves, or the Barons and their Bondmen, or Villains. The generality of the people were in a state of slavery before the Spaniards arriv'd; all the difference was, that during the government of the Inca's, and their native Lords, their service was extremely easy and gentle; they requir'd their service but at certain times, and by turns, and never overloaded or over-drove them, or commanded them into services or countries destructive to their healths. Whereas the Spaniards had no regard to any of these particulars, but destroy'd thousands of them by exacting a too rigorous service, compelling some to work in the mines, others to dive for pearls, others to carry monstrous burthens, and travel into unhealthful climates, without making a suitable provision for them, and by these means perfectly depopulated several American islands and countries. 'Tis true, the common people were vassals and slaves to their superior Lords before the Spaniards conquer'd Peru, as has been intimated already, but then their own Princes used them as children, and the Spaniards treated them worse than brutes.

Some of the poorer Indians, however, were gainers by this change, or at least thought themselves so at first; for the Spaniards, in order to gain them over to their party, gave many of them their freedom, and made use of them in subduing their countrymen: But when the conquest was finish'd, these were not used much better than the rest, 'till the Kings of Spain, by their repeated edicts, in a manner by force compell'd the Adventurers and Planters to treat the Indians as subjects, and not as slaves; since which time the Spaniards have introduc'd vast numbers of Negroes to work in the mines, and perform other laborious services; and the horses, oxen and mules that have been carried to Peru, have made it less necessary to exact those hard and laborious services from the Indians they did formerly, such as carrying their baggage, and drawing their carriages, by which multitudes perish'd.

Peru is now possess'd by a very different set of people than it was at the time of the Spanish conquest two hundred years ago. Besides the native Indians, there have been transported vast multitudes of Europeans and African Negroes of both sexes, from whose mix'd embraces have sprung another race, being a compound of all three, which have different features and different complexions from the people of any of the three parts of the world from whence they are deriv'd; only those that were born in Spain are call'd Spaniards. If any person is born of a Spanish father and mother in America, he is call'd a Criollo, and so are the children of the Negroes born in Peru; and, 'tis said, this term Criollo came first from the Negroes, who call'd their children so that were born there, to distinguish them from native Africans.

The

CHAP.
XI.

The children born between a Spaniard and an Indian, are called Mestizo's; and so are the children of a Spaniard and a Negroe. Those born of a Negroe and an Indian, are call'd Mulata's, or Molata's; and to the children of these Mulata's the Spaniards gave the name of Cholo, which signifies a dog of a mongrel breed; and they esteem them little better. The children of a Spaniard and a Mestizo they call Quartravo's, by which they would signify they are three parts Spanish and one Indian; but the children of a Mestizo with an Indian woman, they call Trefalas, or three parts Indian. The descendants of all these have different names and different privileges; and when any of them come to resemble the Spaniards so much in their features and complexions that they cannot be distinguished from them, they chuse to remove to some distant town, where their pedigree is not known; and there they enjoy the honours and privileges of the native Spaniards, especially if they are people of Substance.

But, as was intimated in the history of Mexico, there are always great divisions and heart-burnings between the Spaniards born in Spain, and the Criolli, or those that are born of Spanish parents in Peru.

The Criolli are by far the most numerous (perhaps a hundred to one) and possess'd of the greatest part of the lands; but the power is always lodg'd in the hands of the native Spaniards: The Viceroy, and principal civil and military Officers and Bishops, are always Spanish, which makes the native Spaniards look down with great contempt on the Criolli, though born of Spanish parents, and they are perpetually doing each other ill offices; even among the Ecclesiastics there are everlasting feuds, and the people are taught by the Criolli Priests to hate the Spanish Friars; though the religion of all Peru is now the same, from what nation, or what mixture of nations soever the present inhabitants are descended. The Inquisition (that reigns here with greater terror than in any part of the world) has compelled both Indians and Negroes to profess themselves Catholics; and their way of instructing them in the doctrines of Christianity, is the same here as it is in Spain; namely, by pictures, images, and theatrical entertainments: Every part of the history of the Gospel almost is thrown into a play, and the Indians are the actors; one acts our SAVIOUR, another St. PETER, a third PONTIUS PILATE, a fourth JUDAS, and so on. This they look upon as the readiest way of instructing the vulgar in the Christian religion, and to fix the history of it in their memories.

The navigation of the Peruvians.

I shall conclude this chapter with a word or two concerning the navigation of the Peruvians, who seem to have been provided with most improper vessels and vehicles for transportation or fishing, of any nation in the world. I do not find that they had either ship, boat, or canoe upon their coast when the Spaniards arrived there; they crossed over their rivers on floats of reeds or rushes, and at sea had no other way of fishing, or transporting their goods along the coast, but on bark-logs, of which Mr. DAMPIER gives us the following description.

Bark-logs.

Bark-logs are made of many round logs of wood, in manner of a raft, and very different, according to the use that they are design'd for, or the humour of the people that make them, or the matter they are made of. If they are made for fishing, then they are only three or four logs of light wood, of

seven or eight foot long, placed by the side of each other, pinn'd fast together with wooden pins, and bound hard with withies. The logs are so placed, that the middlemost are longer than those of the sides, especially at the head; or fore-part, which grows narrower gradually into an angle or point, the better to cut through the water. Others are made to carry goods; the bottom of these is made of twenty or thirty great trees, of about twenty, thirty, or forty foot long, fastened like the others, side to side, and so shaped: On the top of these they place another shorter row of trees a-cross them, pinn'd fast to each other, and then pinn'd to the undermost row; this double row of planks makes the bottom of the float of a considerable breadth: From this bottom the raft is raised to about ten foot higher, with rows of posts, sometimes set upright, and supporting a floor or two; but those I observed were raised by thick trees laid a-cross each other, as in wood-piles; only not close together, as in the bottom of the float, but at the ends and sides only, so as to leave the middle all hollow, like a chamber, except that here and there a beam goes a-cross it, to keep the float more compact. In this hollow, at about four foot high from the beam, at the bottom, they lay small poles along, and close together, to make a floor for another room, on the top of which also they lay another such floor made of poles; and the entrance into both these rooms is only by creeping between the great traverse-trees, which make the walls of this sea-house. The lowest of these stories serves as a cellar; there they lay great stones for ballast, and their jars of fresh water closed up, and whatever may bear being wet; for by the weight of the ballast and cargo, the bottom of this room, and of the whole vessel, is sunk so deep as to lie two or three foot within the surface of the water. The second story is for the seamen and their necessities: Above this second story the goods are stow'd to what height they please, usually about eight or ten foot, and kept close by poles set upright quite round; only there is a little space abaft for the steers-man (for they have a large rudder) and a fire-hearth before to dress their victuals, especially when they make long voyages, as from Lima to Truxillo, or Guiaquil, or Panama, which last voyage is five or six hundred leagues. In the midst of all, among the goods, rises a mast, to which is fastened a large sail, as in our west-country barges in the Thames: They always go before the wind, being unable to ply against it; and therefore are fit only for these seas, where the wind is always in a manner the same, not varying above a point or two all the way from Lima, till such time as they come into the bay of Panama, and even there they meet with no great sea, but sometimes northerly winds, and then they lower their sails, and drive before it, waiting for a change. All their care then is only to keep off from shore; for they are so made, that they cannot sink at sea. These rafts carry sixty or seventy tons of goods and upwards; their cargo is chiefly wine, oil, flour, sugar, Quitto cloth, soap, goat-skins dress'd, &c. The float is manag'd usually by three or four men, who (being unable to return with it against the trade-wind) when they come to Panama, dispose of the goods and bottom together, getting a passage back again for themselves in some ship or boat bound to the port they came from, and there they take a new bark-log for their next cargo.

The smaller sort of bark-logs lie flat on the water, and are used for fishing, or carrying water to ships, or the like (half a ton or a ton at a time) and

CHAP.
XI.

are more governable than the other, though they have masts and sails too. With these they go out at night, by the help of the land-wind (which is seldom wanting on this coast) and return back in the day-time with the sea-wind.

The present shipping of Peru.

As to the present state of their navigation, the Spaniards have scarce any ships on this sea but coasting-vessels, and the King's ships of war, which may be ten or twelve in number, and serve to protect the trade against the Buccaneers and Privateers, who are, however, very often too hard for them; and should any European Power send a small squadron of men of war into the south-sea, the whole royal navy of Spain on this coast would not be a match for them: But of the forces of the Spaniards (by sea and land) on the western coast of South-America, I shall give a more

particular account when I have survey'd the province of Chili.

CHAP.
XI.

The Peruvian, or Spanish inhabitants, have yet no other foreign commerce but with the rest of the Spanish colonies, either in Chili to the southward, or with those of Mexico to the northward: They sail every year from Peru (at the proper seasons) to the fairs of Acapulco and Panama, carrying the product and manufactures of Peru thither, but chiefly gold and silver, to a very great value; and at those fairs they furnish themselves with the product and manufactures of China and the East-Indies from the west, and those of Europe from the east; and in this rich traffick there are not more than seven or eight ships employ'd within the space of a year, though they export and import the value of many millions,

THE

THE PRESENT STATE OF CHILI.

CHAP. I.

Of the name, situation, and extent of CHILI, and of the face of the country, their mountains, &c.

CHAP.
I.
Name.

THIS country was named Chili by the first Spanish Adventurers, from a famous river and valley of that name, where they obtain'd a signal victory over the natives : Whether the people had any common name for the whole country before the Spanish conquest I very much question, it not being united under one Sovereign, but divided into a great many little clans or tribes, commanded by their respective Chiefs, when the Spaniards arrived there ; and every particular nation or family had a distinct name, which they received from or communicated to the several countries they possessed. Chili, in which I shall take the liberty of comprehending Patagonia, the Terra-Magellanica, and Terra del Fogo, is bounded by Peru on the north, by La Plata and the Atlantic-ocean on the east, and by the great South-sea on the south and west, extending in length from north to south 27 degrees, 30 minutes, viz. from 25 to 57 degrees, 30 minutes south latitude : But the breadth is very unequal, being about 400 leagues broad in the north, and lessening gradually till it is not 100 broad in the south, and is consequently of a pyramidal form, the northern boundary being the base, and Cape Horn the summit of the pyramid. The opposite part of the globe to this country is the East-Indies.

Situation.

Face of
the country.

The face of this country very much resembles that of Peru ; for all our sea-men agree, that the coast of Chili is a high bold shore, and that further within the land there arise other hills, which the Spaniards call Sierra's, and above them the Andes, the highest mountains in the known world, which extend, as has been observed in the description of Peru, from Santa Martha in Terra-Firma, to the Straights of Magellan, that is, from 10 degrees north to 55 south latitude, running 65 degrees from north to south. To the description I have given of these hills in Peru, I shall here add OVALLE's account of them, and of the face of this country, which he had cross'd often between Chili and La Plata (as he informs us.)

The Andes of
Chili.

These mountains, says that writer, are a prodigy of nature, and without parallel in the world, being a high chain of hills 1500 leagues in length, and 40 leagues broad, with many intermediate valleys : The ascent is so prodigious that we employ three or four days in arriving at the top of them, and as many more in the descent, that is, speaking properly, and only of the mountain ; for otherwise it may be affirmed, that one begins to mount even from

the sea-side, because all the way, which is about 40 leagues, is nothing but an extended shelving coast, for which reason their rivers run with such force, that their streams are like mill-streams, especially near their sources.

CHAP.
I.

When we come to ascend the highest part of the mountains, we feel an air so piercing and subtil, that it is with much difficulty we breathe, which obliges us to fetch our breath quick and strong, and to open our mouths wider than ordinary, applying to them likewise our handkerchiefs to condense our breath, and break the extreme coldness of the air, and so make it more proportionable to the temperament which the heart requires. This I have experienced every time that I have passed those mighty mountains.

Don ANTONIO DE HERRERA, and other writers observe, that those who pass the Andes in Peru, suffer great reachings and vomitings ; because no one thing produces so great an alteration at once as a sudden change of air, and that of the mountains being so unproportioned to common respiration, produces in those who pass over it those surprizing and painful effects. 'Tis true, that in that part of the Cordillera in Peru which they call Periacaca, there may be a concurrence of other causes, and a particular disposition of the climate, to which may be attributed some of these effects : For if they were to be attributed only to the height of the mountain, we that pass it in Chili ought to find those inconveniencies as much or more, because the mountain is highest without comparison here ; and yet I never endured those reachings, or vomitings, nor have seen any of those motions in others, but only the difficulty of breathing, which I have mentioned.

Others experience other effects, which I have often heard them relate ; but certain it is, we go through these mountains, treading as it were upon clouds ; when we ascend to the highest we can no longer see the earth for the clouds below, but the heavens are clear, and the sun shines out in its full lustre.

The Iris, or rainbow, which in the valleys we see crossing the heavens, we observe from this height extended under our feet ; nor is it less admirable, that while we travel over these hills, and see at a distance tempests and storms falling into the valleys beneath, the serenity over our heads exceeds that of the finest summer's evening.

There

CHAP.

I.
Vulcano's
in the An-
des.

There are, in this Cordillera, or chain of mountains, sixteen vulcano's, which at several times have broken out, and caused effects very terrible and astonishing to all the country. Amongst the rest, that which happen'd in the year 1640, is worthy to be remember'd; it broke out in the enemy's country, in the territory of the Cacique ALIANTE, burning with so much force, that the mountain cleaving in two, cast forth pieces of rocks all on fire, with so horrible a noise, that it was heard many leagues off just like the going off of cannons.

The first of these vulcano's is called the vulcano of Copiapo, and is about 26 degrees on the confines of Chili and Peru; in 30 degrees is that of Coquimbo; in 31 and a half that of Ligua; in 35 that of Peteroa; in 36 and a half that of Chilau; in 37 and a quarter that of Antoco; this is followed by that of Notuco in 38 and a half; that of Villarica is in 39; near this is another in 40 and a quarter, and in 41 is that of Osorno; and near that, in less than a quarter of a degree, that of Guanatraca; and in a little more than 42 degrees, that of Quetrucabi; and last of all are two more, one without a name, in 44, and that of St. Clement, which is in 45 and a half.

Mines of
the Andes.

These mountains are supposed to be very rich in mines, but there may be two causes assigned why their riches do not manifest themselves more: The first is that general state-reason and inviolable maxim among the Indians, to conceal and not discover them to any other nation: For if any one among them, either out of interest, negligence, or any other motive of convenience, discovers any thing of this kind, his death is infallible, and no power on earth can save him.

The other reason to be assigned for not seeking after these mines is, the great plenty of every thing necessary for life; so that hunger, which is the prompter of covetous desires, being wanting, there are few that care to run hazards, and go through impracticable deserts in search of hidden treasure; especially finding already so much gold in the valleys and rivers, that even the mines in the low countries are not wrought.

Further
observa-
tions on
the Andes.

The difference which may be observed in passing the Cordillera between each side of the mountain is so great, that they seem two different worlds (the east and west parts.) One would think heaven had placed these mountains here to divide them as a wall, and keep off from the west all the storms and ill weather of the east. Any one that travels to the top of them may experience this clearly, for there he discovers both horizons, and when he looks to the east, all is covered with great vapours, which seem to hinder the light, and shadow all the country; and at the same time looking west, the heavens are so bright, that it causes pleasure and joy to look on them. The east side is full of a cloudy thick air, which engenders storms and hail, with horrible thunders and lightnings: On the other side, in the west, there is not a cloud to be seen, but all is clear and bright, as if in the heavens themselves there were such a partition as the Cordillera to divide the climates; and upon earth there is a difference in the trees, plants, and animals on each side.

A curious observer contemplating once from this height, this remarkable difference, said, That nature, in the fabrick of this part of the world, seem'd to have turn'd her back upon the eastern provinces, and look'd with her face only upon Chili, giving blessings with both hands to this last, and leaving the other as it were disinherited, and grieving at the pre-eminency of its elder brother. In going down

to the eastward also, there are fewer fountains and rivers, and those muddy, the face of the land melancholy, without so much as one green tree to recreate the sight, nor any pleasant verdure; and when at last you meet with some, as in the valley of Uspallata, the heats begin to be intolerable, but when we go to the west 'tis quite otherwise; for as soon as we begin to descend, we meet with lovely springs, the trees are green, the groves fragrant and pleasant, and the little valleys are like so many resting-places in that great stair-case; from the very foot of the mountains one feels the mildness of the sea-air, and one is charmed with the harmony of the birds and other delightful objects.

At the foot of the mountains, on the east-side, on the contrary, the land is barren and little cultivated, neither are there flocks of any kind fed or bred; so that the fields look like a barren desert, but this may proceed possibly from the thinness of the people, who have not try'd the fertility of the earth; for the plains below these are extremely fertile where they are cultivated.

The springs on the west-side of the mountains do so fertilize the fields below, that they keep the earth fresh and green all the year: And there is such variety of trees, so admirably disposed, that one would think they were planted by the hand of man; many of these are loaded with the fruits of the country, of which the Indians make excellent liquors, and some of their fruits are very good to eat. The valleys also are full of odoriferous beautiful flowers, produc'd by nature without human industry, and there are among them most extraordinary physical plants. The little hills afford good pasture, and in their valleys, olives, almonds, and all sorts of fruit-trees thrive extremely. In the plains also are vineyards, of which are made excellent wines.

With the first rains of the winter, which are about the middle of May, the Cordillera begins to be cover'd with snow, and to put on, as it were, a white armour to hinder its being passed, not only by men, but even by animals and birds, which are so driven out of it by the rigour of that season, that there is not one remaining in it.

Weather
on the An-
des.

Even the Silguerrillo's and Sorfales (birds, which of their own nature are so hot, that in the very beginning of the summer they take to the mountains) as soon as they perceive that the winter draws near, come in flocks down to avoid its rigour in the mountains; and then the ground being almost covered with them, it proves the season of pleasure, for the youth of the country take and carry loads of them home, reserving some to put in cages, their notes being very sweet. The Cordillera is thus shut up five or six months in the year; so that till October or November, it cannot be passed without manifest danger of one's life, and in the midst of winter not at all, because all the paths and ways are cover'd to the height of many yards; and if any one should be rash enough to attempt it, he would not be able to go forward or backward, as has happened to several who either upon some very pressing concern and interest, or flying from a death which threatened them for their crimes, have found it in these deserts.

These are buried in the very bosom of frost and snow, which preserves them without being embalmed, and yet keeps them incorruptible and dry, for so they have been found after many years; such is the cold of those mountains, that it dries up all the moisture that can cause corruption in dead bodies, and so preserves them.

This

CHAP. I. This difficulty of passing the Cordillera is less at the entrance than at the end of the winter, because the drifts of snow are not then so violent as to shut up the ways entirely. In those seasons, therefore, some do venture to pass, tho' with great danger, and sometimes they are so lucky as to get off well, because they meet with a clear sky, yet at other times it costs them dear, and always 'tis with infinite labour that they get through.

In short, every body has some story to tell of the mountain, and complain of it; for some lose their toes, others their fingers, some their sight, some are benumb'd and lam'd, and so remain all their lives with great infirmities. And I do not wonder at all at this, because tho' one should pass without a storm, yet the cold is so intense, that it cannot but injure nature extremely in that season, since even in the midst of summer when we pass this mountain, and in the lower part of it we sweat with heat, as soon as we come to pass the top, we are forced to put on double cloathing, and prepare the stomach with good warm things to withstand the sharpness of the cold, and the subtilness of the air, which penetrates the body through and through if it be not well covered.

'Tis necessary to observe, that it is of this cold of the mountain that authors speak when they say, that the cold of Chili is so severe, that the rivers are frozen up, and men frozen to death in the fields: For this is true only of those uninhabitable mountains where I believe at that season the rivers are frozen, and if any springs do escape, they are very few, and that in the valleys most secur'd and shelter'd.

And thus the truth of what historians relate may be reconciled; for they not knowing the contrary, make no distinction between the mountains and the plains, in which there never was seen any such effect of cold in any part of them; for the sea-air, which is thick and moist, tempers the sharpness of the blasts from the Cordillera; and for this reason it is, that the colds of the Pampas of Cuyo and Tucuman, on the east side of the Andes, are so insupportable; which being at such a distance from both seas, and not enjoying the warmth of its vapours, the air in summer is intolerably scorching, and in winter so cold, and for want of rain so dry, that 'tis common for animals to be found dead in the fields as well as men.

CHAP II.

Of the springs, lakes, baths, rivers, ports, seas, winds, tides, and seasons of Chili.

CHAP. II.

Springs and Rivers.

I HAVE already taken notice of the numerous springs, lakes and rivers that are found on the mountains of the Andes in Peru: There are as many on the mountains of Chili; and 'tis observed, that springs and rivers abound much more in the low lands of Chili than they do in Peru. The rivers which run from the Andes westward, and fall into the South-sea, both in Peru and Chili, as has been observed, are rapid torrents, generally occasioned by the melting of the snows on those mountains, and the declivity of the ground, and consequently are scarce any of them navigable far from their mouths; but near their sources they run so violently, that there is no crossing them at some seasons. There are rivers also that precipitate themselves from the tops of those high mountains, forming the most beautiful natural cascades that ever the eye beheld, while others tumble from so vast a height, that

VOL. III.

CHAP. II. their waters disperse and fall upon the valleys beneath in drops like showers of rain; and when the sun shines upon them, afford a most agreeable prospect as they descend; of these, the water-works in the palaces of Italy and France are but faint resemblances, and would be contemned by any one that had view'd those splendid effects of natural causes.

OVALLÉ mentions several famous fountains in the mountains of the Andes, particularly those call'd Los Ojos de Agua, or The Eyes of Water, in a valley of about a mile diameter, adorned with evergreens and flowers, which make it the very picture of Paradise, he says. This valley is surrounded with prodigious high rocks, and in the middle of it these fountains spring up, throwing themselves with great force into the air, and falling down again form two large streams, running into a winding serpentine course through the valley, sometimes at a distance, and then approaching nearer each other till they unite at length in one channel and form a considerable river, the water whereof is as clear as crystal, and so extremely cold, that 'tis impossible to drink a draught of it. He mentions also some streams issuing from the Andes, that forcing themselves thro' a mountain, have a natural bridge over them, form'd of a rock, the vault whereof is adorned with stones of various colours, which hang like icicles from the top and sides of it, under which run five different rivers of hot water that cure many diseases.

There are many salutary fountains also in the Baths, plains and valleys of Chili, particularly one that rises at the foot of the volcano of Villarica, and runs into a neighbouring lake. There are two more which rise near each other and form the river Chico, one of them hot and the other cold. The baths of Rancagua, near the town of St. Jago, are celebrated also for the cure of many distempers; those of Mayten, Mapocho and Conchially, have the like healing virtues; but, my author observes, those fountains are the best that are the farthest from the Andes.

The most considerable fresh-water lakes are those of Tagatagua, near St. Jago, and that of Puren, in which the Chileans had an impregnable fortress, from whence the Spaniards could never drive them. They have also several salt-water lakes, which have a communication with the sea, part of the year. In stormy weather the sea forces a way into them, and leaves them full of fish; and when the communication with the sea ceases, as it does in January, and the hot weather comes on, the water congeals, and leaves a crust of fine white salt a foot thick.

I come now to speak more particularly of the rivers of Chili, of which there are fifty large ones rising in the Andes, and running westward into the South-sea, and these are join'd by many other lesser streams that fall into them in their course, none of them running more than 30 or 40 leagues before they reach the sea, and that so precipitately from those high mountains, that they are not navigable (as has been hinted already) for a vessel of any burthen much beyond their mouths.

The chief of these rivers are, 1. The river of Salado, a salt river on the south confines of Peru, which falls into the South-sea in 25 degrees of south latitude, the waters whereof are so hot that they cannot be drank. But, I presume, OVALLÉ talks merrily when he relates that a horse which drank plentifully of them was turned into salt while he was drinking.

2. The river Capiapo, which discharges itself into the same ocean in 26 degrees south latitude. Copiapo river.

- CHAP. II. 3. The river Guafo, which falls into the sea in 28 degrees: The last two forming good bays at their mouths for shipping to ride in.
- Guafo. 4. The river Coquimbo, which discharges itself into the South-sea in 30 degrees south latitude.
- Coquimbo. 5. Govanadore, in 31 degrees, 20 minutes south latitude.
- Govanadore. 6. Jongoy.
7. Lemari.
8. Chuapa.
9. Tongoroma.
- Valpariso. 10. Valpariso, and
- Maypoco. 11. Maypoco. All which discharge themselves into the South-sea between 31 and 33 degrees of south latitude.
12. There are four or five smaller rivers which fall into the sea together, near Valpariso, as FURNEL relates; but says, he does not know another instance of so many rivers so near together on the whole coast of Chili.
- Maule. 13. The river Maule, one of the largest of their rivers, the mouth whereof is in 33 degrees and an half.
- Itata. 14. The great river Itata, in 34 degrees.
- Bobio. 15. The river Bobio, in 37 degrees, esteemed the largest river in Chili.
- Imperial. 16. The river Imperial, which falls into the South-sea in 38 degrees, 40 minutes.
- Baldivia. 17. The river of Valdivia, or Baldivia, which discharges itself into that ocean in 40 degrees south latitude.
- Chico. 18. The river Chico, Balena, and Coronado, which fall into a great bay, form'd by the island of Chiloe and the Main, between 41 and 43 degrees of south latitude, to the southward of which are the river of Martyrs and the river of the Apostles, which fall into the South-sea between 45 and 48 degrees of south latitude.
- Coronado. 19. The chief ports of Chili upon the South-sea, are, the port of Copiapo, in 26 degrees south latitude; of Coquimbo, in 30 degrees; of Govanadore, 31 degrees, 20 minutes; of Valpariso, 32 degrees, 30 minutes; of Itata, 34 degrees, 35 minutes; of Concepcion, 37 degrees; of Santa Maria, 37 degrees, 30 minutes; of La Moucha, 38 degrees, 30 minutes; of Valdivia, 40 degrees; of Brewers-haven, or Carelmepe, 41 degrees, 30 minutes; of Castro in the island of Chilve, 42 degrees, 30 minutes.
- Ports. 20. The seas that border upon Chili, if we include Patagonia, are the Atlantic on the east, and the South-sea, or Pacific-ocean, so nam'd from the fine serene weather seamen meet with there, on the west; but this pacific name is only proper to that part of the South-sea which lies within 30, or at most 35 degrees of south latitude, for all that lies south of 35 is as subject to storms as any other sea, and the winds are variable as in other places. But to the northward of 35 or thereabouts, the winds are always southerly two or three points upon the shore, and these southerly winds continue to blow 140 or 150 leagues to the westward of the shore before they alter; and at 200 leagues to the westward, the true trade-wind sets in at east-south-east 'till you have passed the Pacific-ocean and arrive at the East-Indies.
- Seas and winds. 21. The tides on this coast rise but nine or ten foot, it being an open bold shore, with very few bays or harbours in it; and 'tis an observation of DAMPIER and other seamen, that the tide never rises so high on such a shore as it does where there are bays, gulphs and great rivers that confine it.
- Tides. 22. In speaking of the seasons of Chili it is necessary to have regard to the three grand divisions which are comprehended under that general name; for these are as different from each other in many respects as they are from any other part of the world almost; only in this they all agree, that when it is summer, in those countries which lie to the northward of the Tropic of Cancer, as Europe, Asia, and North America for the most part do, then it is winter in Chili and all other countries to the southward of the Tropic of Capricorn.

CHAP. II. SEASONS.

The three grand divisions of Chili are, 1. That of Chili Proper, which lies between 25 and 45 degrees of south latitude, and between the mountains of Andes and the South-sea. 2. The province of Cuyo, or Cuito, which lies between the Andes on the west, and La Plata on the east; and 3. Terra-Magellanica, comprehending Patagonia and Terra del Fogo, and extending from 45 degrees of south latitude to Cape Horn, in 57 degrees, 30 minutes, bounded by the Atlantic-ocean on the east, and the South-sea on the south and west.

The three grand divisions of Chili are, 1. That of Chili Proper, which lies between 25 and 45 degrees of south latitude, and between the mountains of Andes and the South-sea. 2. The province of Cuyo, or Cuito, which lies between the Andes on the west, and La Plata on the east; and 3. Terra-Magellanica, comprehending Patagonia and Terra del Fogo, and extending from 45 degrees of south latitude to Cape Horn, in 57 degrees, 30 minutes, bounded by the Atlantic-ocean on the east, and the South-sea on the south and west.

1. In Chili Proper the spring begins in the middle of August, and lasts to the middle of November, when the summer begins and lasts 'till the middle of February; and then follows the autumn, which lasts 'till the middle of May, when they enter upon their winter. The trees are all bare of leaves, and white frosts cover the ground in a morning, which are usually dissolv'd however within two hours after sun-rise, and 'tis very seldom that any snow falls in the valleys or low grounds.

Neither the heat or the cold are so great here as in other countries of the same latitude, but that part of the country which lies next the sea is warmer than that which is contiguous to the mountains: Nor is there so much cloudy or rainy weather here in winter as in countries that lie in the same latitude either north or south. The north wind, which brings wet weather with it, seldom lasts more than two or three days at a time, and then is succeeded by the south wind, which is always attended with a bright clear heaven, and brings health and pleasure with it. In summer they have constant serene settled weather without rain; nor have they occasion for any, the country is so well watered by the rivers of melted snow, which in the beginning of the summer descend from the mountains of Andes.

2. In the province of Cuyo, which lies east of the mountains of Andes, extending from La Plata to 45 degrees, on the contrary, the winter is extreme cold, it freezes in the house, and their cattle die if left abroad; and the heats are equally intolerable in summer: Thunder, lightning, and tempest, are frequent here also in the summer, and such deluges of rain in the spring, as overflow the country; all which, it is supposed, the mountains of Andes screen the country of Chili Proper from: But then I find the province of Cuyo has scarce any rain in the winter, only continued frosts and bright settled weather.

3. As to that part of the country which is call'd Terra-Magellanica, and Patagonia, which I have comprehended within the bounds of Chili, and lies between 45 and 57 degrees, 30 minutes south latitude:

This is a cold uncomfortable country, and, according to our seamen, who have surrounded it, the cold is more intense here than in other countries in the same latitude in our northern hemisphere. Certain it is, that none of our European Adventurers have been invited either by the air or soil to plant colonies either on the east or west coast of Patagonia, or Terra Magellanica, hitherto, and the Spaniards that possess the rest of Chili, contiguous to this country,

CHAP. II. country, perfectly neglect it, and do not think it worth their while to penetrate further southward than to the latitude of 45 or thereabouts; tho' they claim the property of the land as far as the promontory of Cape Horn, the farthest boundary of South-America.

CHAP. III.

Of the provinces and subdivisions of Chili, and of their chief towns, buildings, and fortresses.

CHAP. III. **THE** provinces and subdivisions of this country are the same I mention'd in treating of the air and seasons, viz. 1. Chili Proper. 2. Cuyo, or Cuito; and 3. The southern district of Terra Magellanica, in which is included Patagonia and the Terra del Fogo.

CHILI PROPER. The province of Chili Proper is bounded by Peru on the north; by the province of Cuyo, or Cuito, on the east; by the Terra Magellanica on the south; and by the Pacific-ocean on the west, being about fourteen hundred miles in length from north to south, and scarce an hundred in breadth, from east to west, being confin'd between the mountains of Andes and the South-sea.

The chief towns in Chili Proper are, 1. St. Jago. 2. Concepcion. 3. Coquimbo, or La Serena. 4. Baldivia, or Valdivia. 5. Imperial. 6. Villarica. 7. Osorno. 8. Castro. 9. Copiapo. 10. Guasco. 11. Angol, or the city of the Confines; and 12. Arauco.

St. Jago. 1. The city of St. Jago, situated in 34 degrees south latitude, 77 west of London, 2 leagues west of the mountains of Andes, and 18 east of the Pacific-ocean, on a small river at the foot of a hill, in a pleasant and fruitful valley, which is above 28 leagues in circumference, and watered by the great river Maypo, or Maypocho, on the banks whereof the Indian villages are very numerous. The Spanish writers relate, that there were not less than four-score thousand Indians inhabited this valley when they first arrived there, which, from the great river that runs through it, was call'd the valley of Maypocho.

St. Jago being the metropolis of Chili, before it was destroy'd by the natives, was the largest and best built city in the country, and, according to the usual Spanish model, had a great square in the middle of it, from whence the principal streets ran in a direct line, and were cross'd by others at right-angles. On the north-side of the great square stood the town-hall, in which their Courts of justice were held; and on the west the cathedral and Bishop's palace; and the other two sides were adorn'd by piazza's and balconies over them. Besides the cathedral, there were several parish-churches, monasteries, and nunneries, built with white hewn stone, and richly adorn'd; and into the principal streets were brought canals from the river, which lies on the north side of the town, and from thence their gardens and the adjacent fields were watered in the dry season, the town being plentifully supply'd with all manner of corn and fruits, both European and Indian, and with flesh of all sorts from the numerous flocks and herds that are fed in the valley that surrounds it. This was a Bishop's see, the seat of the Governor of Chili, and the Courts of justice here was a university, at least the fathers had schools in their monasteries, and a power of conferring degrees on such as had qualified themselves for them by their studies. This city was founded by PETER DE VALDIVIA, who conquer'd this part of Chili in the year 1541. Valparizo is the port-town to it.

2. The city of Concepcion, situated on a fine bay of the South-sea, in the form of a crescent, in 37 degrees south latitude, the island of Santa Maria lying before it, and forming a good harbour. The town to the landward is encompass'd by hills that rise gradually one above another, and are planted with vines and fruit-trees in a semi-circular form, affording a most agreeable prospect from the sea. This town also is a Bishop's see, and was founded by VALDIVIA, in the year 1550.

3. Coquimbo, or La Serena, is situated in 30 degrees south latitude, on a small river in a fine valley (from whence it takes the name of Coquimbo.) It stands in full view of a bay of the sea, from which 'tis about two miles distant, over-looking a fruitful plain, which lies between the town and the sea. This place is of a pretty large extent, containing seven or eight churches, and several monasteries, but of no great strength, as the Buccaneers relate, who took the town and burnt it in the year 1680, with an hundred men only, tho' the Spanish garrison consisted of treble their number; but the people had carried off most of their treasure and valuable effects. This town also was founded by VALDIVIA, in the year 1544.

4. The town of Baldivia, or Valdivia, is in 40 degrees south latitude, situated on an eminence at the point of a peninsula, form'd by two rivers, which, with the islands before it, make it the securest and most spacious harbour on the coast of Chili. It is defended also by several forts on the said island and peninsula: but, in the opinion of Sir JOHN NARBOROUGH, who visited this port by the command of King CHARLES II. in the year 1670, the town might easily be taken.

The passage up to the town for great ships is on the east side, being about 6 leagues, but it is not above 2 leagues from the sea by another passage on the west-side, by which the smaller vessels go up. This Commander observ'd there were three rivers fell into the harbour, but they were not navigable much beyond the town: What this place is most considerable for besides the harbour is, the rich gold mines in the neighbourhood, in the working of which, PETER VALDIVIA, who founded it in the year 1552, and gave his own name to it, employ'd twenty thousand Indians, who finding themselves cruelly oppress'd, by being forced to dig in the mines and to do other intolerable drudgeries, rose upon the Spaniards, re-took this and most of the towns they had built, and making VALDIVIA prisoner, 'tis said, pour'd melted gold down his throat, reproaching him, that his avarice was not to be satisfy'd otherwise. The war continued between the Spaniards and the Chilians for an hundred years, and is not entirely ended at this day, tho' the Spaniards have repossess'd themselves of Baldivia and some other places; but I shall enlarge upon these articles when I come to treat of the history of this country.

5. The town of Imperial is situated on an eminence at the confluence of two rivers, in 39 degrees south latitude, about 23 leagues to the northward of Baldivia, being about 3 leagues distant from the sea, but the port is not deep enough for vessels of any considerable burthen.

6. The town of Villarica, situated on a lake near the foot of the Andes, in 40 degrees south latitude, 20 leagues east of Baldivia. This place obtain'd its name from the vast quantities of gold found in the adjacent country. It was taken and destroy'd by the Chilians, in the year 1604, who put every man they found in it to the sword, not sparing

CHAP.
III.

sparing the Priests or Monks, and carried the women into captivity, in revenge for the numerous cruelties exercised on them by the Spaniards: Nor can I learn that the Spaniards have ever re-built the town since, or even re-possess'd themselves of this part of the country.

Oforno.

7. Oforno is situated on a bay of the sea, in 41 degrees south latitude, about 20 leagues south of Baldivia, and was built by HURTADO DE MENDOZA, who succeeded VALDIVIA in the government of Chili. This town was also destroy'd by the Indians in another insurrection, but the Spaniards afterwards rebuilt it, and are possess'd of it at this day.

Castro.

8. Castro is situated on the west side of the island of Chiloe, in 42 degrees south latitude. This town was built by the Spaniards, about the year 1600, when the Chileans had in a manner driven them from the continent, and forced them to fly for refuge thither. This island of Chiloe, according to Sir JOHN NARBOROUGH, extends from 41—40 south latitude to 43—30. It is a fruitful island, and bears good wheat; and both here and at Oforno, over-against it, there is great plenty of gold, which the Spaniards purchase of the natives; but the Chileans will not suffer the Spaniards to search for mines as formerly, keeping possession of all the inland country, and maintaining their liberties to this day, which they recover'd with so much bravery after the Spaniards had enslaved them, and in appearance establish'd their dominion.

Copiapo.

9. The town of Copiapo is situated 26 degrees north latitude, at the mouth of a river of the same name, which, with an island that lies before it, forms a tolerable harbour in the South-sea. The valley of Copiapo, to which this town communicates its name, was the first the Spaniards possess'd themselves of after their conquest of Peru, being a fruitful and well-peopled country.

Gualco.

10. Gualco is situated on a bay of the same sea, in 28 degrees south latitude, where ships ride secure from the south and south-west winds, but is not a place of any consequence.

Angol.

11. Angol, or the city of the Confines, is situated in 38 degrees south latitude, in a fine fruitful plain 8 leagues west of the mountains of Andes, being wash'd by the great river Biobio on the south, and another river on the north, and is said to be founded by VALDIVIA, soon after the town of Concepcion, from which it is about 20 leagues distant.

Arauco.

12. Arauco is situated about 5 leagues north of Angol, and gives name to a valley inhabited by the bravest people of Chili, who long defended their country against the invasion of the Spaniards, and when they were subdu'd by the irresistible artillery, fire-arms, and cavalry of the Spaniards, not being able to bear the oppression of their conquerors long, had recourse to arms again, took the towns and fortresses that had been built to keep them in subjection, and defeated and kill'd their General VALDIVIA in battle, as will be more particularly related in the ensuing history.

Cuyo province.

13. The province of Cuyo, or Cuito, in which I comprehend the deserts of Pampas, is bounded by La Plata on the north; by the Atlantic-ocean on the east; by Patagonia on the south, and the mountains of Andes on the west; being about a thousand miles in breadth generally from east to west, and extending from the 35th to the 45th degree of south latitude; of which the Spaniards are masters only of a very small part between the Andes and La Plata; the rest of the country be-

tween the Andes and the Atlantic was never yet subdu'd.

I find but three Spanish towns mention'd in the province of Cuyo, viz. 1. Mendoza. 2. St. John de Frontiera; and 3. Oromante, or St. Lewis of Loyala, all of them upon the northern confines, the Spaniards possessing very little of this country on the south and east.

1. Mendoza is situated in 35 degrees south latitude, on a pass of the mountains of the Andes, between the provinces of Chili Proper and that of Cuyo.

2. St. John de Frontiera is situated to the northward of Mendoza, on the confines of La Plata.

3. Oromante, or St. Lewis, is situated south-east of Mendoza, in 36 degrees south latitude, and 70 degrees of western longitude, which is all the description I can meet with of these three towns.

3dly, The province of Patagonia, or Terra Magellanica, in which I include the Terra del Fogo, is bounded by a line drawn from the Atlantic to the Pacific-ocean, in 45 degrees of south latitude, on the north; by the Atlantic-ocean on the east; and by the South-sea, or Pacific-ocean, on the south and west. The most southern promontory, call'd Cape Horn, lying in 57 degrees, 30 minutes south latitude.

In this part of the world I meet with no towns either of the natives or Europeans, and therefore I proceed in the next place to describe the houses of the Chileans, and their way of life in these three Chilean provinces.

The Chileans do not live in towns, but every tribe extends itself on the bank of some river in the valleys between the mountains, their houses standing regularly, and at a distance from each other; neither do they remain long in one place, but remove for the conveniency of pasture, and, as the season of the year requires, sometimes into the higher and sometimes into the lower grounds, in which they do not find much difficulty, for their houses are all upon a floor, slightly built of wood, and consist of three or four rooms only, which are so contriv'd that they can be taken asunder and remov'd one after another: Their doors have neither hinges, locks, or bolts, their furniture being so mean, though they live in one of the richest countries in the world, that they fear no robberies: Their beds are the skins of beasts laid upon the floor, a block or a stone serves them for a pillow, and they lay a coverlet or two over them, made of the wool of their country sheep. Their dishes are of wood, or made of some calabash, or gourd, which serve them also instead of pails and pitchers; earthen pots they have to boil and stew their meat in; a rough unhewn block serves for a seat, and another of the same kind for a table; and their lances, swords, and other arms are the principal ornaments of their houses: This is to be understood of the Indians of the province of Chili Proper; for those who inhabit Cuyo, and the plains on the east side of the mountains of Andes, are still less polish'd. Some of them live in caves, and others, after the Arabian way, are ever roving from one part of the country to another; and that they may do this with the greater ease, they have no houses at all, only a slight tent made of the skins of beasts to shelter them against the rain and sun, and they have nothing to do but to take up their tent-poles and skins, whenever they are dispos'd to march.

They look upon it as a sort of imprisonment to be confin'd to one place, therefore have neither houses,

CHAP. III. houses, gardens, plantations, or furniture to clog or stop their progress.

The liberty of wandering whither they please is esteem'd the greatest of all earthly blessings. Sometimes, say they, we are pleas'd with the freshness of a river side, and weary of that, we resort to the woods and shades, and then again we remove to the open and champain country. All the pleasure of life is in variety. In one season we hunt, in another we are employ'd in fishing, and in another we enjoy the fruits of the earth, which are produc'd spontaneously; when these begin to fail us in one country, we resort to another. Whenever we happen to encamp, that is our home. We have no more fondness for one place than another. We go where we will, without leaving any thing behind us we much regret or desire, which uses to torment those who have fix'd habitations when they are forced to part with them, or from them: We fear no ill news, having nothing to lose. Our wives and children are our only treasure, and while we have these we want nothing.

As to the natives of Patagonia, or Terra Magellenica, I could never learn there was a single town in the country, and scarce any thing that looks like a house; nothing but poor huts of a pyramidal form, just to screen the miserable inhabitants from the rigour of the weather have ever been seen there, and very few of these; for this seems to be the most thinly inhabited of any part of South-America.

Fortresses. As to the fortresses, and strong places of the Chileans, according to the account the Spaniards give us of them, they seem to resemble those of the ancient Britons. They were usually situated in woods, surrounded by lakes, or morasses, and the trees cut down and laid a-cross serv'd them instead of walls. Where they had no water or marshes to defend them, they made broad ditches, and planted sharp stakes at the bottom of them. In some places the ditch was cover'd over with a slight crust of earth, so that the Spanish horse fell in upon them when they least suspected it; and this seems to have been a common stratagem all over America to dig pits in the roads and set stakes in them whenever they expected to be attack'd by the Spanish cavalry; but the Spaniards reveng'd themselves with great severity on the natives whenever they happen'd to lose either men or horses by this stratagem.

CHAP. IV.

Of the persons and habits of the Chileans; their genius, temper, arts, manufactures, food, exercises, and diversions.

CHAP. IV. THE Chileans, according to Sir JOHN NARBOROUGH, are of the middle size, and strong limb'd, of a tawny complexion, and have long black hair exceeding harsh; their features tolerably good, their teeth white and sound, active of body, but of a dejected countenance. They agree with the rest of the Americans in pulling the hair off their chins and other parts of their body, as soon as it appears, with tweezers, or nippers made of shells. Their women are moderately tall, slender, and well-shap'd: They braid and curl their hair frequently, letting it grow to a very great length.

When OVALLE, and other Spanish writers, tell us that the Chileans are very fair, it must be understood in comparison of those Indians that lie near the Equinoctial, and perhaps they may be fairer than some of the Spaniards and Portuguese;

VOL. III. NUMB. CXXVI.

but Sir JOHN NARBOROUGH, who was an Englishman, esteem'd them very tawny compar'd with his countrymen.

As to those Chileans who inhabit the province of Cuyo, and the plains of Pampas, between the mountains of Andes and the Atlantic-ocean, these are people of a larger stature than those of Chili Proper, and of a darker complexion, and the women paint their faces, or some part of them green.

The third province of Chili, denominated Patagonia, and Terra Magellenica, is the country which our first Discoverers peopled with giants, dwarfs and monsters: But none that have visited these coasts the last hundred years having seen any thing of this kind, the most credulous seem now ready to give up those relations as fabulous; I shall say nothing more therefore of the people that inhabit this tract of land, but that the further we proceed to the southward beyond the Equator, the more robust the people are, and the lighter the colour of their hair, as we find it in our northern hemisphere; and as they have very little communication with any part of the world, they are esteem'd as savage as any of the Americans.

The men of Chili Proper wear a loose garment made of the wool of their country sheep, pretty full, and reaching down to their knees or lower, which is put on like a surplice, not being open before, or on the sides, and has not sleeves. They have a kind of open drawers and doublets, but no shirts, any more than shoes and stockings, but wear a kind of buskin, or half-stocking, on their legs; and on their heads a stiff hat or cap, cock'd up before like a dragoon's cap, the crown of which is sometimes adorn'd with a beautiful plume of feathers, dy'd wool, or a nosegay of flowers.

The habits of the women differ little from those of the men, only they have no covering on their heads, but a kind of coronet of wool of several colours binds their temples. Their hair is part of it curl'd and braided, and the rest flows down their backs to a great length. The women have also a kind of sash with which they bind or swathe their bodies from the middle upwards, and when they go abroad, throw a cloak or mantle over all.

On festivals their cloaths are of the same form, Ornamented but finer, and of more beautiful colours: and as ornaments, they adorn their heads with feathers or flowers, their necks are cover'd with chains of beautiful shells, or precious stones.

The Indians on the east side of the Andes, in the province of Cuyo and the plains of Pampas, are not near so well clothed as those on the west: They are contented with leaves to hide their nudities, and the skins of beasts serve them for cloaks, or mantles, which is all the cloathing they wear as far as I can learn, and their ornaments are some glittering trifles which they hang upon their lips, that are bor'd through for that purpose, and rather disfigure than adorn their faces, in the opinion of strangers.

As to the people of Patagonia, or Terra Magellenica, 'tis said, they go like the ancient Britons, perfectly naked, though they live in an exceeding cold climate; so cold, that the Spaniards who were sent to build forts and settle colonies in the Straights of Magellan, all of them perish'd, and the whole country is so disagreeable to Spanish constitutions, that they have not one colony in it, though they claim the property of the whole as far as Cape Horn, the most southern promontory in America.

As to the genius and temper of the Chileans, Genius and temper, they are the bravest people of the new world, and to this day remain unconquer'd, for the most part.

22 U

The

CHAP. IV. The Peruvian Emperors formerly made some impression on their northern frontiers, but were repuls'd when they came to the valley of the Araucans, and could never penetrate further. The Spaniards, by the advantage of their artillery, fire-arms and horse, which these people had never seen before, also subdu'd several of their provinces; but when the terror of these were over, and the Chileans had learned the use of fire-arms, and to manage horses, they revolted and drove the Spaniards out of their country, of which they at this day retain but a very small part near the coast of the South-sea, as will be observ'd in the ensuing history.

Nor were these people less remarkable for their wit than their courage; they did not only learn the art of war of the Spaniards, but exceli'd them soon in warlike stratagems, and their Generals became superior to the Spaniards: What gave their enemies a vast advantage of them at first was, their being divided under so many petty Princes, the heads of their clans; but they no sooner united under one Chief or General, than they became exceeding formidable.

The Chileans are remarkable also for their patience and fortitude, being bred up to hardships from their infancy: They endured fatigue, heat, and cold, to admiration, inasmuch that they wanted scarce any qualification that is requisite to form good soldiers; and where they apply themselves to learn any other art or science, frequently excel their Spanish masters.

In temperance only they are deficient. In eating, drinking, and venereal encounters they know no bounds; particularly at their festivals and entertainments, which last several days, they eat and drink most immoderately, scarce ever parting sober; and the women, as well as men, frequently drink to excess, but then it is by themselves, and at different times; for when their husbands carouse, they make it their business to attend and take care of them when they are disorder'd, and prevent quarrels, which frequently arise when they are elevated.

Their food.

They eat very little meat, except venison, before the Spaniards arriv'd and stock'd their country with beef and mutton, hogs and goats; for America, as has been observ'd, produc'd no such animals, and now they seldom eat flesh but at their festivals: Their usual diet is maiz, or Indian-corn, boil'd, parch'd, or ground, and made into paste, with pulse, roots, fruits and herbs: Their drink is either made of their Indian-corn dry'd and steep'd, or of their fruits, and is very strong and palatable; and in the southern provinces the Spaniards have introduc'd grapes, and make good wine, but the northern provinces are too cold for it.

Their diversions.

They dance, sing, and play upon instruments at their festivals, tho' they make but dull musick with their wooden drums and flutes, as they are call'd; and if their wind-instruments are made of the bones of their enemies, as some relate, it cannot be very harmonious. They dance round a kind of may-pole, as the common people sometimes do here, but with this improvement, that they lodge several bottles of good strong liquor about the pole, and drink round to one another in the intervals of their dances 'till they are exceeding merry, and sometimes very drunk. And thus they frequently pass away whole nights as well as days; and it is when the men are thus heated with liquor that they resolve upon some expedition against their enemies, or on a hunting-match, in both which they will endure incredible fatigues, tho' they live so luxuriously at

other times: And indeed it is their laborious exercise, and the hardships they sustain in the field, that makes them excel all other Indians in military exploits, and gives them such robust constitutions: Pain and pleasure they experience alternately, and the labours of the chase, or a severe campaign, give a relish to their foster amusements.

Their children are bred up from their infancy to endure hardships, to manly sports and the exercise of arms; and even their women are not exempted from them, but attend their husbands in the most hazardous enterprizes, in which they sometimes bear a part. The whole nation is so addicted to war, that it seems to be both their business and their pleasure: Nor did they ever want an exercise for their courage during the reigns of the Peruvian Emperors, who were perpetually invading and harassing their frontiers, tho' they could never make any great impression on them. Since the Spaniards arriv'd, they have been in a perpetual state of war with those invaders, and have learn'd of them to manage their horses so well, and to use the fire-arms they have taken from the Spaniards, that to this day they maintain the inland-country against them, suffering the Spaniards to possess only some few towns upon the coast. This genius for war, possibly, may be one reason they have made so little improvement in other arts and sciences; for except those who form their arms, their bows, arrows, lances and darts, there are very few artificers among them: And indeed they have very little occasion for mechanicks, neither their houses or furniture requiring many materials, or much skill to put them together; and their cloathing is always the same, not shap'd to their bodies, but loose about them, and they never alter their fashions. However, it appears they understood spinning, weaving, and dying pretty well, and could sew or tack their cloaths together before the Spaniards came amongst them; and where they apply themselves to learn any mechanick art of the Spaniards, they make excellent workmen.

Few artificers.

They had no books, letters, or writings among them, any more than the rest of the Americans, but assisted their memories by quippo's, or knots, as the Peruvians did, and would cast up an account by them with great exactness: And many of them are now become the greatest proficient in the liberal arts who live under the Spanish jurisdiction.

Learning.

The skill the natives of Chili had in physick and surgery was very mean; bleeding, purging, and vomiting, and the application of certain herbs to their wounds, was all they knew of this science almost: And instead of a lancet, they used a sharp piece of flint set in a small cane, not much unlike the instrument we bleed horses with. But the natives are said to be of such strong, hale constitutions, and use so much exercise, that they have very little occasion for physick, and live frequently to an hundred years of age, their memory seldom failing them to the last, any more than their teeth or eyes; but if they are remov'd into Peru or any hot climate, they soon sicken and die, as we find by the Chilean prisoners the Spaniards take and send to their colonies nearer the Equinoctial.

Physick.

So averse are they to slavery, that there is no keeping them prisoners long in their own country: They will run any hazard to make their escape, and sometimes die by their own hands; so much do they dread the cruelty of the Spaniards, who send the captive Chileans therefore to the most distant countries. Several of them however have escap'd back to their own country, even from Lima, which is 500 leagues distant from it; tho' they are forced

Their aversion to servitude.

CHAP. IV. to creep along by the sea-side, and traverse all the turnings and windings of the shore, which make the way as far again; and in this extensive journey they dare not enter any town or inhabited place for fear of being retaken by the Spaniards, inasmuch that they are forced to feed upon cockles and other shell-fish they find by the sea-side. Nor are they less put to it for water to drink in the Peruvian deserts than they are for food: And a further inconvenience is, that they are forced to swim cross the mouths of several rapid rivers in their passage; and yet do they frequently overcome all these difficulties by time and patience, and arrive at their own country.

OVALLE relates, that some of these Chileans being taken captive, and sent in chains from Baldivia to Peru on board a ship, found means to get off their fetters, and jumping into the sea, swam on shore when the ship was more than a mile distant from it; and that one old man, who was not so fortunate as to get away with the rest, when he found all his companions gone, the next day fell upon the master of the ship, and having wounded him in several places with a knife, threw himself into the sea, but was shot before he could reach the shore; which occurrence OVALLE produces as an instance of the bravery of the Chileans, and the aversion they have to the being carried out of their country.

CHAP. V.

Of the animals of Chili.

CHAP. V. **I**N this country we meet with the Peruvian Sheep and Goats, and such other quadrupedes as have been described in Peru, but they don't seem to have abounded in four-footed animals in any part of America, or to have had that variety of them as we have in this part of the world. The Spaniards, however, transported thither almost every species about two hundred years ago, which being left to run wild in their forests, are vastly multiply'd, inasmuch that 'tis said, the Chileans can now bring a body of ten or twelve thousand horse into the field at a short warning; and they carry on a very great trade with the hides of their black cattle as well as the flesh, which they dry and send to Peru, but are forced to burn or bury vast quantities of beef every year, not having a sufficient demand for the flesh of those numerous droves they annually kill for their skins.

Their birds and fowls also are much the same that are found in Peru; Eagles, Hawks, Parrots, and the Couder, a prodigious large and ravenous bird of prey, two or three of which will seize upon a young calf or heifer and devour them, and they are not afraid to attack boys or girls; but of these there are not many here, any more than in Peru.

The Parrots fly screaming in such numerous flocks, that they obscure the sight of the sun, and never fail to come down from the mountains into the valleys at the season of the year when the fruits are ripe, of which they destroy great quantities.

At the time when they slaughter their beef, there comes down another voracious fowl, larger than a duck, which gorges itself with the carcases that are left in the fields, so that it cannot fly till it has got rid of its load; and they are hunted and knock'd on the head by the boys at this season.

The Ostrich is another bird the natives hunt, and tho' he cannot fly, yet by the help of his wings

he runs so swiftly that he frequently escapes from the fleetest dogs and horses.

They have another long-legg'd fowl, bigger than a turkey, that wades through ponds and rivers, and lives upon fish. These the Indians hunt for their feathers, which are red and white, and take many more fowls on the same account; for plumes of beautiful feathers are the principal ornaments of their heads. They abound also in singing-birds of various kinds, many of them unknown to this part of the world; and they have several the same as ours, such as Linnets, Nightingales, Blackbirds, and Finches. Of tame fowls they had but one sort, between a Duck and a Hen, when the Spaniards arrived here, but now they have introduced all manner of European poultry, which multiply exceedingly, and are much better food here than in warmer climates. These only, of all the people of America, can say they are gainers by being acquainted with the Spaniards; for they still retain their liberties (most of them) and have acquired the possession of European cattle, fowls, grain, and fruits, which they wanted before. They have also learned several arts and sciences of the Europeans, and in many instances excel their masters.

Their lakes and rivers abound in good fish as well as their seas. Whales and Grampus's are frequently found on the coast of Chili, and there is plenty of Albecores, Boneta's, flat-fish, and shell-fish.

CHAP. VI.

Of their forest and fruit-trees, grain, plants, herbs, roots, flowers, and minerals.

AMONG the forest-trees of this country, the principal are the Cypress-tree, the Cedar, the Oak, the Paregua, and the Cinnamon-tree, so call'd, I presume, from some resemblance it may have to the true Cinnamon in its colour; but the bark has neither that fine smell or taste as the true Cinnamon has. This timber is used chiefly in their buildings, and they have also the Sandal, the Palm, the Pine-tree, and the Guayac, which is a wood as hard and as heavy as iron almost. There is another tree call'd the Thorn-bush, that grows in clusters, or groves, which is their ordinary fuel near St. Jago: It has some resemblance of an Oak; but more durable; the heart of it is red, and scarce ever decays. They make charcoal of this wood for their furnaces and forges. Both this and the Oak lose their leaves in winter, as well as their fruit-trees, but there are some wild trees that do not, though covered with snow. The mustard-plant, OVALLE relates, grows vastly large here: He says, he has travelled many leagues through groves of mustard, which were taller than man and horse, and the birds, as 'tis said in the Gospel, build their nests in the branches.

As soon as the first rains fall in the spring, the fields are clothed with green, and within a month there is good grass, with which nature produces yellow flowers in great abundance, and after these, a vast variety of other flowers, red, blue, green, yellow, &c. of which, OVALLE says, he numbered two and forty several sorts at one time: Nor did he reckon among these any of their garden flowers, or those brought from Europe, such as Carnations, Roses, Gilliflowers, Lillies, &c. and those wild flowers smell extremely sweet morning and evening, as do several of their green herbs, from which they distil perfum'd waters.

They

CHAP.

VI.

Medicinal
herbs.

They have also physical herbs of great virtue, and the Spaniards have discovered many more, since their arrival, than the natives were acquainted with, some whereof will expel poison.

OVALLE mentions a plant call'd Quinchamali, which rises about a foot above the ground, and spreading like a nosegay ends in little flowers that resemble saffron; this they take up and boil with the roots, and the liquor being drank hot, dissolves any coagulated blood in the body, occasioned by wounds or bruises, preventing impostumations.

Another of these healing herbs is called Albaquilla, which grows on a shrub almost as large as a tree; the leaves are fragrant and sweet to the taste, the juice whereof apply'd to green wounds is a present cure.

A third healing herb grows like a lock of fine hair, and being boiled in water and drank, cures fevers and pleuristics. There are herbs that cure the Sciatica, others that dissolve the stone in the bladder, and, if we may credit OVALLE, here are herbs that cure almost every malady.

Fruits.

The fruits peculiar to the country mentioned by OVALLE are, the Pengu, a red fruit of an oval form, something bigger than a Filbert, which they boil and eat with their meat. The Magne, whose fruit is black, like a Mistle-berry, and well tasted, but perfectly dyes the mouth and hands black. They have many other fruits, of which they make good liquor; but the most admired is the Murtilla, which grows in 37 degrees beyond, and is the common food of the natives of that part of the country: It is of a red colour, and in form like a small grape with little seeds in it, like those we find in figs: This fruit has a delicious taste or smell, and they make a wine of it, which excels our European wine, 'tis said, and all other liquors, and is the more valuable because it grows in a part of the country that is too cold for our wine; and when it turns four exceeds all other vinegar in flavour.

They had also a seed call'd Madi, which afforded very good oil before the Spaniards introduced olives.

As to their fruits in general, the Spanish writers observe, that they have scarce any of those that grow in the countries between the Tropics, and consequently those that are found in Mexico and Peru are not many of them to be met with here. But then they have this advantage, that whatever fruits are carried thither from Europe thrive prodigiously, particularly Vines, Figs, Olives, Apple-trees, Pears, Apricots, Peaches, Quinces, Pomegranates, Cherries, Plumbs, Oranges, Lemons, Citrons and Almonds. But the fruit that thrives most is the Apple of every kind, of which they have prodigious orchards, and they are forced to thin them when they are small, or they break down the trees before they are ripe.

European
fruits.

Corn.

Of Maiz, or Indian-corn, they had great plenty before the Spaniards arrived, but they had neither Wheat, Barley, Oats, Annis, Cummin, Coriander-seed, Linseed, Flax, Hemp, Peas, Cabbage, Lettice, Radishes, Cardoons, Chicory, Endive, Cucumbers, Pursley, Garlick, or Onions, all which they have now in abundance, and in greater perfection than they are to be met with here; and their roots, particularly Turnips, grow to a prodigious size.

OVALLE observes, that though every part of America is obliged to the Spaniards for some of these European seeds and plants, yet they are all to be found only in Chili. In some provinces, says he, they have European grain, in others oil, in others fruit, but in Chili they have now all manner of

trees, plants, seeds and animals almost that are in Europe, and here they thrive and multiply to admiration. He adds, that he has seen Apple-trees, Pears, Mulberry-trees, and Walnut-trees grow to the size of Elms, Strawberries as big as Pears, and Quinces as big as a man's head: That fruit is so plentiful that they enjoy it in a manner in common. No man refuses to let another go into his garden and take what he pleases; and he has seen their best fruits grow wild in the fields for a mile together.

CHAP.
VI.

There are mines of Gold, Silver, Copper, Quick-Mines.

silver and Lead in Peru, but the Spaniards seem to slight all of them but the Gold. When VALDIVIA made a conquest of part of this country, it is said, he employ'd no less than fifty thousand Indians in working the gold mines; at which the natives were so provoked, that they made a general revolt, defeated and kill'd VALDIVIA, and drove the Spaniards out of most of the towns they had built. After which they made a law, that it should be capital to discover a mine to the Spaniards or any other foreigners. Nor will they suffer a mine to be opened now; so that though the Spaniards have repossessed themselves of some towns upon the coast, they meet with no other gold at present than what they purchase of the Chilians, who gather none but what they find in the sands of their rivers, or on the surface of the earth, tho' there are more gold mines here than in any part of the world. Both the English and Dutch have endeavoured to cultivate an understanding with the natives of Chili, in order to traffick with them for their gold, but could never succeed. They look upon all strangers to have the like passion for gold as the Spaniards have, and imagine, if they should suffer them to plant colonies there, they would attempt to take their country from them, as the Spaniards have done. And since I am now treating of the produce of this country, it may be proper to say something of the foreign trade of Chili, which consists altogether in exporting that produce to Peru and Mexico; namely, gold, copper, and other metals, hides, tallow, dry'd flesh, fish, corn, fruits, wine, oil, salt, hemp, flax, cordage, leather, timber for shipping and other uses, medicinal herbs and drugs: The chief articles in these exportations being hides and tallow. OVALLE relates, that he has known twenty thousand quintals of tallow exported in one year from Chili to Lima only, and hides and leather in proportion. Their naval stores are another great article, which the Peruvians receive entirely from thence, as also the copper, of which they make their great-guns and bells: And the Spaniards of Chili take in return from Mexico, Panama, and Lima, the merchandize of China, East-India and Europe: At least this was the nature of their traffick when the Spaniards were possessed of this country; but no doubt it must be decreased in proportion to what the natives have received from them.

Foreign
trade.

What has been said hitherto upon this head the reader will observe, relates to the province of Chili Proper; as to that of Cuyo, which lies on the east of the mountains of Andes, and between those mountains and the Atlantic-ocean, we have not so perfect an account as could be wished, nor indeed of any of the inland provinces. The reader must be content therefore with such a one as I can collect from the authors before me, among whom OVALLE, a native of Chili, and who was Procurator for the Jesuits of that province at Rome, is the principal.

He

CHAP.
VI.
The difference
between
Cuyo and
Chili Proper.

He repeats, in the first place, some observations he made upon another occasion, namely, that it is amazing to reflect when there are only the mountains of Andes between the provinces of Cuyo and Chili Proper, they should be so different in their qualities, and in every respect almost diametrically opposite to each other, tho' the latitude be the same.

In Cuyo, he says, the heats are intolerable in summer, while the weather in Chili is very temperate. In Cuyo thunder, lightning, rain, and tempests are frequent in summer, while in Chili they have settled serene weather, without thunder, lightning, or rain. In winter the weather is variable in Chili, but never excessive cold to the westward of the mountains, whereas in Cuyo they have constant serene weather in the winter, and excessive hard frosts, insomuch that the cattle die in the fields if they are not hous'd, and for five or six months every year the passages of the mountains are so lock'd up by the snows, that these two provinces have no manner of communication.

In Chili there are scarce any snakes or poisonous insects, but in Cuyo they abound, and they are tormented also with bugs, musquito's and other vermine, of which they have none, or very few, in Chili.

As for cattle, the Spaniards have pretty well stock'd this province with all manner of European cattle as well as Chili, and they have great numbers of Peruvian sheep and goats of their own. They abound also in corn and wine, and their fruits are said to have a better flavour than those of Chili, their summers being hotter, and of this there is such plenty that they supply the province of La Plata, and even Buenos Ayres, on the Atlantic-ocean, with dry'd grapes, dry'd peaches, apples, oil, and excellent wine. But then this must be understood of that part of the province that lies next the mountains, for the deserts of Pampas extend six or seven hundred miles further eastward, over which they are forced to pass in their way to Buenos Ayres. These, says my author, are vast plains, which, like the ocean, afford an unbounded prospect, but produce neither trees or herbage; and then proceeds to relate the manner of travelling over those deserts, which gives us some further light into the nature of this country.

The deserts of
Pampas.

They travel, he says, in covered carts and waggons, made as commodious almost as an house, with doors to shut, and windows on each side to let in the air; and they lay beds, or mattresses, on the floor, on which they sleep great part of the journey. These waggons are drawn by oxen, and they set out about two hours before sun-set, travelling all night and 'till the sun is an hour high the next morning, and then they bait (not at an inn, for I can't learn there is a single house in the country) but they rest and eat that provision they carry with them, or take in hunting by the way; for those that are disposed for rural sports have horses and dogs with them, and take great numbers of the guanaco's and vicunes, a kind of wild sheep and goats, animals almost peculiar to South-America, which have been already describ'd in treating of Peru. They take also a great many partridges, francolins, and other game, from whence one would be inclin'd to think it must be a mighty pleasant journey from Chili to Buenos Ayres; but travellers inform us that they are subject to inconveniencies which very much abate the pleasure of it, particularly the excessive heats which oblige them to lie still all the middle of the day, and then they have no other defence from the sun or rain than what the waggon

VOL. III.

affords at many stages, though at some there happens to be small brooks and willows growing by them that afford the traveller a refreshing shade: But the greatest inconvenience is the want of water; which they do not meet with sometimes for several days journey, and therefore are forced to carry water both for themselves and their cattle; and sometimes this is all spent, as my author says it happen'd when he pass'd these plains, and they must have perish'd if they had not happily been reliev'd by a shower of rain. But all this might be remedied if the country was inhabited; for they meet with springs it seems in many places within a few yards of the surface: And the rains alone, which happen frequently in summer, might be preserved in cisterns and reservoirs, if there were any towns or villages in the country; but at present, says my author, these are the difficulties we meet with in the plains of Cuyo, Tucuman, and Rio Plata; adding, for many leagues we do not see a hill, a tree, or a stone, any more than water, unless our way lies near the banks of the river Plata, or some other river.

CHAP. VII.

The history of Chili, containing the ancient and present state of that country.

THE first account the Spaniards receiv'd of Chili was from the Peruvians, who subdu'd the northern part of that province in the reign of their tenth Inca, YUPANQUI, but afterwards met with so powerful an opposition from the confederate Chileans, that the Inca's determin'd to make the river Maule the utmost bounds of their empire, and accordingly fortified the banks of it against the invasions of the Barbarians, as they call'd them; for all we can learn of the ancient Chileans from the Peruvians is, that they worshipp'd a great many creatures animate and inanimate as gods, and were very unpolish'd and unciviliz'd; that they had no other form of government than the patriarchal. Every tribe or family was governed by its respective head, or chief, who was succeeded by his eldest son, or nearest relation, on his decease. And when they were invaded, or had wars with their neighbours, they made choice of the man most famous for courage and military skill for their General. As to that part of the country that was conquer'd by the Inca's, the Chileans were obliged to conform themselves to the religion and manners of the Peruvians, and their Emperors made no difference between these and the rest of their subjects.

DON DIEGO DE ALMAGRO was the first of the Spanish generals who, after the reduction of Culco, the capital of Peru, undertook an expedition against Chili, in which he was introduced by the Inca PAULLA, who put him in possession of that part of it which was under the dominion of the Peruvian Emperors, about the year 1535, as has been already related in the history of Peru: After which, ALMAGRO subdu'd some of the more southern provinces of Chili; and probably would have extended his conquests further, if he had not been oblig'd to return to Peru to make head against the PIZARRO's, who had formed a design to deprive him of his share of that province, and to have usurp'd the sole dominion of all the conquests the Spaniards had made to the southward of the Equator.

VALDIVIA, or BALDIVIA, was the next Spanish Commander that attempted to extend their conquests

conquests in Chili. He had served in the wars of Italy, and was look'd upon as one of the best officers that went over to America, for which reason he was made choice of by the Marquis PIZARRO to enlarge their empire on that side. VALDIVIA enter'd upon this service in the year 1540, and met with little opposition from that part of Chili which was subject to the Inca's; but on his advancing further he was frequently encounter'd by the confederated Caciques. However, he penetrated as far as the valley of Mapocho, which he found extremely fruitful and well-peopled. In this valley, being 80 miles in circumference, and situate 2 leagues to the westward of the mountains of Andes, he founded the city of St. Jago, in the year 1541, in 34 degrees south latitude, and built a castle for the defence of it and of the gold mines in the neighbourhood, which he compell'd the conquer'd Indians to work in: At which the Chileans were so exasperated, that they rais'd forces and attack'd the castle before it was well finish'd, and were very near carrying it; however they were at length repuls'd, and VALDIVIA acquainting the Vice-roy of Peru with the state of his affairs, received a reinforcement of troops from thence, under the command of JOHN BAPTISTA PASTENE. But still it appears he was not strong enough to make any great progress; and the Indians giving out that there were very rich gold mines in a certain part of the country not far from St. Jago, drew a detachment of his forces (who went in search of them) into an ambuscade, and cut off every man of them except their Commander and a Negroe, who escap'd to St. Jago by the swiftness of their horses. Whereupon VALDIVIA sent for another reinforcement of troops to enable them to advance against the Chileans; and built the town and castle of Coquimbo, or Serena, on a bay of the sea, in 30 degrees south latitude, to secure his communication with Peru, and prevent the supplies being cut off which he expected from thence.

In the mean time the civil wars breaking out in Peru, VALDIVIA was commanded thither with some of his officers and soldiers, and left his conquests in Chili to the care of his Lieutenant FRANCISCO DE VILLAGRA; but the rebels being defeated in Peru, VALDIVIA returned again to Chili with a good body of veteran soldiers, who had serv'd in those wars. During the absence of VALDIVIA, there happened a misunderstanding between his Lieutenant FRANCISCO DE VILLAGRA and PEDRO SANCHEZ DE HOZ, to whom the King of Spain had granted the government of the further part of Peru and Chili, and who with reason therefore expected the command of the forces in Chili in the absence of VALDIVIA; and indeed he had a right to that command before VALDIVIA himself, as he received his commission only from the Marquis of PIZARRO, who had no authority in Chili; nor would Don SANCHEZ have submitted to VALDIVIA's taking upon him the command of that army, but upon condition of his being put in possession of the richest part of Chili.

This VALDIVIA had agreed to, but his Lieutenant VILLAGRA, taking an opportunity to quarrel with SANCHEZ in the absence of VALDIVIA, as has been intimated, made him prisoner and cut off his head, whether by the order of VALDIVIA his rival or not, is uncertain, but he appear'd very well pleas'd with the fact when it was done, having thus got rid of a man that had so much colour to claim the best part of his conquests, and look'd upon VALDIVIA himself as a usurper.

While the Spaniards were thus engaged in civil broils both in Peru and Chili, the Chileans made their advantage of them, surpriz'd the Spanish garisons of Copiapo and Coquimbo, and putting them to the sword, demolished both those towns: And it was with difficulty FRANCISCO DE VILLAGRA defended himself in St. Jago itself 'till the return of VALDIVIA, who bringing a good army with him, restor'd his affairs, drove the Chileans from the valleys of Copiapo and Coquimbo again, and rebuilt the towns the Indians had destroy'd there; after which he marched further southward, and having passed the river Maypo, subdu'd the Promoc's, a warlike nation, who had defended their frontiers not only against the Peruvian Emperors, but against the Spaniards commanded by ALMAGRO. He afterwards transported his troops over the great rivers Maulle and Itata, and observing an advantageous situation on a bay of the South-sea, in 37 degrees south latitude, he founded a city there in the year 1550, giving it the name of Conception. But the Chileans, enraged to see themselves thus bridled and restrain'd of their native liberties by the towns and fortresses erected by the Spaniards in their country, assembled in great numbers, and harass'd the new city of Conception with repeated attacks, killing a great many Spaniards, and endangering the loss of their whole army. VALDIVIA, however, finish'd the fortification of that town the latter end of the year 1550, and having sent out a party to discover the country, advanc'd further southward in the beginning of the year 1551, bending his march towards the plains of Angol; and having cross'd the great river Biobio, founded the city of Imperial on a hill at the confluence of two rivers in 39 degrees south latitude, 4 leagues east of the Pacifick ocean, and 40 to the southward of Conception.

This city stands in a fine fruitful plain, inhabited, as the Spaniards relate, by fourscore thousand Indians when they arriv'd there, a very peaceable nation, that gave them no disturbance while they were building the city, and suffered VALDIVIA to parcel out both their persons and their lands among his followers without opposition.

From hence he marched towards the mountains of Andes, and 16 leagues to the eastward of Imperial laid the foundation of a city, which he call'd Villa Rica, from the richness of the gold mines he found there. And here the Spanish historians take the liberty of censuring the conduct of their hero VALDIVIA, in endeavouring to grasp more than he could possibly hold with the few Spanish forces he commanded. That brave people, they observe, had never been vanquish'd by the Spaniards in so many encounters, if they had not been terrify'd and astonish'd at the firing their artillery and small arms, which the Indians, at first, imagin'd to be real and not artificial thunder and lightning; and that those who discharg'd them were rather gods than men: Their horses and the men upon them, arm'd cap-a-pee, seem'd also invulnerable, not being able to pierce their armour with their spears and darts, which rendered the Spaniards still more terrible. But the Chileans being at length undeceived, and finding their enemies to be but men like themselves, notwithstanding the disadvantage they had in the want of horses, artillery, and armour, resolv'd to make another bold push for the recovery of their liberties, being persuad'd they should be able, by their numbers and courage, to expel these strangers out of their country, who had so unjustly enslaved them; in which they were not entirely mistaken; for the Spaniards, not considering that the dread of their

CHAP.

leians re-
volt.

their arms and horses was now worn off, grew remiss and negligent in their military discipline, and attended more to the enriching themselves than to the securing their conquests, which was attended with many ill effects; for by compelling the Indians to dig in the mines, they daily exasperated them more and more. And by assembling so many of them together at the mines, gave them an opportunity of forming schemes, and executing them too with better success than they could have done if they had remain'd dispersed in their respective villages.

The Araucans, the bravest nation of the Chileans, had opposed the Spaniards with the greatest success, but had been at last oblig'd to submit; and this being one of the most desirable countries in Chili, BALDIVIA, in the distribution of the lands, had reserv'd this valley for himself; and being sensible that the natives were not to be kept under yoke by pure force, he erected three castles in this valley, and left garrisons in them while he march'd further southward, and built the town of Valdivia, as has been related; where finding still richer mines, 'tis said, he employ'd fifty thousand Indians in the working of them, and spent so much time there in amassing wealth, that the Araucans, taking advantage of his absence, engaged the whole country in a conspiracy against the Spaniards, and chose the celebrated CAUPOLICAN for their General.

Caupoli-
can Gen-
eral of the
Chile.

VALDIVIA receiving intelligence of the intended insurrection, return'd in some haste to the valley of Arauca, where he found thirteen or fourteen thousand of the natives assembled in arms, whom he charg'd with his horse, and oblig'd them to retire into the woods and inclosures as often as they appear'd, but was not in a condition to disperse them entirely; they frequently rallied and attack'd his troops, and thus they continued to encounter him for several days in a sort of running-fight.

His con-
duct.

The Chilean General observing that his engaging the Spaniards with such numbers only occasion'd confusion among his people, those in the front frequently giving way to the Spanish cavalry, and disordering the rest of his forces before ever they were engag'd, divided his army into battalions of a thousand each, ordering them to charge the enemy by turns. He represented to them, that the Spaniards were but an hundred and fifty horse, and that a thousand of his brave countrymen might easily maintain their ground for some time against so small a number, notwithstanding the advantage the enemy had in their arms and horses. However, he only desir'd they would make their utmost efforts. He had no expectation that the first battalion should gain the victory; but when they found themselves oblig'd to retire, requir'd them to take care in their retreat not to disorder the other bodies, but rally themselves, and draw up in the rear, that they might be ready for a second charge; and the same commands he gave to the officers of the other battalions.

In pursuance of these orders, the first battalion engaged the Spanish horse with great resolution, and having held them in play some time, leisurely retir'd, being succeeded by the second and that by the third, and so on 'till the Spaniards had continued the engagement for seven or eight hours without intermission, and both men and horses began to faint with the labours of the day, or for want of refreshment; which VALDIVIA too late observing, made a precipitate retreat, ordering his troops to take possession of a pass about a mile from the field of battle, where he did not doubt he should yet be

able to defend himself against all the power of the enemy. But a Chilean, who had been Page to VALDIVIA, and baptized by the name of PHILIP (whose Indian name was LAUTARO) hearing his master give orders for their retreat, deserted at that instant to his countrymen, and directed them to take possession of the pass before the Spaniards could arrive there. He bid them (says the royal historian, DE LA VEGA) "make use of the advantage they had in their hands, recover their liberties, and rescue their country from destruction, by cutting off those thieves and usurpers who had invaded it": And taking up a spear charged his late lord, VALDIVIA, at the head of a company of Chileans, while another detachment of the Indians secured the pass, as he directed them.

deserts to
the Chi-
lese.

And now the Chileans seeing the Spaniards unable longer to resist their attacks, pressed them on every side, without giving them a moment's time to breathe, who finding death inevitable, call'd upon JESUS CHRIST, but more upon the blessed Virgin and the rest of the Saints, to save them; but were all cut in pieces on the spot, except the General VALDIVIA himself, who was taken prisoner while he was making his confession to a miserable Priest in the same circumstances, whom they kill'd immediately, but brought VALDIVIA, with his hands bound behind him, before CAUPOLICAN, the Chilean General, who ordering him to be ty'd to a tree, that he might be executed with more ceremony than those that fell in the battle. VALDIVIA, 'tis said, meanly begg'd his life of the conquerors, addressing himself chiefly to LAUTARO, who was but a few hours before his slave. He promised, if they would spare him, to withdraw all the Spanish forces out of Chili, and never more disturb their peace, swearing by all that was sacred to perform his promise; but the unrelenting enemy was deaf to his entreaties; even LAUTARO observed, that it was madness to trust to the promises of a captive, who would infallibly change his note if he was set at liberty. Whereupon the General pronounced his doom, tho' authors differ about the manner of his execution. Some affirm, they poured melted gold down his throat, bidding him satisfy himself with that metal he so violently thirsted after. Others relate, that one of the Indian Caciques, not bearing to hear it debated whether the destroyer of their country should live or die, beat out his brains with a club, without asking the General's leave; and all the Spanish writers agree that they made trumpets and flutes of his bones, and preserved his skull as a memorial of that important victory; which they celebrated by feasting and dancing after their country manner, and instituted publick sports and exercises, such as running, wrestling, and leaping, to be observ'd annually in memory of it; and expecting the Spaniards would give them another visit, they encamped in some of their most inaccessible woods and mountains; and CAUPOLICAN constituted LAUTARO his Lieutenant-General for the services he had done in the late battle, finding him every way qualified for that post.

enant-
General.

The news of VALDIVIA's misfortune arriving at the city of Concepcion, his Lieutenant FRANCISCO DE VILLAGRA assembled the Spaniards that were dispersed in the several provinces of Chili, and being joined with several thousand of his Indian allies, marched to the valley of Arauca to give battle to CAUPOLICAN; but that General cunningly retir'd before him, 'till he found the Spaniards so far engaged in the woods and defiles that their horse could

CHAP.
VII.

could be of little use to them; and then sending out detachments to possess the passes in their rear, he boldly fac'd about and attack'd them in front, ordering his men not to stand to be shot at, but immediately advance and come to a close engagement, mixing themselves with the enemy, whereby they avoided the mischief they used to receive from their fire-arms at a distance; and being much more numerous than the Spaniards and their allies, by this stratagem gained another memorable victory, killing no less than two thousand five hundred Spaniards and Indians on the spot. After which LAUTARO, with a part of the Chilean army, marched towards the city of Concepcion, and finding it abandon'd by the Spaniards, set fire to the town and demolish'd it.

The Chileans obtain a second victory. Concepcion abandon'd and burnt. Imperial besieged.

LAUTARO afterwards laid siege to the city of Imperial, but the winter coming on, was oblig'd to raise it, by the great rains which fall at that season; tho' the Spaniards ascribe their deliverance to a miracle, assuring us, that the Virgin MARY appeared visibly to the whole army over the city Imperial, and defended it against these Barbarians.

Concepcion rebuilt, and destroy'd a second time.

The Spaniards afterwards rebuilt the city of Concepcion, but LAUTARO drove them from thence a second time; and observing that the Chilean liberties would ever be precarious while the Spaniards had any footing in their country, he assembled a great army, and laid siege to the capital city of St. Jago, where being unfortunately kill'd with an arrow, the siege was raised.

Lautaro kill'd before St. Jago.

However, the Governor of Peru apprehending all Chili would be lost, sent his son DON GARCIA DE MENDOZA with a powerful reinforcement of troops to suppress the Araucans, who was so fortunate, after several encounters with various success, to make their General CAUPOLICAN prisoner, whom he put to death after he had persuaded him to declare himself a Christian. But this was far from putting an end to the war, the Chileans were determined to perish rather than become slaves to the Spaniards, and raising fresh forces attack'd all their colonies at once, some of which were taken and retaken several times; and thus the war continued to be carried on with great obstinacy and cruelty for upwards of fifty years, when it appears, by the Spaniards own relation, that they were driven with great slaughter from most of their settlements in that country.

Caupolican taken and put to death.

The Spaniards driven out of all Chili almost.

The royal historian, GARCILASSO DE LA VEGA, being then in Spain, informs us that he receiv'd the following relation of the miseries of the Spaniards there from an intimate acquaintance in two letters, one of which was dated from St. Jago in Chili, in the month of March, anno 1600, in which the writer acquainted him, that about break of day, on Wednesday the 24th of November, 1599, five thousand Indians, whereof three thousand were horse, and the rest foot, seventy of them carrying fire-arms, and two hundred of them in armour (they had taken from the Spaniards) took the city Imperial by surprize, being guided thither by a treacherous spy, burnt and destroy'd the whole town, killing and taking four hundred Spaniards, men, women and children.

Imperial taken by the Chilese.

Six Spanish towns taken by them.

And in another letter from Chili, in the year 1604, the writer tells us, that of the thirteen cities which were established in this kingdom of Chili, the Indians had destroy'd six, namely, Valdivia, Imperial, Angol, Santa Cruz, Castro in Chiloe, and Concepcion. They overthrew their houses, dishonour'd and prophan'd the temples, obscur'd the brightness of that faith and devotion which shined

in those parts, and what is worse (says the writer) this success hath encouraged and raised the spirits of the Indians in that manner, that they are grown bold and confident, omitting no opportunity or advantage which may offer to rob or destroy our cities and monasteries with fire and sword. They have learned also many arts and stratagems of war; for when they besieged the city of Osorno, and compelled the Spaniards to retire within their works, they so straiten'd them that they could receive no sustenance, unless it were some small quantities of the seed of herbs, and leaves of turnips, which too they were fain to fight for and gain with the point of the lance. In one of the sieges of this city they broke the images of CHRIST and our Lady, and other Saints, to the great dishonour of God, which none but his infinite mercy and patience could have suffer'd. In the last siege which the Indians laid to this place they surpriz'd the Spaniards, and kill'd the centinels, and without any opposition entered and possessed themselves of the town, exercising such cruelty as was agreeable to the barbarity of their natures; for they butcher'd the children, and put the women and nuns in chains, intending to carry them away into slavery: But while they were thus busily employ'd in packing up and disposing their booty, and plundering every where without order, the Spaniards took courage, and with that opportunity fell upon them, and God assisting their endeavours, they rescu'd their wives and nuns from their violent hands, and with the loss of some few forced them to fly, and quit both their prey and their city. The last victory which the Indians obtained was when they took Villarica with great effusion of Spanish blood: They set fire to the four quarters of the town, and killed the Friars of St. DOMINICK, St. FRANCIS, and the Merceds, with all the Clergy that were there, carrying the women away captives, many of which were ladies of quality and condition. And this was the fate of that city, which was once of fame and great renown, and illustrious among the neighbouring cities of that new world. Thus far proceeds the relation of Chili in the year 1604.

Osorno siege.

Taken by storm.

and recovered again.

Villarica taken and destroy'd.

To which nothing can be said (says DE LA VEGA) but that "these were judgments which God in his secret providence permits for the chastisements of mankind." Not reflecting that these calamities were no more than the Spaniards richly deserved, who had unjustly invaded this country, and made slaves of the natives without any manner of colour or pretence.

Remarks on these calamities.

The Chileans afterwards recovered several other places from the Spaniards, and almost expell'd them their country, of which the Hollanders receiving intelligence, their West-India company, in the year 1642, fitted out a Squadron of men of war under the command of Captain BREWER, and having put some land-forces on board, order'd them to sail to the coast of Chili, and settle colonies there, not doubting to possess themselves of some of the gold mines of that country; for they concluded, that every people which were enemies to the Spaniards would be well received by the Chileans.

The Hollanders attempt to settle colonies in Chili.

The account the Dutch were pleas'd to publish of this expedition was of the following tenour.

That BREWER and his Squadron set sail from the Texel on the 6th of November, 1642, and arriv'd at Fernambuco, on the coast of Brazil, in 9—degrees of south latitude, on the 22d of December following, where having consulted with Count MAURICE of Nassau, General and Commander in chief for the Dutch in Brazil, he sailed from Fernambuco

CHAP. VII. nambuco with five ships well equip'd and provided with necessaries, on the 15th of January 1642-3, and on the 5th of March they came in sight of the Straights of La Maire, as they are call'd, which is only a passage between a small island denominated Slate's island, and the most easterly point of Terra del Fogo, in 54 degrees, odd minutes south latitude. They came to an anchor in a bay of Slate's Island, to the eastward of the Straights of La Maire, where having remained till the 25th of March, they sailed round Cape Horn, suffering pretty much by stormy weather, and losing the company of one of their ships, called the Orange-tree, and arrived with the other four on the coast of Chili, of the 30th of April, 1643; and on the 9th of May they came to an anchor in a bay of the South-sea, in 41 degrees, 30 minutes south latitude, to which they gave the name of Brewer's-haven, being a little to the southward of the Spanish town of Carelmappa.

Arrive on the coast of Chili, April 1643.

An officer being sent on shore with a company of soldiers, they discovered great herds of oxen, sheep, and horses, and some houses, but the inhabitants were fled; however, they supposed that part of the country to be in the possession of the Spaniards, by the large wooden crosses they saw fix'd at the entrance of the houses; and going on shore the next day, they discovered a party of Spanish horse, and some cannon-shot were fired at their boat.

Engage a Spanish party.

A company of fifty soldiers being sent on shore again, the 20th of May, they discover'd the town of Carelmappa, and had a smart engagement with a Spanish party, consisting of ninety men, horse and foot, whom they defeated. Whereupon the Spaniards abandoned the town of Carelmappa, and the Dutch took possession of it, where they remain'd till the 25th, and then setting fire to the town, and killing the horses they had taken in the engagement, they retir'd to their ships.

They land at Castro.

They afterwards sail'd to the town of Castro, on the island of Chiloe, where they arrived on the 6th of June. There appeared a good body of Spanish horse and foot on the shore, but the Dutch no sooner landed some soldiers than the inhabitants set fire to the town and abandoned it, having before carried away every thing that was valuable.

They relate, that Castro was heretofore a fine Spanish town, replenished with magnificent buildings, pleasantly situated on a hill, surrounded with fruitful orchards and gardens, adorned with fountains, and the fields beyond well cultivated; and that at the time when the Dutch arrived there the fruit then remained on many of the trees, tho' it was in the beginning of their winter.

The Dutch having taken an hundred sheep, and some hogs off the island, reembark'd, and on the 17th of June returned to Brewer's-harbour. From hence they propos'd to sail to the river Baldivia, but the north wind blowing hard in their teeth, they altered their minds and came before Carelmappa again, where landing a company of soldiers on the 16th of July, they took three Spanish prisoners, who inform'd them, that the winters on that coast were usually tempestuous, but that the most stormy month was past; that there were gold mines at Osorno, and more at Baldivia, but the mines were not wrought of late; and that at Castro there were none to be seen, the Indians not having been compelled to work in the mines since the general revolt in 1559.

The conditions of the Spaniards before the Indians revolted.

They learned also from an old Spanish woman they had taken, that before the said general revolt, the Spaniards lived in great splendor at Osorno; that the meanest of them had three hundred Indian

CHAP. VII. vassals at least, who were compelled to pay their respective lords a certain weekly tribute in gold, and were used so cruelly by the Spaniards, that the Chileans rose as one man, drove them from Osorno and other Spanish towns, and they possessed little more in this part of Chili than Carelmappa and St. Michael de Calimbucó. Since which, however, the Indians of Osorno, Baldivia, Villarica, Imperial, Tucapel, Aurauco and Puren, had lived in a pretty good intelligence with the Spaniards till very lately, when the Indians took up arms again, and they were now actually in a state of war with the Spaniards; which was confirmed by six Indian Caciques, who came on board the 20th of July, and assured the Dutch they were extremely rejoiced that they were come to assist them against their ancient enemies the Spaniards. The Dutch answered, they had brought good store of arms to exchange with their countrymen of Osorno, Baldivia, and other places, for such merchandize as Chili afforded, that they might be enabled to carry on the war against the Spaniards, and were ready to assist them to the utmost of their power. The Chileans reply'd, they lived very uneasily under the Spanish government of Carelmappa, and were contriving how to get to their friends at Osorno and Baldivia; but the Spaniards had possessed the passes, and the country was so overflow'd by the winter-rains, that they found it impracticable to go by land at present, and therefore desired the Dutch would carry them to Valdivia in their ships; which the General agreeing to, they returned on shore to give their friends an account of it, and make preparations for their voyage.

The next day more Chileans went on board, and one of them brought the head of a Spaniard with them, whom he had killed, and declared they were determined to shake off the Spanish yoke. Whereupon the General made a present to them of some spears and swords, as also muskets, with powder and ball: And the Chilese sent some black cattle on board in return; but on the 7th of August the Dutch General BREWER died, who had projected the enterprize, and was best acquainted with the state of that country, and in what manner the Indians were to be treated, whose death was evidently the reason the Dutch had no better success in this expedition. He had set his heart upon this undertaking, and had a prospect of bringing the whole country of Chili under the dominion of his masters the Dutch; and though Captain HERCKEMAN, who succeeded him in the command, might have no less zeal to serve his country, yet he certainly miscarried for want of a proper address. He too soon discover'd to the natives with what view the Hollanders visited their coast, and created jealousies in them which he found it impossible afterwards to remove, as will appear hereafter. The late General was so confident of the success of the enterprize, that he directed his countrymen to take his corpse with them and bury it at Baldivia, which he had determined to fortify, and appointed the Chileans to rendezvous there and meet the fleet; not doubting of a general revolt in their favour. His great ambition was to have a tomb erected in that place, which might perpetuate the memory of his being the author of so great a good to his country.

General Brewer dies.

But to proceed in the relation. The Dutch having taken four hundred and seventy Chilese on board, who had furnished themselves with corn, cattle, and other provisions for the voyage, set sail for the river Baldivia on the 21st of August, where they arrived the 24th. The river is but a league

22 Y

over

CHAP.
VII.

over at the mouth; and the Dutch having sailed half a league up it, they observed three channels, of which taking the middlemost they run a-ground, and it was two or three days before they could get all their ships a-float again; so that it was the 28th before they arrived at the town of Baldivia, where they only found the ruins of the ancient gates, which were very high and strong built, but the place was now over-run with bushes and weeds, and more like a wilderness than a city. Here they found three or four hundred Chileans, horse and foot, armed with spears eighteen foot long; some of whom came on board and welcomed them at their arrival. The Dutch General harangued them by an interpreter, and acquainted them, that the Hollanders were now in possession of Brazil upon the same continent, not above two months sail from them, and were in a condition to supply them from time to time with arms and ammunition, and would assist them to drive their enemies the Spaniards out of the country, desiring they would enter into a league offensive and defensive with them. He also presented them with letters from the Prince of Orange of the like tenour, which were interpreted to the Indians. For we must remember here, that neither the people of the East or West-Indies have any notion of a republican form of Government; and therefore the Hollanders in all their negotiations with those distant nations, pretend to be authorized to treat with them by the Prince of Orange, or some single person whom they insinuate is their Monarch, or Sovereign of their country.

The Caciques gave the General no other answer to his propositions at present, but that they would consult their brethren of Osorno and Conceo, and then return to Valdivia again. Whereupon the Dutch proceeded to land their soldiers on the 2d of September, and the General took a view of the ground, in order to erect a fort.

A treaty
between
the Dutch
and the
Chile-
ans.

The same evening arrived above a thousand Chileans from Osorno and Conceo to treat with the Hollanders, and the next day the General, by his Interpreter, made them another speech, acquainting them, that the chief motive of their voyage was to assist the Chileans, the same of whose great actions had reached as far as Holland; that the Dutch had been at war with these same Spaniards for upwards of fourscore years as well as the Chilese, for the preservation of their liberties, and had met with the like success, extending their conquests as far as Brazil: And if the Chilese would now enter into a confederacy with the Hollanders, they were ready to supply them with cannon, small arms, and ammunition, which they would exchange for the product of their country, and the Chileans would be enabled thereby not only to defend themselves, but to expel the Spaniards from their coasts. After which, a letter was delivered to every one of the Caciques, as sent them from the Prince of Orange. To which the Chileans answered, that they thought themselves extremely fortunate to meet with a supply of arms from so distant a country as Holland, at a time when the war with the Spaniards was revived.

The Dutch thereupon enquired if the Chilese could supply their fleet with flesh and other provisions, if they continued on their coast to protect them against the Spaniards? To which they unanimously answered, they would not fail to bring them all the provisions they wanted, for they had plenty of corn and cattle, provided the fleet did not stir from the coast: And they readily entered into a parole-alliance offensive and defensive with the Hol-

landers against the Spaniards, but would not be persuaded to sign written articles which were offered and interpreted to them, declaring that this was not customary amongst them, promises were ever looked upon as sacred and of equal obligation with written contracts. But I am apt to think they had an apprehension that there was some witchcraft or charm in writing, as several other Americans had when the Europeans came first amongst them; or perhaps they were so politic as not to enter into a written engagement, lest the articles might fall into the hands of the Spaniards, and be made a pretence for oppressing and tyrannizing over such of the Indians as lived under their government, or were made prisoners by them.

The Hollanders then proceeded to build a fort at Baldivia for their security, which the natives did not seem to oppose; but when the Dutch proposed the trafficking with the Chilese, and exchanging arms for their gold, the Caciques immediately appeared jealous of their new allies, and declared they had no gold mines, nor was there any such thing as gold in use amongst them. They remembered, indeed, that heretofore they had been forced to pay heavy taxes to the Spaniards in gold on pain of losing their ears and noses, and many of them did who could not procure as much as was expected, and this had given them such an abhorrence of that metal that they could not bear to hear it named amongst them: They were very far from valuing or coveting it, as they found all strangers did.

The General finding the natives were not ignorant of his views, replied, they were not come to exact any thing of them, as the Spaniards had done, but were ready to pay them with arms, or whatever merchandize they liked best, for their gold. Every one was at liberty to exchange what he pleased.

Whereupon the Caciques stared at one another without returning one word of answer; and the Dutch relate, they did not think fit to urge them any further on that head, lest they should imagine they intended to serve them as the Spaniards had done; tho' they had certain information there were very rich mines in that part of the country.

The Dutch General therefore, sensible he was now to expect but little assistance from the natives, and that it would be impossible to maintain his ground long against the Spaniards, and the rest of the Chileans in alliance with them, dispatched Captain CRISPINSON with two of his ships to Fernambuco in Brazil, to give their friends an account of the state of their affairs, and to desire a further reinforcement, and in the mean time continued to fortify the post he had taken at Baldivia, where he hoped to defend himself till those supplies arrived.

In the letter the Dutch General sent by Captain CRISPINSON to Brazil, he informs the Government, that the Spaniards had not more than fifteen hundred soldiers, either on the continent or islands of Chili, viz. three hundred in Valparaiso and St. Jago (this must be a little port called St. Jago on the coast, and not the capital city of St. Jago, that lay far within land near the foot of the mountains of the Andes, for that was demolished by the Indians, and lay in ruins at that time, as I apprehend) three hundred in the city of Concepcion (at this time the capital of the Spanish settlements in Chili) one hundred in Serena, or Coquimbo, one hundred on the banks of the river Biobio, eighty in Tucupel, five hundred in the forts in the valley of Arauco, one hundred and twenty in the island of Chiloe, Carelmappa and Calimbucó. What the number of the Spanish inhabitants were he does not

CHAP. VII. not say, only that they were more numerous than the garrison soldiers: And it is evident that many of the Chilese professed the Christian religion, and were intermarried with the Spaniards at this time, and therefore were in a manner one people with them; and that some tribes or clans that were not under the Spanish government were in alliance with them, tho' most of them were in a state of war with the Spaniards.

And in these circumstances the Dutch General informs the Government of Brazil, that in case ten ships and three yachts, with eight hundred soldiers, seamen, cannon, and ammunition in proportion, were sent to his assistance, he did not doubt making himself master of all the Spanish settlements above-mentioned, and should have no reason to be afraid of all the naval force the Spaniards had, either in Peru or Chili: And if he could make himself master of Chili by this means, it might encourage the natives of Peru to throw off the Spanish yoke, those Indians having entertain'd an inconceivable aversion to the Spaniards. He informs his employers also, that they had received advice that the natives of the neighbouring province of La Plata had rose upon the Jesuits (the then Sovereigns, or Usurpers of that country) and had murder'd many of those Fathers; which was look'd upon as an indication of a general revolt against the Spaniards: And then repeating his importunities for a speedy and effectual supply, concludes, that it was not improbable, when the war should be once kindled on that side, it might spread over the whole Spanish West-Indies; and the Hollanders might supplant them in the West, as they had done the Portuguese in the East-Indies and Brazil. Such was the ambition of this Dutch Officer to make his Masters Sovereigns of all Spanish-America, as they actually were of the most desirable and profitable countries in the East, from whence a little before they expell'd the English as well as the Portuguese.

This express had not been dispatch'd a week, before the Dutch General became sensible of his mistake; and that whatever misunderstanding there might be between the Chileans and the Spaniards, the natives were now much more afraid of the Hollanders than of their ancient enemies; and would probably join with the Spaniards to expel him their country.

For in the next conference he had with the Caciques, they gave him to understand that he must expect no provisions from them; and endeavour'd to terrify the Dutch, by reporting that the Spaniards were assembling their forces by sea and land to drive them from Valdivia. And it is highly probable that the Dutch in this case expected no assistance from their new allies, but were rather apprehensive they would betray them to the Spaniards; for he soon after demolished his new-erected fort, and having re-embarked his people, set sail for Brazil, on the 28th of October, 1643; and having surrounded Cape Horn, repass'd the Straights of La Maire on the 21st of November, and on the 28th of December arrived at Fernambuco in Brazil; so that they were but just two months in their voyage from Baldivia to the northern part of Brazil.

I shall conclude this expedition of the Hollanders to Chili with some remarks they made on Brewer's-haven, and the port of Baldivia; viz. that Brewer's-haven, by some call'd the English-harbour, was a very convenient harbour, there being good anchorage, and an easy passage into the open sea; nor did there want wood or fresh water on the land; and

there was plenty of fish, both in the harbour and in the brooks on shore: That the country and the neighbouring islands abounded in horses, sheep, hogs, goats, and poultry: That the soil was fruitful in wheat, peas, beans, turnips, potatoes, flax and fruit; but their fruits were frequently spoil'd by stormy weather before they were ripe.

That the mouth of the river Baldivia formed a spacious bay, at the entrance whereof there was a small island that would have commanded the passage if it had been fortify'd: That the country thereabouts abounded in horses, oxen, sheep, hogs, goats, and tame fowl, producing great quantities of peas and beans, and some wheat, very good apples, and other European fruits: That the weapons of the natives were chiefly pikes of fifteen foot long; and they had some fire-arms and armour they had taken from the Spaniards: That they were generally good horsemen, and manag'd their lances on horseback with great dexterity.

The next remarkable voyage to Chili was made by Captain (afterwards Sir JOHN) NARBOROUGH, by the command of King CHARLES II. in the year 1669, about thirty years after the said attempt of the Hollanders. It seems to have been undertaken upon some intelligence given to the Court of England by an old Spaniard, usually call'd Don CARLOS, who had formerly resided in South-America, importing, That his countrymen had in a manner abandon'd Chili, and that it would not be difficult for the English to cultivate a good understanding with the natives, and establish a very advantageous traffick there, the principal returns whereof would be in gold: And he pointed out Valdivia, as the port where they were most likely to succeed, it not being imagin'd that the Spaniards had re-possess'd themselves of that place, having deserted it for three or fourscore years: For Captain NARBOROUGH was expressly commanded not to molest the Spaniards in any of their settlements, or to commit any acts of hostility against Spain.

Captain NARBOROUGH having performed this voyage, printed a narrative of it, of the following tenor, viz.

That having receiv'd a commission to command the man of war call'd the Sweep-stakes, of 300 tons and 36 guns; mann'd with fourscore men, and provided with fourteen months provision: And instead of beer having four half tuns of Brandy allow'd him, with guns, nets, and other implements for fishing and fowling, he began this voyage from England in company with the Batchelor Pink of 70 tons, four guns, and mann'd with nineteen men and a boy, on the 26th of September, 1669, carrying with him, at his majesty's cost, the following goods to exchange with the natives, viz. knives, scissars, looking-glasses, beads, hatchets, hoes, nails, needles, pins, pipes, bells, linnen and woollen cloths and stuffs, tobacco, &c. That taking his departure from the Lizard at noon the same day, he made the island of Madera on the 17th of October, and on the 23d of the same month he pass'd the Tropic of Cancer, and then thought it proper to have all his men let blood, having observed in former voyages to St. Helena and the coast of Guinea, that this tended to the preservation of his men from calentures, and other distempers in those hot climates; for he never had one day's illness in those or any other hot voyages, which he imputed to his opening a vein whenever he approach'd the Equinoctial: And the writer of these sheets well remembers, that Captain RAINS, with whom he sail'd to the East-Indies, observ'd the

Narborough's voyage to Chili, anno. 1669.

Sept. 26, 1669.

CHAP. VII. the same rule when he passed the Tropick of Cancer, and had scarce a man sick the whole voyage, tho' he had 150 men on board, and passed the Equator twice.

Made Cape Verde islands October 28. But to proceed: Captain NARBOROUGH relates, that he made the Cape Verde islands (in 15 degrees north latitude) on the 28th of October, where having taken in water, cows, hogs, and other fresh provisions, he sailed on the 8th of November to the southward, having first given orders to the Batchelor Pink, if she was separated from him, to sail to Port Desire near Cape Blanco, on the coast of Patagonia, in 47 degrees odd minutes south latitude; and that after he had passed the mouth of the river Plata, he should keep along the American coast 'till he made Cape Blanco aforesaid, and look for him at Port Desire; and if he (Captain NARBOROUGH) should be there before him, he would leave an inscription engraven on a board, and fastened to a tree or post, mentioning the time of his departure, and the port he intended to make next; and that he would do the like at St. Julian, in 49 degrees odd minutes south latitude, and order'd the Pink to do the same, and to stay two whole months for the Sweep-stakes, as she would for the Pink, if she arrived first at those ports; and inform'd the Pink, that she should touch on the coasts of South-America, beyond the river Plata, to endeavour to establish a commerce with the natives.

The Sweep-stakes and the Pink kept company together 'till they came into soundings on the coast of Patagonia, in 45 degrees south latitude; but here the Sweep-stakes lost sight of the Pink in foggy weather, and on the 21st of February the Captain made Cape Blanco, in 47 degrees, odd minutes south latitude, having past Port Desire in a fog. Whereupon he stood to the northward again, and came to an Anchor at Port Desire, where he went on shore and waited six weeks for the Pink, but heard nothing of her afterwards.

Some description of this Port of Patagonia. While the Sweep-stakes remain'd in this port, the Captain made several journies into the country, where he informs us he met with great store of wild pease with green leaves and a bluish blossom, some sweet herbs like tares, with white and yellow flowers, and another herb like sage, which made very good sallads, and preserved his men from the scurvy. On the rocks they found abundance of muscles and limpets, and on a neighbouring island great numbers of seal and water-fowl, which were excellent food, and his ship's crew lived on them and the fish he caught there a considerable time; and here he found two tolerable springs of fresh water also, with which he replenish'd his casks.

Seal, or Penguin Island. That on Friday, on the 14th of March, he went with his boats and forty men to an island near Port Desire, where they knock'd down four hundred Seals, and loaded their boats with them, from whence he gave it the name of Seal Island. He observ'd the full grown male Seals were of the size of a large calf, or young heifer, having shaggy necks, heads and faces like lions. The females also resembled lionesses before, only their hair was smooth like horses; whereas the male was smooth only in his hinder-parts. Both of them were very deformed, the body growing tapering downwards 'till it came to a point, where grew two fins like feet, and two feet more grew out of its breast, so that they could climb to the highest rocks and hills, though they delighted chiefly up sleep near the shore. The length of this amphibious animal was from eight to eighteen feet, and they were generally as big about as a barrel at the shoulders.

Other animals. On Saturday, the 5th of March, he went eight or ten miles up into the country, and met with some

CHAP. VII. herds of guanaco's, or camel-sheep, which are so common in Peru. He also saw several ostriches, a fox, and a wild dog, and five or six hares, of which he kill'd one with his grey-hound: It resembled an English hare, only was much larger, and had a stump of an inch long instead of a tail; and he observed they liv'd under ground like rabbits. They saw no wood, unless some bushes like white-thorn. The land was a dry gravelly soil, moderately hilly, and produc'd grass in the valleys, but scarce any thing else; no fruits of any kind.

He found, in a small island near Port-Desire, an inscription upon a post, signifying that JAMES LA MAIRE was at that port in the month of January, 1616 (being written in Dutch;) and thereupon he call'd it La Maire's Island. Finds an inscription left by La Maire.

The Captain being about to depart from Port Desire, formerly took possession of that country for his British Majesty, under an apprehension that it might yield gold as Chili, which lies on the opposite shore, does; but though he ordered his people to search diligently in the brooks and gullies for gold-sand, and dug in several places, he could discover nothing that look'd like a mineral.

On March the 26th, 1670, he observ'd an eclipse of the moon, which shew'd there was four hours forty minutes difference of time between the meridian of London and the meridian of Cape Blanco, which lies in 47 degrees, 20 minutes south latitude, on the south-east coast of America. From Port Desire he sail'd to Port St. Julian, in 49 degrees, 10 minutes south latitude, where not finding the Pink as he expected, his men were much discouraged, considering, they could expect no relief if they should happen to run a-ground on that unknown coast. But the hopes he gave them of finding immense riches in Chili, and setting before them the example of Captain DRAKE, who sail'd round the world in one ship, when navigation was not brought to so great perfection, they recovered their courage. That on the 21st of April, he caught in this port, with his Seinet, in the space of four hours, five hundred fishes of the size and form of Mulletts, and some of them as big as a man's leg, which were a great relief to his ship's company. And now the winter came on apace; the snows fell, the waters froze, and the wind blew very hard and cold from the south-west; from whence he concluded he should not be able to pass the Straights of Magellan at this time of the year, and therefore determin'd to winter thereabouts, ordering every one of his men a quart of brandy a week, and for meat they had salted seals and penguins given them, which prov'd very good food.

Going on shore at Fort St. Julian on the 22d of April, he found a salt-pond, or lake, two miles in length, crufted over with good white salt two inches thick, of which he laid two tuns in. A Salt-lake.

Having remain'd here till the 6th of June, he went on shore with sixteen men, and travelled ten miles into the country, but could go no further for the mountains, which were cover'd with snow. They yet saw no people, but discover'd there had been some in the snow, and that they had made fires, and eaten guanacoes and ostriches by the remains they found of their feast.

That going on shore again the 22d of June, he sent Mr. WOOD, his Lieutenant, to the westward with three armed men, who saw seven indians on a hill, and three of them advanced towards him, with bows and arrows in their hands, loose skins about their shoulders, furs on their heads, and pieces of skin wrapp'd about their feet, and all the rest naked, 5

CHAP. VII. naked, only some part of their faces and bodies were painted with red and white, their natural colour being olive: They were of a middle stature, not so tall as the Lieutenant, well limb'd, their hair black (which they did not wear very long) and spoke in the throat. They came pretty near, but would not suffer themselves to be touch'd. The Lieutenant threw them a knife and some other trifles, which they took up; but when he offered them a bottle of brandy they would not drink.

Their
Stature.

That some others of his crew saw two more of the natives behind a bush, and would have approach'd them; but they run away, leaving a bundle and two little dogs coupled together, which were brought to the Captain; and he found in the bundle several bags made of skins, with red and white earth in them, used in painting their bodies and faces. There were also flint-stones, arrow-heads, bracelets of shells, braided thongs, armadillo-shells, and some other trifles; that the skins were guanacoes and seals, and sewed together with a green gut in a slit stick, and near the bundle were found two staves of tough cane, in short joints, about four foot long. The Captain saw afterwards a place where the natives had made a fire, and left the bones of some guanacoes and ostriches scatter'd about. He also saw the skulls of three men without any flesh upon them; from whence the Captain conjectures that the natives were man-eaters; and such evidence as this is frequently produced to prove the Americans to be cannibals. The Captain was fully convinc'd by ocular demonstration that the Patagonians were not giants, as the first Adventurers reported; but still he seems to be in doubt, whether they were not cannibals, tho' the evidence of both is the same; and the Indians might as well infer that the Europeans were cannibals, because our Surgeons and Apothecaries have frequently skulls, and sometimes skeletons in their houses. But our people, it seems, began to be ashamed of the fabulous relations of the American giants and monsters at that time, though they were yet extremely prejudiced in favour of cannibals; and though Captain NARBOROUGH is admitted to be a gentleman of good judgment, yet allowances must be made for the age and country every person lives in. At some times, and at some particular places, magick, witchcraft, and apparitions are in great vogue, and not a week passes but our belief is requir'd to some notable story of this kind, on pain of being reputed infidels: While in other countries, and at other times, people imagine they may be very good Christians without swallowing every incredible tale that weak or designing people have the confidence to affirm the truth of, especially when they bring no better proof of what they relate than the Captain produces to maintain that heavy charge against this nation of their being cannibals, namely, that three skulls happen'd to be found in the possession of some of the people of the country.

The proof
of their
being ca-
nibals.

But to proceed: The farthest journey the Captain made into the country while he lay at Port St. Julian, he says, was twenty-five miles to the north-west, in which he met with teal and other fowl, a kind of herons all over red, great numbers of guanacoes and ostriches, hares and partridges bigger than ours, some snipes and small birds, penwrens, kites, hawks, owls, foxes, wild-dogs, brant-geese and armadillo's, but no snake or venomous creature, or any wild beasts, and was of opinion that the country was very proper both for European corn and cattle, seeming to be a good fruitful soil.

Other ani-
mals.

VOL. III.

In the mean time the Captain relates, that twelve of his men, who did not use much exercise, fell ill of the Scurvy, and their legs and thighs turned perfectly black. Whereupon he thought proper to leave Port St. Julian and sail to Port Desire, where he took great numbers of seals and penguins, which he distributed to the sick, with such sallads as this part of the country affords, and they all recover'd in a very short time.

CHAP. VII.
Returns to
Port De-
sire.

While the Captain lay on shore at Port Desire, he says, the natives came in the night-time to the place where his men used to fill their fresh water, and stole from thence an iron pot, and three suits of cloaths, with some linnen; and he saw, in an adjacent valley, a model they had made of his ship with earth and sticks, which he imagin'd they did in order to preserve the memory of that floating castle, having never seen one before, possibly on that coast.

Here the Captain takes an opportunity to inform us, that the isle of Penguins, which lies at the entrance of Port Desire, affords such numbers of penguins and seals, that at the time he was there, as many of them might have been taken as would have fill'd three hundred tons of cask, when dress'd and salted, and that the flesh might be kept sweet and good for four months, if well cur'd.

The Penguin, he observes, is of the bigness of a Brant-geese, weighing usually about eight pounds, and lives upon fish. Instead of wings it has flat stumps, like fins, and its feathers are a kind of down of a blackish colour, only grey on the head and white on the neck and belly. The legs are short, like those of a goose; and the bill hooked. They are driven in flocks to the boat-side, and knock'd on the head by the seamen; so that shipping can never be in want of fresh provisions at this port; and he was of opinion there might be found a sufficient quantity of salt also here in the summer to salt up their seals and penguins, but if not, they would never fail of finding salt at Port St. Julian.

Penguins
describ'd.

The winter being now pass'd, the Captain set sail from Port Desire on the 13th of October, 1670, and on the 19th pass'd by the cape call'd Beachy-head, and the hill of St. Ives, in 50 degrees, 10 minutes south latitude, where the land forms a bay, into which the river of St. Cruce discharges itself. And on the 22d of October, they arriv'd at Cape Virgin Mary, at the north entrance of the Straights of Magellan, situated in 52 degrees, 26 minutes south latitude, which are in some parts three or four leagues, but in others not half a league broad.

Sails from
Port De-
sire, Octo-
ber 13,
1670.

Magella-
nick
Straights.

All about the entrance of the Straights, 'till he came to the first narrow passage, he observ'd there was very good anchorage and not much tide; but in the narrow the tide runs stronger than in the Hope at the Thames-mouth, the flood setting into the Straights, and the ebb out, and kept a constant course, as on other coasts, viz. six hours flood and—hours ebb, and rises and falls near four fathoms perpendicular.

Tides
here.

The Captain having pass'd the second narrow in the Straights, went on shore on the island Elizabeth, and nineteen of the natives coming down the hill to him, he exchange'd knives, beads, and other implements with them for their bows, arrows, and coats, which were made of the skins of guanacoes, seals, and otters: That they were for laying hands on every thing they saw in a very brutish manner, and the more he gave them the more they craved: That several of his men danced and sported with them, and shewing them some gold, he intimated by signs, that if they could bring him

22 Z

any

CHAP.
VII.Natives
describ'd
again.

any he would purchase it of them; but either they did not understand him, or knew of none: And he no sooner left them and went on board, but they set fire to the grafs.

He relates, that these people are of a middle stature, well-limb'd, with round faces, low foreheads, little noses, and small black eyes; their teeth are smooth, even and white, their hair flaggy and very black, of an indifferent length, men and women alike; they are all full-breasted, of an olive colour, and painted all over their bodies with red earth and grease, their faces daub'd in spots with white clay, and black streaks made with smut, their arms and feet the like; their heads are generally small, their fingers short, and their bodies very active; their cloathing is of the skins of seals, guanacoes, and otters sewed together; their garments are in form of a carpet five foot square, which they wrap about them as the Scotchman does his pladding: On their heads they wear caps of the skins of fowls with the feathers, and on their feet pieces of skins to keep them from the ground. They are very hardy, for tho' it was very cold then, they don't wear these skins when they go about any business that requires stirring. They have no hair on any part of their bodies or faces, nor any thing to cover their nudities, except that the women have a piece of skin hanging before them. The men and women are cloathed alike, only the women go without caps, and wear bracelets of shells about their necks, which the men have not. The men are something taller than the women, and fuller faced; the men have a harsher voice, and rattle in the throat, the women somewhat shriller; they often repeat the word *Urah*, and if they did not like any thing, would cry *Ur, Ur*. They feed both upon fish and flesh, live under no manner of government, or worship any thing. At our landing, they came to us with a great noise, every one his bow ready, and two arrows in his hand: Their bows are about an ell long, and every arrow eighteen inches, neatly made of wood, headed with flint-stones curiously wrought, broad-arrow fashion, and well fastened to the arrow, the other end being feather'd with two feathers, and ty'd on with the gut of some beast while yet green and moist, the bow-string is of twisted guts. They have large mungrel dogs of several colours, not unlike Spanish dogs. I saw no other domestick creatures, nor their boats, which then lay on the other side of the island towards the main, where they waited for fair weather to catch penguins, of which there is a vast quantity, as also of white-breasted divers.

Trees
in the
Straights.
A spicy
bark.

He saw on both sides of the Straights woods which seemed to be regularly planted, and timber in them two foot diameter. The bark of some of these trees is as hot as pepper, and when dry'd had the smell of fine spices, and they used it in seasoning their meat and soup, to which it gave a fine flavour, and he believed this spice to be very wholesome; but he saw no fruit-trees on the shores, or oak, ash, hazel, or any trees like ours in England, the woods consisting chiefly of the pepper-rind-tree above-mentioned, and another like our beech. The largest tree he saw in the Straights was about two foot and a half diameter, and thirty or forty foot high. The woods were usually on the sides of hills, the land being very high on both shores, and the tops of the mountains scarce ever free from snow.

Cape Fro-
ward the
most
southern
promon-
tory.

He observes, that Cape Froward, the most southerly land on the continent of South-America (for Cape Horn is upon the island *Del Fuego*) lies in 53 degrees 52 minutes south latitude, 68 degrees 40

minutes west of the Lizard: And he computed the whole length of the Straights from Cape Virgin Mary to Cape Disseada to be an hundred and sixteen leagues: And on the north-west part of the Straights, in the South-sea, lie four little islands near Cape Victory, which he denominated The Islands of Direction, being a guide to those who enter the Straights from the South-sea. From the Straights mouth he sailed north to the Island of Succour, in 45 degrees south latitude, where he arriv'd the 26 of November and took in fresh water. He saw none of the natives of this island, only one of their huts, which resembled those of the natives on the continent of Patagonia, and were more like arbours than houses, being composed of boughs of trees.

CHAP.
VII.Length of
the
Straights.Island of
Succour,
Nov. 26,
1670.

Between the Isle of Succour and the continent, there lies another island, where the Captain went on shore, and having taken possession of it for his Majesty, gave it the name of Narborough Island. Here, he says, he found his men in pretty good health, and seventy-two in number; so that he seems to have lost eight in his passage hither. He sailed from Narborough Island to the river of Baldivia, where he set on shore the Spaniard, Don CARLOS, on the south side of the harbour, on the 15th day of December. He carried with him a sword and a case of pistols, a bag with beads, knives, scissars, looking-glasses, combs, rings, pipes, bells, and tobacco, to make himself acceptable to the natives; for the Captain does not seem to have been then apprized that the Spaniards had repossess'd themselves of the town of Baldivia and rebuilt it.

Narbo-
rough IsleBaldivia,
Decem.
15. Don
Carlos set
on shore
here.

Don CARLOS took the path by the sea-side, leading to the mouth of the harbour, and after a quarter of a mile's walk, turned out of sight, behind a rock. He had directed the Lieutenant who set him on shore to look out for his fire in the night-time, but they never saw or heard of him more.

The next morning the Captain sent one of his Lieutenants with his boat to make some discoveries in the harbour, and coming near a Spanish fort, call'd *St. Jago*, the garrison wafted a white flag, and invited them ashore; whereupon the Lieutenant landed in hopes of meeting with Don CARLOS, whom they had seen going along the path leading directly to this fort between the wood and the sea-side; for the fort stands on an eminence by a wood on the south side of the harbour. The fort had seven guns mounted, which were defended by a breast-work and some slight pallisadoes.

The Lieutenant was received on shore by about twenty Spaniards and Indians, who conducted him to the Governor, whom he found sitting with two other Spanish gentlemen under a great tree. The Governor welcomed him on shore with a silver bowl of wine, and asked which way they came into these seas; and the Lieutenant in his turn enquired whether the Spaniards were at war with the Indians, to which the Governor answer'd, Yes; intimating, that they were enemies all round the harbour, and tho' barbarous, were a brave people and good horsemen: That the Spaniards had scarce any ground belonging to their fort, nor durst walk out a musket's shot from their pallisadoes without being well arm'd: That the Indians had such plenty of gold, the breast-plates of their armour were of that metal.

The Spa-
nish Fort
of *St. Jago*,
and the
garrison

After this conference, the Spanish Governor made the Lieutenant a handsome entertainment in a tent; and he observ'd, that not only the dishes, but all the kitchen utensils were of silver, as were the hilts of the common soldiers swords, and those of

CHAP. VII. of their officers of gold, and the plate at the butt end of their muskets of the same metal.

The account the Spaniards give of the state of Chili.

When the Lieutenant return'd on board the Sweep-stakes, four Spanish gentlemen came with him, who offer'd to conduct the ship into the harbour; but the Captain being well acquainted with the treachery of the Spaniards in those parts, civilly refused the favour. These Spanish gentlemen related, that there was a great deal of gold about Baldivia, but that the natives being a brave people, of a gigantick stature, and able to bring ten thousand horse into the field, would not let them come at their gold: That their arms were long lances or pikes, bows, arrows and swords, and they had some muskets which they had taken from the Spaniards: That the Indians were very numerous about Baldivia, Osorno, and at Castro in the island of Chiloe, and would barter their gold with the Spaniards, tho' they were not at peace with them.

The Spaniards demanding of the Captain whether he was bound, he answered for China, and only touched at Baldivia to refresh his men and take in provisions. They reply'd he should have what the country afforded, and pointed to a rivulet where he might take in fresh water, which they said had golden sands; adding, that the Spaniards bought a great deal of gold of the natives, which they gathered with dishes in the brooks and gullies between the hills and rocks about thirty leagues from the sea; and that between the sea and those hills was a fine fruitful country (abounding in horses, oxen, sheep and goats) which the Indians had taken from the Spaniards: And that there was more gold in Chili than in any country yet discover'd in America. But the Captain observ'd the Spaniards had little knowledge of the country to the southward of Baldivia, except of Osorno, and the island of Castro over-against it, which was a fine island fruitful in wheat; but the Indians were so numerous there, that they would not suffer the Spaniards to search for gold if there were any in the island.

That a ship loaden with arms, ammunition, wine, linnen and woollen cloth, tobacco and sugar, came annually from Valdivia and took gold, bezoar-stone, and red-wool of the guanaco sheep in return: That there was a road from Baldivia to the Spanish settlements in the north of Chili, but they never used it, unless furnish'd with a very strong convoy, for fear of the natives: That the Spaniards represented this country as an earthly paradise, where people lived in the greatest delight and plenty in the world; and indeed the Spanish gentlemen who came on board him, and those he saw on shore were corpulent jolly fellows, and had good rosy complexions.

Upon this intelligence, the Captain sent his boat and eighteen men on shore to view the harbour and fortifications, and to endeavour to settle a commerce with the natives, being of opinion that this country was lost for want of a true knowledge of it. The Spaniards bought several things of the boat's crew, for which they gave them pieces of eight, but would not part with their gold or their bread. However, they had a considerable profit by what they sold them; as for a fowling-piece, worth twenty shillings in England, they had sixteen pieces of eight (or crowns); for a case of knives, bought for three shillings, they had five pieces of eight; for a pair of gloves of ten-pence, a piece of eight; and the Spaniards appear'd very desirous of purchasing cloaks of bays, though their under-garments were very rich, viz. velvet, silk and silver brocades, and they wore fine linnen, and good

Flanders-lace: That four of the Spaniards wives came into the boat, who were born in Peru, of Spanish parents; these were dress'd after the Spanish mode, had large gold chains about their necks, and pendants of saphire in their ears: And the Governor presented his Lieutenant with some ostrich feathers, a silver-headed cane, and some other trifles; but the boat's crew could find no opportunity of conversing with the natives by themselves; for tho' some Indians made a fire by a wood side, and hung out a white flag, as a signal they would traffick with them, the Spaniards would not permit the English to go to them. Whereupon the boat return'd on board, and the Governor of St. Jago sending word he had no orders to permit him to take in water there, and directing them to go to St. Peter's Fort, he sent one of his Lieutenants and three more to the Governor of St. Peter's Fort, who receiv'd them with great civility, but detain'd them prisoners under pretence he had receiv'd orders from Don PEDRO DE MONTADES, Governor of Chili, to keep them prisoners 'till the ship came under the command of the fort; which when the Captain understood by the seamen who return'd with the boat, he seem'd resolv'd to attack the fort and rescue his Lieutenant and his three companions by force: But whether, upon mature consideration, he did not think this practicable, or remember'd Sir WALTER RALEIGH's fate, who lost his head for attacking the Spaniards in America when he had no commission for it, he altered his resolution, and left his four men prisoners at Baldivia, whose names were THOMAS ARMIGER, the Lieutenant, JOHN FORTESCU, Gentleman, HUGH COE, Trumpeter, and THOMAS HIGHWAY, the Interpreter, who was born of Moorish parents in Barbary, but a Christian, and lived formerly with an English merchant at Cadiz: Captain NARBOROUGH observ'd they were all healthful people, well qualify'd to make observations, and he hoped would give a good account of the country; but I am afraid they met with worse usage from the Spaniards than he expected, and whether any of them ever return'd to England I cannot learn.

While Captain NARBOROUGH lay in the river Baldivia, some Indians under the Spanish Government came on board him, whom he acquainted that he was come to establish a trade with them, and desir'd they would communicate this to their friends in the country. They seem'd glad of it, and were unwilling to return on shore, declaring that the Spaniards were mere devils, insulting and abusing those they had in their power without mercy, and said, that both the Spaniards and the Indians had abundance of gold. He gave them some knives, looking-glasses, and other toys, when they went on shore, and they promised to acquaint the inland inhabitants with what he said. But, it seems, these people were of a middle stature, they were not those giants the Spaniards had represented them.

And here we may observe, that the accounts we have receiv'd of America from the Spaniards are not agreeable to truth, but formed upon the plan of interest, bigotry or vanity. They furnish'd us with such relations as might deter other European nations from sending colonies thither; or such as might seem to justify their usurpations and cruelty to that people, and reflect honour on the Spanish nation, or the Roman catholick superstition, to which they are known to be more bigotted than any nation in Europe; and we poor credulous Protestants, notwithstanding our abhorrence of Popery, greedily swallowed

swallowed the most improbable and incredible tale they were pleased to frame.

From these sources we may derive those shocking relations which obtained so universally on the first discovery of America, of giants, monsters, and cannibals, tho' the Spaniards carried the matter so far, and dress'd up their stories with so many contradictions and unnatural circumstances, as one would have thought should have confuted their own narratives; and indeed now we come to reflect coolly and deliberately upon them, and discern with what view they were propagated, they need no other confutation, where the prejudices of people are not insuperable, and they have an opportunity of examining them thoroughly.

The Spaniards, we find, inform'd Captain NARBOROUGH, that tho' there was a great deal of gold in the country, yet the mines were in possession of the natives, who were a barbarous and gigantick race, expert in the exercise of arms, both Indian and European, and who could bring ten thousand good horse into the field upon a very short warning; from whence they would have him conclude, that it was in vain for any European nation to attempt to settle colonies in Chili, or expect to come at their gold. The Spaniards themselves had no more than what was found in rivulets, or on the surface of the earth, which they purchased of the natives; and tho' they had been settled there so long, they had been driven from the mines, and could not at present penetrate further into the country than the pallisadoes of their own forts.

But Sir JOHN NARBOROUGH saw with his own eyes that the natives were not the giants they were represented: That their stature was rather inferior to that of the English, and that the Spaniards were so much masters of the sea-coasts thereabouts that the natives durst not come thither to traffick with his people: He was sensible also, how poor a fortification that of Baldivia then was, and that there was not an hundred Europeans in garrison there. How then was it possible to believe that the Chileans were giants, or expert soldiers, and could raise a body of ten thousand horse? This was evidently all gasconade, and only fit to amuse women and children with. Notwithstanding the Spaniards therefore had represented the Chileans as such a powerful and barbarous people, and averse to the entertaining any commerce with foreigners, Sir JOHN declares it to be his opinion, that the most advantageous trade in the world might be established in those parts, if England had the Freedom of the Spanish ports there, or if they had not, that a trade might be carried on in spite of all the Spanish forces on that side by a squadron of four or five ships of twenty or thirty guns each; and he did not question but the natives of the south parts of Chili, about Castro, Osorno, and Baldivia, would be willing to exchange their gold for knives, scissars, looking-glasses, beads, combs, hatchets, and other merchandize of that kind.

But can any one imagine, that a rascally garrison of a hundred Spaniards, defended only by seven guns and a poor breast-work, could have kept the brave Chileans in awe, and prevented their trafficking with foreigners on the coast, if, according to the Spanish account, the Chilese could have brought ten thousand men of a gigantick stature, completely arm'd and vers'd in the trade of war into the field? Would not such a force have been able to toss the Spaniards and their paltry fort into the sea, and made their way to the coast against all the power of Spain in South-America?

But to get some farther light into the state of Chili, and discover whether it be yet practicable, or worth the while to settle colonies and establish a trade with that coast, I shall consider some other voyages that have been made with that view to Patagonia, to the Straights of Magellan, and round Cape Horn and the Terra Magellenica, to the coast of Chili, and to the islands near it: Give me leave only to observe in the first place, that Sir JOHN NARBOROUGH in his return took his departure from Cape Gallery, the south point of the harbour of Baldivia, on Thursday the 22d of December, 1670, sailing to the southward along the west coast of America till the 6th of January, when he made the islands of Direction, at the western mouth of the Straights of Magellan, which he pass'd, and arrived at Cape Virgin Mary in the North-sea, on February 14, 1670-1, he made Cape Blanco on the 23d, and on the 24th anchor'd in Port Desire bay, in 47 degrees odd minutes south latitude, from whence setting sail on February the 26th, he arrived at the Lizard in the English channel on the 10th of June, 1671, so that he was about a year and three quarters from home upon this voyage, but not more than half a year in his passage from Valdivia, in Chili, to England. So that it appears to be much the same in extent as an East-India voyage, and possibly may be perform'd in less time now they have found the way round Terra del Fogo, and are not hinder'd by going through the Straights of Magellan, which usually took up six weeks or two months of the voyage.

Before the passage round Cape Horn was discovered, the Spaniards imagining there was no other way into the South-sea but through the Straights of Magellan, built forts on the narrowest part of that Straight, and garrison'd them with several hundred men, in order to exclude all other nations from the South-sea, and secure the empire of that ocean and those rich and extensive countries bordering upon it to themselves; but Sir THOMAS CAVENDISH passing the Straights of Magellan in January, 1586, and coming to the first Spanish fort, found no more than twenty-four alive of four hundred that were left there, and these almost starv'd. He arriv'd afterwards at another fort in the Straight, to which the Spaniards had given the name of Fort St. Philip, and found it in ruins, most of the garrison whereof perish'd for want of food; whereupon Sir THOMAS gave it the name of Port Famine, and proceeding in his voyage pass'd happily into the South-sea. Several other Commanders also have pass'd these Straights successfully, particularly Sir JOHN NARBOROUGH, already mentioned; but many however have been disappointed, drove back and lost by tempests; and the passage was found for the most part so difficult, that it put some enterprising seamen upon finding a way round Cape Horn further to the southward, in which both LA MAIRE and Admiral BREWER succeeded: The first passing through a short and narrow Straight, between Terra del Fogo and States-island on the east of it, which has since obtain'd the name of La Maire's Straight, and BREWER passing through a straight made by States-island, and another small island to the eastward of it, gave that pass the name of Brewer's Straight; but none of these Straights are used at present; ships that are bound to the South-sea or coast of Chili now stand away to the south-east till they come into 58 or 60 degrees, surrounding the Terra del Fogo, and all the other islands in the neighbourhood of it: Nor do they find any inconvenience in going thus far south but the meeting

Sir John Narborough returns thro' the Straights.

Spanish forts on the Straights of Magellan.

Passages found out by La Maire and Brewer.

The passage round Terra del Fogo, and the other islands.

CHAP. VII. ing with vast pieces of ice, as our mariners do in Greenland, which are not so numerous however as to interrupt their voyage. Our countrymen, Captain COWLEY, Captain DAMPIER, Captain ROGERS, and Captain SHARPE, all passed these seas round Cape Horn without any ill accident, and sav'd a great deal of time by avoiding the Straights of Magellan.

The islands of Patagonia and Chili described. And here I shall give some further description of those three considerable islands on the coast of Patagonia and Chili, of which all seamen, who visit the Pacific-ocean, take so much notice, viz. 1. The island of Terra del Fogo; 2. The island of Chiloe; and, 3. The island of John Fernando.

Terra del Fogo. Situation and extent. 1. The island of Terra del Fogo is bounded by the Straights of Magellan on the north, by the Atlantic-ocean on the east, and by the great South-sea on the south and west, being of a triangular figure, the base whereof is the Strait of Magellan, three hundred miles in length from east to west, and it is about the same extent from north to south, viz. from the Straights of Magellan to Cape Horn, the point or summit of the pyramid, which lies in 57 degrees, 30 minutes south latitude.

Face of the country. This island, like the continent over-against it, is mountainous and woody, the tops of the mountains almost always cover'd with snow; but it has several good bays and harbours on the coast to shelter shipping from the storms and tempests that reign in these seas, and does not want rivulets of fresh water.

Natives, their persons and habits. As to the natives, travellers differ very widely in the description of them in some particulars, tho' they agree pretty well in others. They all agree, that they are a brave and hardy people, but not very numerous: That they paint both their faces and bodies, and have no other cloaths but a cloak or mantle made of raw hides, or the skins of fish and fowls tack'd together with green guts, only the men wear a cap of feathers. The women have nothing on their heads, but wear a piece of penguin's skin before their nudities. They live in huts, or in arbours, made of the boughs of trees, and eat seals, penguins, venison, and other game they take either by land or water. Their arms are clubs, bows and arrows pointed with sharp flints or bones. Their boats are canoes, or hollow trees, and they make their nets of guts and sinews, the fibres of the bark of trees, or such other materials as their country affords.

But some travellers, especially the Dutch, related, that the natives were giants, ten or eleven foot high at least: That they tore up the trees by the roots to encounter their enemies, and threw stones at them big enough to sink their boats: And they reported also, that they were cannibals, though it is universally acknowledged they liv'd chiefly on the flesh of other animals.

But late travellers, and even the Dutch themselves, since they have discover'd the way round the island of Cape Horn, acknowledge the people are of a moderate stature, not exceeding that of the Europeans: And as to their being cannibals, no manner of proof has ever been brought of it from first to last; this fact is supported solely by the surmises of our wise Adventurers, and the credulity of their readers.

Probably some of the first Discoverers thought it convenient to give out that the natives were giants, to excuse their running away from them; and added, that they were cannibals, to render them still more terrible, and to justify their murdering these naked defenceless people with their artillery and fire-arms.

VOL. III. NUMB. CXXVII.

CHAP. VII. 2. The island of Chiloe, situated on the west-side of a great bay of the South-sea, near and over-against the continent of Chili (a multitude of lesser islands (some say forty) lying in the same bay.) It is a long island, stretching from north to south, and extending from 41 degrees 40 minutes, to 53 degrees 30 minutes south latitude, computed, to be about 140 miles in length, and 20 in breadth.

The face of the country is various, consisting of mountains, valleys, woods, champain, savannah, or meadow and marshy grounds, and has in it some fine springs and rivulets of fresh water.

The chief, and for ought I can learn, the only town in it is that of Castro, built by the Spaniards, and already described, which is situated in 42 degrees odd minutes south latitude, and 84 degrees of western longitude. The country, according to BREWER and Sir JOHN NARBOROUGH, abounding in corn, cattle, and fruit, both European and Indian, though by TECHO, and some others, said to be barren, and one of the poorest of all the Spanish settlements; which different accounts may easily be reconciled. I don't find any reason to doubt the relations given us by the Dutch, and Sir JOHN NARBOROUGH, that it appear'd a fruitful country when they were there, for this was before the Spanish plantations were quite ruined. But in the time of TECHO the natives seem to have recover'd the country again, and left the Spaniards little more than the town of Castro, which has been so often burnt and plunder'd, that it is now reduced to a miserable village, with a small fort that defends it: And in these circumstances no wonder the lands are uncultivated, and consequently appear unfruitful. This is the case of many parts of the world; the soil seems to alter according to the genius or circumstances of the inhabitants. We are told of these very Chileans, that upon the continent they sow and plant no more than just furnishes their particular families with food, and the Spaniards have no encouragement to improve a country they are not masters of, and where they cannot enjoy the fruit of their labours in quiet. Besides, the Chileans are not now their slaves to do their drudgery, as they did formerly; and we are well acquainted with the pride and laziness of the Spaniards even in their own country, where the French frequently cultivate their lands for them; the owners will not work or improve their estates, tho' they starve upon them; and this possibly is the case of their countrymen in Chiloe, now they have no slaves to work for them, and cultivate the lands in that island.

3. The third and last island I proposed to describe on the coast of Chili is that of Juan, or John Fernando, which obtain'd its name from the first Discoverer and Planter. This island is situated in 34 degrees odd minutes south latitude, about 400 miles west of the coast of Chili, being thirty-eight or forty miles in circumference. Hither it was that Governor PULLEN advis'd the sending of a squadron of men of war during the last war with France and Spain in the reign of Queen ANNE, when the Ministry requir'd his opinion concerning the feasibility of preventing the treasures of Peru and Chili from being brought to Europe by the French and Spaniards, and of excluding the French from that traffick, whereby they were enabled to maintain the war so long against the Confederates. It was propos'd also to the Governor's consideration, whether it was not practicable to fix British colonies in those rich countries of Chili and Peru, and thereby come in for a share in those treasures. And because it is very possible that this nation may

23 A

CHAP. VII. Island of John Fernando. Propos'd to be planted and fortified by England, by Governor Pullen.

CHAP. VII. be in the like situation again (that is) be at war with France and Spain again, or at least with the latter, and the same conduct may hereafter become expedient which was advisable then; and because we no where meet with a juster account of the state of the Spanish West-Indies, and of Chili in particular, the country I am now treating of, than in the writings of this ingenious gentleman, I shall take the liberty to transcribe as much from that essay of Mr. PULLEN's on the subject above-mentioned as I apprehend for my present purpose.

I shall first begin (says Mr. PULLEN) with what is necessary to be done to ruin their commerce (that is, of the French in the South-sea; for then they were admitted into all the Spanish ports in America, supplied their towns and colonies with European goods, for which they received gold and silver in return, and were entrusted by the Spaniards to bring their plate to Europe) a commerce the most beneficial to them, and consequently most prejudicial to us. To effect which, I propose the sending thither eight fifty and sixty gun ships the next season; for the manning of which Squadron, I propose but half the complement of seamen that are allow'd to such ships by the rules of the navy, and that the rest of the number should be made up with soldiers, either mariners or detachments out of marching regiments, as the Government shall judge most expedient, provided they be men acquainted with service; and if they have served some campaigns, so much the better, because they will be less subject to sickness, and not so soon be discouraged with hardships as raw men; for probably they may often have their patience exercised in so long and remote a voyage: And the reason why I propose so few seamen is, because most of the soldiers will be made seamen by the length of the voyage, and be much more serviceable both for landing, of which there will be frequent occasion, as well as for small-shot upon the decks in an engagement, at which they are much more expert than our sailors.

I am concern'd that I am oblig'd here to take notice of the great ignorance of our seamen (generally speaking) in the use of small-arms, which, by a great blindness, they have too much neglected of late days, and endeavour to confirm one another in the contempt of them, by alledging, that in loading the great-guns with cartridge-shot you perform the same thing better; than which nothing is more false in fact, and is one of the chief reasons the French are so bold in boarding our seventy and eighty gun ships; for they know that our seamen are so unskilful in the use of the musket, that when they are beat from their artillery, they seldom give them much trouble afterwards, and what resistance they have found upon our men-of-war's decks of late time, hath mostly been from our mariners, who have very justly acquir'd a great reputation, and are certainly a most useful body of people, and the motto which I have seen upon some of their caps (*Sine his Nihil*) is now literally true. I affirm, this is one of the principal reasons that makes the French despise our seamen, and hath exposed us to such loss both of reputation and shipping as hath not been known but of late days, and deserves a very serious consideration, in order to procure a speedy and effectual remedy. If I should say that the fire-arms that are put on board our men-of-war are both too heavy and too short, and the locks good for nothing, and that the French extremely excel us in the commodiousness of their fire-arms in all respects, I should advance nothing but truth.

The season of the year proper to begin their

voyage is from the first to the middle of September; CHAP. VII. but I advise by all means that they should set out by the 15th of August, that they may arrive some small time in the South-seas before the French trade, that goes the same year: For by this means one could hardly fail of destroying all the ships bound thither that season, and perhaps meet with some returning home; for they must observe the same time of year and return by the same rout out of those seas that they went into them by.

To make this still plainer, it will not be amiss to set down here the rout they always use going thither, which is by or round Cape Horn, the southernmost promontory of all America; for they never venture through the Straights of Magellan, because they find now by experience, that for one ship that gets through, three are forced back, and so lose their voyage that year, to the ruin of their owners: But having sufficient sea-room the other way, they are never exposed to any such risque. After they have doubled Cape Horn, they steer directly for the isle of Juan Fernando, to refresh their men, who by the time they get thither want sufficiently, and likewise to take in fresh water, for their first stock can't fail of being near expir'd before they reach this place. I have taken a great deal of pains to inform myself of this matter from several French sailors that have perform'd the voyage, who all agreed that they never miss'd that island if they could help it, because their men are almost all in the scurvy by that time, and it would infallibly occasion a mutiny, if the Captain should refuse touching there.

It seems necessary, having mention'd this island, that I should give you a description of it, the rather because of the advantages I propose from the planting of it. The isle of Juan, or John Fernando, lies in the latitude of 34 degrees, 45 minutes, its circuit may be about thirty-eight or forty English miles, and its distance from the continent of South-America four hundred. Its soil is indifferent upon the hills, but its valleys are fine, fruitful and pleasant, interspersed with savannahs, as they are usually call'd here, that is, natural meadows which are common in the West-Indies, and which I have mention'd elsewhere in the description of Buenos Ayres. These valleys therefore are doubtless capable of great improvements, since there need be no question of their producing every thing which is agreeable to this climate; and tho', as I have said, the hills are in their soil unfruitful, yet I would not be understood by that to exclude trees, of which there are many, and some which might be of great use; but what principally induc'd me to mention the settling of it was the breeding cattle and raising fruits of the earth, and by tillage; by means whereof great advantage might accrue to the inhabitants, since the ships which pass the Straights of Magellan, or by Cape Horn, constantly touch here, by reason that their crew having by this time contracted an epidemick scurvy, the Captain's missing the island, might, as I have said, occasion a mutiny. I foresee one objection which would be made to this proposal, and that is, the difficulty there would be in maintaining such a settlement at such a distance from Britain, and from any British colonies: But to this I answer, "That never any island was more capable of being fortified so as to resist an enemy who could attack it in that part of the world." There are in it but two bays capable of receiving ships, which are both at the east-end, and a small charge would soon build such works as would render it impracticable for any to land there against the will of its inhabitants. The west-end, which is the highest,

Governor Pullen's description of the island of John Fernando.

CHAP. VII. est, rockiest, and by far the most barren part of the island, hath yet this advantage, that it is of such natural strength that a small body of men might defend it, even against the greatest force that could be brought against it.

Seals are found here in the greatest plenty of any part of the world, and their skins are of an extraordinary value from the fineness of the furs: Their fat makes very good train-oil, and much better still is made of what is called the sea-lion, which is a creature much bigger than the seal, tho' amphibious like them, yet without a fir. The number of these creatures, which is frequently so great as entirely to cover the shore, sufficiently demonstrates the plenty of fish which must be on its coasts, those amphibious animals living on little else; and indeed there are here as fine, and in as great quantity, as could be wish'd. To these advantages may be added the great abundance of goats, which have been produced by three or four which were left here by its first discoverer. All which put together, would render it no disagreeable place for those who in the voyage I propose have no other view than settling somewhere in the world, to plant themselves here, where they would be sure of finding most of the necessities of life ready to their hands; the grass of the savannahs in this island not being like those throughout the rest of America long and flaggy, but thick and short, extremely fit for grazing, inasmuch that a very competent judge avers, he has not carry'd his calculation too high in averring, that these savannahs are now capable of maintaining a thousand head of cattle, besides goats, who grow fattest on the most barren part of the island.

JOHN FERNANDO discover'd this isle in the voyage he was making from Lima to Baldivia; and being exceedingly pleased with its situation, soil and climate, resolv'd to settle it, judging that its produce might very well support four or five hundred families. On his return to Lima he endeavour'd to procure a patent for that purpose. In his first instance he was favourably receiv'd, but whether it clashed in any degree with the private interest of the Spanish Vice-roy, or whether it be a maxim in the Spanish policy not to settle in any place in America in which are no mines, I shall not pretend to determine, but shall only add, that it has continued uninhabited ever since, except now and then some body who has been left when the ships watered there, and who have found a way to subsist tolerably till they have been taken in again by some other ship that came on the same errand.

But I have dwelt long enough on this subject of planting it. Let us next observe of what use in its present state it might be to our squadron. And in the first place it is evident, that while our ships remain'd here it would be next to an impossibility for them to miss those for whom they waited. But besides, we should not lose a moment's time here by such a view more than is necessary to all ships that come on the same design; and we should likewise have an opportunity of sitting up our small-craft, design'd for landing of men, in order to the surprising such places as it should be resolv'd to attempt. Nor can there be a more proper conjuncture than while the fleet lies here, to concert the scheme of action while they remain in the South-seas.

The squadron having done this, ought to sail for Aurica, on the coast of Peru, and by sending a nimble sailor a-head, endeavour to learn, by taking some prisoners, whether the plate be yet there which is brought from the mines of Potosi to this place; for

Aurica is the barcadeer or port to Potosi; thither the King's galleons come once a year to fetch it up in the first place to Callao, and from thence, after some stay, to Panama, from whence it is sent over land to Porto Bello, where it is put on board of the galleons, which convey it to Spain.

Now if it should happen that the plate be there (as 'tis odds but it is) I advise without more ado to land and attack the place, and 'twill be a miracle to me if you can fail taking it: For Captain SHARPE took this place with no more than eighty men, tho' the whole force the country could raise was there to defend it. But there was a little paltry fort at the end of the town, that while his small force was attacking it, the people whom he had just before beat out of the town, return'd and charg'd him at his back: And tho' he beat them out again four or five times, his small number so diminished by these repeated attacks, that he was forced to make his retreat, tho' he saw, and was in possession of for some time, more silver than would have loaded four or five such ships as his was. You may see an account of this whole matter in Mr. RINGROSE's journal, who was one of Captain SHARPE's crew at that time, and is printed under the name of The history of the Buccaneers. But if nothing is to be done at this time here, then sail immediately to Cape Passo, under the Equinoctial line, where you can hardly fail of taking every ship that comes from the coast of Peru to Panama; for the whole trade of the South-seas consists in going and coming from this last port to Peru, as 'tis well known to every one that knows any thing of these seas.

In this cruise you will meet with the provisions that must support you in these parts: for the city of Panama is wholly sustain'd by the provisions sent from the several ports of Peru, as wheat, flour from Guanchaco, wine, bacon, and marmalade from Pisco, and chocolate from Guiaquil, sugar and oil from Hillo. In my opinion these foregoing articles may afford a comfortable subsistence for our people, during their stay there, and what they need never fear meeting with in sufficient quantities, if their Commanders understand the proper methods for intercepting it.

The provisions the Spaniards are forced to send for the support of this great city was the reason they could never hinder the Buccaneers subsisting in these seas, which they endeavour'd by all means within their power: And I am of opinion, that that they might probably effect it were it not for the continual supplies they are obliged to send to Panama, which can never be dispensed with; for if they should take such a resolution, that great city would certainly be starv'd. I have dwelt longer upon this article than otherwise I design'd, to convince people that a squadron need neither perish by hunger, or be driven by it out of these seas, if they know how to take the proper means to prevent it. But I shall say more upon this head when I come to answer the objections against the impracticableness of this voyage, which I propose to do in the sequel of this discourse.

After the squadron hath made what stay they find convenient in this last station, they ought to proceed to the bay of Panama, where there are several small islands that abound with refreshments and water, and very good anchoring, in several places. Here they will intercept all ships bound for this port, and likewise a great number of small barks from Natta, La Velia, and Puebla Nova, which are laden with fowls, hogs, manatee, and Indian-corn for the use of Panama, and you may

attack

CHAP. VII. attack Panama itself, or the golden mines of St. Maria, or both, according to the information you receive from the prisoners you take; and indeed if you staid long here, the city of Panama would infallibly be starved.

At this place, in my opinion, they should divide the Squadron, after they have perform'd all the service they can here, and send four ships to cruize on the coast of New-Spain, in order to take the Acapulco ship; two of these ships must cruize off the mouth of Acapulco harbour, or rather to the northward of it, and the other two must take their station near Cape St. Lucar, in California, which is always the first land the Manilla ship makes coming home, except she hath reason to fear an enemy there, and then she endeavours to make the land as near the harbour's mouth as she can, for which reason I have placed two ships in each station. The time she arrives never exceeds ten days before or after Christmas, which makes it almost impossible to miss of her, if the disposition I have here laid down be followed. They will likewise have a chance to take the outward-bound Acapulco ship, if they take care not to be discover'd from the coast, for she never fails to begin her voyage betwixt the 10th of December and the 10th of February, and is most prodigious rich in pieces of eight.

Now to return to the four ships which we left in the bay of Panama, I think they ought to take this opportunity to go over to the Galleppagos (under the Equator) where they will find both great store of excellent refreshments for their sick men, and ports where they may careen and refit their ships with all manner of security; therefore the four ships sent to look out for the Acapulco ship must be appointed to rendezvous here after their cruize is out. Now I have pointed at all the principal things that can be undertaken at sea in these parts, but have omitted a great many enterprizes that might be formed against the rich towns upon the coast of Peru, because I would not swell this discourse to too great a bulk.

First, 'Tis objected, and with a great deal of seeming reason, that having no ports there where the Squadron can either revictual or refit upon any occasion, that therefore they would run the greatest risque imaginable of starving, or having the ships in a little time render'd unserviceable.

To which I answer, That if they please to make use of the following advice, they need neither fear the one or the other, viz. To send all such ships as you take in your cruize between Peru and Panama (loaden with provisions) over to the Galleppagos with one of your frigates, with orders to chuse out the best harbour, and where there is the greatest plenty of refreshments, and there unrig your prizes you think fit to send, and form a magazine, which indeed the place itself invites you to, for you need never fear the Spaniards disturbing you, for two reasons; First, because they have no naval force, though join'd by the French, capable to dispute the sea with you. Secondly, because they know hardly any thing of these islands but the name, dreading them extremely, and telling strange romantick stories of whirlpools and currents that have destroyed several of their ships that had the imprudence to come too near them in their voyages (you may see more of this in Mr. RINGROSS's Journal) and indeed here is so many of them, that it would not be an easy matter to find that out which we should pitch upon except by chance. The ignorance of the Spaniards in these parts is hardly credible.

I say, hither they must send all the ships they take loaden with provisions, timber, or any other stores that may prove useful to them whilst they stay here; and the very ships themselves may serve for hulks to clean by, and such of their masts and yards as are large enough be preserved for the use of our own ships. The only reason why the Privateers never did this, in my opinion, was because nobody had authority enough to make part of the men stay here to look after the stores; for there might indeed happen among that unruly sort of people forty accidents that might occasion their being left there for ever. But that they made other very good uses of them is very plain to them that know any thing of Captain DAVIS's voyage, or Captain SHARPE's, or indeed of any of the Rovers that ever enter'd those seas for thirty years last past.

And 'tis worth considering, that Captain DAVIS staid in these seas three years, and twice took the very ships equipp'd out to fight him, which had the very best men they were able to pick out of all Peru, and after surprizing several of their rich towns, return'd to these very uninhabited islands, where he fitted and victuall'd his ship for his return home, which he happily perform'd, though he used none of the precautions I have here recommended. Captain SHARPE did yet much more in a ship of less force; for after having made a good voyage (as they call it) he sail'd to Nicoya, a small village that consists all of carpenters, and surprized it, and made the very Spanish carpenters take down his ship's poop, and alter his main-deck to make her fitter for the sea: And though the Spaniards could not but know of it, they durst never give him any interruption; and when his work was done to his mind he very generously rewarded his Spaniards and dismiss'd them, and afterwards successfully perform'd his intended voyage to the West-Indies.

Thus I could name several others that have carried their point, in spite of all the opposition the Spaniards could make; and if it be objected, that they were only in small numbers, therefore could better subsist: I answer, they perfectly mistake the matter; for the force I propose could upon occasion ravage the best and most plentiful country in these parts in the face of the sun. But things may easily be kept from coming to these extremities.

The second objection is, that the Spaniards or French could not fail of being inform'd by their good friends here of the intended expedition, and so render it useless and unsuccessful. To this I answer, that if it was to be carry'd on in a method I could propose, they could never know of it, except it was betray'd by them that only have the power to put it in execution: But suppose it was, I can tell you, they could ward against very few of the intended blows; for in the first place, they could send no silver from Peru to Panama, and so the galleons would come empty; and pray consider the consequence of that. In the next place, you must of necessity ruin the French trade during the time you staid there; neither could they prevent with all their knowledge your taking their sea-port towns, or the homeward bound Acapulco ship. In my opinion, it could only hinder your taking the galleons going between Aurica and Panama, or the Spaniards bringing their silver to Aurica from the mines; and as to the French sending a superior Squadron after us, 'tis not so easily done as supposed, for reasons too long to insert here, but such as I shall be very ready to produce when desir'd. In my poor opinion, these foregoing objections are the only

CHAP. VII. only ones of weight that can be brought against this proposal.

The Governor proposes settling colonies in Chili.

I have yet left untouched a most noble design that may be formed upon Chili, a country that the Spaniards have but hold on by the border. King CHARLES the II^d seem'd to aim at something of this kind by his sending Sir JOHN NARBOROUGH thither in the Sweep-stakes to discover it; but the Spanish Don who went with him in the nature of a pilot, and without doubt put the King upon the enterprize, after his being put on shore in the man-of-war's boat where he desired, never appear'd more; upon which, and upon some other disasters, Sir JOHN return'd home. But 'tis certain this is one of the best and richest countries in America, where if we could settle ourselves, we should prodigiously enrich our native country; and for my part, I don't think it impossible to be done.

In my opinion, the proper time to undertake this will be in returning home; for if the design does not succeed, it will not put you a league out of the way. But I advise by all means to attack the city of Coquimbo, which is situated upon the very confines of Chili, because you will certainly find here several Chilean slaves, who, if manag'd dexterously, will prove exceeding serviceable; and likewise you can't fail of being informed of the present posture of affairs in that country, and if it prove impracticable at this time to prosecute the project any further, the Squadron may take in their stores of fresh water and other excellent provisions for their voyage home; for there is not a better port for that purpose in all these seas. Captain SHARPE took this place with ninety men, and though discover'd before he landed, met with very little resistance.

To make what I here advance more intelligible, it will be necessary to give a short account of the Spanish affairs in Chili. This noble country, which all the Spanish authors that have wrote concerning it compare, both for temperature of air and productions of the earth, to France, was search'd into by PEDRO BALDIVIA, some considerable time after the conquest of Peru; and the principal city, if not the only one the Spaniards have at this time in that country, is call'd after his name. He found the country to abound with the finest gold in the world, which caus'd a great many people from Peru to join themselves with him. By this means three considerable cities were built and fortify'd in a very small time in that country, viz. Baldivia, Osorno, and Castro.

After the Spaniards had settled themselves, securely, as they thought, from any attempts of the Indians, according to their usual custom, they began to treat the natives of the country in a most inhuman manner, but they presently found themselves mistaken, and were convinc'd they had to do with a people the bravest and most martial of any in all America; for they gave the Spaniards several battles, and always routed them, and at last took their very cities and utterly expell'd them the country. In one of the battles, wherein they not only defeated the Spaniards, but likewise took BALDIVIA their General prisoner, and served him as the Parthians did CROESUS, pouring melted gold down his throat, and telling him, at last they had found a way to satisfy his avarice.

In this interim the Dutch made a voyage to the South-sea with four ships from Brazil, which was then almost all in their possession, and touch'd at Baldivia, which at that time was not re-settled by the Spaniards. The natives flock'd down to them

VOL. III.

in very great numbers, perceiving they were not Spaniards, by their complexions and hair, and were overjoy'd when they understood that they were at war with them, and would assist them against their common enemy upon all occasions. This good understanding lasted several days, with abundance of interchangeable good offices, 'till unluckily the Dutch began to be very inquisitive after gold, which as soon as the Chileans perceived, they immediately abandon'd the port, and would never afterwards converse with them, notwithstanding all the endeavours the Dutch could use.

After this imprudent negotiation, perceiving they could never retrieve the blunder they had made, they set sail and return'd to Brazil, being only four months and some days upon the whole voyage, which is a remark worth taking notice of. The Spaniards, some time after this voyage was made, re-settled at Baldivia, not being able to support the thoughts of losing so rich and pleasant a country entirely, or perhaps fearing the Dutch might find means to seize upon it, being then in open war with them, who besides depriving them of the vast quantity of gold they used formerly to draw from this country, would prove troublesome neighbours to Peru.

These and the like considerations made the Spaniards resolve to re-establish a new colony at Baldivia at all hazards, and without doubt it was done with great trouble and expence; for by all the relations I ever could procure (and I have been very inquisitive) I can't find the Spaniards have any other settlements in the whole country. But this I am sure of, that the war continues between the Spaniards and the natives as fierce and bloody as ever. And Mr. FUNNELL says, in the year 1704 they durst not touch at the island La Moucha, which is on the coast of Chili close to the main-land, because, says he, we should run great danger of being murder'd by the inhabitants, who are always at war with the Spaniards, and think all white men to be such: But grant they do, there may be found out means to undeceive them; but I think the voyage I have quoted sufficiently refutes that opinion.

I shall only mention a particular or two more of the Chileans, and then come to what I propose concerning them. Amongst the several nations that inhabit this province, and are at war with the Spaniards, there is one call'd the Araucans, who, the Spaniards say, are so valiant that they attack them whenever they meet with them, though inferior sometimes considerably in number, and know not, at least have not the use of fire-arms; and notwithstanding these disadvantages, generally are successful, insomuch that the Spaniards stand in great fear of them; and add, that they are so good at imitation in what relates to war, that they learn to camp and decamp, and intrench themselves in places of advantage to make a handsome retreat or an assault, with having but once seen them practis'd; and sometimes make improvements upon their teachers to their great cost, who heartily curse them for their docility. A famous Spanish Poet, during the time he served in the Chilean war, compos'd a poem must esteem'd by those of his nation, call'd H. Araucano.

Now I propose, that the Commander of this Squadron should have instructions to endeavour by all possible means to get a conference with the natives of this province, which if he can bring about, the business will be done to his hand; for as soon as they perceive he is an enemy to the Spaniards, he will want no assistance they can give him, if he

23 B

gives

CHAP.
VII.

gives orders that neither gold nor silver be mention'd in any discourse held with them. After this, he may either attack Baldivia in conjunction with them, or seize on any other port he finds convenient, where he may repair to in case of need, either for victuals, which this country abounds with, or for other occasions. But if he takes Baldivia, which I recommend if practicable (for I believe it is in a good posture of defence, because they have an enemy at their very gates, who they stand in great dread of) in such a case it would be requisite to leave a garrison, a small one would serve the turn, whilst the Squadron cruized in those seas, because the Spaniards can't go thither by land, and durst not peep by sea during the time it stay'd in those parts.

But when it was thought convenient to return home, it ought to be provided with a very good garrison, for this country is well worth the keeping possession of, and would mightily enrich our native country; and take off a great quantity of our woollen manufacture, because here is a severe winter of four months: And I am verily persuaded, if a prudent man should be left Governor, who cultivated a good correspondence with the natives, that the Spaniards, tho' assisted by the French, would never dare to stir a foot to retake it; or if they did, would be unsuccessful, they would be so harass'd and plagu'd by the Indians, their implacable enemies, who, if they had fire-arms, would certainly be too hard for them on all occasions. Indeed 'tis requisite this acquisition (if made) should be encourag'd from England as a thing of the greatest importance, and a sufficient number of men, with all other necessities, be sent away by the first opportunity. For,

Besides the riches of this country, you would infallibly in time of peace have a stol'n trade with Peru for all sorts of woollen goods, as we formerly had from Jamaica with the Spaniards inhabiting the ports of the North-seas; and the Indians in a short time would be brought to supply you with gold when they saw you paid them for it in goods they wanted and valued, as cloaths, arms, and toys. These Indians must always be treated as a free people, and all manner of satisfaction given them upon all occasions that's reasonable. I should imagine this following way to be a good method to begin a friendship with them.

Upon taking any towns upon the coast of Peru, to enquire narrowly if there be any Chilean slaves; and if you meet with any such, as you certainly will, to send them abroad, and treat them with all imaginable good usage, and carry them to their native country and set them ashore, having first engag'd them to settle a correspondence betwixt you and their countrymen, which without doubt they will readily undertake, and be as joyfully accepted of. And these slaves, speaking the Spanish language, will be of as great use as interpreters. I am mightily mistaken if Mr. RINGROSE does not say, in some place, the Spaniards remov'd their Chilean slaves from the sea-ports, for fear of their joining with the Buccaneers when they made descents upon the coast of Peru to surprize any place they had an intention to plunder. I shall now dismiss this head, tho' there may be much more said of it; but I think it will not be amiss to take notice that 'tis situated betwixt the 25th and 45th degrees of south latitude, and is the first country that is inhabited by any Spaniards, as you come into those seas round Cape Horn.

I have been more concise in the several points treated on in this short work than otherwise I should have been, because I intended at the same time that

I publish'd these papers of my own, to accompany CHAP. VII. them into the world with a small treatise of Captain LEWIS PAIN's, a very understanding honest gentleman, who was taken by the Spaniards in Europe, and sent over in 1707 to America, where he was kept in chains several years, being made use of as an engineer, by which means he had paper, pen and ink allow'd him; and in those intervals he had of leisure compos'd the following short memoir of the state of the Spaniards there. At last he found a way, by means of a Mesteeze woman, to escape to Jamaica, but dy'd three weeks after his arrival. I purchas'd all his manuscripts for ten pistoles, and amongst them found this, with which I now present my readers, containing a more exact and intelligible draught of those truly Terra incognita, the in-land Spanish plantations, than any that (I at least) have any where met with.

The love of my native country prevail'd on me to enter on this work, which I hope will afford at least hints to some unworthy persons to improve the naval strength of Britain, extend her commerce, enrich her inhabitants, employ her hands and exalt her glory: Which are the utmost wish of the author of these pages, and have been equally the end of his endeavours, as they were the farthest aim of his ambition.

“ Thus far Governor PULLEN. I shall, in the next place, exhibit such passages out of Captain PAIN's papers, which fell into the Governor's hands, as may enable us to form a just idea of the state of the Spanish colonies in general, and of this province of Chili in particular, and then proceed to make remarks on the Governor's scheme of sending a Squadron of men-of-war into the South-seas in case of a war with Spain, and the endeavouring to settle colonies upon the coast of Chili.

The empire of the Catholick King in America (Captain PAIN observes) is a sufficient demonstration that projects, how surprising soever in their extent, are not always chimera's. COLUMBUS, when he first form'd that which with so much glory he executed, offer'd it with all its advantages to his countrymen the Genoese. Those in the government of the publick affairs examin'd it, and being satisfy'd with the reasons, were for encouraging the proposal; but Signor LUCIO BERNERDI representing to them the condition of the State, and that any conquests attained in this new-discover'd world would be almost impossible to be preserv'd, and would serve but to open the way to more powerful Princes, it was thereupon rejected, perhaps not without cause. Then it was by BARTHOLOMEW COLUMBO offer'd to King HENRY the seventh of England, next to the King of Portugal, a great encourager of navigation, and lastly, to FERDINAND and ISABELLA, or rather to her only, for it seems agreed amongst the Spanish historians, that Queen claim'd a sole and peculiar right thereto, suffering none other but her own subjects, the Castilians, to pass over thither; which FERDINAND at her decease alter'd, and left all Spaniards as much freedom in this respect one as another. Several brave Captains and well-appointed ships of war soon after were transported thither; which quickly subdu'd not only the islands COLUMBUS had discover'd, but also conquer'd a great part of the continent, erecting two noble governments on the ruins two vast empires, viz. Mexico and Peru. Each of these hath its Vice-roy, who has many great officers under him, with some places within the bounds of these two general divisions, which yet are independant,

Captain
Pain's ob-
servations

sent state
of Spanish
America.

CHAP. VII. dant, and subject only to the Council in Spain; but the form, the maxims, and the end of their policy, being throughout the vast extent of their American dominions the same, I shall, for the sake of being at once concise and perspicuous, first describe their method of ruling, and then give a particular description of the several provinces which are at present under their dominion.

The only essential maxim which runs through the whole political œconomy of the Spaniards, in respect of their territories here, is the keeping them in an absolute dependance upon Spain. All things therefore relating to their American empire receive their first form, and all disputes, all projects, and all designs of extending or improving their dominions are consider'd in their dernier resort by the Council for the Indies in Spain, compos'd of such who both from theory and experience have attained a perfect knowledge of these countries. As to America itself, it is, as I have said, divided into two large governments, Mexico, call'd also New-Spain, and Peru, each of which hath its Vice-roy, who is honour'd with a very extensive commission. He hath for his assistance a Council, and under him, in the large provinces of his government, several subordinate officers, who wear the titles of Presidents, Alcalds, &c. appointed at the will of the Vice-roy, who, notwithstanding some outward forms and shew of limitations from his Council, is for all that absolute; making by presents, perquisites and traffick, an immense wealth by large sums, out of which he procures himself to be continu'd another five years (his first and usual term) in his government, and sometimes more. The two chief points which these Vice-roys have committed to their care is, the conserving, and if it be any way practicable, the increasing the King's revenues in plate, &c. which yearly is carry'd from Porto Bello to Spain, and the keeping the natives, Criollo's, Mesteeze and Indians in subjection, which is executed with the utmost rigour, and is the source of all the evils that are felt here: And since the chief knowledge that can be acquir'd of the true situation of these affairs is deriv'd from hence, it seems reasonable I should explain it a little farther.

The natural-born Spaniards are solely vested with command throughout all the Spanish-Indies; they only enjoy posts of honour, profit and trust; and this it is which occasions those draughts which have so drain'd and weaken'd their dominions in Europe; for putting no confidence even in the very first generation of their descendants, and absolutely prohibiting all strangers from going thither in their service, a necessity follows of sending thither continually large supplies, that they may be still in a condition to hold the reins with equal tightness. This form of government creates an irreconcilable antipathy between the European Spaniards and the Criollo's, i. e. those born of Spanish parents in the West-Indies. These latter see with indignation themselves equally shut out from all considerable preferment either in Church or State, the most palpable partiality shewn in all judicial decisions between them and Spaniards, and in a word, the whole policy of their Governors bent to distress and to deject 'em. The Spaniards, on the other hand, no ways ignorant of their sentiments, and moreover continually jealous of their desire to throw off the Spanish yoke, entirely exert their utmost arts to enfeeble and enslave them: They discourage, as far as they are able, all sorts of manufactures, of which being unprovided, they must of course purchase such as are sent from Spain; they also endeavour to hin-

CHAP. VII. der plantations (except Estantians, or Beef-farms) that they may not have it in their power to possess rich and improv'd settlements, the cause why those noble countries are so little cultivated, and lastly, they make it their aim to increase luxury, idleness, and pusillanimity amongst them, that they more easily may be kept in obedience; whence it apparently follows, Buccaneers and such like in small numbers are able to do the utmost mischief. And thus throughout all these vast rich and noble provinces, the inhabitants seem inspir'd with a spirit of dissention, which renders them continually restless and uneasy, making almost useless those blessings indulgent Providence has conferr'd upon them.

As to the religion of the Spanish Americans it is universally popish; and if there be any degree in bigotry amongst them, it is among the natives, who almost adore the Priests, and are severely fleec'd by them, paying them out of all they have much more than the tythe. Amongst the Clergy there are great divisions, occasion'd chiefly by the national quarrels between the Criollo's and the Spaniards, which have subsisted long, and seem rather to increase than diminish. The several orders of Friars, as in Europe, are exceedingly jealous of one another, tho' they all find ways to gain so much upon the minds of the people, that there is not perhaps in the world finer and more costly monasteries and religious houses than are here, the power, riches, and grandeur of the church rising no where higher.

The inhabitants of these countries are, 1. Natural-born Spaniards. 2. Criollo's, of Spanish parents, born in America. 3. Mesteeze, born of Indian and Spanish parents. 4. Indians, properly natives. 5. Negroes brought hither from Africa. As for the Spaniards, they differ little from those in Europe, except that they are more high and lofty than in Spain, as they are lords here, possessing every thing, and living on the labour of others. The Criollo's fall not a bit short of them in vanity and haughtiness; but, as I have said, are kept much under, never allow'd any considerable preferment, and are even worse us'd than the Indians themselves; they are ignorant, lazy, and pusillanimous in general, though here and there, especially amongst the church-men, some deserve a better character. The Indians are a simple well-natur'd industrious people, much lessen'd in their numbers by the excessive cruelty us'd at first by their conquerors; they are yet sufficiently press'd by the yoke of bondage, but wherever they are allow'd a relaxation, they build convenient cities, and so make themselves rich and flourishing. The Negroes here as elsewhere are made use of as slaves.

As to the commodities of this country, I shall speak more particularly under the description I shall give of its several parts. In respect of its trade, it is wholly domestick, except what is carry'd on with Spain in a yearly ship from Acapulco to the East-Indies, and the prohibited commerce they us'd to carry on with the English. The Spaniards, who, as I have said, own no other maxim in their Indian politicks, than to keep the Americans in absolute subjection, are in nothing more careful than what relates to traffick, having taken every precaution they were able to hinder their intercourse with other nations both by heavy fines and severe punishments, which sometimes have extended even to death itself, and by maintaining vessels of force in pay, under the name of Guard de Costa's, in order to cruize about, and make prize of whatever ship they find within the limits of their seas. They likewise suppress

CHAP.
VII.

prefs some, and carefully discourage all manufactures from being carried on there, though for all that, some very tolerable cloth is made in Quitto; for it is here as in some other polite countries, a handsome present to those in the administration is a certain method to strike justice, or at least the ministers of justice, both blind and dumb. The shipping here are neither numerous nor convenient, what there are continually pass to and fro between the two vast divisions of this empire; which as they were before the only parts of the world known to the Indians, so they are now the only places which have any commerce together under the government of the Spaniards: But as all is of late fallen under the direction of the French*, it is highly probable they soon may be alter'd.

Captain
Pain's re-
marks on
Chili.

Chili lies next to the province of Peru, and is absolutely the finest country and richest in all America, whether north or south. The inhabitants are a hardy, valiant, and stubborn people, who having been ill used by the Spaniards, drove them out of their country, kill'd their Governor, and are their inveterate enemies to this day: However, the Spaniards have now recover'd Baldivia and some other places on the sea-coast. Paraguay, or rather La Plata, is at the back of Chili, in which the Catholic King hath the valuable settlement of Buenos Ayres, one of the finest in America; the true Paraguay is entirely subject to, and formed by the Jesuits. Terra Magellenica is the last Spanish settlement I have to mention, and to say truth is difficult enough to determine whether it be settled or no; however, they claim it, and as they reckon it part of their possession, so shall I.

The au-
thor's re-
marks on
Governor
Pullen's
project of
settling
colonies in
Chili.

I come in the last place to give my own thoughts on Mr. PULLEN's project, in case we should ever have another war with Spain; and must agree with the Governor that nothing could more sensibly affect the enemy than the interrupting their trade with Peru and Chili, and that a squadron might be well employ'd in the South-sea for that end; but I should rather chuse the island of Chiloe for a station for our ships than that of John Fernando's, because the latter lies four hundred miles from the coast, and the other in sight of it, within three or four leagues of the continent in many places; besides, the island of Chiloe is ten times larger, already well stock'd with cattle, has many good harbours in and near it, and is known to be well watered and fruitful where it is cultivated. And if any thing should be wanting for the fleet or land-forces, provisions might easily be procur'd from the neighbouring continent, which is in view of it. Besides, Chiloe is known to have gold mines in it, which might be wrought by our Negroe slaves; and were we once fix'd here, we should command the whole coast of Chili, if not that of Peru. It would not be possible for the Spaniards, tho' assisted by the natives, to expel us from that important island of Chiloe; and as it lies between the latitudes of 41 and 44 the climate is not disagreeable to British constitutions in point of health and convenience. All manner of European grain and fruits grow here, our cattle multiply and improve to a miracle, and it might be stock'd with them in a few hours from the adjacent continent if they were not to be met with there already.

But further: The town of Baldivia, near which are the richest gold mines of America, lies almost in sight of the island of Chiloe, and would infallibly fall into the hands of the English if they were possess'd of that island, there being no naval power in those seas that could protect that port against us.

And tho' I don't suppose the Chileses would willingly suffer us to open those mines at first, yet were we once establish'd on the continent, and supported by the garrisons I propose to leave in Chiloe, and a squadron of men-of-war, we might traffick with the natives, as the Spaniards do for the gold they pick up, and possibly in time, by one means or other, procure the mines to be opened and wrought by our own Negroes; for the great objection the natives have against working them is, lest they should be put to that drudgery themselves, as they formerly were by the Spaniards.

But I must confess there are some very considerable objections against our attempting to plant colonies on the coast of Peru or Chili. As first, That it is a very long and hazardous voyage of five or six months, and if any misfortune should happen by tempests, or the sickness of our men, it would probably be defeated: That the Dutch actually attempted this, and fix'd themselves at Baldivia, and yet were forced to relinquish it again: Nor have they ever thought fit to attempt it a second time, tho' they have frequently been at war with Spain.

It may be objected further, That neither the French or Dutch would sit still and see the English in possession of the gold and silver mines of America, but would assist both the Spaniards and natives in expelling us from thence.

As to the first, I do not think the hazard so great as to deter us from attempting an enterprize that would enrich the nation to so great a degree, and weaken our enemies (as this scheme supposes the Spaniards to be). And as to the miscarriage of the Dutch in the like attempt, it is evident their squadron and land-forces were too weak for such an enterprize; and their losing their General, who projected it, was another great disadvantage to them. But their principal misfortune was his being succeeded by a person that wanted address, and gave the natives such jealousies of their design to enslave them, as made them his enemies. But what discourag'd the Dutch most from pursuing this design, and making another attempt, was a suspicion very well founded, that neither the French or English would sit still and see them in possession of the treasures of Peru and Chili.

And this is indeed the grand objection against our attempting to fix colonies there, and getting possession of the gold and silver mines of Peru and Chili. The French and Dutch would no more permit us to be masters of them than we should suffer either of those nations to monopolize that treasure: We are all agreed that they are much better in the hands of the indolent unactive Spaniard, who makes but little use of them to the prejudice of his neighbours. Nay, most of the plate he brings from America is employ'd in paying for the merchandize of Britain, France, Holland, Italy, &c. which countries perhaps have this way had as great a profit, or a greater (at least some of them) than they could expect if they were masters of the mines. We should but send the same goods to the Spanish West-Indies directly which we now send by the Spanish Flota: And had Britain as great a share in that traffick now as formerly, she would have no reason to covet those treasures; but unhappily for us, ever since the French used those seas, and have had so good an understanding with Spain, they have supplanted us, and we are now in a manner beaten out of that most valuable branch of our commerce, where for our woollen manufactures, which were dispersed all over Spain and Spanish-America, we received chiefly bullion in return: This traffick is now

CHAP.
VII.Objections to
the settling colo-
nies on
the coast
of Chili
consider'd.

* This was wrote during the wars in Queen Anne's reign.

C H A P. VII. now in a manner lost to us, as we too sensibly feel at this day.

The advantage of erecting forts on the isthmus of Darien.

And since we have lost the affections and trade of Spain in a great measure, and are never likely to recover them again by fair means, the next best thing we can do is to render ourselves as formidable to the Spaniards as possible. It is certainly our wisdom at this day, if they persist to quarrel with us and insult our merchants, to possess ourselves of some port-towns, either on the islands or continent of America, that they may fear us, and be compell'd to admit us into a good share of that trade again, on pain of seeing their own commerce with Mexico and Peru interrupted and ruined; which I am apt to think might be more effectually done by planting colonies and erecting forts on the isthmus of Darien than by any settlements on the coasts of the South-sea; for the first would give us the command both of the North and the South-seas, and make us masters of the trade and navigation both of Mexico and Peru: Not a Spanish ship could stir either way if we had once fix'd ourselves on the isthmus of Darien. We might then prescribe to the Spaniards what goods they should take of us, and upon what terms we pleased, which would be more to our purpose than possessing the mines of Spanish-America, if that was feasible; for by this means all our handicrafts and mechanicks would have full employment, our woollen manufactures would be disposed of to the best advantage, and the commerce of our neighbours with the Spanish-West-Indies lessen'd in proportion to the increase of ours.

Another reason for planting colonies on the isthmus of Darien rather than on the coasts of the South-sea is, that the voyage to Darien is but short, not above six weeks or two months, whereas that

into the South-sea is a voyage of five or six months, and in case of a misfortune we have no friendly port to sustain or refresh our people. C H A P. VII.

We have also the island of Jamaica a little distance from Darien, from whence our garrisons might be supply'd with arms, ammunition and provisions from time to time, and even with men inured to the same climate, and consequently not so subject to the diseases of hot countries, as our northern people are. Though it appears, that there are some situations even upon the isthmus of Darien that are agreeable to Europeans. The Scots actually found such a one when they erected their fort of New-Edinburgh, which was naturally so strong that with a very small force they could have maintain'd against all the power of Spain, if we had not inhumanly and impolitickly denied them provisions at Jamaica and other English settlements.

I know every one will be apt to object the misfortunes of Admiral Hostier and his Squadron to this scheme: But that was a very different case. They were oblig'd to lie before Porto Bello, the most unhealthful place in Spanish-America, for an unreasonable time, without going on shore, or receiving any refreshments from thence. The Scots fared much better, who pitch'd upon a place, for aught appears, as healthful as any in England; and why we should not plant the same, or find out another as good, in case of a rupture, I can't see. Nay, why we should not immediately endeavour it, since great part of this country is not under the dominion of the Spaniards, I can see no manner of reason. It would make them cautious how they disturbed our trade by their Guard de Costa's, and readier to make us satisfaction for their repeated depredations.

C H A P. I.

Of the name, situation, and extent of LA PLATA, and of the face of the country.

CHAP. I.

Plata the name.

Its situation and extent.

Face of the country.

THE province of La Plata (sometimes call'd Paragua) receiv'd its name from the river Plata, which rising near the city of that name in Peru, runs to the south-east through this country.

It is bounded by the country of Amazons on the north, by Brazil on the east, by Patagonia on the south, and by Peru and Chili on the west, lying between the 12th and 37th degrees of south latitude, and between the 50th and 75th degrees of western longitude, being about 550 in length, from north to south, and near as many leagues broad in the middle of it; but towards the north, where it is bounded by Brazil on the east, and by Peru on the west, it is not 200 leagues broad.

That part of this country which lies west of the great river Paragua consists of large plains extending two or three hundred leagues in length, without any trees, at least any thing that looks like timber, and scarce a hill or a stone to be seen in them; but in the country to the eastward of that river which borders on Brazil, there is a variety of hills and valleys, woods and champaign.

C H A P. II.

Of the seas, lakes, springs, rivers, and seasons of La Plata.

CHAP. II.

Seas.

Lakes.

THIS is for the most part an in-land country, and only borders upon the Atlantic-ocean on the south side of the mouth of the river La Plata, near which the city of Buenos Ayres is situated.

Lakes they have in great abundance, and some of them very large, particularly that of Xarayes, which our Geographers place in 15 degrees south latitude, and out of which the great river Paragua is said to rise.

There is another call'd the Lake of Venoras, in 31 degrees south latitude, about eighty miles west of the river Paragua; and a third call'd Caracaroës, in 30 degrees, 20 leagues east of the river Paragua, which is an hundred miles in length and upwards;

but there are not many springs in the flat country.

CHAP. II.

Rivers.

The sources of their rivers are some of them in the mountains of Andes; those that rise there run to the south-east, and fall into the great river Paragua: Others rise in the hills which separate this province from Brazil, and running south-west, fall into the same river Paragua, which rises, as has been said, Paragua out of the lake Xarayes, in 15 degrees, and running almost directly south, unites its waters with the Uragua, in 34 degrees; after which it is call'd the river of Plata 'till it reaches the Atlantic-ocean.

2. As to that which is properly call'd the river Plata of Plata, it rises, as has been observ'd, near the town of La Plata in Peru, and running to the south-east, falls into the river Paragua, in 28 degrees south latitude, after which it loses the name of Plata, and the united stream is call'd the Paragua 'till it meets with the river Uragua, and then it resumes the name of Plata again 'till it discharges itself into the ocean.

This river is said to have obtain'd its name of Plata upon a double account; 1. Because it rises near the town of La Plata; and, 2. Because the plate is sometimes brought down this stream from Peru to Buenos Ayres.

3. The third considerable river is that of Uragua, Uragua which rising in the mountains that divide Brazil river. from this province, runs almost due-south 'till it unites its waters with the Paragua, in 34 degrees south latitude, and is almost as large as that river, being navigable for ships several hundred miles.

4. Out of the same mountains to the northward Parana rises the river Parana, another very large stream, river. which running almost parallel to the former, falls into the Paragua in 28 degrees south latitude.

5. The fifth river I shall mention is the river Salado Salado, so named from the saltness of its waters. river. This river rises in the Andes, and running to the south-east falls into the Paragua in 33 degrees, south latitude.

The river Tercero, which rises in the mountains Tercero of Andes, and running almost due east, falls into river. the

CHAP. II. the Paragua in 34 degrees, not far from the town of Spirito Sancto.

There are a multitude of other rivers both on the east and west of this province which fall into the great river Paragua, and so fertilize the plains that they abound in good meadow and pasture grounds, which feed innumerable herds of European cattle, viz. horses, cows, sheep and goats, which, from a few of each species that were carry'd thither by the Spaniards two hundred years ago, are multiply'd to admiration.

Seasons. As to the seasons, the north part of this country, which lies within the Tropic of Capricorn, has in November and December annually, when the sun is vertical, very heavy rains, storms and tempests, as other countries which lie in the same latitude within the southern Tropic have: And at this time all the flat country is over-flow'd, their cisterns and reservoirs of water are replenish'd, which serve them the rest of the year 'till the rains return: Their lands are moisten'd and made capable of tillage, and whenever these rains fail it occasions a famine amongst them. The beginning of the rainy season is the time of sowing and planting, and the fair season, which follows upon the retreat of the sun to the northward, is their harvest.

Periodical storms and floods.

But directly contrary, in that part of the country which lies south of the Tropic of Capricorn, it is their summer (their fair season, when the sun is nearest them, viz.) in November, December, and January: And those rivers which rise within the Tropics, particularly La Plata, Paragua, and Parana, after the rains are fallen within the Tropics, swell and overflow their banks as they pass through the south part of this country, rendering it as fruitful as the Nile does Egypt; and indeed this is the case in almost every part of the world where the rivers rise within the Tropics; the periodical rains swell them, and occasion them to over-flow their banks, so that the flat country near their mouths appears like a sea, and as the water goes off the husbandman begins to sow and plant his lands, which are render'd exceeding fruitful by the inundation; whereas without this it would be impossible for him to raise a crop in many places. Their plains are so exceeding hot and dry, and there falls so little rain in the countries which lie just without the Tropics, as this and Egypt does, that they would produce scarce any thing if they wanted these annual floods. And I am apt to think it is when these are at the height, that the mouth of the river Plata appears to be two or three hundred miles broad; for the same thing happens annually near the mouth of the river Niger in Africa, near the mouth of the Ganges, in the East-Indies, and at the mouth of every river almost that has its source within the Tropics, where the rain falls in vast quantities whenever the sun is vertical.

CHAP. III.

Of the provinces, chief towns, and buildings of La Plata.

CHAP. III. **Provinces** LA Plata may be thrown into two grand divisions almost equal in extent, viz. 1. The provinces on the east side of the river Paragua; and, 2. Those that lie west of the said river. The provinces on the east side of the Paragua are those of, 1. Paragua Proper; 2. Guayra; 3. Parana; 4. Uragua. Those on the west side of the Paragua are, 5. Tucuman; and 6. La Plata Proper.

CHAP. III. 1. Paragua Proper is bounded by the country of the Amazons on the north, by Brazil on the east, by Guayra on the south, and by the river Paragua, which separates it from Tucuman and Peru, on the west. At least these are the boundaries assign'd by Geographers. But it must be acknowledg'd that Paragua Proper is a perfect Terra incognita. I meet with no author or traveller that pretends to give any description of it, or to know the extent of it: And our map-makers are so ingenious as not to incumber their maps with the name of one town in all the country.

Paragua province.

2. Guayra is bounded by Paragua Proper on the north, by Brazil on the east, by Parana on the south, and by the river Paragua on the west. The chief towns whereof are,

Guayra province and town.

1st, Guayra, situate on the river Parana, in 24 degrees south latitude.

2dly, St. Xavier, situate on the confines of Brazil, about 100 leagues to the eastward of Guayra. **St. Xavier town.**

3dly, Concepcion, situate on a river about 100 leagues south-west of St. Xavier. **Concepcion town.**

3. The province of Parana is bounded by that of Guayra on the north, by Brazil on the east, by the province of Uragua on the south, and by La Plata Proper on the west. The chief towns whereof are,

Parana province.

1st, Acarai, situated in 26 degrees south latitude, at the mouth of a small river which falls into the Parana. **Acarai town.**

2dly, Ignatio, situated on the south side of the river Parana, in 30 degrees, 30 minutes south latitude. **Ignatio town.**

3dly, Itapoa, situated to the northward of the river Parana, in 27 degrees south latitude. **Itapoa town.**

4. The province of Uragua, bounded by the province of Guayra on the north, by Brazil on the east, by the river Plata and Paragua on the south and west. The chief towns whereof are,

Uragua province.

1st, Purification, situate on the river Uragua, in 29 degrees south latitude. **Purification town.**

2dly, La Capia, or Tapia, situate on the east side of the river Paragua, in 32 degrees, odd minutes south latitude. **Tapia town.**

5. The province of Tucuman (in which I include that of Charco) bounded by Peru on the north, by the river Paragua and La Plata Proper on the east, by La Plata Proper on the south, and by Chili on the west. The chief towns whereof are,

Tucuman province.

1st, St. Jago de Ibero, situate almost in the middle of the province in 29 degrees south latitude, being a Bishop's see and university, the capital of Tucuman, and lies in the mid-way between the mines of Potosi and Buenos Ayres, being about 250 leagues from each. The plate is brought from Potosi thither on the backs of mules, the country of the Charcas, which lies to the northward of this province, being very mountainous; but from St. Jago to Buenos Ayres the plate is carry'd in waggons over one continued plain, in which there are neither woods or hills to be seen.

St. Jago town.

2dly, Cordua, or Corduba, is situated about an hundred leagues south of St. Jago, on the road to Buenos Ayres. It is a Bishop's see, and university, and has several fine convents in it, but the Jesuits infinitely excels all the rest. As the inhabitants trade chiefly to Peru and Chili, and take gold and silver in return for their merchandize, they are vastly rich, and the Clergy still richer than the Laity: Their churches and monasteries are magnificently built and adorned.

Cordua.

3dly, Salta is situated on the road from St. Jago to Potosi, almost in the mid-way. **Salta.**

6. The province of La Plata Proper is bounded by the river Plata towards the north, by the river Paragua and the Atlantic-ocean on the east, by Patagonia

La Plata Proper.

C H A P. III. *agonia on the south, and by Chili and Tucuman on the west. The chief towns whereof are,*

Buenos Ayres.

1st, Buenos Ayres, said to be so named from its healthful situation. It stands on the south side of the river La Plata, 50 leagues from the mouth of it, in 36 degrees south latitude, and in 60 degrees of western longitude, the river La Plata being seven leagues broad at this town, and navigable for ships twenty miles higher, but there they meet with a cataract that spoils the navigation. Buenos Ayres is a Bishop's see; there are in it five churches besides the cathedral, and several convents, and it is defended by a castle regularly fortify'd with upwards of forty guns mounted on the walls. It is a very great mart, for hither all European merchandize is brought, and sent from hence to Peru and Chili; and hither greater numbers of Negroes also are brought and sold to Peru and Chili, which traffick the English have the advantage of at present by virtue of the *Asiento* contract, and lands are assign'd them to keep their Negroes upon 'till they meet with a sale. From Buenos Ayres are exported to Europe part of the gold and silver of Peru, with vast quantities of hides and tallow, and such other merchandize as this part of America affords.

Santa Fé

2dly, Santa Fé, or St. Faith, a well-built town, situate in 32 degrees, odd minutes south latitude, at the conflux of the rivers Salado and Paragua, being almost surrounded with their waters, and lies between two and three hundred miles north-west from Buenos Ayres on the road to Peru.

**Assumpti-
on town.**

3dly, Assumption, situate in 25 degrees, odd minutes, at the conflux of the rivers La Plata and Paragua, between four or five hundred miles north of Santa Fé. It is said to be a well-built populous town, and the see of a Bishop, Suffragan to the Archbishop of La Plata in Peru. As to the natives, before the Spaniards came amongst them, they lived in tents or slight huts, wandering from place to place like the wild Arabs. But this is to be understood of those that inhabited the plains on the west side of the great river Uragua. Those that dwelt on the east side of the river lived in woods or caves; but neither the one or the other had any thing like a town amongst them 'till the Spaniards taught, or rather compell'd them to alter their way of life.

The Jesuits, who are now in a manner Sovereigns of that part of the country which lies between Brazil on the east, and the great river Paragua on the west, boast of their having reduced these savage nations to civility, and made Christians of them purely by their preaching. Certain it is, they govern them absolutely both in spirituals and temporals. There is no place in the world where the people express a more profound submission to their superiors. Among other things the Jesuits relate, that they have prevail'd on them to abandon their brutish and vagrant way of life, and dwell in towns and cantons, as the Missionaries call them, the situation whereof is always chosen and assign'd them by these Fathers. And as the flat country near the rivers is annually over-flow'd (as has been related already) and yet in the dry season it is absolutely necessary to have their habitation near some water, as well on account of their plantations and husbandry, there being the greatest increase where the inundation has been, as also for the conveniency of water-carriage, and an easy communication with the several cantons: for these and many other reasons, the Fathers pitch upon some fair eminence on the side of a lake or river where they have plenty of wood, and here they lay out a town after the Spanish model; that is, they first form a square, on the side of which

usually stands a handsome church, their schools, the Father's house, who presides in the canton, and the halls and offices of their Courts of justice, and from the square run broad handsome streets of a great length, having other streets crossing them where the canton is large.

Father SEPP informs us, that they have twenty-six of these cantons on the banks of the rivers Uragua and Parana, each of them containing eight hundred or a thousand houses, and seven or eight thousand souls, under the government of two Missionaries. The church of each canton is usually built of brick or stone, and has a lofty steeple, containing four or five bells. It is as richly furnish'd and adorn'd with plate, vestments, and utensils as the Spanish churches in Europe: And besides the high-altar, they have frequently several side-altars and chapels. They have also organs, trumpets, haut-boys, violins, and other instrumental musick, and some exceeding good voices; so that few cathedrals are better accommodated than the churches of these cantons.

The Father further relates, that the station allotted him was the canton of Japegu, the first of the twenty-six converted cantons, situated on an eminence near the river Uragua, in 29 degrees south latitude, in a place form'd for pleasure and delight; for to the eastward of it runs that noble river, the banks whereof are planted with large timber-trees for several hundred leagues, and there are some islands in it lying in view of the canton, which he describes as a perfect paradise. On this river and the islands in it, says the Father, I frequently take the air, attended by my disciples and a numerous band of musick. On the south-west and north the canton is surrounded with the most fruitful pastures in the world, of a vast extent, and stock'd with incredible numbers of European cattle; venison also is in great plenty, such as deer, wild goats, and Indian sheep; and they do not want partridges, pigeons, and other fowls wild and tame. They have also shoals of excellent fish in their rivers.

But notwithstanding the pleasant and advantageous situation of these Indian towns thus laid out by the Jesuits, the buildings were generally mean at first: A brick and tiled house was very rare. The materials were usually thatch and clay, and one room serv'd the whole family: Here they lay promiscuously, some on the skins of beasts on the floor, and others in hammocks of net-work; their kitchen utensils being only some few pots, pans, and calabashes, with wooden spits, and gridirons, on which they dry'd rather than broil'd their meat.

But the Father tells us they begin to improve both in their buildings and furniture since the Jesuits have taught them to make tiles, and instructed them in other mechanick arts. He had in his canton particularly six long streets, the houses whereof were cover'd with tiles.

C H A P. IV.

Of the persons and habits of inhabitants of La Plata; their genius and temper, food, exercises, and diversions; and of their mechanick arts.

IN this country, as in every other part of South-America almost, the first Discoveries were pleas'd to affirm the natives were giants and cannibals, though we meet with neither of them here at this day. Father SEPP is perfectly silent in the article of cannibals; though he lived long amongst them, and mentions

The Indian towns.

C H A P. IV.
La Plata.

CHAP. IV.

Genius and temper.
Food.
Excellent mechanicks.
Exercises and diversions.

tions the rest of the food they eat: And as to their persons he relates, that they are so far from being of a gigantic stature, that they are not so tall as the Europeans. However, he describes them to be big-boned, strong, well-set men, and their legs usually pretty thick: That their faces are flat, and rather round than oval, and their complexion olive: That they have black hair as strong as horse-hair, which they wear very long before they are converted; but then the Fathers oblige them to cut it shorter: That those who have not yet conformed to the Spanish customs, wear only the skin of some beast about the middle of their bodies; and the better sort have another skin which serves for a cloak or mantle; the ordinary women have their arms, shoulders and breasts bare, and no covering on their heads but their hair, which they wear of an immoderate length. Their ornaments are glittering fish-bones, which they wear in their ears, and about their necks and arms in chains, and their Chiefs have a kind of tripe crowns upon their heads. Boys and girls go perfectly naked.

They seem to be a brave people, having defeated several considerable bodies of Spaniards when they first invaded their country. It was a great many years before the Spaniards could fix themselves even in the plains: But in the woods and mountains, to the eastward of the river Uruguay, the natives defended themselves so well that they were never subdued, 'till the Jesuits found means in the last century to insinuate themselves into their good opinion, and in a manner wheedled them into a submission without making use of force.

The same Father SEPP informs us, that their principal food is Turkey or Indian-corn, which they beat to flour in a mortar and boil with flesh, or make cakes of it on the hearth: That they eat all manner of fish, flesh, and fowl, and are the greatest gluttons in the world: That they are extreme lazy and indolent, and dull at invention, but will imitate almost any thing you give them a pattern of: That several of them are lately become such excellent mechanicks that they make organs and other musical instruments as good as those that are brought from Europe; others are watch-makers, painters and musicians, in all which arts they have been instructed by the Jesuit-Missionaries, who are taught the mechanick as well as liberal arts before they are sent abroad, that they may have an opportunity of rendering themselves useful and agreeable to every class of men, and without which they could never have propagated their superstition with that success in every kingdom almost upon the face of the earth: But this they have done no where with such success as here, where the country is their property, and may justly be stil'd, The Jesuits earthly paradise.

The exercises and diversions of these people are at present either rural sports, such as hunting, fishing and fowling, or dancing and feasting, as in other countries: But their principal diversion, or rather business, before the Spaniards brought them to remain in fix'd habitations, was to rove about the country from place to place, and view new scenes every day they lived.

CHAP. V.

Of their husbandry, plants, animals, and minerals.

CHAP. V.
Husbandry.
Corn.
VOL. III.

THEY have a wooden plough which does not enter the ground above three inches deep, and yet they have usually a very plentiful crop however of Turkey or Indian-corn. The Missionary of every canton has commonly forty or fifty acres

CHAP. V.

sown with European-wheat, and frequently gives his Indian disciples enough to sow their grounds and make provision for their families; but instead of putting it to that use, they usually devour it as soon as they have it. The Father adds, It may truly be said of these Indians, that they follow our SAVIOUR's rule, Not to be concern'd for the next day; for if I happen to allot a cow to a family enough to serve them three or four days (says he) they will often eat her in one, and come the next morning for more; so that we are forc'd to give to the father, mother, son, and daughter, and to the young children to each his piece of flesh of five, six, seven, nay eight pounds, and that twice a day; for if they had it at once, they would eat it all at noon, and want more by night; for they are so voracious that the mother will snatch the meat from her child, and eat all that comes in sight of them: For which reason each Missionary has a great barn, into which he forces them to lay up a certain proportion of corn, which he gives them back at seed-time: Notwithstanding which they sometimes deceive the Missionary, or rather themselves. It is to be observ'd, that their seed-time is in June or July, when the Missionary allots each Indian two or three oxen to plow withal. One of these Indians, after a quarter of an hour's plowing, began to grow weary of the sport, and finding himself and his wife very hungry, they agreed to kill one of the oxen, which they did accordingly, and having quarter'd the ox (as they usually do) they put the flesh on a wooden spit, and (for want of other fuel) made a good fire with the plow, throwing into it some of the suet to increase the flame; and thus they roasted and eat it. The Missionary perceiving the smoke in the field, began shrewdly to suspect the truth; and making the best of his way to the field, he soon saw by the bones that he had not been mistaken in his guess. He fell to chiding the Indian, who gave no other answer, but that he being both tir'd and hungry, he had made bold with the ox, begging the good Father to give him another, which he was oblig'd to do, unless he would see him and his family want bread all the year after. Such things often happen to the Missionaries, these Indians being naturally so lazy, that often (unless compell'd thereunto by blows) they will not carry in their Turkey-wheat when it is ripe.

You wonder, perhaps, which way they can be compell'd by blows: This is done in the same manner as we do our children, only that instead of birch they make use of a scourge: This is perform'd by some Indian or other, who gives the delinquent twenty-four or more strokes, according to the Missionary's order. This correction they take very patiently, without any cursing or swearing, nay, without making the least noise; and if they happen to make any exclamations, it is by the name of Jesu Maria. The correction being over, they kiss the Missionary's hand, and return him thanks into the bargain, their love and respect being such towards the Missionaries, that they take every thing without the least regret at their hands; which being imprinted in them from their tender age, they can never shake off afterwards.

As to their fruits and kitchen-gardens, Father SEPP gives us the best account of them I meet with, in the description of his own gardens in the canton of Japega. Next to my apartments, says the Father, I have a garden divided into several partitions, one whereof is my flower-garden, another my physick-garden (for they know not what a Physician or Apothecary means) another my kitchen-garden, besides

CHAP. V. besides an orchard and vineyard. In the kitchen-garden grow all the year round divers sorts of salad-herbs, Endive curl'd and not curl'd, Cichory-roots, Parsnips, Turnips, Spinage, Radishes, Cabbages, Carrots, Beet-roots, Parsley, Aniseed, Fennel-seed, Coriander-seed, Melons, Cucumbers, and divers sorts of Indian-roots. In my physick-garden I have Mint, Rue, Rosemary, Pimpernel, Sweet-marjorum, &c. My flower-garden produces White-lillies, Indian-lillies, yellow and blue violets, Poppies, and many sorts of Indian flowers.

In my orchard I have Apple and Pear-trees and Hazel-nut-trees; but these two last will bear no fruit here, though they grow very lofty; Peaches, Pomegranates, sweet and sour Lemons, sweet and sour Citrons, Vaninceys, and divers other Indian fruits.

My vineyard has so many vines, that sometimes it may produce five hundred large casks of wine in one year, but this year I have scarce had Grapes enough for my table; the reason is the vast number of pismires, wasps, wild-pigeons, and other birds, which have devour'd all, though I have constantly kept eight Indian boys on purpose to cleanse them of the pismires: Add to this the north-wind, which has blown continually all this year: A slender recompence for the pains I have taken in pruning, shaving, and attending the vines; but patience!

However, these frequent miscarriages of the vines make wine here a dear commodity, a cask being sold sometimes for twenty or thirty crowns, a great price for such an unwholesome wine as this, which is not to be preserv'd without a great deal of lime, without which it would turn to vinegar in a little time. This makes us use the wine very sparingly, and sometimes we have scarce any in six months, it being so scarce that we shall not have enough for the Communion-table.

No wood
in the
plains.

Woods in
the hilly
country.

He relates also, that in the plains on the west side of the river Uragua, and particularly between the city Buenos Ayres and St. Jago, there is not a tree to be seen fit for timber or fuel of the natural growth of the country; but that the Spaniards have of late years planted such abundance of peaches, almonds, and figs, that there are now vast woods of them, which serve for fuel at Buenos Ayres and other Spanish towns: On the contrary, that the country to the east-ward of the river Paragua, has large woods and forests well replenish'd with timber, extending several hundred leagues on both sides the river Uragua, and that they have the finest pastures and meadows in the world, both in the east and western parts of La Plata; however, there is no mowing of grass, or making of hay here, because their cattle feed all the year up to the knees in grass.

They have also whole fields of cotton, but no hemp or flax growing in the country, which makes linnen excessive dear.

Beasts.

They had no great stock of cattle before the Spaniards imported European animals; the principal were their Indian sheep, goats, swine, and deer, already describ'd, with a sort of hares, armadillo's, and other American animals, already described in treating of Mexico and Peru; but the European cattle are so vastly increased of late years in La Plata, that there is scarce a canton which has less than three or four thousand horses and mules, with black cattle in proportion, and thirty or forty thousand European sheep in some of them: They abound also in hogs, goats, and poultry, and have plenty of fish in their rivers.

The same Father assures us, that they see some-

times fourteen or fifteen thousand oxen feeding together that have no particular owner, but any one sends and takes what he pleases: And that the Jesuits at Buenos Ayres sold at one time, to the shipping that came thither, twenty thousand tall oxen for twelve thousand crowns, which were valued only for their hides, their carcases being devour'd by wild dogs or birds of prey.

In another place the Father relates, that his canton sent out a party of Indians two days journey into the country, who within two months brought in fifty thousand cows, which were to serve for provisions for the canton the following year; for they eat cow's-flesh altogether, and kill the bulls only for their skins, there being no oxen, properly so call'd, in that country. He adds, that the three ships he went over with carry'd back to Spain thirty thousand bulls hides, without any cows skins amongst them: And these they had for little or nothing; tho' every skin would make six crowns in Spain, so prodigiously are European cattle multiply'd in La Plata: And 'tis observed, than one sheep is more valued there than three horses, on account of their wool; for a good horse may be purchased for a knife of the value of six-pence, and a bridle is of more value than three horses, and a horse-shoe is worth six horses; but they seldom shoe their horses here on account of the scarcity of iron, nor do they much need it, the turf or surface of the ground being very soft, and few stones in the country.

As to minerals, it is certain there are few or none in the plains or flat country; and tho' 'tis reported the Jesuits have discover'd some gold mines in the mountains that divide La Plata from Brazil, those Fathers do not acknowledge there are any.

CHAP. VI.

Contains an abstract of the history of La Plata, and treats of the religion of its ancient and modern inhabitants, and of their marriages.

AS the natives of La Plata were divided into a multitude of tribes commanded by their respective Chiefs, they knew nothing of the general history or state of their country when the Spaniards arriv'd: And what they receiv'd by tradition relating to their particular clans could be very little relied on as they were not acquainted with letters, and had no way of recording the actions of their ancestors. All that we know of their history is, that those on the west side of the river Paragua lived a wandering life like the Arabs, and those on the east-side of that river in caves: That the Spaniards and Portuguese made several attempts in vain to subdue the inhabitants of the plains from Brazil and the mouth of the river La Plata, in which they met with very great opposition and losses, 'till the Spanish Governors of Peru and Chili attack'd them from the west, and then they made a compleat conquest of that country.

The first Adventurer that penetrated into this country was ALEXIUS GARCIA, a Portuguese, who was sent upon that enterprize by the Governor of Brazil, in the year 1524. He march'd quite cross La Plata, as far as the borders of Peru, where having amass'd a vast quantity of plate, he was cut off in his return with most part of his men; and GEORGE SEDENHO, with sixty Portuguese, having been sent out to support him before the death of GARCIA was known, was also cut in pieces by the Indians with all his party.

In

CHAP. VI. In the year 1526, SEBASTIAN CABOT being employ'd to make a further discovery of South-America by the Emperor CHARLES V. enter'd the mouth of the river La Plata (first discover'd by JOHN DIAZ DE SOLIS, in the year 1515) and sailing up that river as far as the place where GARCIA was kill'd, there met with the plate, he had got on the confines of Peru, which he purchas'd of the natives, who did not know the value of it, for a trifle, and imagining it to be the product of that country, concluded he had made a very important discovery. Whereupon he erected a fort on the north side of the river, near the place where the town of Assumption now stands; he also detach'd ALVARO RAMON with one of his ships to sail up the river Uruguay, and get further intelligence of the mines he supposed were to be found near the banks of it; but RAMON having proceeded three days in that voyage, his ship run a-ground, and he and all his people were cut off by the natives. After which accident, CABOT remov'd from that shore, and built another fort on the south-side of the river of Plata, where the town of Spirito Sancto now stands, and leaving a garrison of one hundred and twenty men in it, he return'd to Spain for a re-inforcement of troops to prosecute his discoveries: But the natives surpriz'd the fort soon after he was gone, and put the garrison to the sword.

However, CABOT representing to the Court of Spain that Plata was one of the richest countries in the world; and bringing so much plate and treasure along with him as sufficiently confirm'd his report in the opinion of the Spaniards, several of the best families of that kingdom made interest to be sent on an expedition thither. Whereupon a body of two and twenty hundred land-men, besides mariners, were embarked for the river of Plata, among whom, it is said, there were thirty heirs of noble families, the whole being commanded by Don PETER DE MENDOZA, the Emperor's Sewer; who arriving at the mouth of the river La Plata, founded the town of Buenos Ayres, in the year 1535, but not without great opposition from the natives, for they attacked a body of three hundred Spaniards, commanded by JAMES MENDOZA, the Governor's brother, and killed him with two hundred and fifty of his men upon the spot; and provisions growing very scarce at the same time, the Governor thought fit to return to Spain, leaving OYOLA his Deputy-governor behind him with part of the troops. But OYOLA thought fit to abandon Buenos Ayres, and built the fort of Assumption, on the north-side of the river Plata, whither he removed with his half-starv'd garrison. The Governor ALVARO NUNEZ CABEZA DE VACA afterwards made further discoveries, planting colonies as far as the north of Tucuman, and he and his successor rebuilt Buenos Ayres and some other towns near the mouth of the river La Plata. And in 1553, FRANCIS DE ACQUIRE being detach'd from Chili with two hundred men by VALDIVIA, built the city of St. Jago, the metropolis of La Plata; and two years afterwards JOHN GOMEZ ZARITA was sent from Chili to La Plata with another body of troops, who built the town of Cordua, and made an entire conquest of all the country as far as the river Paragua; but the provinces to the eastward of that river were never conquer'd by force, but reduc'd, as has been said, by the address of the Jesuits under the dominion of the Crown of Spain; and that Court, in return for this service, conferr'd the property of that country on those Fa-

thers. If it be demanded how the Jesuits were able to effect this, I have already intimated, that they are instructed in every art and science when they are sent upon these missions. They don't only understand physick and the mathematicks, but almost every mechanick art, by which means they become exceeding useful where they reside. Their administering physick gratis infinitely obliges the people, and by their skill in mathematicks they surprize the ignorant natives, who are ready to adore them as gods, and readily resign their understandings and consciences to their direction. But what prevail'd still more on these people to submit to the Jesuits was, the protection they gave them against the Spanish officers and soldiers, and preventing their imposing on them those rigorous services they did on other Indians under their government. They even furnished the natives with arms and ammunition, and instructed them in the art of war, whereby they were enabled to repel the attacks both of the Spaniards from the west, and of the Portuguese from Brazil on the east, who harra's'd their country for several years till they found they had so formidable an enemy to deal with, that they lost more than they got by their incursions into La Plata; and the Jesuits and their subjects who inhabit one of the finest countries in the world between the river Paragua and Brazil, have of late years enjoy'd an uninterrupted peace in the greatest affluence and plenty imaginable.

As to the religion of the natives of La Plata, if we are to credit TETCHO the Jesuit, he relates, that they worshipped the Sun, Moon, and Stars, and Thunder and Lightning, as the Peruvians did, and had temples dedicated to the Sun; which is not at all improbable, since this country is contiguous to Peru, and part of it was under the dominion of their Inca's; and in some parts of the country, the Jesuits relate, they worshipped trees, stones, rivers, animals, and almost every thing animate and inanimate; which likewise may be true, because other nations in South-America have done the like. But as to the great serpent the Fathers tell us of, that was as big about as an ox, and one of the objects of their adoration, we may without offence suspend our belief of such relations till we find it prov'd that there ever were any such monsters on the face of the earth.

But whatever the ancient religion of La Plata was, the people are now in general as good catholics as the Jesuits can make them, and the most obedient vassals of that order.

As to the marriages of these Indians, anciently they allow'd both of polygamy and concubinage, and the greatest objection they have to Christianity the Fathers inform us is, their confining them to one woman. At present the Jesuits have the entire direction of this matter: And Father SEPP tells us, when a virgin is fourteen and a lad sixteen, they do not suffer them to remain longer unmarried for fear of worse consequences, having found by experience, that when the maidens and young men continue in a single state for any considerable time, they have found means to pair themselves. The objection which in other places is made against such young marriages takes no place here, where there is no dispute about dowry or settlements, or which way they will maintain themselves; all this they leave to God Almighty and our care (says this Father) never applying themselves to any trade or profession unless we oblige them to it, and upon the marriage it is the Missionary that provides the hurt, it is he that provides the wedding-cloaths, viz. five yards

yards of coarse woollen stuff for each ; a bed they never want, bull-hides being cheap enough ; and the wedding dinner is made with a fat cow, which is likewise presented by the Missionary.

Their marriage agreement consists only in two articles, viz. The woman promises to fetch what water the husband wants from the river, in lieu of which he engages to furnish the kitchen with fuel. We allow them no musick nor dancing at their weddings, but so soon as they are marry'd and have heard mass, the bridegroom goes his way and the bride her's : And if the Missionary has presented them with a fat cow, a little salt, and a few loaves, they invite their parents to dinner, and

so make the best cheer they can. There is one thing peculiar in their marriages, viz. that here the man does not woo the woman, but on the contrary the woman the man : In this case the maid comes to the Missionary and says, Pay, i. e. Father (for so they call us) I have an inclination to marry such or such a one, if you will be pleased to give your consent. Whereupon the Missionary sending for the person, says, my son (for so we call them) such or such a one is desirous to be marry'd to you, are you contented she should? Unto which if he replies yes (as they seldom do otherwise) then the match is made, and wants nothing but the Priest's blessing.

CHAP.
VI.

THE PRESENT STATE OF THE AMAZONS.

Name of
the coun-
try.

THE country of the Amazons obtain'd its name from a suppos'd nation of female warriors that were said to inhabit the banks of one of the greatest rivers in the world, which runs through this country from west to east. There is not a circumstance related by the ancients of the Asiatic Amazons which has not been applied to these by the moderns, tho' all the ground there was for these fictions seems to have been, that there were seen some women mingled with the men that came to gaze on the Spaniards when they first invaded their country.

And here it is not easy to avoid reflecting how exactly the first Spanish Adventurers copied after the romantic writers among the ancients.

In one part of America they furnish us with Giants, in another with Monsters, in a third with Canibals, and here with a race of Amazons. They seem to have been a little dull of invention, that they struck out no new whimsies or monsters in nature, but barely transcrib'd or imitated the fabulous relations they met with in the ancient poets and other writers, who intended no more perhaps than beautiful allegories, or to display their talents at invention, never dreaming that after-ages would look upon such flights of fancy as historical facts. But to proceed in the describing the situation of this country, which has obtain'd the name of the Amazons. It is bounded by the Equator, which separates it from Terra-Firma on the north, by Brazil and the Atlantic-ocean on the east, by Brazil and La Plata toward the south, and by Peru on the south-west, lying between the Equator and the 15th degree of south latitude, and between 50 and 75 degrees of western longitude.

The situa-
tion and
extent.

As we have no other accounts of this country than what we have receiv'd from those who have

been sent by the Spaniards and Portuguese to make discoveries either up or down the river Amazon, I shall give an abstract of the several Adventurers of this kind, and then collect from them the state of the country.

GONZALO PIZARRO, brother to the Marquis (Conqueror of Peru) was the first that accidentally discover'd this mighty river, in the year 1540, when he was Governor of Quito, the most northern province of Peru. Some Indians had assur'd him, that to the eastward of Quito, on the other side the mountains of Andes, were countries that abounded not only in cinamon but in gold, more than any countries the Spaniards had hitherto discover'd, tho' they were exceeding difficult of access on account of the rocks and precipices they must first pass, and the woods and morasses on the other side of them, and the little provisions they must expect to meet with in a desert and uninhabited country ; and what would render their march extremely troublesome were the heavy rains that fall under and near the Equator for the greatest part of the year. But nothing could deter PIZARRO from an expedition wherein he expected to meet with mountains of gold in a literal sense. He made extraordinary preparations therefore for this difficult and hazardous undertaking, assembled three hundred and forty veteran Spaniards, of whom one hundred and fifty were horse, and took with him four thousand able body'd Indians, some of them soldiers, but most of them employ'd in carrying his ammunition, provisions and baggage, and driving some thousands of Indian-sheep and hogs before them, which he propos'd to kill by the way. And thus provided, he set out from the city of Quito at Christmas, in the year 1539.

An account of which expedition we find thus related by DE LA VEGA, in his Royal Commentaries

The river
Amazon

by Gon-
zalo Pi-
zarro.

of

of Peru. The General (says the royal historian) having continued his march some few days, there happen'd so terrible an earthquake that many houses in the villages where they then were, fell to the ground; the earth opened in many places, and so terrible were the lightnings and thunder, and so very quick and almost without intermissions, and so fierce were the rains, which pour'd down like buckets of water, that the Spaniards much admir'd at the nature of that climate, so different from any thing they had ever seen in the northern parts of Peru.

After this storm was over, which continued forty or fifty days, they prepar'd to pass the Andes, or snowy mountains, for which tho' they had made good provision, yet the climate was so extremely cold by the great quantities of snow which fell, that many Indians who went thin in their cloathing perish'd. The Spaniards, that they might make haste out of the snow and cold, left their cattle and provision behind them, expecting to find sufficient supplies of all things at the next place where the Indians inhabited. But the matter succeeded otherwise; for having pass'd the mountains, they enter'd into a country so barren that it was void of all inhabitants, whereof doubling their journies to get out of it, they came at length to a province and people call'd Cumaco, situated at the foot of a vulcano, where they found plenty of provisions; but the country was so wet, that for the space of two months they remain'd there it never ceas'd one day from raining.

In this province, call'd Cumaco, or Canela, which is situate under the Equinoctial, or very near it, grow the cinamon-trees, as they call them, which they went in search of as well as gold. These trees are lofty, bearing a leaf as big as the laurel, with a small sort of fruit which grows in clusters like the acorn: Some grow wild in the mountains, and produce fruit, but not so good as that which is gather'd from the trees which the Indians plant and cultivate in their own grounds.

The Spaniards found that in Cumaco and the adjacent countries the Indians went naked, without any cloaths, only the women, for modesty sake, wore a little flap before them: the climate is so excessively hot that they need no cloaths (says DE LA VEGA) and is so subject to rains, that they would become rotten in a short time if they had them.

GONZALO PIZARRO leaving the greatest part of his people in Cumaco, took with him a small party of such as he esteem'd most active, to search for some pass leading out of the country; for as yet the way for an hundred leagues together had been nothing but mountains, desarts and woods, which they were forced to lay open by the hatchet and strength of their arms; and sometimes the Indians, who were their guides, deceiv'd them, carrying them out of the way by mountains and desarts and difficult passages (where they sustain'd hunger and cold, without any other sustenance than herbs and roots, and wild fruit) and conducting them through by-ways, to avoid the country of their friends and confederates.

With such labours and sufferings as these, which may rather be fancy'd than describ'd, they came at length to a province call'd Cuca, which was more populous than any they had formerly pass'd. Here provisions were plentiful, and the Cacique, or King of the country, came in a peaceable manner to welcome them, and brought them provisions.

In these parts they remained two months, in expectation of the coming of those Spaniards whom they had left in Cumaco, and had directed to fol-

low them by such traces and marks as they should find of the way they had taken before them. Their companions being come up and refresh'd after their journey, they march'd by the banks of a great river for the space of fifty leagues, in all which way they neither found bridge nor ford.

At length they came to a place where the whole river falls from the top of a rock above two hundred fathom high, which cataraet, or falling of the waters, makes a noise that is heard above six leagues from the place, at which, tho' the Spaniards were amazed, yet it was much more wonderful to see, above forty or fifty leagues lower, that immense quantity of water contracted and straitened within a channel made by one great rock. This channel is so narrow, that from one side to the other it is not above twenty foot wide; but so high, that from the top, where the Spaniards made their bridge, was two hundred fathom from the water. GONZALO PIZARRO and his Captains considering there was no other passage to be found over the river, and that it was necessary to pass to the other side, because the country was barren on that side where they then were, agreed to make a bridge over the top of the rock.

The Indians on the opposite side, tho' few in number, stoutly defended the pass, but were driven from it by the fire of the muskets; and the pass being now clear, the Spaniards fell to work on the bridge of timber, which cost much labour before the first beam could be pass'd over to the opposite rock, by the help of which a second was more easily laid, and then other pieces of timber, so that by degrees they formed a bridge, over which both men and horse securely pass'd: After which they march'd by the side of the river over mountains so thick with wood, that they were forced to open their way again with the hatchet. Through these difficulties they came at length to a country call'd Guema, where the Spaniards and their Indian servants were forced again to sustain themselves with herbs and roots, and with the tender sprouts of trees. Thus with famine and the perpetual rains many of the Spaniards fell sick and died. They arriv'd afterwards at a country where the natives were more civiliz'd than the former; for they eat maiz or Indian-corn, and cloathed themselves with garments of cotton; but still the climate was subject to violent rains.

Whilst they stay'd in this place they sent small parties out every way to see if they could discover a better country; but they all return'd with the same news, that they met with nothing but wild mountains full of bogs, lakes and moorish grounds, over which was no passage. Hereupon they resolv'd to build a brigantine or vessel to ferry over from one side of the river to the other, which now was become two leagues broad. In order whereunto, the first thing to be done was to set up a smith's forge for nails and iron-work, which they made of the horses shoes they had kill'd for food, and some iron bars they had carry'd with them; but iron was now become more scarce than gold.

GONZALO PIZARRO, tho' Chief Commander, was the first that laid his hand on the axe to hew down the timber, and to make the charcoal which was requisite to forge the iron, and was always the most forward in every office, tho' never so mean, that so giving a good example, none might excuse himself. The resin which issued from certain trees served them instead of pitch, and their old shirts and rags were made use of instead of ockam to caulk the seams of their vessel, which being in this manner finish'd, they launched into the water with great joy and triumph, imagining that herewith they should quickly escape

out of all their dangers and difficulties. But it proved otherwise; for a few days shewed the contrary, and gave them cause to repent that they had ever made it.

They embark their gold and baggage.

All the gold they had gather'd, which amounted to above the value of one hundred thousand pieces of eight, with abundance of emeralds, some of which were of great value, as also their iron and iron-work, and whatsoever was of any esteem, they laded on their vessel; and such as were weak and sick and not able to travel were also put on board. And now after a journey almost of two hundred leagues they departed from this place, taking their course down the stream, some by water and others by land, keeping such a convenient distance each from the other, that at night they always join'd and lodg'd together; which journey was perform'd with great difficulty, for those on the land were forced to open a great part of their way with hatchet and bill, and those on the water were put to hard labour to keep the vessel from being forcibly carry'd down by the current from the company on shore, when at any time their passage was interrupted by some mountain; so that they could not keep near the river: They then ferried to the other side by help of their vessel and four canoes they had made; but this was a great hindrance to them, and very grievous to men starving and perishing with hunger.

Having in this manner travelled for the space of two months, they at length met with certain Indians, who by signs, and by some words which were understood by their Indian servants, gave them intelligence that about ten days journey from thence they would find a country well peopled, plentiful of provisions, and abounding with gold and other riches of which they were in pursuit; and farther signified to them, that this country was situated on the banks of another great river which join'd and fell into that wherein they now were. The Spaniards being encouraged with this news, GONZALO PIZARRO made FRANCISCO DE ORELLANA Captain of his brigantine or vessel, and thereon put fifty soldiers aboard, giving them orders to pass down the stream to that place where the two rivers met, and that there leaving the goods he had then on board, he should lade his vessel with provisions, and return towards them with all the speed imaginable to relieve them in that great distress, many of the Spaniards being already dead, and more Indians, who from four thousand were now reduc'd to half the number.

Orellana with fifty soldiers embarks on board the brigantine.

According to these orders, FRANCISCO DE ORELLANA enter'd on the voyage, and in the space of three days, without oars or sails, only by force of the current, was carry'd to the confluence of the two rivers mention'd by the Indians, but found no provisions there; whereupon ORELLANA pretending it was impossible to return to PIZARRO against the stream, resolv'd to set up for himself, and accordingly casting off all care and regard for PIZARRO and his companions then in distress, he resolv'd to continue his voyage to the mouth of the river, and then go over into Spain and obtain the government of those countries for himself: But this cruel resolution was oppos'd by many of those who were then with him, who told him plainly, that he was not to exceed the orders of his Captain-General, and that it was inhuman to forsake his companions in their great distress, knowing how useful and necessary that brigantine was to them. In this point none were more zealous than Friar GASPAR CARVAJAL, and a young gentleman native of BADAJOZ, named HERNANDO SANCHEZ DE VARGAS, whom those of the contrary opinion made their Chief, and were so warm in their debates on this subject, that the quarrel had

He runs away with the vessel.

come to blows had not ORELLANA with fair words appeas'd the tumult: However, he manag'd so artfully afterwards with those who had oppos'd his intention, that he entic'd them all over to his party, and then rudely treated the poor Friar whom he had expos'd to the same famine and misery (had it not been for respect to his habit and profession) as he did SANCHEZ DE VARGAS, whom he left in that desert encompassed with high mountains on the one side, and a great river on the other, to perish by famine.

FRANCISCO DE ORELLANA afterwards found some provisions amongst the nations on the river below; but because the women came out at first with their husbands to oppose his landing, he gave it the name of the river of Amazons.

Proceeding yet farther down this river, they found these Indians more civil than the other, who received them amicably, admiring the brigantine and men so strangely habited. These treated the Spaniards hospitably, and furnish'd them with as much provision as they had occasion for. ORELLANA remain'd here therefore several weeks, and built another brigantine, for they were much straitned for room in the first, and having fitted it up as well as they were able, they adventur'd out to sea, sailing along the coast of Caribiana, about 200 leagues to the northward, till they arriv'd at the island of the Holy Trinity, having escap'd such dangers that they often gave themselves over for lost. At this island ORELLANA bought a ship, with which he sail'd into Spain, where he request'd his Majesty's commission for the conquest and government of the country of the Amazons, as he was pleas'd to stile it. To make this enterprize appear the more desirable, he alledg'd that it was a country abounding with gold, silver, and precious stones, and in testimony thereof produc'd the riches which he had brought with him; whereupon his Majesty granted the request he made for the government of what he should conquer there, and ORELLANA was join'd by five hundred volunteers, the greatest part of them brisk young gentlemen, and persons of honour, with whom he embark'd at St. Lucar for the river Amazon, in the year 1554; but he lost one of his ships in his voyage thither, and met with so many difficulties and misfortunes before he had sail'd an hundred leagues up the river, that he abandon'd the enterprize, and died in his return home.

Orellana comes into the Atlantic-ocean.

Sails to Spain and obtains the government of the Amazon country.

And now let us return to GONZALO PIZARRO, Dies in whom we left in such distress after FRANCISCO DE ORELLANA was run away with the brigantine: And first he built ten or twelve canoes and other floats to pass from one side the river to the other, as often as his march was interrupted by impassable mountains or morasses, and proceeded in that manner down the river in hopes to meet the brigantine they had dispatch'd for provisions.

At the end of two months they arriv'd at the point where the two rivers met; but instead of their brigantine and the provisions they expected to meet with, they found only the honest HERNANDO SANCHEZ DE VARGAS, who with constancy of mind, like a man of honour, had endur'd with great resolution famine and all the miseries to which he was expos'd in that solitude; and from him they receiv'd a particular account of the villainy of the perfidious ORELLANA, which PIZARRO could scarce credit, having hitherto entertain'd an entire confidence in the man.

The General however, putting a good face upon the matter, cheer'd up his men, and encourag'd them with hopes of better fortune, telling them, that they ought, like Spaniards, to bear with equal-
lty

Pizarro's distress.

lity of mind these labours and disappointments, and yet greater if any such could be: That the more danger the more honour, and the greater would their renown be in history, which would transmit the fame of their adventures down to future ages. The soldiers observing the cheerfulness of their General, who had most cause to resent ORELLANA's usage of him, took heart and continued their march by the banks of the river, sometimes on one side and sometimes on the other.

But the difficulty of carrying the horses over upon floats (for there still remain'd about fifty of their number) cannot be express'd, any more than the famine they were expos'd to: However, the Indians who remain'd alive serv'd their masters with great faithfulness and affection in these extremities, bringing them herbs, roots, wild fruit, snakes, and other vermin they found in those mountains, all which went down with the Spaniards; nor could they have subsisted without such kind of food.

Pizarro returns to Quito.

And now GONZALO PIZARRO being resolved to return to Peru, left the river and took his way more to the northward, which proved shorter by 100 leagues than the way they came, but no less difficult, being forced to cut their way frequently through the woods, and for want of other provisions they now eat up all their remaining horses and dogs; for the four thousand Indians, who used to purvey for them, all died in this expedition; and there were but fourscore Spaniards who return'd to Quito alive, and these almost without cloaths, and so sun-burnt and emaciated with the fatigue and want of food, that their nearest friends scarce knew them.

With such insupportable hardships and hazards did the first Spanish Adventurers struggle in search of gold, even when they had before acquir'd enough one would have thought to have satisfy'd the most boundless avarice. I question whether GONZALO PIZARRO, who was one of the proprietors of the mines of Potosi, had not amass'd more than a million of crowns before he enter'd upon this expedition.

Peter de Orsua attempts to discover this country.

PETER DE ORSUA, who afterwards obtain'd a commission from the Governor of Peru, in the year 1550, to subdue the provinces bordering on the river Amazon, embark'd on the river Xauxa in Peru with seven hundred armed Spaniards and two thousand Indians, and sail'd down the stream two or three hundred leagues, 'till he came to the confluence of the two rivers Amazon and Xauxa, and continuing his voyage afterwards 200 leagues further, was kill'd in a mutiny of his men, which put a period to that enterprize.

Two Friars successful in discovering it.

Several other Adventurers made the like attempts afterwards, but most of them prov'd unfortunate, 'till two Monks and some Soldiers, who set out with JOHN DE PALACIOS from Quito in Peru, in the year 1635, and embarking on the river Amazon, where it first becomes navigable, sail'd the whole length of it 'till they arriv'd at Paria in Brazil, which lies on the south side of the mouth of this great river: But their Captain, JOHN PALACIOS, was kill'd in a skirmish with the natives in their passage.

Texeira sails up the river to Peru.

The Friars having given an account of their voyage to the Governor of Brazil, he order'd sloops and boats to be provided, on which he embark'd seventy Portuguese and two thousand Indians, and in October, 1637, order'd them to sail up the river, under the command of TEXEIRA, a mariner of great skill and experience, who by the help of the easterly wind, which generally blows here, sail'd up against the current 'till he arriv'd at Les Reyes, a town of Quito in Peru; and the river not being

navigable higher for his vessels, he left them there and went by land to the city of Quito, where he was kindly receiv'd by the Spanish Governor, and furnish'd with whatever he wanted to facilitate his return to Brazil: And the Governor sent Father DE ACUNA and another Spanish Jesuit down the river with him, ordering them to embark for Spain when they arriv'd at Brazil, and communicate the observations they should make in this voyage to his Catholick Majesty; and TEXEIRA embarking again at Les Reyes, on the river Amazon, with the two Jesuits, in the month of February, 1638-9, arrived at Paria in Brazil the December following; from whence DE ACUNA and his companion went over to Spain, and publish'd a relation of their voyage in 1640, which is the best account of this river and the countries bordering upon it that is extant.

The sources of the river Amazon.

From these several relations we learn that the head of the river Amazon rises in Quito, almost under the Equator, in 76 degrees of western longitude, and running south-east 'till it unites its waters with the river Xauxa, continues its course almost due east in the latitude of 4 degrees for 26 degrees of longitude, and then returning to the north, by many mouths discharges itself into the Atlantic-ocean, almost under the Equator. They compute, that with all its turnings and windings it does not run less than 1800 leagues; and observes that it is ordinarily 2 or 3 leagues broad; but in the rainy season over-flows the flat country on the right and left, and at the mouth of it is fifty or sixty leagues broad; that from the river Negro, which falls into it about five hundred leagues from the mouth, it is generally thirty or forty fathom deep, and up higher from eight fathom to twenty; that there is one straight where it is not above a quarter of a mile over, and that there are near two hundred rivers which fall into it from the north to south.

Its course and magnitude.

The Adventurers in general agree that the air is cooler than could be expected so near the Equator, which proceeds from the heavy rains that occasion the numerous rivers to overflow their banks one half of the year; from the cloudy weather, from the shortness of the days, which are never more than twelve hours long, and from the brisk easterly wind that blows frequently from the Atlantic-ocean quite through the country so strong that vessels are enabled thereby to sail against the stream, and perform the voyage almost as soon up the river Amazon as down it, which I perceive is a voyage of eight or ten months, where no ill accident interrupts the passage. Travellers also observe, that they have most terrible thunder and lightning great part of the year; but this is no more than what is usual in other countries that lie under the Equinoctial: And it may properly be said they have two summers and two winters every year; that is, fair weather when the sun is at the greatest distance from them in either Tropic; and foul when it is vertical, as it is at the vernal and autumnal Equinox.

The air.

Weather.

Winds.

Thunder.

Seasons.

The trees here are ever-greens, and they have fruits, flowers and herbage all the year round. Their fruits are Cocoa-nuts, Anana's, or Pine-apples, Guava's, Banana's, and such other fruits as are usually found between the Tropics. Their forest and timber-trees are Cedar, Brazil-wood, Oak, Ebony, Log-wood, Iron-wood, so call'd from its weight and hardness, the Canela, or Cinamon, as it is call'd from its spicy bark, and several sorts of dying-wood.

Trees and fruits.

They

Corn, roots, and plants. They have also Indian-corn, and the Cassavi-root, of which they make flour and bread, Tobacco, Cotton, Sugar, Yams, Potatoes, Sarsaparilla, and other roots. They have also plenty of venison, fish and fowl, among which they mention Deer, Indian-sheep, and Goats, Guano's, Manatee, Armadillo's, Tortoise, and vast flocks of Parrots of all colours, which serve them for food, and their feathers for ornament.

Persons of the natives. The natives are of the ordinary stature of men: They have good features, long black hair, and black eyes, and their complexion is a copper colour, whereas the natives of Africa in the same latitude, on the opposite side of the Atlantic-ocean, are all Negroes.

The stories of Amazons, &c. fictitious. As to the nation of Amazons, which were said to give name to this river and country, they are now no where to be found, any more than the Giants and Canibals the first Adventurers mention'd. The people are generally acknowledg'd now to have as much humanity or more than the Europeans who invaded them, and to have a genius for painting and some mechanic arts, particularly they make good joiners-work, though they have no other tools than such as are edg'd with sharp stones.

Habits. They also spin and weave themselves cotton garments, and are pretty decently cloath'd: Their earthen-ware also is much admir'd; but I don't perceive they have learnt to make bricks, or build with stone, the materials of their houses being of wood, thatch, and clay, but one floor, and built usually on some eminence near the river-side to avoid the inundation.

Government. The banks of every river, as they relate, are in-

habited by a distinct people, commanded by their respective Caciques or Sovereigns, who are distinguish'd from their subjects by coronets of beautiful feathers: Their arms are bows, arrows, and spears, and they make war on each other by water as well as land, but have no other boats than canoes, which are great trees made hollow: Whatever their pretensions are for war, their principal end in it is to make slaves; however, 'tis said, they use their slaves with great humanity, and never sell them to foreigners.

They worship images, and carry them with them in their expeditions; but I don't find they have temples dedicated to any god, or any order of Priests. They countenance both polygamy and concubinage. As to the gold and silver mines the Spaniards went in search of when they first discover'd the river of Amazon, I can't learn they have yet met with any here, though they find some gold in the rivulets that fall into the river Amazon near its sources in Peru. After the river is swoln to any magnitude there is no more gold to be found; and this I don't doubt is the reason that neither the Spaniards or Portuguese have planted any colonies in the lower part of it. The Spaniards made great efforts from Peru to subdue this country while they had a notion it abounded in gold, but seem to have neglected the discovery ever since they were undeceiv'd in this particular; and indeed they have a larger dominion already in America than they can defend, which is a sufficient reason for their slighting such countries as do not produce gold or silver.

Religion.

No gold in this country.

THE PRESENT STATE OF THE Spanish ISLANDS.

CHAP. I.

Of the island of Cuba.

CHAP. I. THE three principal Spanish islands that remain to be describ'd are those of Cuba, Hispaniola, and Porto Rico.

Situation and extent. The island of Cuba is situated between the 20th degree of northern latitude and the Tropic of Cancer, and between the 74th and 87th degrees of western longitude, 30 leagues north of Jamaica, and about as many south of Cape Florida, being 300 leagues in length, and generally between 20 and 30 leagues broad.

Name. The natives had given it the name of Cuba before COLUMBUS arriv'd there, who at first call'd it

Juanna, 'tis said, and afterwards Ferdinandino, from **CHAP. I.** King FERDINAND, who was King of Spain when this island was discover'd; but it soon recover'd its American name of Cuba, which it retains to this day.

A ridge of mountains run almost through the island from east to west, well replenish'd with timber and other trees, but the land near the shore is generally a plain champaign country.

There are abundance of rivulets which run from the mountains north and south, but none of them large, falling into the sea after a very short course, and

Face of the country.

Rivers.

CHAP. I.
Harbours. and no place in the world has better harbours, the chief of which are St. Jago, at the bottom of a large bay at the east-end of the island, and that of the Havana, on the north-west, which is one of the strongest and most commodious havens in America.

Seasons. They have no winters here, but great rains and tempests usually when the sun is vertical in July and August, which cools the air however, and renders the climate tolerable. The fairest season is when the sun is at the greatest distance from them, and then the morning is much the hottest part of the day; for towards noon the sea-breeze begins to blow pretty briskly, and continues to do so till the evening. From October to April they have brisk north or north-west winds in these seas at the full and change of the moon, and in December and January they frequently increase into storms, though this be their fair season: And DAMPIER observes of the isle of Pines, situated near the south-west coast of Cuba, that it rains there when it is fair every where else; and if we may credit our mariners, they scarce ever have a fair day on the Isle of Pines. The trade-wind in these seas blows from the north-east.

Provinces. I don't find the island of Cuba divided into provinces, though some relate that the east part of it is subject to the Governor of St. Jago, and the west to the Governor of the Havana.

Chief towns. The chief towns in the island are, 1. St. Jago; 2. The Havana; 3. Baracoa; 4. Porto del Principe; 5. Santa Cruz; 6. Trinidad; and 7. Spirito Sancto.

St. Jago. 1. St. Jago is situated (as has been already observ'd) at the bottom of a fine bay in the south-east part of the island, which with some small islands in the bay, form a very commodious harbour: It was built by General JAMES VELASQUEZ, who reduc'd this island under the dominion of the Spaniards about the year 1514: And it may still be stil'd the capital of Cuba, being the only Bishop's see in it, but is very much upon the decline at present, both the Bishop and Civil Governor residing at the Havana, for the most part.

The Havana. 2. The Havana, situate at the north-west part of the island, about five hundred miles to the westward of St. Jago, of which that celebrated traveller GEMELLI CARRERI, who was at the Havana in the year 1698, gives us the following description, together with some other particulars relating to the country, and the voyage of the galleons from thence to Spain, which I am confident will be acceptable to my readers.

Some description of the people. The Havana (says GEMELLI) is a little city half a league in compass, seated in a plain, and in the latitude of 23 degrees, 20 minutes. It is almost round, inclos'd with poor low walls on the land side, and defended on the other part by water. The inhabitants are about four thousand souls, Spaniards, Mulatto's, and Blacks, who live most of them in low houses. The women are beautiful, and the men ingenious. The Governor hath the title of Captain-General of the island, and administers justice with the assistance of an Assessor, call'd a Lieutenant, who is appointed by the Council of the Indies.

It is very dear living there; for three ounces of bread cost fifteen grains of Naples money; that is, about three-pence English, and half a pound of meat the same price. A hen is worth a noble, and fruit and other things proportionably; so that a man can scarcely live under two pieces of eight a day, especially when the galleons are there: Though the cli-

VOL. III.

CHAP. I. mate is temperate, wheat has not throve there for some years, and the reason is not known, so that what comes from abroad to the bakers is dearly paid for: But this want is in some measure supply'd by a root call'd Yuca (the Cassavi-root) whereof they make bread, boiling and then pressing it to get out a venomous juice there is in it. They bake it upon little earthen stoves, and this bread serves not only the poor, but the better sort who have large families. This root produces neither leaves nor seed, but they set bits of it into the ground to grow again.

The island is three hundred leagues in length from east to west, and about thirty in breadth. The inhabitants are poor, having no trade but tobacco and sugar; and all the labour falls upon the Blacks, of whom their masters exact four rials (two shillings) a day, and six when the fleet is there, and at least three of the women: Now what can a miserable Black do who has two masters, as it often happens? In Peru the master's avarice is greater; for they send the Black women to be got with child, like cows, and if they prove barren they sell them.

The city Havana is encompassed on two sides by its safe harbour, which is so deep that the ships anchor within a few steps of the shore. It is defended by three castles, the chief of them call'd Del Morro, on the left-hand of the mouth of it; the second De la Punta, or Of the Point, on the right; and the third call'd only The Fort, on the right of the last: We shall speak of them at large hereafter.

Friday the 3d, I saw the little, but neat, church, call'd Santo Christo del Buen Viage, serv'd by Secular Priests. Next day that of the Recolets, seated on the best ground in the city, and in it twelve beautiful chappels, and in the monastery cells for fifty Fathers.

The weather, which had continued serene and warm as summer, on Thursday the 9th, chang'd so cold, with rain, that I believe the like has scarce ever been felt in a place lying in 23 degrees and 20 minutes of latitude.

Wednesday the 15th I heard mass in the church of St. Clare, which has seven altars well adorn'd. The monastery will contain an hundred religious women and servants, who are there cloath'd in blue.

Thursday the 16th the chests of pieces of eight (crowns) began to be put on board the galleons, the King's held three thousand each, and the rest two thousand, in all amounting to thirty millions, as well belonging to the King as Merchants, for goods sold at the fair of Porto Bello, carry'd on between the traders of Seville and those of Lima. The great faith these traders repose in one another is very remarkable; for when once agreed on the price, they interchangeably deliver one another the bales of goods and chests of pieces of eight without seeing any thing of the contents, but giving entire credit to the written particulars they deliver to one another; for afterwards the bales and chests are opened in the presence of Publick Notaries, and if they find any thing amiss, the Companies of Seville and Lima are to make all good. This year the Company of Lima traders paid five thousand pieces of eight for goods found over and above in the bales at the foregoing fair. The same is practis'd at Acapulco when the galleon comes from Manila.

There was also deliver'd to the Master of Plate (which is an officer on board the galleons, who had charge of all the plate and jewels), aboard the Admiral,

23 F

CHAP. I. **1** A pearl weighing sixty grains, shaped like a pear, by F. FRANCIS DE LA FUENTE a Jesuit, to be deliver'd to the King. This pearl was taken at Panama in the King's island, by a Black belonging to a Priest, who being rich would not sell it to the President of Panama for fifty thousand pieces of eight, nor to the Vice-roy of Peru for seventy thousand, both of them being to send it to the King, but said, "He would carry it to his Majesty himself." Being come to Porto Bello with the pearl, which he call'd La Perseguida, or the Persecuted, he there died before he went aboard, and therefore committed it to the care of the aforesaid F. FUENTE, who told me that it was larger than that call'd La Peregrina, but somewhat duller. The Black had his liberty for his reward.

There went on board the galleons twenty Doctors of Peru, being the sons of Spaniards and Indian women going to Court for preferment, and the least that every one of them carry'd was thirty thousand pieces of eight.

Peruvians rich. **Birds.** Monday the 20th, going abroad a shooting, I kill'd a great many of those birds they call Cotorra's; some of them have black and green feathers, and others blue, others black and green wings, their breasts red, and half the head white. They are not amiss to eat. Returning home I kill'd two Guacamaia's, which though they do not talk, are so finely colour'd, that the best pencil can scarce equal them. The country is very delightful, being full of little houses with gardens and farms where there is no want of Indian fruit. I found a sort of snails, very large like the sea-snails.

Churches. Friday the 24th, I saw the church and monastery of the Augustinians; the first has thirteen little altars, the latter very poor dormitories.

Sunday the 26th, I was at the mother-church of the city, where the Bishop officiates with the Clergy belonging to it, his residence being at Havana, tho' the cathedral is at St. Jago where the Canons reside.

Tuesday the 28th, I heard mass in the church of St. John de Dios, which is small and has nine altars. The monastery is also small, and the hospital is for soldiers; its revenue is twelve thousand pieces of eight per annum.

On Saturday, the 1st of February, arriv'd the long-wish'd for vessel with provisions for the fleet, being seventeen hundred quintals, or a hundred weight of biscuit, six hundred load of meal, fish, and other necessaries for the galleons.

Tuesday the 4th I went to the hermitage of St. James, a church built by the Bishop within the walls of the city for his own particular devotion, well adorn'd, and with an apartment for him to retire to sometimes.

Wednesday the 5th, I saw the castle of the Point, which is very small, and has four bastions.

Forts. Monday the 10th, going to visit the Castellan D. ANTONY DE ROXAS, I had the opportunity of seeing the castle they call The Fort: Its compass is small, but it has four good bastions, and a platform towards the mouth of the port, well furnish'd with brass cannon.

Fruits. There are two particular sorts of fruit at Havana, which do not grow elsewhere. One is like a heart, call'd Guanavana, green without, and has some thorny prickles within, made up of white morsels of an unpleasant taste, between sweet and sour, with some stones. The tree is as big as that which bears the anana's, or pine-apple; the other is exactly like an orange on the outside, and within has a white and red pulp of a sweet taste. The tree is

as tall as a pear-tree; the leaf on the one side is green, and on the other of a cinnamon colour. Of European fruit there grow quinces, oranges, lemons, pomegranates, and other sorts.

The mountains are full of wild Hogs, Cows, Cattle. Horses, and Mules. Of birds there are abundance, Birds. especially Parrots and Partridges, with blue heads, and as for those that are fit for the cage, there is great plenty of those they call Chambergos.

Monday the 3d of March, I saw the castle Del Morro, built upon a rock on the left of the mouth of the harbour, which it defends with a platform of twelve pieces of cannon, call'd the Apostles, which lie level with the water. There are in all about fifty-five guns in the castle. The ditch about it is cut out of the rock and filled by the sea. Abundance of the birds call'd Cardinals are brought over from Florida; I saw the people belonging to the galleons give ten pieces of eight a-piece for some of them, and six for the worst. Upon computation, they said, there had been eighteen thousand pieces of eight laid out upon those foolish birds, notwithstanding the deplorable loss of Cartagena, and the expensive delay of keeping the fleet three years in America.

Saturday the 8th, proclamation was made, forbidding any that belong'd to the fleet to stay in Havana upon pain of death, and in the evening a cannon was fir'd to warn all aboard.

To return to the description of the towns; 3. Baracoa is situated at the north-east part of the island, upon a good harbour for small vessels, but is not capable of receiving large ships.

4. Porto del Principe, situated on the north-side of the island, about three hundred miles to the eastward of the Havana. **Porto del Principe.**

5. Santa Cruz, situated also on the north side of the island, thirty miles east of the Havana, upon a very good harbour. **Santa Cruz.**

6. Trinidad, situate at the bottom of a bay on the south side of the island; and **Trinidad.**

7. Spirito Sancto, situate also on the south-side of the island, about thirty miles south-east of Trinidad. **Spirito Sancto.**

This island produces the same animals as the neighbouring continent; but there is no place where the seas and rivers abound more with crocodiles, from whence several small islands upon this coast have obtain'd the name of Caymans, or the Crocodile Islands. **Crocodiles.**

Tortoises and Manatee are also exceeding plentiful here, and the European cattle the Spaniards brought hither are so vastly increas'd, that they run wild, and are killed chiefly for their hides and tallow, and their horses are said to be the best bred in America. **Tortoises. Manatee. Cattle.**

Their timber-trees are cedar, cotton, oaks, pines, palms, cocoa-nut-trees, and such others as are usually found between the Tropics. **Trees and fruits.**

Their fruits plantains, panana's, anana's, guava's, oranges, lemons, grapes, and other fruits introduced by the Spaniards; but their wine turns sour and will not keep, as is the case in other countries situate in hot climates. They have also ginger, cassia, fistula, aloes, and long-pepper; but as to cinnamon, which our voyage-writers talk of, and other fine spices, they are only to be found in the East-Indies.

There are a kind of bituminous fountains in the island, which produce a substance that serves instead of pitch: And there is a stone-quarry, we are told, where vast quantities of flints are found of the shape and size of cannon-balls. **Bitumen. Stones.**

Travellers mention also gold mines in this island; but if there were any they are exhausted, tho' there are some of copper not far from St. Jago. **Mines.**

CHAP. I. *History.* COLUMBUS first discover'd this island in the year 1492, as related in the introduction in this volume; but in all the voyages he made to America, he never found that it was an island, and the Spaniards fixing first at Hispaniola on account of the gold mines there, this island of Cuba was not entirely conquer'd till the year 1512, or 1514, Don JAMES VELASQUEZ having the honour of reducing it. The Spaniards having frequently been disturb'd in the possession of it by their enemies and the Buccaneers, particularly Captain CLIFF took the capital city of St. Jago in the year 1601, and Captain MORGAN the town of Porto del Principe in the year 1669; for the rest I must refer to the introduction.

CHAP. II.

Of the island of Hispaniola.

CHAP. II. *Situation.* THE island of Hispaniola is situated between 18 and 20 degrees of north latitude, and between 66 and 75 degrees of western longitude, being about 80 leagues in length, and generally about 40 leagues broad, and lies 15 leagues to the eastward of Cuba, 20 leagues east of Jamaica, and upwards of 100 leagues north of Terra-Firma.

Name. The name the Indians gave it anciently was Bohio, but COLUMBUS call'd it Hispaniola, or Little Spain, probably in honour to the Crown of Spain, which employed him in this discovery; and it was frequently call'd Dominica, or Domingo, from its capital.

Face of the country. As to the face of the country, there are mountains in the middle of it well planted with forest-trees, and other mountains more barren, in which formerly were gold mines, that seem to be entirely exhausted at this day. On the north and south are fine fruitful plains, watered with abundance of pleasant rivers which fall from the mountains, of which those on the south-side of the island are the largest. There are also several woods and groves of timber and fruit-trees: And no island hath more secure and commodious ports. The air and seasons are much the same here as in the island of Cuba. The island may be thrown into two grand divisions, viz. The south-east part which is subject to the Spaniards, and the north-west now subject to the French.

Chief towns of the Spaniards. The chief towns under the Dominion of the Spaniards are, 1. St. Domingo, or Dominica; 2. Higüey; 3. Zibo; 4. Cotuy; 5. Afo, or Azua; and 6. Conception.

Domingo. 1. The city of St. Domingo, situated on a commodious harbour on the south-side of the island, near the mouth of the river Hayna, in 18 degrees, 20 minutes south latitude, and in 70 degrees of western longitude. This town is built after the Spanish model, having a large square in the middle of it, about which are the cathedral and other publick buildings; and from this square run the principal streets in a direct line, being cross'd by others at right-angles; so that the form of the town is almost square. It is most delightfully situated, having a fine fruitful country on the north and east, a large navigable river on the west, and the ocean on the south, and is the see of an Archbishop, to whom the Bishop of St. Jago in Cuba and several others on the continent of Honduras and Terra-Firma are Suffragans. It is also a royal audience, the most ancient in America, and the seat of the Governor of the island. There are in it several fine churches and monasteries, and it is so well fortify'd that it defended itself in the year 1654, against one of the

most formidable fleets and armies that ever was sent to America by the English. The inhabitants are Spaniards, Mestices, Mulatto's, and Albatraces, a sixth part of which may be Spaniards: And in its flourishing state, when its audience received appeals from every province of Spanish-America, it might contain about two thousand houses; but is very much declin'd of late years. It was founded by BARTHOLOMEW COLUMBUS, brother to the Admiral, in the year 1594, who gave it the name of Domingo, or Dominic, in honour of their Father who was of that name.

2. The town of Higüey, situated 30 leagues to the eastward of Domingo, most considerable for its sugar-works.

3. Zibo, 20 leagues east of Domingo.

Zibo:

4. Cotuy, situated near the east-end of the island formerly a rich town when there were gold mines in its neighbourhood, but now an inconsiderable place.

Cotuy.

5. Azua, or Afo, a good port-town at the bottom of a bay on the south-side of the island, 8 leagues west of Domingo.

Afo.

6. The city of Conception de la Vega, situated 25 leagues north of St. Domingo, in which is a cathedral and several parochial-churches, and others belonging to convents, being heretofore a Bishop's see, founded by COLUMBUS, who from this town had the title of Duke DE LA VEGA conferr'd on him by his Catholick Majesty.

Conception.

The towns subject to the French are, 1. Petit Guaves; 2. Logane; 3. Port Lewis; and 4. Cape St. Francis.

Towns subject to the French.

1. Petit Guaves is a port-town situated in a great bay at the west end of the island, the principal settlement the French have upon it.

Petit Guaves.

2. Logane, another port belonging to the French in the same bay.

Logane.

3. Port Lewis, a good harbour on the south-west part of the island.

Port Lewis.

4. Cape St. Francis, the most easterly settlement the French have on the north-side of the island, near which they have the Fort De Paix. Besides these there are at this day a great many more thriving French colonies on the north and west part of the island.

Cape St. Francis.

As to the inhabitants, it has been already hinted that the south-east part is under the dominion of the Spaniards, and the north-west subject to the French, and consequently the Spaniards and French are Lords of their respective districts; but these are not a fifth part of the people upon the island; the Crioli, Mestices, Negroes and Albatraces are much more numerous than their European Lords, tho' their slavery and dependance are as intolerable here as upon the continent; but there is this difference between the French and the Spanish settlements, that the French work and apply themselves to business sometimes themselves, whereas the Spaniards live a lazy indolent life, depending on their vassals and slaves entirely for their subsistence.

Inhabitants.

The stature and complexion of the natives are the same as in the like climates on the continent. There may be observ'd a great variety of features and complexions here, and in all European colonies in America; some of the native Spaniards and French are fair, and others tawny: The descendants of these are a degree browner, and the next generation still of a darker colour: Whereas on the other hand the imported Negroes and their issue are as black as possible, and their features like those of other African Blacks; but mixing with Europeans or Indians, their children are tawny, and in some gene-

Persons.

CHAP. II. generations these tawny creatures cohabiting with other Europeans, their children and grandchildren are scarce to be distinguish'd from native Spaniards or French by their features or complexions; and when their original is forgot have the same privileges as those descended from French or Spanish ancestors on both sides, provided they have acquir'd fortunes or estates to support their pretensions.

Quadrupedes. It is very remarkable that when the Spaniards first discover'd Hispaniola and the neighbouring islands, there was not one four-footed animal upon them, unless some little Cur-dogs that could not bark: But the Spaniards afterwards importing horses, oxen, asses, mules, sheep, hogs, dogs, and cats, they multiplied prodigiously, and the Spaniards afterwards deserting this island in a manner, having first destroy'd the natives, the black cattle run wild in the mountains and forests, and for many years were kill'd by the Hunters and Buccaneers chiefly for their hides and tallow, of which incredible quantities were exported to Europe: And here the Buccaneers used to victual their ships with beef and pork and sell the same kind of provisions to the shipping that touch'd there; but since the French became masters of the north-west part of the island, and the number of cattle is decreased by the continual slaughter that was made of them, they have apply'd themselves to the planting sugar, tobacco, &c.

Fowls. As to the feather'd kind, there is a sort of fowls in their woods equal to our poultry, which the Spaniards call Pintado's, and great numbers of Parrots of various colours. Here is also the Carpenter-bird, so call'd from his pecking holes in trees, with the Cabrero, a sort of Cormorants, Men-of-war birds, Ravens, Crows, Swallows, Ducks, Teal, and many more such as are found in the same latitude on the continent.

Reptiles and insects. As to reptiles and insects, there are serpents of various kinds, but none of them venomous; Che-go's, Musketo's, Fire-flies, Crickets, and Millipedes.

Crocodiles and Tortoises. The Caymans, or Crocodiles, and Tortoises also are as numerous here and in the small islands on the coast as in any place of the world, and they have plenty of fish in their seas and rivers.

Fish. The principal forest-trees on Hispaniola are the Cedar, the Oak, the Pine, the Maho-tree, the Acoma-tree, Brasil, and other dying woods, and the Manchiril, the fruit of which last is poisonous, and the very saw-dust of this wood has been fatal to the workman. They have also several sorts of Palms, as the Latimer-plam, the Prickle-palm, the Wine-palm, and the Rosary-palm, with several kinds of fruit-trees, such as Banana's, Plantains, Guava's, Anana's, Oranges, Lemons, Citrons, Limes, Grapes, Apricots, Caramite-trees, whose fruit resembles Damascene-plumbs, the Genipa-tree, not unlike our cherry-trees, but the fruit bigger than a tennis-ball, and the Abelcose, which yields a fruit as big as a Melon.

Fruits. But the principal produce of the island at this day is Sugar, of which the French, as well as the Spaniards have very large plantations: And the great plenty of provisions, or rather the frugality and parsimony of the French, enables them to sell this kind of merchandize cheaper than the British colonies can do, and consequently must diminish our trade in that particular; for which I know no remedy but to advise our Planters to live as frugally as the French, and then possibly they may recover the trade they have lost.

Sugar. They plant Tobacco also in Hispaniola, and have several gums and drugs that are used in medicine,

Tobacco, Drugs.

such as Gum-elema, Guaiacum, Aloes, Cassia, and China-root. **CHAP. II.**

The first discovery of this island, in the year 1492, and part of its history have been already treated of in the introduction in this volume. I shall take leave to add in this place, that the Spaniards, after they had made an entire conquest of it, lived in great splendor here for many years, 'till they had exhausted the gold mines and worn out the natives in the working of them, and in other rigorous services, insomuch that of three millions of Indians that were found here there was not one Indian left upon it. After which the Spaniards (who at one time, 'tis said, amounted to fourteen thousand families) deserted the island themselves, and went over to the continent, most of them to Peru and Chili, where they understood there was the greatest plenty of gold and silver. Whereupon this island became the habitation of wild beasts 'till a people no less savage than these brute creatures, consisting of Out-laws, Buccaneers, and Pirates of all nations, began to make settlements here, and maintain themselves by hunting the wild cattle on shore, and the prizes they made at sea; or by plundering the maritime towns in those seas. The Spaniards finding their commerce very much interrupted by these Free-booters, and apprehensive that other European nations might at length take possession of Hispaniola, and dispute their dominion in that part of the world, thought fit to send colonies thither, and repossess themselves of the south-east part of the island again, but could not entirely drive the Buccaneers from the north-west coast and the little island of Tortuga over-against it, where they had fortify'd themselves; and these being most of them French, his most Christian Majesty at length sent a Governor thither, and oblig'd these disorderly people to build towns, cultivate the lands, and live in subjection to the laws of France, since which time they have made prodigious improvements, insomuch that Hispaniola may now be look'd upon as one of the most valuable acquisitions the French have in America, particularly with regard to their sugar-plantations (as has been intimated already) and the noble harbours and forts they are now in possession of on that coast, which gives them an opportunity of disturbing and ruining the commerce of other nations they happen to be at war with, as the Spaniards experienc'd in King WILLIAM's war, and the English in that of queen ANNE.

One reason of the Spaniards deserting this fruitful island of Hispaniola, 'tis said, was their being perpetually harass'd and plunder'd by the English and Dutch in the reign of Queen ELIZABETH; and why neither of those nations possess'd themselves of this important island when they had driven the Spaniards from thence is not easy to be conceiv'd; for were either of the maritime Powers possess'd of it, there are so many fine harbours for the security of their ships, and such plenty of provisions, that here they might ride masters of the American seas, and give laws to all other Powers.

Sir FRANCIS DRAKE, in the year 1586, took the capital city of St. Domingo by storm with twelve hundred men, and then quitted it again, as he had done several other Spanish ports in America. It seems to have been a maxim then in the Court of England, to humble the pride of the Spaniards, but not absolutely to drive them from their settlements in the West-Indies.

But CROMWELL and his Ministry were of a different mind. There is no one enterprize that cunning Usurper seem'd to have set his heart upon more

Cromwell attempts the conquest of Hispaniola.

CHAP.
II.

more than the possessing himself of this important island, which he evidently saw must give him the command of those seas, if it did not let him into a share of the treasures of Mexico and Peru. He sent Admiral PENN and VENABLES thither therefore, in the year 1654, with a fine fleet and ten thousand landmen on board, who had infallibly made themselves masters of the island, if some that envied CROMWELL that glorious conquest had not defeated the design by unnecessary delays in executing his orders, and sending such provisions, arms, and ammunition on board the fleet, that when they came to use them were found to be good for nothing. However, tho' these forces were not so fortunate as to subdue the island of Hispaniola, they did the nation the next best service they could possibly have perform'd in making a conquest of Jamaica, which the English have kept possession of to this day.

His forces
reduce Ja-
maica.Islands of
Savona.
St. Cata-

Guanabo.
Tortuga.Bucca-
neers,
their ori-
ginal.

There are several small islands near the coast of Hispaniola, of which the chief are Savona and St. Catalina, at the south-east part of the island; Naviza, at the west end of Hispaniola; Guanabo, in the bay of Leogane; and, lastly, Tortuga, on the north-west coast, an island of between twenty and thirty leagues in circumference, in which there is an excellent harbour of difficult access.

Here the Buccaneers and Free-booters of all nations had their first rendezvous, and fortifying the island, bid defiance to all mankind for some years. They consisted chiefly of the French Hunters of Hispaniola, who possess'd part of that island on the Spaniards deserting it, and spent their time in hunting, and taking the black cattle that run wild there. These were joined by great numbers of English and Dutch and other seamen, who having been barbarously treated by the Spaniards, form'd considerable fleets, and made all Spanish ships prize that came in their way; and sometimes, 'tis said, they made no scruple of seizing the ships of other nations, or at least plundering them of their ammunition and provisions when they wanted themselves; but since the French King has oblig'd those people to submit to a regular form of government, and establish'd his dominion in the north-west part of the island of Hispaniola, the Buccaneers have desisted their depredations at sea as well as their hunting by land, and apply'd themselves to cultivate the soil, and particularly to improve the sugar-plantations there, in which they have been very successful. This colony, as has been intimated already, does not only prejudice the British sugar-plantations extremely, but will ever remain a thorn in our sides in time of war; for from hence they will be in a condition to disturb the trade of our American colonies, unless we can find means to remove them: And one reason why the Spaniards have of late years favour'd the French more than the English may be, that they dread the power of the French more than the English, since they have possess'd themselves of the north-west part of Hispaniola, where they have a variety of commodious harbours for the greatest fleets, with which they can at any time cut off the trade between Spain and America.

CHAP. III.

*Of the island of Porto Rico.*CHAP.
III.Porto Ri-
co. Situa-
tion and
extent.

THE island of Porto Rico is situated in 18 degrees of northern latitude, and between 64 and 66 degrees of western longitude, being of an oblong form, about forty leagues in length from east to west, and twenty in breadth from north to

VOL. III.

south, and lies about twenty leagues east of Hispaniola.

CHAP.
III.

Name.

The Indian name was Boriquen, and COLUMBUS when he discover'd it call'd it St. John, but the chief town being afterwards built upon a commodious harbour, call'd Porto Rico, or the Rich Harbour, the island lost both its former names, and goes by the name of Porto Rico to this day.

The whole island is pleasantly diversified with woods, hills, and valleys, but has few large plains, and is well watered with springs and rivers; only on the little island, on which the city of Porto Rico stands, they have neither spring or brook, but fetch their fresh-water from the main island, or preserve it in the time of the rains in cisterns and reservoirs: However, as two of the most considerable rivers discharge themselves into the same bay, they easily import fresh-water from thence in boats.

Face of
the coun-
try.

The chief towns are, 1. Porto Rico; and, 2. St. Germain.

1. The town of Porto Rico, or St. John's, is situated on a small island in the harbour from whence it takes its name, the island being about two miles in length, and join'd to the main island by a narrow causey. The town stands upon an eminence, and is about half a league in circumference, built after the Spanish model; and being a Bishop's see, has a handsome cathedral and six or seven parochial and conventual churches. The entrance of the harbour is very narrow, and defended by strong forts and batteries, which render the town inaccessible by sea.

Porto Ri-
co city.

Nor is the place less pleasant than it is strong, for its elevated situation gives it the command of the sea on the one side, and of the main island on the other, and the small island in which it stands is planted with fruit-trees which are green all the year long.

2. The town of St. Germain is situated at the west end of the island of Porto Rico, about four miles from the sea; but of this I do not meet with any particular description.

St. Ger-
main.

Their rainy and tempestuous season is in the months of June, July and August, when the sun is near them, and then the winds in these seas are at south-east, though they are north-east at other times; but the hurricanes (which they are subject to as well as the Caribbee islands in their neighbourhood) blow from every point of the compass; and it is about Midsummer, or something later, that they expect these storms, though they do not happen every year.

Seasons:
Winds.

It is very fortunate that it rains here in those months, which would otherwise be the hottest: And the sea-breezes are another great relief; for about eight in the morning there rises a fresh gale of wind and blows 'till four in the afternoon: From six in the morning 'till the sea-breeze rises is very hot, but five in the afternoon is the hottest time of the day: From three in the morning 'till six it is the coolest, then a man may bear the bed-cloaths upon him very well.

The time of the rains is usually unhealthful; foreigners especially find it so, as the Earl of CUMBERLAND experienc'd, who, after he had taken the town of Porto Rico with its castles, was forc'd to abandon them again, having lost the greatest part of his men by the flux; which leads me to give a short abstract of the history of this island.

St. John de Porto Rico was discover'd by COLUMBUS in his second voyage, in the year 1493, who informs us that he met with some elegant buildings and gardens in this island; but being employ'd in discoveries on the continent afterwards, it was not reduc'd under the obedience of the Spaniards, or planted by them 'till the year 1510, when

JOHN

CHAP. III. JOHN POUNCE DE LEON, Deputy-governor of Hispaniola, being inform'd there were gold mines in Boroquen, obtain'd leave of NICHOLAS OBANDO, the Governor, to plant a colony there, and embarking with some few Spaniards, arriv'd at Boroquen; where pretending he only came to establish a friendly commerce with the natives, the chief Cacique, or Lord of the island, made an alliance with the Spaniards, and treated them very hospitably, shewing them two rivers wherein were some gold lands. Whereupon POUNCE DE LEON introducing a good number of Spaniards, and building several forts in the island, usurp'd the dominion of it: And not content with taking the country from the inoffensive natives, he obtain'd a commission from the Court of Spain to be Governor of the island, under colour whereof he made all the people slaves, dividing them among his captains and followers, who employ'd those poor people in digging for gold (of which it seems there was little to be found) and in all manner of drudgery, such as building, planting, carrying burthens, &c. using them as unmercifully as the Spaniards had done the natives of Hispaniola. Whereupon some of the Indians run away to the woods and mountains, and others stood upon their defence; but not being in a condition to resist the fire-arms, horses and dogs of the Spaniards, they were at length most of them compell'd to submit to that cruel bondage, and those that would not were tortured or torn in pieces with dogs. The Spanish writers relate abundance of incredible stories of the sagacity of their dogs in distinguishing between those who submitted to this slavery and those that refused to obey them: However, all agree that their country-men hunted those naked people with dogs in the woods and mountains as they would wild beasts or other game, and frequently tore in pieces men, women, and children in mere sport, turning them loose before their dogs, as they would a hare or a fox: And when repeated orders came from Spain to use the people better, and to prohibit the making the Indians slaves, those Adventurers represented to his Catholick Majesty that they were cannibals, and procur'd leave to make slaves of all they were pleas'd to denominate such. And this is one reason so many of the American nations have been represented as cannibals in Europe; nothing short of such prejudices could have induc'd any Christian Prince to have suffer'd his subjects to be treated so barbarously as the Indians were by the Spaniards; for though they claim'd their country by virtue of the Pope's grant, no Prince would ever have authoriz'd them to worry and tear in pieces whole nations after they had submitted to the Spanish yoke, if these savage Adventurers had not first dress'd them up in horrid colours, and falsely accus'd those inoffensive people of the most barbarous and unnatural customs: And strange it is (as has been observ'd on other occasions) that if almost all the American nations were cannibals, as the Spanish writers affirm'd, that there should not be one of those nations left at this day in the inland-countries that were never under the dominion of any European power, and consequently have not been brought off these customs by any such Catholick reformation. But to return to the history.

Porto Rico founded by Drake rebuilt there.

The city of St. John de Porto Rico was founded in the year 1514, and continued in a flourishing condition for many years. Sir FRANCIS DRAKE having a good fleet under his command, with land-forces on board, gave several assaults to the town in the year 1595, but was beaten from it. The Earl of CUMBERLAND had better success; for with a much less force he made himself master of the place

the next year with a fleet set out at his own expence, assisted by two regiments of the Queen's, for it was QUEEN ELIZABETH's good husbandry to encourage private men to be at the expence of such expeditions to the West-Indies, only lending them her ships and men. It was not often she put the publick to the whole expence of them. But it was with great hazard and difficulty the Earl carry'd the town of Porto Rico, tho' thus assisted; for in an assault he made upon the place, he fell from a rock into the sea in his armour, and remain'd so long under water before his people could get him out, that he was almost dead; and Sir JOHN BARKLEY continued the attack, 'till the Earl recover'd; soon after which the enemy abandon'd the town and retir'd into their forts, and these also surrender'd two or three days afterwards. The Earl had determined to take possession of Porto Rico, and from thence to have attack'd the Spanish settlements on the continent and islands after he should have been reinforc'd from England; but losing more than half his men by the bloody-flux in a very short time, he was compell'd to set sail for England on the 14th of August, with much less treasure than he expected to have met with here; for the Spaniards having notice of his coming, had carried off or conceal'd all that was valuable. The best prize he made was eighty pieces of brass cannon he found in the town and forts. He demanded a great sum of the Spaniards to ransom the town from being burnt, which they promised to pay him; but finding his men rot so fast they neglected to pay the money, and though the Earl was press'd to set the city on fire on their disappointing him, he left the town standing, and only demolish'd their forts.

The Earl of Cumberland takes the town.

Loses his men by sickness, and forced to quit it.

There is no doubt but Porto Rico would have been of vast advantage to the English if they could have kept it; and had they come before it in the dry season, possibly that mortality among the soldiers had not happen'd; which the Earl ascrib'd partly to the great labour his men sustain'd in this service, but more to the heavy rains that fell at that season, and observes when there was no rain the dews that fell in the evening were no less fatal to his men, who chose to lie in the open air in that hot country in fair weather: The fruits of the country also might contribute to this distemper; which brings me to treat of the produce of the island of Porto Rico.

The soil is rich, producing long coarse grass, which they feed their cattle with, but never make into hay. They have good timber fit for the building of ships, and variety of fruit-trees, such as Cocoa's, Pine-apples, Mammeyes, Guava's, Banana's Plantains, Palms, Oranges, Limes, Citrons, Jamaica-Pepper, and the bastard Cinamon. The country also produces Rice and Indian-corn, but they make more bread of the Cassavi-root than of corn, being too lazy to cultivate the soil. The principal produce of the island for exportation is Ginger, Sugar, and Hides, for they have vast numbers of black cattle here as well as in the neighbouring island of Hispaniola; but they have more Goats and Hogs than they have of European Sheep, and the mutton they have is poor dry food: Their pork is excellent, and their Kids are pretty good meat: They have also all manner of European poultry, and plenty of fish. Parrots are as common as Crows in England, and they are well stocked with Wood-pigeons as well as Guanoes, a kind of great Lizard, which they esteem good food in the West-Indies. They have also Land-crabs, not unlike the Sea-crab, which burrow in the ground like Rabbits; but these are the food of dogs more than of men. Those who were in the expedition

Produce of Porto Rico.

Their dogs feed on land-crabs.

CHAP. III. dition against Porto Rico with the Earl of Cumberland relate, that the Earl proposing to make this an English colony, transported the Spanish inhabitants to other places; whereupon the dogs set up a dismal howl, which they continued all night after their Spanish masters were gone, and run away to the woods next day, which the English apprehended was in search of their masters. However, the dogs returned to the town again in the evening; and after they were acquainted with the English, left off their howling in the night-time, but still went every day to the woods by the sea-side, where the English at length observ'd that they devour'd the Land-crabs, these being their principal food.

Gold, none here.

As to the gold mines that travellers relate there are in this island, there are none wrought at this day; nor was there ever any that were very considerable,

but possibly there might be some little gold found in their rivulets formerly, which invited the Spaniards to take possession of the island; though I believe their chief reason for keeping Porto Rico at present is, that it may not fall into the hands of some other European power that might disturb their commerce with their American dominions, and perhaps endanger the loss of their more valuable settlements on the continent.

The Virgins Islands are the last Spanish islands The Vir-I shall mention. These are a cluster of barren rocks, gins islands a little to the eastward of the island of Porto Rico, through which the passage is something difficult. They are scarce worth claiming by the Spaniards, or any other nation; though they are generally said to belong to Spain.

THE CONCLUSION

OF

Spanish-AMERICA.

IN this survey of the Spanish territories in America, it appears that they are the richest (if gold and silver are to be accounted riches) and the most extensive that ever any Monarch possess'd since the flood. What are the conquests and acquisitions of ALEXANDER or CÆSAR if compar'd with these? especially at a time when CHARLES V. was upon the throne, who was Emperor of Germany, Sovereign of Spain, Italy, and the Low-Countries, and had part of Asia and Africa under his dominion?

This Prince was actually engaged in war with the Turk, the French, the Flemings, the Africans, and Indians of north and South-America almost at the same instant: And in every part of the world was generally successful: But the empire of Mexico and Peru, a dominion of seven thousand miles extent almost, was entirely subdu'd by the Spaniards during his reign; so numerous were the enterprizes his forces were engaged in, that he might well be deem'd the grand Knight-errant of his times; and CERVANTES is supposed by some to have had an eye to CHARLES V. in his Don QUIXOT, especially where he brings in the hero charging the flock of sheep, to which the naked Indians might properly be resembled when they were attack'd by men arm'd cap a-pee on horseback, with the advantages of artillery and fire-arms. In this and in shipping, it must be acknowledged that CHARLES V. had the better of ALEXANDER and CÆSAR, and other Knight-errants of antiquity; for though the

Greeks and Romans excell'd in military discipline, which enabled them to subdue the nations about them, their conquests probably would have been swifter and more extensive if they had known the use of fire-arms, and been better skill'd in navigation. These render'd the Spaniards so much superior to the Indians, that they might well be looked upon as sheep, if compar'd with their Conquerors, as they were call'd, though with as little property as a troop of horse may be said to conquer a flock of sheep or hares they trample under their feet without resistance. They might have stiled their expeditions to America executions, or barbarous massacres; but the name of conquest (which carries in the notion of it hazard and difficulty, and presumes the enterprize to be just and honourable) ought never to be profaned and apply'd to butchers and hangmen, to robbers, pirates, and usurpers, who make no scruple of torturing and murdering the inoffensive or industrious part of their own species to possess themselves of their country and treasures.

But how barbarously or unjustly soever the Spaniards acquir'd the dominion of America, they remain'd in the uninterrupted possession of it (except Brazil) for an hundred years and were possess'd of that too for threescore years and upwards, namely, while Portugal was in possession of the Spaniards.

The English and other European nations seem'd to have resign'd the dominion of that new world to the Spaniards, scarce endeavouring to make a settlement,

The vast extent of the Spanish territories in America. Charles V. the grand Knight-errant.

America possess'd by the Spaniards alone for 100 years.

tlement, or send a colony thither for three or four-score years after it was discovered. SEBASTIAN CABOT was employ'd indeed by HENRY VII. of England to find out a passage to the East-Indies by the north-west, in the year 1496, and in that attempt discover'd the north-east coast of America; but no endeavours were made to improve that discovery till the year 1560, when the English and some other European nations began to promote a fishery on the banks of Newfoundland.

The French attempt to settle colonies in Florida, 1562. Monsieur CHATILLON carried a colony of the French to Florida, in the year 1562, and call'd that part of the country Carolina, in honour of CHARLES IX. of France, which name it retains to this day; but the French were driven from it soon after by the Spaniards, which they revenged and then abandon'd this country again. In the year 1567, DRAKE sailed with Captain HAWKINS, who had five ships under his command, to Guinea, and from thence to Vera Cruz in Mexico, with Negroe slaves, where the Spaniards agreed to traffick with them, but surpriz'd HAWKINS and three of his ships in the harbour; and DRAKE return'd to England, having lost all he had in the world, which he revenged on the Spaniards two or three years after by plundering Nombre de Dios, and seizing abundance of treasure that was coming from Panama: And on his return to England made preparations for that memorable voyage round the world, which he enter'd upon in the year 1577, and being come into the South-sea, took and plunder'd several Spanish towns and made prize of their ships; after which he came home by the East-Indies and the Cape of Good Hope, in the year 1580. The same bold Seaman took and plunder'd several Spanish settlements in the North-sea afterwards, but planted no colonies in America. Sir WALTER RALEGH procur'd the first patent to govern such countries as he should discover in America, in the year 1584, and sent a colony to Virginia, which was driven from thence by famine again. The English miscarry'd a second and third time in their endeavours to settle a colony at Virginia in the years 1586 and 1587 (but here it is necessary to observe, that Sir WALTER RALEGH gave the name of Virginia to all the north-east coast of America, now in possession of the English, in honour of Queen ELIZABETH his Sovereign.) The first settlement the English actually made and establish'd in America, was that at James-Town in Virginia, in the reign of King JAMES I. 1606: And eight or ten years afterwards colonies were sent to New-England: And about the same time the French made some acquisitions in Canada. From whence it appears that the Spaniards had the sole dominion in America for upwards of an hundred years (except that the Portuguese were masters of Brazil part of the time.) And the Spaniards look'd upon themselves to be so much the proprietors of those countries, that they sunk the ships of every nation they met with in those seas, and hang'd up the men; which put both the English and the Dutch on making reprisals, questioning by what title the Spaniards claim'd the sole right of that part of the world; and these disputes continue in some measure to this day, the Spaniards seldom failing to make prize of such ships they find in the gulph of Mexico, or on the coast of Terra-Firma, when they find themselves strong enough; and we are become so very tame as to put up these insults for the most part, while the French have in a manner bullied the haughty Spaniards into a submission since their fixing themselves on the north-west of Hispaniola, and may now be

looked upon as the most formidable power in those seas; and indeed that nation seems to assume the privilege at present of giving laws to the English as well as the Spaniards both on the continent and islands. But to return to Spanish-America.

Notwithstanding the vast addition of dominion and treasure to the Spanish Crown, which their Princes enjoy'd almost without a rival for the space of an hundred years, that kingdom has been upon the decline ever since they were possessed of them.

One reason whereof may be that the countries subject to them were too numerous and extensive for any Prince that had not the capacity of an Angel to govern them. Even CHARLES V. who had so vast a genius, and who actually attempted and made some progress in the conquest of three parts of the world, and was not without hopes of reigning sole Monarch of it, this great Prince sunk at last under the weight of that unwieldy empire. Some repulses he met with abroad, and the stubborn opposition of his subjects at home so ruffled his soul, that he abandon'd the world, and retir'd in discontent to a cloister; and, fully convinc'd that he had grasped too much for any mortal man to govern, divided his dominions between his brother and his son.

Another reason given for the decline of the Spanish Monarchy on the conquest of the new world, is, their sending over annually such numbers of their best men thither for the securing this foreign prize, and neglecting their affairs in Europe. And there is still a third cause more fatal than both the former, namely, that the prodigious treasures which at first flowed in upon them render'd their people proud, lazy, and inactive, inasmuch that most of their manufactures were neglected, and at length the greatest part of that treasure they received from America came to be distributed among their more industrious neighbours for the merchandize they received from them, and the Spaniards were little more than factors for the rest of Europe: The gold and silver of America indeed passes through their hands, but very little of it remains long in their country; from all which considerations it is pretty evident that the Spaniards are rather losers than gainers by that envy'd conquest.

The next enquiry which it is natural to make is, whether the Americans have been any great gainers by their intercourse with the Spaniards. It is true that they first instructed them in the Christian religion, introduced learning, with the liberal and mechanic arts; and that the Spaniards first imported European cattle, corn, and fruits, by which no doubt America is or might have been abundantly improved, and a more elegant way of living introduced than the Indians were before acquainted with.

But how dear did the first generation of Indians pay for this! and in what a miserable servitude do their posterity still remain! The Spaniards indeed had religion and reformation in their mouths, but practis'd the greatest cruelty, injustice and oppression: And religion was only made a pretence for their barbarity. They represented the natives as sodomites, cannibals, and monsters, and then used them as such. Instead of reforming they actually extirpated the greatest part of the natives, and the rest were reduced to a state of slavery: And as to the Christian religion, it was so disguised by superstitious rites, and its doctrines so perverted, that instead of improving their morals, the natives who live under the Spanish government are become the most vicious mortals upon earth: And all the present

The Spaniards weaken'd by their conquests.

The Americans the worse for the Spaniards.

James-Town in Virginia, the first colony of the English in America, settled in 1606.

The Spaniards in America in a perpetual state of war with other nations.

But humbled by the French, who are now very formidable in those seas.

sent inhabitants, whether descended from European, Indian, or African ancestors, are oppress'd to a very great degree. Necessitous and rapacious Governors are sent over from time to time, who make merchandize of all places of trust and profit to their inferior officers; and these again fleece the miserable inhabitants in their respective governments till they have repaid themselves what has been extorted from them by their superiors, to whom it is in vain to complain or petition for justice, while a continued series of bribery runs through the whole administration.

The communicating the Christian religion, arts, and sciences, and the importing so many valuable species of animals, corn and plants, might have been esteem'd a very great happiness to the Americans, if they had not been compell'd to resign their country and liberties in exchange for them. But what pleasure can slaves take in the midst of the greatest affluence? They see indeed all that is desirable in life with their eyes; but as they can call nothing of all this their own, it does but add to their misery when they find they have no share in these blessings, or none at least but what they are liable to be depriv'd of every moment by their imperious masters. As it seems evident therefore that the Americans are not much the better for their commerce with Europe, so some make it a question whether the inhabitants of this continent have gain'd any great advantage by their intercourse with the new world.

We have certainly received great quantities of gold and silver from thence, but the multiplication and increase of these metals does not seem to have added much to our happiness. In proportion to the importation the value of them has decreased; and since estates have been converted into money, which may be hoarded up or lodg'd in banks, hospitality has visibly declin'd. The money'd man is generally the most useless member in a commonwealth, where he does not apply it to traffick. An ordinary Farmer employs more people, and does more good in his neighbourhood than a man that is possess'd of ten thousand pounds and lives on the interest of it.

But if we are not much better for the gold and silver of America, it must be acknowledged, however, that Europe reaps great advantages from the rest of the produce of that new world, which furnishes us with abundance of valuable drugs and merchandize we wanted. Our colonies also take off vast quantities of our manufactures, and consequently employ great numbers of people on this side. Navigation and the knowledge of nature also has been extremely improv'd since our discovery of these countries; and in time, when we come to know one another better, and come to treat each other with more humanity, there is no doubt but that they and we shall receive great advantages by a mutual intercourse, and the communication of the produce of the respective continents.

The last observation I shall make is, that the best Spanish historians cannot be relied on: They have evidently made such representations of the country and the natives, as their interest, their vanity or superstition prompted them to make, and have had very little regard to the truth of things; and how false soever their relations have been, they have generally been transcribed and copied by other nations, who had no other opportunity of informing themselves of the state of those countries before the Spaniards arrived, insomuch that I have found as much difficulty in discovering the true state of those countries as if we had but just heard of them, especially as to the religion and morals of the Indians when the Spaniards came amongst them.

As to the numerous nations of cannibals, giants, and monsters that were said to be found in America, I am perfectly satisfied that these relations were all pure fiction: And as to their human sacrifices, I am very much in doubt upon the most strict and impartial review whether there were any such. Certain it is these matters were very much aggravated, if there was ever any foundation for them: And it is strange, if many Indian nations did formerly sacrifice men, there should not be one left among the nations unsubst'd and unconverted that sacrifice men at present. Their celebrated Acosta and other Spanish writers do charge both the Peruvians and Florida-Indians with sacrificing children, which is now known to be false: Why may we not then suspect the truth of the human sacrifices they pretend there were among the Mexican nations?

Another thing I cannot help doubting of is, the noble and elegant buildings that are said to be found in the city of Mexico and some other cities at the arrival of the Spaniards. I must confess, when I first observed the concurrent testimony of the Spanish writers in these particulars, I did give credit to them, as the reader will observe in the description of the Mexican cities; but having observed since, that there are no such buildings to be found in any other parts of America, I think we have some reason to question whether these were not set in a better light than they deserved: As to the largeness of their buildings, and the vast stones they were composed of, these particulars possibly may be true, since the whole country were slaves to their Princes, who could command as many of them as they pleased to assist in building their palaces, temples, or fortresses. But when it is related, that the materials of their buildings were of jasper and other polish'd marble, when they had no iron tools to form or beautify the stone; and when there are no such works to be found in any part of the country which the Indians possess at this day, and when so many other particulars in the Spanish historians have been found to be false, I cannot give entire credit to all that has been written on this head.

THE PRESENT STATE OF BRAZIL.

CHAP. I.

Of the situation and extent of BRAZIL; of its name, the face of the country, springs, rivers, lakes, seas, air, winds and seasons.

<p>CHAP. I. Situation.</p>	<p>I COME now to the second grand division of America, I proposed to describe, namely, that of Brazil, under the dominion of the King of Portugal, which is situated between the mouth of the great river Amazon, under the Equator, and the mouth of the river La Plata, in 35 degrees south latitude, being bounded by the Atlantic-ocean on the north and east, by the river La Plata on the south, and by the province of La Plata, or Paragua, and the country of the Amazons on the west, being two thousand, four hundred miles and upwards in length from north to south, if we measure in a direct line, and near four thousand if we take in all the turnings and windings of the coast, but is not in many places more than two thousand miles broad, though in some the Portuguese may have penetrated four or five hundred miles into the country.</p>	<p>several fine harbours, bays, capes, and promontories, the principal whereof are, 1. Cape Roque, in 4. degrees odd minutes south latitude. 2. The harbour of Pernambuco, or Recife, in 7 degrees 30 minutes south latitude. 3. Cape St. Augustin, in 8 degrees. 4. The harbour or bay of All Saints, in 13 degrees odd minutes. 5. The harbour of Porto Seguro, in 16 degrees 30 minutes. 6. The port and bay of Reio Janeiro, in 23 degrees south latitude. 7. Cape Frio, some few minutes east of Reio Janeiro. 8. The port of St. Vincent, in 25 degrees south latitude. 9. Cape St. Mary, the most southerly promontory of Brazil, in 34 degrees odd minutes south latitude. 10. The port of St. Gabriel. And, 11. The port of St. Salvador, situate on the north shore, at the entrance of the river La Plata: The rest of the ports and bays will be taken notice of in the description of the respective provinces.</p>	<p>CHAP. I. Harbours and capes.</p>
<p>Name.</p>	<p>The Portuguese, who first discover'd this country, gave it the name of The Holy Cross, but it afterwards obtain'd the name of Brazil (by which it is now universally known) from the great abundance of Brazil-wood which grows here.</p>	<p>As to the seasons, air and winds, they are not the same throughout this extensive country, but vary with the several situations. I shall divide it therefore, in respect of the seasons, into three parts, viz. 1. The most northerly, which lies next the Equator; 2. That part of it which extends from 5 degrees south latitude to the Tropic of Capricorn; and, 3. That part of the country which is situated between the Tropic and 35 degrees of south latitude.</p>	<p>Air, winds, and seasons.</p>
<p>Face of the country.</p>	<p>As to the face of the country, the land is rather low than high near the coast, but exceeding pleasant, being chequer'd (according to DAMPIER's expression) with woods and savannahs, or meadow-grounds, and the trees, for the most part, ever-greens: But on the west side of it, far within land, are high mountains, which separate it from the Spanish province of La Plata, and in these are innumerable springs and lakes, from whence issue abundance of rivers that fall into the great rivers Amazon and La Plata, or run cross the country from west to east, and fall into the Atlantic-ocean, which last are very numerous, and of great use to the Portuguese in turning their sugar-mills, and meliorating their lands, which they over-flow annually, as the Nile does Egypt.</p>	<p>As to the north of Brazil, which lies almost under the Equator, this, like other countries in the same situation, is subject to great rains and variable winds, particularly in the months of March and September, when they have deluges of rain, with storms and tornadoes; the country is overflow'd, and the air unhealthful; but this part is very little inhabited: The Portuguese only keep possession of the coasts to keep foreigners out. As to the air, winds and seasons in that part of Brazil which lies between 5 degrees south latitude and the Tropic of Capricorn, Mr. DAMPIER has given us this account of it.</p>	<p>Near the Equator.</p>
<p>Springs, lakes and rivers.</p>	<p>Through every province of Brazil there runs a great river (besides several lesser streams) which communicates its name to the province, the course whereof will be describ'd in treating of the respective provinces.</p>	<p>He observes, that the winds and seasons are the very reverse here to what they are in other parts of the world in the same latitudes; for whereas the dry season comes on in other places south of the Equinoctial, when the sun goes to the northward of the</p>	<p>In the middle of Brazil.</p>
<p>The sea.</p>	<p>The only sea that borders upon Brazil is that of the Atlantic-ocean, which washing its coasts for the space of three hundred miles and upwards, forms</p>		

CHAP. I. the Equator, and the wet season begins when the sun returns to the southward; here the wet season begins in April, when the south-east winds set in with violent tornadoes, thunder and lightning: And in September, when the wind shifts to east-north-east, it brings with it a clear sky and fair weather, and this is the time of their sugar-harvest.

There are but two winds blow upon this coast, viz. the south-east from April to September, and the north-east from September to April again: But thirty or forty leagues out at sea they meet with the constant trade-wind, which blows in the Atlantic-ocean all the year round from the eastward with very little variation.

There is no country between the Tropics where the heats are more tolerable, or the air more healthful than this, being constantly refresh'd with breezes from the sea, and abounding in lakes and rivers, which annually overflow their banks: And in the in-land part of the country the winds from the mountains are still cooler than these that blow from the ocean.

3. I proceed in the next place to enquire into the air and seasons of the most southerly part of Brazil, which lies without the Tropic of Capricorn, and this appears to be like other countries in the same climate, one of the most desirable parts of the world, having a greater share of fair weather, and a more temperate air than those countries that are nearer, or those that are remov'd further from the Equator, and are generally bless'd with a most fruitful soil. The winds here are variable, at least beyond the latitude of 30, and the little winter they have is when the sun is in the northern signs; but the territories of the Portuguese are but very narrow here, lying between the sea and the mountains which divide them from that part of La Plata subject to the Spanish Jesuits, deservedly call'd The Jesuits Paradise, from the excellency of the soil and climate.

CHAP. II.

Of the provinces and chief towns of Brazil, and the buildings of the natives.

CHAP. II. **BRAZIL** is usually divided into fifteen provinces, or captainships (viz.) 1. The captainship of Paria. 2. Maragnan. 3. Siara. 4. Potigi, or Rio Grande. 5. Parayba. 6. Tamara. 7. Pernambuco. 8. Seregippe. 9. Batria de Todos Santos. 10. Ilheos. 11. Porto Seguro. 12. Spirito Sancto. 13. Rio Janeiro. 14. St. Vincent. And, 15. del Rey.

1. The captainship of Paria, or Para, is bounded by the mouth of the river Amazon and the ocean on the north, by the province of Maragnan on the east, by the country of the Tapuyers on the south, and by the country of the Amazons on the west. The principal river, which gives name to the province, runs through it from south to north, and falls into the mouth of the river Amazon; and the chief town, call'd also Para, or Belem, is situated at the mouth of the river Amazon, in 1 degree of south latitude, and 47 degrees odd minutes western longitude, where 'tis said the Portuguese keep a garrison of four or five hundred soldiers. 2. Corupa, situated about fifty leagues south-west of Para.

2. The captainship of Maragnan, bounded by the ocean on the north, by the province of Siara on the east, by the Tapuyers country on the south, and by Paria on the west.

The chief towns are; 1st, St. Lewis de Maragnan, situated in 2 degrees, odd minutes south latitude, on an island in a fine bay made by the mouths

of their three principal rivers, viz. 1. Mary, or Maragnan; 2. Tapucary; and, 3. Mony.

The town and island of St. Lewis were formerly possess'd by the French, and then by the Dutch, but both nations were driven from thence by the Portuguese, who are now in possession of it.

2dly, Cuma, situated on the continent, over-against the said island of Maragnan.

3. The captainship of Siara, bounded by the ocean on the north and east, by the province of Potigi, or Rio Grande, on the south, and by Maragnan and the Tapuyers country on the west. The river Siara, which gives name to the province, runs from the south-west to the north-east, and falls into the sea in 4 degrees odd minutes south latitude, at the mouth whereof stands the town of Siara, and about twenty leagues to the eastward of it the fort of St. Luke.

4. The captainship of Potigi, or Rio Grande, bounded by Siara on the north, by the ocean on the east, by the province of Payraba on the south, and by the country of the Tapuyers on the west. The chief river of Rio Grande gives name to the province, runs from west to east, and falls into the ocean in 5 degrees odd minutes south latitude, on which river stands the town of Tiguares, being the only town I meet with in this province.

5. The captainship of Payraba, bounded by Potigi on the north, by the ocean on the east, by Tamara on the south, and by the country of the Tapuyers on the west.

The river Payraba running from west to east, divides this province in two equal parts, and falls into the ocean in 6 degrees odd minutes south latitude.

The town of Payraba lies on the south side of this river, about five leagues from the sea. There are in it several churches and cloisters, and it is defended by a wall and forts; and two leagues to the north of this town lies the port of Lucena, which is a good harbour for ships.

6. The captainship of Tamara, or Tamarica, bounded by Payraba on the north, the ocean on the east, by Pernambuco on the south, and the Tapuyers country on the west. The chief river whereof is Tamara, in the mouth whereof lies the island and town of Tamarica, which form a tolerable harbour.

There is another town call'd Guia, or Goyana, situated on the Goyana, about three leagues from the sea, but of none of these towns do I meet with any particular descriptions, only 'tis said the Portuguese have abundance of sugar-mills on these rivers, sugar being the principal produce and manufacture of the country.

7. The captainship of Pernambuco is bounded by that of Tamara on the north, by the ocean on the east, by Seregippe on the south, and by the country of the Tapuyers on the west, extending two hundred miles along the coast from north to south, and an hundred and fifty miles in breadth from east to west, and was the principal province belonging to the Dutch when they were in possession of North-Brazil. The chief town whereof was Pernambuco, or the Recife. This harbour was call'd Pernambuco, or rather Infernoboco, the mouth of hell, by the Portuguese, on account of the rocks and shoals under water at the entrance of it. It is composed partly of a peninsula on the continent, and partly of several small islands which were built upon and fortify'd in the time of the Dutch. The peninsula is call'd The Recife, and lies in 7 degrees 30 minutes south latitude, and 35 degrees of western longitude, a little to the north of Cape St. Augustin. South of The Recife, and just opposite to it, is an island built upon, and call'd Maurice-town, from the palace of Prince MAURICE, which

CHAP.
II.

which was situated on it, and hath a communication with The Recief by a bridge. It was naturally strong, surrounded by water or morasses, and defended by several forts and redoubts; but was however surrender'd by the Dutch to the Portuguese, in the year 1647, for want of ammunition and provisions, which the Dutch West-India Company did not take care to supply their colonies in Brazil with in due time.

Olinda.

2dly, The city of Olinda is situated on some small hills on the sea-coast, a very little north of The Recief, and before the Dutch took it from the Portuguese, was the principal port in Brazil, well built and fortify'd, and contain'd two thousand inhabitants, besides the religious people and slaves, who were both very numerous.

Porto Calvo.

3dly, Porto Calvo, or Cavelo, lies at the conflux of four rivers, about thirty miles south of The Recief, and four leagues west of the sea-coast. This place was strongly fortify'd when in the hands of the Dutch.

Cape St. Augustin.

4thly, Cape St. Augustin harbour is situated near the most easterly promontory of Brazil of the same name, in 8 degrees odd minutes south latitude, and 35 degrees of western longitude, and lies about twenty-five miles north of the little island of St. Alexio. The entrance of the harbour is dangerous on account of the rocks which lie under water; and this is the case of most of the harbours upon the coast of Brazil, which may however safely be enter'd by the assistance of the pilots of the coast.

Captainship of Bahia, or Serigippe.

8 and 9. The captainship of Bahia de Todos Santos, or of the bay of All Saints, in which I include Serigippe, is bounded by the province of Pernambuco, from whence it is separated by the great river St. Francis on the north, by the ocean on the east, by that of Ilheos on the south, and the Tappuyers country on the west, being about two hundred and forty miles in length from north to south along the sea-coast; how far it extends to the westward is uncertain, but it is esteem'd the richest and most populous province in Brazil. The chief towns whereof are, 1. Serigippe, or St. Christophers; and, 2. Bahia, or St. Salvador.

Serigippe town.

1st, Serigippe is situated on a bay of the sea, in 11 degrees south latitude, between the great rivers of St. Francis and Real.

Bahia, or St. Salvador, the capital of Brazil, described.

2dly, Bahia, or St. Salvador, of which the last is the true name; but it is generally known by that of Bahia, or the Bay, on account of the commodiousness of the harbour on which it stands. It is situated on a hill above the harbour, in 13 degrees of south latitude, according to DAMPIER, and is the most considerable town in Brazil, whether we regard the beauty of its buildings, its magnitude, or its trade or revenue. The harbour is capable of receiving ships of the greatest burthen. The entrance whereof is guarded by a strong fort, call'd St. Antonio, and there are other small forts which command the harbour, one whereof is built upon a rock, about half a mile from the shore: Close by this fort all ships must pass that anchor here, and must ride also within half a mile of it at farthest between this and another fort (that stands on a point at the inner part of the harbour, and is call'd The Dutch fort) but must ride nearest to the former all along against the town, where there is good holding ground, and less exposed to the southerly winds that blow very hard here. They commonly set in about April, but blow hardest in May, June, July, and August: But the place where the ships ride is expos'd to these winds not above three points of the compass.

CHAP.
II.

Beside these there is another fort fronting the harbour, and standing on the hill upon which the town stands. The town itself consists of about two thousand houses, the major part of which cannot be seen from the harbour; but so many as appear in sight, with a great mixture of trees between them, and all placed on a rising hill, make a very pleasant prospect.

There are in the town thirteen churches, chapels, hospitals, and monasteries, and one nunnery, viz. the Ecclesia Major, or cathedral, and the Jesuits College, which are the chief, and both in sight from the harbour: St. Antonio, St. Barbara, both parish-churches, the Franciscans, and the Dominicans, and two convents of Carmelites, a chapel for seamen close by the sea-side, where boats commonly land, and the seamen go immediately to prayers; another chapel for poor people, at the farther end of the same street, which runs along by the shore, and a third chapel for soldiers at the edge of the town, remote from the sea, and an hospital in the middle of the town. The nunnery stands at the outer edge of the town next the fields, wherein, by report, there are seventy nuns. Here lives an Archbishop, who has a fine palace in the town, and the Governor's palace is a fair stone building, and looks handsome to the sea, tho' but indifferently furnish'd within, both Spaniards and Portuguese in their plantations abroad affecting to have large houses, but are little curious about furniture, except pictures. The houses of the town are two or three stories high, the walls thick and strong, being built with stone, with a covering of pantile, and many of them have balconies. The principal streets are large, and all of them pav'd or pitch'd with small stones. There are also parades in the most eminent places of the town, and many gardens, as well within the town as in the out-parts of it, wherein are fruit-trees, herbs, fallading, and flowers in great variety, but order'd with no great care or art.

Here are about four hundred soldiers in garrison. They commonly draw up and exercise in a large parade before the Governor's house, and many of them attend him when he goes abroad. The soldiers are decently clad in brown linnen, which in these hot countries is far better than woollen. Beside the soldiers in pay, he can soon have some thousands of men up in arms upon occasion. The magazine is on the skirts of the town, on a small rising between the nunnery and the soldiers church. 'Tis big enough to hold two or three thousand barrels of powder, but it seldom has more than an hundred. There are always a band of soldiers to guard it, and centinels looking out both day and night.

A great many merchants always reside at Bahia, for 'tis a place of great trade. DAMPIER found here above thirty great ships from Europe, with two of the King of Portugal's ships of war for their convoy, beside two ships that traded to Africa only, either to Angola, Gamba, or other places on the coast of Guinea, and abundance of small-craft that only run to and fro on this coast, carrying commodities from one part of Brazil to another.

The merchants that live here are said to be rich, and to have many Negroe slaves in their houses, both men and women. They are chiefly Portuguese, foreigners having but little commerce with them; yet here was one Mr. COCK, an English merchant, DAMPIER relates, a gentleman of good repute, who had a patent to be English Consul, but did not care to take upon him any publick character, because English ships seldom came hither, and there had been none in eleven or twelve years before

DAMPPIER

CHAP. DAMPIER was there in the year 1699. Here ^{II.} was also a Dane and a French merchant or two, but all have their effects transported to and from Europe in Portuguese ships, none of any other nation being admitted to trade hither. There is a custom-house by the sea-side, where all goods imported or exported are enter'd: And to prevent abuses, there are five or six boats that take their turns to row about the harbour, searching any boats they suspect to be running of goods.

Goods imported and exported.

The chief commodities that the European ships bring hither are linnen cloths, both coarse and fine, some woollens, as bays, serges, perpetuana's, &c. hats, stockings, both of silk and thread, biscuit-bread, wheat-flour, wine (chiefly port) oil-olive, butter, cheese, &c. and salt beef and pork would there also be good commodities. They bring hither also iron, and all sorts of iron tools, pewter vessels of all sorts, as dishes, plates, spoons, &c. looking-glasses, beads, and other toys; and the ships that touch at St. Jago bring thence cotton-cloth, which is afterwards sent to Angola.

The European ships carry from thence sugar, tobacco, either in roll or snuff, never in leaf. These are the staple commodities; besides which here are dye-woods, as fustick, &c. with woods for other uses, as speckled wood, brazil, &c. They also carry home raw hides, tallow, train-oil of whales, &c. Here are also tame monkeys, parrots, parroquets, &c. which the seamen carry home.

Claying of sugar described.

The sugar of this country is much better than that which we bring home from our plantations: For all the sugar that is made here is clay'd, which makes it whiter and finer than our muscovado, as we call our unrefin'd sugar. Our planters seldom refine any with clay, unless sometimes a little to send home as presents to their friends in England.

Their way of doing it is by taking some of the whitest clay, and mixing it with water 'till 'tis like cream; with this they fill up the pans with sugar that are sunk two or three inches below the brim by the draining of the molasses out of it, first scraping off the thin hard crust of the sugar that lies at the top, and would hinder the water of the clay from soaking through the sugar of the pan. The refining is made by this percolation: for ten or twelve days time, that the clayish liquor lies soaking down the pan, the white water whitens the sugar as it passes through it, and the gross body of the clay itself grows hard on the top, and may be taken off at pleasure, when scraping off with a knife the very upper part of the sugar, which will be a little fully'd, that which is underneath will be white almost to the bottom: And such as is call'd Brazil-sugar is thus whiten'd. When DAMPIER was here, this sugar was sold for fifty shillings per hundred, and the bottoms of the pots, which is very coarse sugar, for about twenty shillings per hundred, both sorts being then scarce; for here was not enough to lade the ships, and therefore some of them were to lie here 'till the next season.

The voyage from Portugal to Brazil.

The European ships commonly arrive here in February or March, and they have generally quick passages, finding at that time of the year brisk gales to bring them to the Line, little trouble then in crossing it, and brisk east-north-east winds afterwards to bring them hither. They commonly return from hence about the latter end of May, or in June.

From Brazil to Guinea.

The ships that use the Guinea trade are small vessels in comparison of the former: They carry out from hence rum, sugar, the cotton-cloths of St. Jago, beads, &c. and bring in return gold, ivory, and slaves, making very good returns.

VOL. III. NUMB. CXXIX.

The small-craft that belong to this town are ^{CHAP. II.} chiefly employ'd in carrying European goods from Bahia, the centre of the Brazilian trade, to other places on this coast, bringing back thither sugar, tobacco, &c. They are sail'd chiefly with Negroe slaves, and about Christmas there are mostly employ'd in whale-killing; for about that time of the year a sort of whales, as they call them, are very thick on this coast. They come in also into the harbours and inland lakes, where the seamen go out and kill them. The fat of them is boiled to oil, the lean is eaten by the slaves and poor people. These are said to be but small whales, yet here are so many, and so easily kill'd, that they get a great deal of money by it. Those that strike them buy their licence for it of the King, who, 'tis said, receives thirty thousand dollars per annum for this ship-fishery. All the small vessels that use this coasting traffick are built here, and so are some men-of-war also for the King's service: And the timber of this country is very good and proper for this purpose, being more strong and durable than any we have in Europe, and they have enough of it.

Whale fishery.

Ship-building.

Besides merchants and others that trade by sea from this port, here are others pretty wealthy men, and several artificers and tradesmen of most sorts, who by labour and industry maintain themselves very well, especially such as can arrive at the purchase of a Negroe slave or two. And indeed, excepting people of the lowest degree of all, here are scarce any but what keep slaves in their houses. The richer sort, besides the slaves of both sexes whom they keep for servile uses in their houses, have men-slaves who wait on them abroad for state, either running by their horses sides when they ride out, or to carry them to and fro on their shoulders in the town when they make short visits near home. Every gentleman or merchant is provided with things necessary for this sort of carriage. The main thing is a pretty large cotton hammock of the West-India fashion, but mostly dy'd blue, with large fringes of the same hanging down on each side. This is carried on the Negroes shoulders by the help of a bambo about twelve or fourteen foot long, to which the hammock is hung, and a covering comes over the pole, hanging down on each side like a curtain; so that the person so carried cannot be seen unless he pleases, but may either lie down, having pillows for his head, or may sit up by being a little supported with these pillows; and by letting both his legs hang out over one side of the hammock, when he hath a mind to be seen he puts by his curtain and salutes every one of his acquaintance whom he meets in the streets; for they take a piece of pride in greeting one another from their hammocks, and will hold long conferences thus in the streets; but then their two slaves who carry their hammock have each a strong well-made staff with a fine iron fork at the upper end, and a sharp iron below, like the rest for a musket, which they stick fast in the ground, and let the pole or bambo of the hammock rest upon them 'till their masters business or compliment be over. There is scarce a man of any fashion, especially a woman, will pass the streets but so carried in a hammock.

The way of life of the Portuguese at Bahia.

Carriages and visits.

The chief mechanick trades here are Smiths, Hatters, Shoe-makers, Tanners, Sawyers, Carpenters, Coopers, &c. Here are also Taylors, Butchers, &c. which last kill the bullocks very dextrously, sticking them at one blow with a sharp-pointed knife in the nape of the neck, having first drawn them close to a rail; but they dress them very slovenly, DAMPIER says. It being Lent when

CHAP. II. he came hither, there was no buying any flesh 'till Easter-eve, when a great number of bullocks were kill'd at once in the slaughter-houses within the town, men, women and children flocking thither with great joy to buy, and a multitude of dogs almost starv'd following them, for whom the meat seem'd fittest it was so lean. All these tradesmen buy Negroes and train them up to their several employments, which is a great help to them: And they having so frequent a trade to Angola and other parts of Guinea, they have a constant supply of Blacks both for their plantations and towns. These slaves are very useful in this place for carriage as porters; for as here is a great trade by sea, and the landing-place is at the foot of a hill too steep for drawing with carts, so there is great need of slaves to carry goods up into the town, especially for the inferior sort. But the merchants have also the convenience of a great crane that goes with ropes or pulleys, one end of which goes up while the other goes down. The house in which this crane is, stands on the brow of the hill towards the sea, hanging over the precipice; and there are planks set shelving against the bank from thence to the bottom, against which the goods lean or slide as they are hoisted up or let down. The Negroe slaves in this town are so numerous that they make up the greatest part or bulk of the inhabitants: Every house, as I said, having some both men and women of them. Many of the Portuguese, who are batchelors, keep of these black women for misses, though they know the danger they are in of being poison'd by them if ever they give them any occasion of jealousy. These slaves also of either sex will easily be engag'd to do any sort of mischief, even to murder, if they are hir'd to do it, especially in the night.

Thus far Mr. DAMPIER's description, who was there in the Year 1699: After which it is almost unnecessary to observe, that Bahia, or St. Salvador, is the capital of Brazil, the residence of the Viceroy and the Courts of justice, and the See of an Archbishop, to whom the rest of the Bishops of Brazil are Suffragans. This city was founded by THOMAS DE SOUSA, a Portuguese, in the year 1541, and is observ'd not to be very strong on the land-side, being commanded by some neighbouring hills, and accordingly it has been frequently taken and retaken by the Dutch, the Spaniards, and Portuguese; but the last have now continued in the quiet possession of it for fourscore years and upwards.

The captainship of Ilheos. 10. The captainship of Ilheos is bounded by that of Bahia on the north, by the ocean on the east, by the province of Porto Seguro on the south, and by the country of the Tupinambes on the west. There are two considerable rivers in this province, the one nam'd St. Antonio, which separates it from the province of Seguro, rising in the west and running easterly falls into the ocean in 16 degrees, odd minutes south latitude. 2. The river Ilheos, which rising in a lake to the westward of this province, runs to the east and falls into the sea about twenty leagues to the north of St. Antonio. **St. Antonio river.** The chief town, also named Ilheos, stands on a promontory near the mouth of the said river in 15 degrees, odd minutes south latitude, and is only remarkable for the sugar-mills. **Ilheos town.**

The captainship of Porto Seguro. 11. The captainship of Porto Seguro is bounded by that of Ilheos, from whence it is separated by the river Antonio on the north, by the ocean on the east, by the province of Spirito Sancto on the south, and by the country of the Tupinambes on the west. **Dolce river.** The river of Dolce, or the river of sweet-water, is the largest in this province. It rises in the moun-

tains to the westward, and running eastward falls into the Atlantic-ocean in 20 degrees of south latitude; besides which there are three other rivers that run parallel to it (viz.) the river of Crocodiles, the Alequa, and the river of St. Michael. **CHAP. II.**

The chief towns are, 1st, Porto Seguro, situate upon a rock near the sea-coast, in 17 degrees south latitude; 2dly, Santa Cruz, about 3 leagues south of Seguro; and Sancta Amaria, a little further to the southward. **Three other rivers.**

12. The captainship of Spirito Sancto, bounded by that of Seguro on the north, by the ocean on the east, by the province of Rio Janeiro on the south, and by the country of the Tupinambes on the west. **Towns of Porto Seguro, Sancta Cruz, and Sancta Amaria.** The principal river of this province is that of Pariba, or Parina river, which falls into the Atlantic-ocean in 22 degrees, odd minutes south latitude. **The captainship of Spirito Sancto.** The only town I meet with here is Spirito Sancto, situate in 20 degrees, 40 minutes south latitude, on the banks of a river of the same name, about twenty-six miles from the sea, a good harbour, but of difficult entrance.

13. The captainship of Rio Janeiro, so call'd from a celebrated bay and river of that name, discover'd in the month of January in the year 1515, is bounded by the province of Spirito Sancto on the north, by the ocean on the east, by the captainship of St. Vincent on the south, and by the mountains which separate it from La Plata or Paraguay on the west, being about two hundred miles long, and as many broad. This bay and river are now resorted to by the Portuguese as much as any part of Brazil on account of the rich gold mines that have been discovered in the mountains to the westward of this and the neighbouring province of St. Vincent; these have occasion'd the building and peopling the banks of the river Janeiro more than any other part of Brazil, and brought hither a very great trade. **Bay and river of Janeiro much resorted to on account of the gold mines.**

The chief city of St. Sebastian is situated in 23 degrees south latitude, on the west side of the river, about 2 leagues from the sea, and defended by several strong forts. It is the see of a Bishop, Suffragan to the archbishop of St. Salvador, or Bahia. 2dly, Los Reyes, or Angra de Los Reyes, situate about twelve miles west of the bay of Rio Janeiro. 3dly, The town and harbour of St. Salvador, over-against which lies the cape or promontory call'd Cape Frio, in 23 degrees, odd minutes south latitude, and in 42 degrees of western longitude. **Chief town St. Sebastian.**

14. The captainship of St. Vincent is bounded by that of Rio Janeiro on the north, by the sea on the east, by the province of Del Rey on the south, and by the mountains which separate it from La Plata on the west, extending in length from north to south three hundred miles and upwards, viz. from the Tropic of Capricorn to 28 degrees south latitude, and is reckoned two hundred miles broad at the north end of it, but not more than ninety or an hundred miles broad in the south. The chief towns are, 1st, St. Vincent, situated at the confluence of three rivers on a fine bay of the Atlantic-ocean, in 24 degrees, odd minutes south latitude, and defended by several forts. This harbour is at present in a flourishing condition on account of the gold mines that have been discover'd in the mountains to the westward; but the town which has the most immediate advantage by them is, 2dly, that of St. Paul, built on purpose for their security, and situate about an hundred miles north-west of the town of St. Vincent. 3dly, The town of Santos, situate on the same bay with that of St. Vincent, and a little to the northward of it, by some reckoned the chief town in the province. **The Captainship of St. Vincent.**

CHAP. 15. The fifteenth and last province of Brazil is that of Del Rey, bounded by St. Vincent on the north, by the Atlantic-ocean on the east, by the mouth of the river La Plata on the south, and by the country of La Plata, or Paragua, on the west, extending from latitude 28 to latitude 34, odd minutes, being four hundred miles in length from north to south, but scarce an hundred broad in any place from east to west. This province has been pretty much neglected by the Portuguese till of late years. But since they have found gold in the adjoining province of St. Vincent they have built several forts on the north side of the river La Plata, and on the islands at the mouth of it, to prevent the Spaniards settling there again, who were once possess'd of the north side of that river. This has already occasion'd some hostilities between the Spaniards and Portuguese, and possibly may occasion a war between them one time or other; for the gold mines are such a bone of contention that no peace can be of any long duration between two Powers situated as the Spaniards and Portuguese are, for their territories are divided only by the mountains which separate Brazil from La Plata, or Paragua, in which the gold they both thirst after is supposed to be found; but no doubt the Portuguese conceal the place as well as they can from the Spaniards and all other European nations, as they do their mines of diamonds and other precious stones they have discovered in Brazil of late years: However, there is no doubt but they have great plenty of gold and precious stones in some part of Brazil (and most probably to the southward) there being brought great quantities of both from thence annually to Europe, which has pretty much sunk their value.

Diamonds and other precious stones.

No division of the country before the Europeans arrived.

Towns, houses, and furniture of the natives.

Some vagrant nations.

Before the Portuguese planted Brazil, the country was not divided into provinces, but was all one great common, every tribe and family inhabiting and cultivating what part of it they saw fit, and removing their dwellings whenever they pleased, only every man was looked upon as the proprietor of what he planted or possessed till he removed and left that part of the country with the fruits and produce of it for another he liked better: And as for their towns, they consisted usually of five or six great barns, each of which contained two or three hundred, and sometimes a thousand people, and over these the head of the tribe or family presided. The materials of their houses were only long poles and reeds, or palmeto-leaves for a covering, and consequently it was no great trouble for them to remove or to erect their town in another place: Nor was their furniture any great burthen to them, which consisted of hammocks of cotton net-work, fasten'd to poles, in which they slept; some earthen pots and pans, and their gourds and calabashes which served them cut in half for pails, tubs, and drinking-cups, for they have them of all sizes; besides which they had baskets, in which they carried their provisions on a march; and the ornaments of their houses were their bows, arrows, spears, and other arms.

There were some vagrant nations also that had no settled abode, but living in tents were continually removing from place to place, and both the one and the other as often tied their hammocks to the boughs of trees and slept without doors as within, but used to make fires near their lodging to correct the air, and prevent the ill effects of the cold dews that fell in the night time, or, as others imagine, to keep off wild beasts and noxious vermine and insects.

CHAP. III.

Of the persons and habits of the Brazilians, their genius and temper, arts and sciences, food, exercises, and diversions.

THE Portuguese and Dutch writers give the name of Tapuyers to the natives which inhabit the north part of Brazil, and the name of Tupinambes, or Tupinamboys, to those who dwell in the south of Brazil, but divide these again into several petty nations, differing in language, but not much in manners and customs; and therefore I shall only treat of them under the two first grand divisions of Tapuyers and Tupinambes.

The Tapuyers are men of a good stature (but not the head and shoulders taller than Dutchmen, as some have related) and as they inhabit a hot climate, almost under the Equator, are of a dark copper colour, their hair black, and hanging over their shoulders; but they suffer no hair on their bodies or faces, and go almost naked, the men only inclosing the penis in a case, as some other Americans do, and the women concealing their nudities with leaves, like their mother Eve. The man has also a cap or coronet of feathers, but I don't perceive the women have any covering on their heads.

Their ornaments are glittering stones hung upon their lips or nostrils, and bracelets of feathers about their arms. Some of them paint their bodies of all manner of colours, whereas others rubbing their bodies with gums, stick beautiful feathers upon them, which make them look more like fowls than human creatures at a distance.

The Tupinambes, who inhabit the south of Brazil, are of a moderate stature, and not so dark a complexion as their northern neighbours who lie nearer the line; but neither the one or the other are so black as the Africans are, who lie in the same latitude, it having been observ'd already that there were no Negroes in America till they were transported thither by the Spaniards and Portuguese. The Tupinambes, however, resemble the Africans in their flat noses, which are not natural, but made so in their infancy, a flat nose being esteemed a beauty among them. They have also black curl'd hair on their heads, but suffer no hair to grow on their bodies or faces any more than the Tapuyers, and paint themselves like the northern Brazilians.

The general food of the Brazilians was the cassavi, or mandioka-root, dry'd and ground to powder, of which they made cakes, like our sea-biscuit. They carry'd this flour with them also on journeys, and it serv'd them, infus'd in water, as the Scots do oatmeal, both as meat and drink; but I don't find they had any sort of corn till the Europeans carry'd it thither. They used also to feed on other roots, fruits, and herbs, and such venison as they could take in hunting, as also on fish and fowl, if they lived near the water, and with every thing eat a great deal of pepper; some have added, that they were cannibals, and eat human flesh from one end of Brazil to the other; but late travellers observing no such thing, little credit can be given to this. The general liquor the natives drink is spring-water, of which, 'tis said, they have the best and the greatest variety in the world; but there are other kinds of liquors which have a good body, made of their fruits press'd and infus'd, or of honey, with which they sometimes get very drunk, sitting.

CHAP. III. fitting whole days and nights over their cups. They are charged also with being a very lazy generation, that will never work or hunt but when necessity compels them : And as to arts and sciences, they were masters of scarce any, unless the art of spinning and weaving, and forming their arms (which consisted of bows, arrows, lances, and darts) and the art of building, which was but mean, for their houses did not want any great contrivance. As for letters, characters, and arithmetick, they were perfectly ignorant of them.

Arts and sciences.

They had some knowledge of the virtues of several herbs and drugs, which they frequently administer'd with success to the sick ; but a merry writer relates, that when they despair'd of recovering the patient, all his relations agreed to knock him on the head, which they thought much better than a lingering death ; and this may be as true as their devouring human flesh.

Exercises.

Hunting, fishing, and fowling were rather their business than diversion, being absolutely necessary for the support of their families, in a country where they had no tame cattle or corn : Drinking, singing, and dancing were more properly their diversions, these they practised on their rejoicing days, on a victory, or the birth of their children. They are great smokers, and take the strongest tobacco : Their pipes are a hollow reed or cane, and the bowl a large nut-shell that holds almost a handful of tobacco.

Diversions.

Genius.

They are a tractable and ingenious people, ready to learn any art or science the Portuguese will teach them, and take nothing so kindly of the Fathers as the instructing their children ; which has given the Jesuits an opportunity of making abundance of converts ; and those who live under the Portuguese generally conform themselves to their customs in eating, drinking, cloathing, &c. Few of these go naked.

CHAP. IV.

Of the Animals of Brazil.

CHAP. IV. AS it has been observ'd of the rest of America, so here they had neither horses, cows, sheep, asses, hogs, cats, or dogs (unless some little mongrel curs) before the Europeans carried them over, of all which they have no great abundance.

Animals.

Those of Europe carry'd thither.

Beasts proper to this country.

The beasts that were found in this country were the same with those already describ'd in Mexico and Peru, particularly the Peruvian sheep, their peccaree (to which the Europeans gave the name of hogs, from some resemblance they had to our hogs) the sloth, the armadillo, the opossum, the guanoe, the racoon, and flying-squirrel, with great variety of monkeys, deer, hares, and rabbits, differing something from ours, the ant, bear, and some lions and tygers, but neither so large or fierce as those of Africa, and porcupines. Many of these animals have different names given us by travellers, but are the same already enumerated and described in Mexico or Peru.

Fowls.

Their fowls are maccaws, parrots, parroquets, the quon, the curasoe, the bill-bird, the cockreco, the partridge, the wood-pidgeon, the heron, the pelican, the crab-catcher, the fishing-hawk, the ostrich, the cormorant, the curlew, the carrion-crow, and the humming-bird ; all which having been already describ'd, I would not tire the reader with repetition. They have also great variety of singing-birds, several species of wild-ducks, wild-geese, and dunghil-fowls, and there is not any sort of poultry

in Europe but what has been carry'd thither by the Portuguese : However, fowls of all kinds are but dry meat in these hot climates ; nor is their mutton very good ; pork is the best flesh we eat between the Tropics, and observed to be as easy of digestion there as any meat.

CHAP. IV.

The most surprising relations travellers entertain us with are concerning the multitude and monstrous size of their serpents. We are told of some that are thirty foot long and upwards, as big about as an hoghead, and which will swallow a whole buck, or a man, and that they easily take by throwing their tails about them : And I remember, some travellers, that have wrote of the East-Indies, have mention'd serpents that have swallow'd a buck horns and all ; but as I could never hear of any such monsters when I was in the East-Indies, or of any serpents that were any thing near that size, I can't help doubting whether there be any such monsters here, how gravely or positively soever such stories are related ; and I am apt to think at last that they have mistaken the crocodile for a serpent here as well as elsewhere, though even this creature does not come up to the dimensions of this pretended serpent.

Serpents and insects.

The same writer (Mr. NIEBUHFF) has furnish'd us in his cuts with a dragon that has wings and feet, an animal which I am still of opinion had never any other existence than in the brains of the ancient poets. Indeed the word dragon is found in scripture, but as the creature is not described there, the term may belong to an animal of a different form. I believe no one will pretend to affirm that our translators have never mistaken the nature and form of some animals we meet with in scripture : For I don't find the learned are agreed about the behemoth and the unicorn any more than they are about the dragon. But commend me to my friend HARRIS, who tells us of a water-snake in Brazil near forty foot long, and every way proportionable, in whose body were found two whole wild boars he had swallowed. One would think our voyage-writers were lying for a wager in these cases. As for the amphibena, or snake with two heads, I think 'tis agreed now that he really has but one ; only some short-sighted people mistook his tail for a head, it seems.

Here is also found the rattle snake, and several other species of snakes, which will be describ'd when I come to treat of the British plantations in America. They have also scorpions, centepedes, spiders, and other venomous insects of an extraordinary size : And their ants are almost as troublesome here as in Africa, marching in great bodies, and devouring every thing in their way, and are only to be destroy'd by fire or water, and one species of them, 'tis said, have wings. Here also is the fire-fly, which seems to differ but little from the glow-worm, only in its wings : When any of these fix on boughs of trees they appear at a little distance like so many stars.

Insects.

Of bees they reckon up twelve several sorts, some of which have vast nests in hollow trees in the woods, and others in holes of rocks, and yield them great quantities of honey and wax ; and the honey does not only serve them for food, but they make a liquor with it that has some resemblance of mead.

Their seas, lakes, and rivers, are full of excellent fish, and as DAMPIER has observ'd, the lean flesh of the whales, of which they have great plenty on this coast, is eaten by the slaves and poor people at Brazil. But the best fish on their coast is the manatee, as big as an ordinary ox, which has been already

already

CHAP. IV. already describ'd in Mexico. They have also the sword-fish, thrasher, paracood, old-wife, cavally, gar-fish, mullets, snooks, herrings, mackerel, and turpoons, already describ'd, oysters, crabs, shrimps, prawns, and other shell-fish. Their best river-fish has a resemblance of our perch, and they have others not unlike jacks and carp.

Amphibious animals. Of amphibious animals they have tortoises of three kinds, viz. the hawkbill, the loggerhead, and the green tortoise; but of these it seems the Portuguese never eat, tho' our seamen esteem the green tortoise very good food. There are also great numbers of crocodiles in their lakes and rivers, but not so large as those of Africa; and they have a creature, which the Portuguese call cachora de agua, or the water-dog, as big as a mastiff, and hairy from head to tail; he has four short legs and a long head, and is of a dark colour, and lives in fresh-water lakes and ponds, but comes on shore to sun himself, and is said to be good food. *

CHAP. V.

Of their plants and vegetables.

CHAP. V. THE soil of Brazil, according to DAMPIER, is generally good, producing very large trees of divers sorts, and fit for any uses. Their savannahs or pastures are laden with grass and herbs, and being cultivated, produce every thing that is proper for such countries as lie between the Tropics, as cotton, tobacco, indico, sugar-canes, maize, or Indian-corn, and fruits.

Forest trees. Of their forest-trees the chief are, the sapiera, the vermiatico, the commeserie, the guiteba, and the ferrie; the speckled-wood, the fustick, and other dying-woods; three kinds of mangrove-trees, and the manchinele-tree.

The sapiera is a large tall tree, very good timber, and made use of in building houses, as is also the vermiatico, a tall straight-body'd tree, which furnishes them with plank two foot broad, and of the bodies of these trees they make their canoes, or little country boats all of a piece, the body of the tree being only scoop'd hollow, and shap'd something like a boat at the head and stern; and though they are so narrow that they frequently overset, they can't sink, and the Indians, who excel in swimming, make no difficulty when they are over-set to turn them up again.

The commeserie and the guiteba are most used in building of ships, for which purpose they are as much esteem'd as oak with us, and are said to be harder and more durable wood. The ferrie-tree resembles the elm, and is very durable in water. Their mangrove-trees are red, white and black, the red being used in tanning leather here, of the black they make good plank, and of the white, masts and yards for their barks, both the black and white being much larger in Brazil than in the gulph of Mexico.

There grows also in Brazil a wild cocoa-nut-tree, neither so tall or so large as those that grow in the East or West-Indies. They bear nuts as the others, but not a quarter so big as the right cocoa-nuts. The shell is full of kernel, without any hollow place or water in it, and the kernel is sweet, but very hard both for the teeth and digestion. These nuts are in much esteem for making beads for pater-nosters, howls of tobacco-pipes, and other toys; and every small shop at the bay has a great many to sell. At the top of these bastard cocoa-trees among the branches there grows a sort of long

black thread, like horse-hair, but much longer, CHAP. V. which by the Portuguese is called Trefabo; of these they make cables, which are very serviceable, strong and lasting; for they will not rot as cables made of hemp, though they lie exposed to wet and heat. These are the cables which they keep in their harbours to let out to hire to European ships, and resemble the Coyre cables.

There are also in Brazil three sorts of cotton-trees, but very little of the right West-Indian cotton-shrub, of which the cotton-cloth is made.

As to fruits they have several kinds of oranges Fruits. and limes, pomegranates, pomelcitrons, and European grapes; but all these have been transported thither by the Portuguese. There were no such fruits in America till the Europeans introduced them. They have also plantains, banana's, guava's, the true cocoa-nut, cabbage-trees, custard-apples, fourlops, cashews, papahs, jenipahs.

The fourlop is a fruit as large as a man's head, of an oval shape, green on one side and yellowish on the other when ripe. The outside or coat is pretty thick and very rough, with small sharp knobs, the inside is full of a spongy pulp, with black seeds or kernels, in shape and bigness like a pumpkin-seed. The pulp is very juicy, of a pleasant taste and wholesome. You suck the juice out of the pulp, and so spit it out. The tree or shrub that bears this fruit grows about ten or twelve foot high, with a small short body, the branches growing pretty straight up. The twigs are slender and tough, and so is the stem of the fruit. This fruit grows also both in the East and West-Indies.

The cashew is a fruit as big as a pippin, pretty long, and bigger near the stem than at the other end, growing tapering. The rind is smooth and thin, of a red and yellow colour. The seed of this fruit grows at the end of it. 'Tis of an olive colour, shap'd like a bean, and about the same bigness, but not altogether so flat. The tree is as big as an apple-tree, with branches, not thick, yet spreading off. The boughs are gross, the leaves broad and round, and in substance pretty thick. This fruit is soft and spongy when ripe, and full of juice. It is very pleasant, and gratefully rough on the tongue, and is accounted very wholesome. This fruit also grows both in the East and West-Indies.

The jenipah, or jenipapah, is a sort of fruit, of the calabash or gourd kind. It is about the bigness of a duck-egg, and somewhat of the oval shape, and is of a grey colour. The shell is not altogether so thick nor hard as a calabash. 'Tis full of whitish pulp mixt with small flat seeds, and both pulp and seeds are taken into the mouth, but sucking out the pulp they spit out the seeds. It is of a sharp and pleasing taste, and is very innocent. The tree that bears it is much like an ash, straight-body'd, and of a good height, clear from limbs till near the top, where the branches put forth a small head. The rind is of a pale grey, and so is the fruit.

Besides these, here are many sorts of fruits which are not met with any where else, as arifah's, mericafah's, petango's, &c. Arifah's are an excellent fruit, not much bigger than a large cherry, shaped like a catherine-pear, being small at the stem and swelling bigger towards the end. They are of a greenish colour, and have small seeds as big as mustard-seeds; they are somewhat tart, yet pleasant, and very wholesome, and may be eaten by sick people.

Mericafah's are an excellent fruit, of which there are two sorts, one growing on a small tree or shrub, which is counted the best, the other growing on a

C H A P. V. kind of shrub like a vine, which they plant about arbours to make a shade, having many broad leaves. The fruit is as big as a small orange, round and green. When they are ripe they are soft, full of white pulp mixt thick with little black seeds, and there is no separating one from the other till they are in your mouth, when you suck out the white pulp and spit out the stones. They are tart, pleasant, and very wholesome.

Petango's are a small red fruit that grow also on small trees, and are as big as cherries, but not so globular, having one flat side, and also five or six small protuberant ridges. 'Tis a very pleasant tart fruit, and has a pretty large flattish stone in the middle.

Petumbo's are a yellow fruit (growing on a shrub like a vine) bigger than cherries, with a pretty large stone. These are sweet, but rough in the mouth.

Mungaroo's are a fruit as big as cherries, red on one side and white on the other side. They are full of small seeds, which are commonly swallowed in eating them.

Muckishaws are a fruit as big as crab-apples, growing on large trees. They have also small seeds in the middle, and are well tasted.

Ingwa's are a fruit like the locust fruit, four inches long and one broad. They grow on high trees.

Otee is a fruit as big as a large cocoa-nut. It hath a husk on the out-side, and a large stone within, and is accounted a very fine fruit.

Musteran deova's are a round fruit as big as a large hazel-nut, cover'd with thin brittle shells of a blackish colour. They have a small stone in the middle, inclosed within a black pulpy substance, which is of a pleasant taste. The outside shell is chewed with the fruit, and spit out with the stone, when the pulp is suck'd from them.

Palm-berries (called here dendes) grow plentifully about Bahia; the largest are as big as walnuts. They grow in bunches on the top of the body of the tree among the branches or leaves, as all fruits of the palm kind do. These are the same kind of berries or nuts, as those they make the palm-oil with on the coast of Guinea, where they abound.

Physick-nuts, as our seamen call them, are call'd here sineon, and agnus-castus is call'd here carapat. These both grow here; so do mendibeas, a fruit like physick-nuts. They scorch them in a pan over the fire before they eat them.

They have plenty of callavances, pine-apples, pumpkins, water-melons, musk-melons, cucumbers; and roots, as yams, potatoes, cassava's, &c. Garden-herbs also good store, as cabbages, turnips, onions, leeks, and abundance of lallading; and for the pot, drugs of several sorts, viz. lassafras, snake-root, &c. besides the wood mention'd for dying and other uses, as fustick, speckled-wood, &c.

DAMPIER relates, that the Jesuits have introduced the cinnamon-tree into their garden at St. Salvador, but it is probable it degenerates, and the bark is not so fine a spice as that of the Ceylon-cinnamon, from whence it is brought; for if it were, there is no reason they should not propagate it more; and indeed the cinnamon that grows on the Malabar coast in the East-Indies, which is but a few leagues from Ceylon, is not comparable to it; which inclines me to believe that no other soil but that of Ceylon will bear the true cinnamon. I wish it were otherwise, that we might share that valuable spice with the Dutch, and were not oblig'd to pay what prices they are pleas'd to set upon it.

The Jesuits have mango's also in their garden at

St. Salvador, which is another East-India fruit, but I find they are not common in Brazil. **C H A P. V.**

As to their corn, there is no sort that thrives in Brazil like maiz, or Indian-corn. Wheat and rye grow too rank and run up into straw; and the only way to procure a good crop is to make the soil poorer by mixing sand with it instead of dung to enrich it: And this is the case of most foreign seeds. Their seed-time is at the beginning of the rainy season, and their harvest immediately after it. Their own trees and shrubs bear leaves, blossoms, and fruit all the year round; and the same is observed of their oranges, limes, and some other fruits that have been carried thither: And those who would have ripe grapes all the year, 'tis said, only prune their vines at different times to effect it, and they produce a fine luscious grape as sweet as honey; and yet they can have no wine that will keep here, or in any other country between the Tropics, unless in Peru.

And here I must caution the reader to understand what is said above only of that part of Brazil which lies within the Tropic of Capricorn, which is the best planted and peopled of any part of Brazil; for in the countries south of the Tropic of Capricorn, the same grain and fruits grow, as do to the north-ward of the Tropic of Cancer, and many kinds of fruit which flourish between the Tropics will not come to any thing without the Tropics: As the air and seasons are very different, so are their grain, fruits, and plants generally; tho' there are some will thrive on either side the Tropic.

The ants in Brazil are great enemies to the corn, fruits, and other produce of the earth, which the husbandmen endeavour to destroy by fire and water, but all their care sometimes proves ineffectual.

As to their minerals, there is no doubt but they have discover'd very rich gold mines of late years by the vast treasures of that kind they send annually to Europe; and, 'tis said, there are some silver mines in the country. They have also discover'd very rich diamond mines, jasper, emeralds, crystal, and other precious stones, inasmuch that the value of these are much fallen. **Minerals.**

C H A P. VI.

Of their history, government, arms, forces, wars, marriages, women, children, slaves, and funerals.

THE first Adventurer that discover'd the coast of Brazil was AMERICUS VESPUTIUS, an Italian, then in the service of the King of Spain: This was in the year 1498, but then he sail'd no further than to the 5th degree of south latitude. Afterwards, in the year 1500, being employed by the King of Portugal, he sail'd again to Brazil, and extended his discoveries to 52 degrees of south latitude; but he does not give us any account of the country, or the natives he saw in either of those voyages. **C H A P. VI.**

The same year, 1500, EMANUEL King of Portugal sending a fleet of thirteen sail to the East-Indies, they were driven from their intended course upon the coast at Brazil, where meeting with a pretty good harbour, after a storm, wherein they had suffer'd much, they gave it the name of Porto Seguro, which lies in seventeen degrees of south latitude, and to the country they gave the name of Santa Cruz; tho' it soon after lost it, and obtain'd the name of Brazil, as has been observ'd already.

The Admiral of this fleet, PETER ALVAREZ CAPRALIS, sent one of his ships back to Portugal with an account of the richness of the country and its

CHAP. VI. is agreeable situation, and then continued his voyage to the East-Indies with the rest.

Several private Adventurers upon this intelligence went over to Brazil with their families, but were most of them destroy'd by the natives, and no settlement was made to any purpose 'till the year 1549, when JOHN III. King of Portugal, sent a great fleet thither with a thousand soldiers on board, under the command of THOMAS DE SOSA their General, and with them a great many Jesuits, whom POPE PAUL III. desired might be embark'd in order to endeavour the conversion of the natives.

This fleet arriving at the bay of All Saints, General SOSA there built the city of St. Salvador, of which FERDINANDEZ SARDINIA was appointed the first Bishop in the following year 1550.

The Portuguese finding the Brazilians divided into several petty kingdoms and states, at war among themselves, and joining with one nation against another, by this means subdu'd first their enemies and then their allies, making slaves of all without distinction. Serigippe, which lies contiguous to the bay of All Saints on the north, and which I have consider'd as part of this province, was the first conquest the Portuguese made.

The French also made several attempts to settle colonies on the coast of Brazil, but were driven from thence from time to time by the Portuguese, who at length possess'd themselves of all the coast from the river Amazon to the river of Plata.

To justify their invasions of this country, and the barbarous massacres they committed there, they have represented the people as infidels without any notion of God or religion, and even cannibals: And whereas we have been told by the Spaniards that the countries of Guiana and Caribiana, which lie contiguous to Brazil, and extend from the Equator to 10 degrees north latitude, were cannibals; now the Portuguese endeavour to persuade us, that the Brazilians, whose country extends from the Equator to 35 degrees of south latitude, were likewise cannibals and infidels: And indeed this is what the Spaniards and Portuguese have affirm'd of all the American nations at one time or other. They tell us, they were perpetually engag'd in war with each other, and eat up their enemies that fell into their hands; and yet none of our English Adventurers for an hundred years past, none of our Buccaneers, that have penetrated through and through the country, and resided among the Caribbees themselves, who were most fam'd for eating human flesh, have ever seen any such thing.

Knivet's account of cannibals, giants, monsters, &c.

About an hundred and forty years ago, indeed, some of our people, who had their intelligence, I presume, from the Spaniards and Portuguese, pretended that they had seen the Brazilians devour their enemies, of whom the most eminent is KNIVET. This gentleman tells us he was left sick on shore at Brazil by Captain CAVENDISH, in the year 1592, and being taken prisoner by the natives, together with twelve Portuguese, his companions were kill'd, broil'd, and eaten, but his life was sav'd because the natives took him for a Frenchman; and of these executions he gives us the following account.

That having taken a prisoner in battle, and convey'd him into their own country, they gave him one of their sisters or daughters to serve him as a temporary wife, furnishing him with the best food, and all that is desirable in life; and when they have fattened him, they proclaim the day and place of his execution; in the morning whereof many thousands of the people assemble early, drinking, singing, and dancing for several hours; after which the captive

is brought out, bound about the body with cords, which are held by six or seven people, but his hands at liberty: In this condition the prisoner usually makes a speech to the people, and tells them, "Thus have I often bound your friends and relations, and then broil'd and devour'd them; nor will my countrymen suffer my death to be long unrevenged." Then they bring him stones and bid him revenge himself, whereupon he throws them among the multitude, of whom he frequently wounds several; and having continued this sport some time, one advances with the fatal club, and demanding, "Art thou he that hast kill'd and devour'd our people?" "Take leave of all that is pleasant and desirable to thee, for thou shalt see them no more; thou shalt be kill'd and devour'd in like manner as thou hast kill'd and devour'd our friends;" and then beats out his brains with a club. After which the wife they had given him comes and bewails the fate of her husband, but eats the first piece of him, however, when he is broil'd, 'tis said, and then the rest of the carcase is cut in pieces and distributed among the people, particularly they give the guts and entrails to the women, and the head and brains fall to the share of the children. PURCHASE, Vol. IV. p. 1217. Vol. V. p. 914.

If any man should be found credulous enough to believe this formal and improbable tale, yet the rest of the monstrous relations contain'd in Mr. KNIVET's narrative, which are now known to be false, are sufficient to shock his faith in this.

He relates, that the people of Tucuman, a province of La Plata, are pigmies; PURCHASE, Vol. IV. p. 1231. And that at the Straights of Magellan he met with another nation of pigmies, of about five spans high, and with mouths from ear to ear, of whom he saw several thousands; and that they traffick'd with the English, giving them pearls and feathers for European toys.

That in the same Straights he saw naked giants sixteen spans high; PURCHASE, Vol. IV. p. 1231.

That he saw a monster of a mermaid, p. 1240.

That he had seen a snake that swallow'd men, stags, and oxen, and after such morsels would lie sleeping 'till his flesh rotted, or was pick'd clean off the bones by birds of prey; after which new flesh grew upon the bones again, and the creature awaked, his head having been alive all the while, but bury'd in mud. PURCHASE, Vol. V. p. 914.

That he knew several Brazilians possess'd by the devil, and some of them kill'd by evil spirits. He himself heard an Indian discoursing with an evil spirit, and threatening to turn Christian if the spirit did not cease to afflict him. May we not, after such a multitude of idle stories, very well suspend our belief of the first in relation to cannibals? And yet this is the man whose accounts of these things are most depended upon, and which PURCHASE, in his collection, has given such countenance to, that he has compil'd his narratives twice over (viz.) in the fourth and fifth volumes, from whence I took these pretty stories. But it being acknowledg'd that the Caribbees and other nations charg'd with eating human flesh have generally left it off at this day; and the reason of their present abstemiousness being demanded, one of Mr. PURCHASE's authors informs us, that they happen'd to eat a Friar whose flesh poison'd several of them, and that was the reason they never lik'd man's flesh since. PURCHASE, Vol. III. p. 865.

As to religion, the Portuguese will not allow the Brazilians any, and yet they tell us they have Priests, and allow a state of rewards and punishments; that

CHAP. VI. the brave go to Elysium, or Paradise, and mean and cowardly souls to a place of torment. PURCHASE, Vol. V. p. 915, &c.

The same authors admit, that their Priests direct them to bring their offerings to them, and assure them, on their doing this, that those invisible beings who give them food and all the good things they enjoy, will prosper their affairs; and if they neglect this they must expect some dreadful calamities will overtake them, and that accordingly the people bring them such fruits as they apprehend will be most acceptable. They inform us also, that they believe their souls survive their bodies, and are converted into dæmons, or spirits, after death. PURCHASE, Vol. IV. p. 1289. Vol. V. p. 916, 917.

Another writer in PURCHASE's collection tells us, they comforted themselves that they should after death visit their ancestors beyond certain mountains. From all which it is evident that this people were not entirely without religion; that they believe some invisible beings are the authors of all their good and bad fortune in the world; and that they shall be rewarded and punish'd hereafter according to their behaviour in this life, and consequently are not those infidels they are sometimes represented.

And though the idolatrous Portuguese make their having no images amongst them another argument that they have no religion, I presume that will be of little weight with Protestants. But further, we meet with writers in PURCHASE that tell us some of the Brazilians worship the New moon, at least that they dance and sing when it appears: And that others worship the constellation call'd the Great Bear, rejoicing much when it appears in their hemisphere.

As to their having no temples, perhaps they look upon the heaven over their heads to be the only proper temple to adore the great Creator in, or at least most proper to adore the Sun, Moon, and Stars, if they worship them as gods, as some relate.

Nor do these people live without government. They have Kings in their respective territories, who administer justice according to the custom of their several countries, tho' they have no written laws: And where one man has injur'd another, he is obliged to make him satisfaction in kind, if it be possible: And no people are more kind or hospitable to strangers than the Brazilians are, so far are they from murdering and devouring foreigners, even by the relation of those very Portuguese, that have represented them as cannibals.

Marriages.

In their marriages they are not confin'd to one woman, but enter into a contract, however, with their relations to use them well, in which they are usually as good as their words; and when a man takes home his wife there is great feasting and rejoicing, but no other ceremony that I can learn.

The women, however, seem to have much the greatest share in the care and trouble of providing for the family; for they are not only employ'd in their domestick affairs, but it falls to their lot to plant and gather in their fruits, roots, and other food. The man is only employ'd in making his arms, or in hunting or fishing; and upon a march or removal, the women carry all the baggage.

They tell us a great many idle stories in relation to their womens bearing children, and particularly that the woman is no sooner deliver'd but she goes about her business, and the husband is put to bed in her stead, and the child is left to shift for itself upon the floor. And yet in other places they tell us, that no people are so fond of their children as the Brazilians; and indeed the relations that PURCHASE has

compil'd are so inconsistent and full of contradictions, that we scarce know what to make of them.

The best account I can collect of their funerals and mourning is, that upon the death of any person, the friends and relations assemble and set up a howl, not unlike that of the wild Irish, repeating by turns the praises of the deceas'd, admiring his wealth, his strength, beauty, and excellent parts, the multitude of his friends, servants and cattle, concluding with words of the following tenour; "He is dead; we shall see him no more until we dance with him beyond the mountains." These lamentations having continued six hours, they prepare to bury the deceas'd, digging a grave like the mouth of a well, in which they place the corpse in a sitting posture, and building a little tomb of the form of a dome over him, they leave at the place all manner of meat and drink, his arms, and whatever was useful to him while alive, coming every day with fresh supplies to the grave for a month, making the same lamentations they did the first day, and afflicting themselves during this time by fasting and other penances; and if he leave wives behind him they cut off their hair. This mourning having continued a month, they resume their former way of life. The master of the family is usually buried in the middle of the house, and his tomb adorn'd with beautiful feathers and other ornaments.

As to the wars of these people among themselves, Wars and arms.

they had no other arms but bows, arrows, and wooden swords or clubs, and in some places shields; and when they charg'd an enemy it was never in rank and file, but in great confusion if they came to a field-fight, which was not often, for most of their actions were perform'd by surprize. They would march day and night with great expedition, and lying in woods fall upon their enemies when they were unprepar'd to receive them, carrying away men, women, and children into slavery; for their towns had no walls or fortifications to defend them.

To proceed in the history. I have already observ'd that the Portuguese discover'd this country in the year 1500; that they made several attempts to plant it with small success, 'till the year 1549, when they fix'd themselves at the bay of All-Saints, and built the city of St. Salvador; that the French also made some attempts to plant colonies on this coast, but were driven from thence by the Portuguese, who remain'd in Brazil almost without a rival 'till the year 1623; but being then under the dominion of the King of Spain, with whom the United Provinces were at war, the Dutch West-India Company fitted out a strong fleet, and putting a good body of land-forces on board, sent them to Brazil, where they attack'd and took the city of St. Salvador, in the bay of All Saints, with very little loss: But the King of Spain sending a great fleet and army thither in the year 1625, recover'd the city again, and drove the Dutch out of the country. However, the Hollanders continued to send strong squadrons to the coast of Brazil every year, where they harass'd the Portuguese settlements, and made abundance of rich prizes; and making a descent near Olinda, in the year 1629, took that city with the fortress of The Recife, and being join'd by some nations of the Indians against the Portuguese, at length possess'd themselves of the entire province of Pernambuco, where they erected a great many forts, and compell'd the Portuguese who resid'd in that part of the country to obey them as their Sovereigns; whereupon Count MAURICE of Nassau was pleas'd to accept the government of the Dutch

St. Salvador retaken by the Spaniards.

The Dutch take Olinda and the whole province of Pernambuco.

CHAP. VI. Dutch territories in Brazil, and remain'd in that capacity at The Recife, or Pernambuco; from the year 1637 to the year 1644; during all which time the Dutch and Portuguese remaining in a state of war, Prince MAURICE recover'd from the Portuguese three more of their northern provinces: Nor did he content himself with taking places from the Portuguese in Brazil, but detach'd from thence a squadron to the coast of Africa, and took from them the important fort of Del Mina, the strongest fortresses on the Guinea coast, which the Hollanders are in possession of at this day. But the Dutch West-India Company not supplying the Count with such a number of forces as he apprehended was necessary to secure their conquests against the Portuguese, he return'd to Holland in disgust, in the year 1644, after which the affairs of the Dutch in Brazil declin'd apace; for the Portuguese who lived under the government of the Hollanders, joining their countrymen, by degrees recover'd all the towns which the Hollanders were in possession of, and drove them entirely out of Brazil again, in the year 1654.

Reduces
three pro-
vinces
more.

However, the Dutch still continuing their pretensions to Brazil, and committing continual depredations on the Portuguese at sea, the latter agreed, at a treaty of peace made between the King of Portugal and the States-General, by the mediation of England, in the year 1661, to pay the Dutch eighty tons of gold to relinquish their interest in that country; which was accepted, and the Portuguese have remain'd in the peaceable possession of all Brazil from that day to this.

The present inhabitants of Brazil.

I come now to consider the present inhabitants of Brazil, which are, 1. Portuguese; 2. Crioli; 3. Mestize; 4. Negroes; and, 5. Brazilians. The Portuguese of Europe, who are the Governors, are the fewest in number; the Crioli, or those born of Portuguese parents in Brazil, are more numerous; and the Mestize, or mingled breed, still more numerous than either; for few of the Portuguese but have had black or tawny mistresses, and the issue of these having intermarry'd, they are multiplied to a very great degree: But whether the Negroes do not exceed all the rest I much question, there having been so many imported annually from Africa for an hundred and fifty years past. The Dutch relate, that when they were possess'd of the northern province of Brazil, which are not a third of the whole, they employ'd no less than forty thousand Negroes in their sugar-works and other husbandry: And as the Portuguese employ'd a proportionable number, which have been increasing and multiplying for upwards of an hundred years, and so many thousands annually imported all the while, they must of necessity swarm upon the Brazil coast by this time; and indeed there are some Portuguese Planters, 'tis said, that have several hundreds of Negroe slaves; and when they have not employment for them they suffer them to work for themselves, paying their masters something weekly out of what they get: And those Negroes which are bred up to any trade, such as Carpenters, Smiths, and Bricklayers, bring in their masters a handsome income.

As to the native Brazilians, they are partly freemen and partly slaves; but the Negroe slaves are much more valued than the Brazilians, being of more robust constitutions, and fitter for labour: As they come from the coast of Africa, opposite to Brazil, which is much hotter, they endure fatigue in the

CHAP. VI. hot season better than the natives. Nor are the latter now very numerous; for the Portuguese, on their invasion of this country, like the Spaniards, in their conquests destroy'd the unfortunate natives by all the cruel ways they could invent, insomuch that of an hundred thousand men they found in the small province of Serigippe (if we may credit the Dutch writers) they reduced them in a few years to four or five hundred men.

As to the forces and strength of the Portuguese in Brazil, I don't at all doubt but that it is sufficient at this day to maintain the dominion of that country against any other Power. The English and Dutch and other Powers may disturb their navigation, and perhaps now and then surprize their maritime places, but I don't apprehend they would any of them be able to take this country from them, if they should attempt it; for that mixture of people, Portuguese, Crioli, natives, Mestize, and Negroes, are now in a manner one people, their religion the same, and their blood intermix'd by marriages, and would infallibly unite therefore against all the rest of the world, however they may disagree among themselves while they have no enemy to contend with. And this is an advantage that the Spaniards, Portuguese, and French have of the English in America; these nations always make the natives and Negroes, where they have any power, of their own religion, and these, in a little time, discover as much or more zeal for their superstition than the Spaniards themselves, and would never bear that any people, who carried the name of hereticks, should plant themselves amongst them, if they had no other reason to oppose it.

The force of the Portuguese in Brazil.

Nor is the circumstance of marriage and alliance inconsiderable. Blood and relations lay strong obligations upon all people to unite against strangers; and this the English do not enough consider, when they prohibit their people matching with the natives or Negroes, and we seem as averse to the instructing them in our religion as we do to the mingling our blood with theirs; which is the reason they generally remain in a separate interest, and instead of serving their allies or masters faithfully, are ever conspiring to cut their throats, and escape out of their hands, and possibly would rather join an enemy than oppose him.

But to proceed. Any European Power would find much greater difficulties in driving the Portuguese from their settlements in Brazil than they did to fix themselves there; for the inhabitants were then a naked defenceless people, and divided into a great many little states and kingdoms; whereas the present inhabitants are all united and understand the art of war as well as we do. They are also used to that hot climate, which must prove fatal to a-bundance of Europeans on their arrival there, as well as the want of provisions, which the Portuguese would not fail to destroy in order to distress their enemies. From all which considerations I conclude, that the Portuguese are now so well fix'd in Brazil that it is not in the power of any other nation to expel them from this country and fix themselves in it.

If the Dutch, who had possess'd themselves of four of their provinces, and had so many fortresses in Brazil, could not maintain their ground, it is reasonable to believe that no other Power will be able to succeed in such an enterprize.

THE PRESENT STATE OF THE British PLANTATIONS.

CHAP. I.

Of the name, situation, extent, and subdivisions of the British plantations on the continent of America; and more particularly of the province of Virginia.

CHAP. I. **T**HE British dominions in America come next to be consider'd: And these are divided into, 1. Those that are situated on the continent: And, 2dly, the islands. The territories subject to Britain on the continent (except Hudson's bay, or New-Britain) lie contiguous, and are extended along the eastern coast of north-America from 31 degrees of northern latitude to 50 and upwards; lying between the 63d and 83d degrees of western longitude. And as the coast runs or extends from the south-west to the north-east, they are about fifteen hundred miles in length, and generally under two hundred miles broad, but in no place four hundred; unless we take in the Iroquois and other Indian nations under our protection, and then they may be extended further westward.

When the Spaniards first discover'd the country north of the gulph of Mexico, they call'd it all by the general name of Florida; but having grasped more than they could cultivate or defend, they in a manner deserted this part of America, and fix'd themselves in those parts of it that abounded in silver and gold. Whereupon the English, French, and Dutch thought themselves at liberty to send colonies to north-America, and gave such names to the countries they respectively possess'd themselves of as they saw fit.

The name SIR WALTER RALEGH was the first English adventurer who attempted to settle colonies on this coast, and gave it the name of Virginia, in honour of his sovereign, the virgin Queen ELIZABETH, as will appear more at large in the chapter assign'd for treating of the history of this country. It was afterwards divided into north and south-Virginia, but at this day we find it subdivided into the eight following provinces (viz.) 1. Carolina, in which Georgia is comprehended. 2. Virginia Proper. 3. Maryland. 4. Pensilvania. 5. New-Jersey. 6. New-York. 7. New-England; and 8. New-Scotland, call'd also Acadia and Acady. 9. There is still a ninth province call'd New-Britain, or the Terra de Labrador; which is in a great measure the same with that call'd Hudson's bay and streights, and is separated from the rest of the British territories by the river of St. Laurence and part of the French Canada. It extends from 50 to 64 de-

grees of north latitude, and lies between 60 and 90 degrees of western longitude. **CHAP. I.**

And that I may not be thought to have assign'd this vast country to Britain without any foundation, I shall here present the reader with that article in the treaty of Utrecht, made in the year 1712, whereby the French resign'd this part of America to Great-Britain, which is of the following tenour (viz.)

"The said most christian King shall restore to the kingdom and Queen of Great-Britain, to be possess'd in full right for ever, the bay and streights of Hudson, together with all lands, seas, sea-coasts, rivers, and places situated in the same bay and streights, and which belong thereto, no tracts of land or sea being excepted which are at present possess'd by the subjects of France. All which, as well as any buildings there made in the condition they now are, and likewise all fortresses there erected, either before or since the French seiz'd the same, shall, within six months from the ratification of the present treaty, or sooner, if possible, be well and truly deliver'd to the British subjects, having commission from the Queen of Great-Britain to demand and receive the same, entire and undemolish'd, together with all the cannon and cannon-ball, and powder, &c. which are therein.

As the French have yielded this country to the English, they have at least given us all the right they had to it, and excluded themselves from it; what right we may have to it in regard to the natives is another point that will be discuss'd hereafter.

I proceed now to describe the respective provinces in the order of time they were severally planted, of which Virginia Proper being the first, naturally becomes the first subject of our enquiries.

This country with the rest of the abovesaid provinces, obtain'd the name of Virginia, as has been already observ'd, from Sir WALTER RALEGH, who call'd it Virginia in honour of Queen ELIZABETH; but the province to which the name of Virginia is now appropriated is bounded by the great river Patowmack on the north-east, by the Atlantick ocean on the east, by Carolina on the south, and by the Apalathian mountains, which separate it from Florida, on the west, extending from 36 to 39 degrees two minutes north latitude, and lying between 74 and

You will find Florida in this Map called Louisiana. The R. Mississippi R. St. Louis; Messieurs Fort & Haven of St. Louis; le Marquis R. R. St. Philip; Ouabach R. R. St. Louis; For thus the French have altered & changed in Kings; Grant of these Countreies to Monsieur Crozat.

CHAP. I. and 80 degrees of western longitude, and is about two hundred and forty miles in length from north to south, and one hundred and twenty miles in breadth from east to west.

CHAP. II.

Of the face of the country, its mountains, seas, capes, bays, rivers, springs, lakes, winds, tides and seasons.

CHAP. II. THERE are no mountains in Virginia, unless we take in the Apalathian mountains, which separate it from Florida; but these have not yet been planted or inhabited by the English or any other people that I can learn.

As we approach Virginia from the ocean, it appears to be low land, inasmuch that (according to Mr. CLAYTON) the trees seem at a little distance to grow out of the water: and for an hundred miles up into the country, there is scarce a hill or a stone to be met with; only in some places there are rocks of iron ore appear, and in others there are banks of petrify'd oyster-shells, some of them above twenty yards deep. The whole country, before it was planted, was either forests or bogs and morasses, which the people in the west-Indies call swamps; and such the greatest part of it is at present. Their trees being much loftier than ours, and no under-wood or bushes growing beneath, people travel with ease through these forests on horseback, and never want a fine shade to defend them from the summer heats.

Seas. The only sea that borders upon Virginia is that of the Atlantick ocean on the east, in which are two very remarkable capes or promontories, (viz.) 1. That of cape Henry; and 2. that of Cape Charles. Cape Henry lies in 37 degrees north latitude, and cape Charles about thirty miles to the northward of it; between which capes ships enter the great bay of Chesapeake, which runs up through Virginia and Maryland, almost due north three hundred miles and upwards, being navigable most part of the way for large ships. This bay is at the entrance seven or eight and twenty miles over, and in most places about twenty miles broad.

Rivers. Into the west side of this bay fall four great rivers, which rise in the Apalathian mountains, all of them running from the north-west to the south-east. The most southerly of these is James river, the Indian name whereof was Powhatan; being generally about two miles over, and navigable at least fourscore miles. York river, whose Indian name was Pamunky, is a little to the northward of James river, and in some places they approach one another so near that they are not five miles asunder. To the northward of York river is the river of Raphanack, which in some places is not ten miles distant from York river, and either of them as broad or broader than James river. North of Raphanack is the great river of Patowmack, which in some places is not above seven miles distant from Raphanack river, and in other places upwards of fifty: this river of Patowmack is navigable near two hundred miles, being nine miles broad in some places, but generally about seven. The mouth of the river Patowmack and that of James river are about an hundred miles asunder; but the heads of all the four rivers rise in the same hills pretty near each other, and, as Mr. CLAYTON expresses it, the heads of these rivers interfere and are lock'd within each other, as they are also within the heads of several other rivers that rise in the same mountains and run towards the west.

CHAP. II. The tides in these Rivers regularly ebb and flow about two foot perpendicular; and at James town there is a tide and a half tide, as they call it; that is, it flows near two hours along by the shore after it is ebb in the channel, and again it ebbs near two hours by the shore after it is flood. This is a great advantage to the boats passing up and down the river. I suppose, says Mr. CLAYTON, this is caused by the numerous creeks and branches of the river, which are many of them as broad as the Thames at London, some ten miles long, and others above twenty, that have little fresh water in them, their current primarily depending upon the flux and reflux of the sea; so that after the tide is made in the channel it flows by the shore a considerable time afterwards, those creeks being still to fill, and therefore (as it were) draws up a source upwards by the shore, and likewise when the tide returns in the channel, the creeks that could not so readily disburse their water, being still to empty themselves, they make an ebbing by the shore a considerable time after it is flood in the channel; and so far as the salt waters reach, the country is deem'd less healthy.

As to their springs, Mr. CLAYTON observes, that their waters are generally more eager than those in England, and require more malt to make beer: nor will they bear soap. He saw a spring in the isle of Wight county, he says, from whence there issu'd a greater body of water than ever he met with, except that of Holy-well in Wales; and there is another spring so cold that it is dangerous drinking of it in summer-time. He observ'd also, that most of their waters had a petrefying quality.

As to lakes, I don't find there are any on the east side of the mountains; unless their swamps or bogs are to be accounted such (as they very well may in winter-time;) and of these indeed they have as many as any country can boast of; but on the west side of the mountains are a great many large lakes, of which the French are in possession, as 'tis said; but these have not a communication with each other, or with the river of St. Laurence, as is commonly reported.

The same writer in his letters to the Royal Society observes, that the air and seasons depend very much on their winds, as to heat and cold, dryness and moisture. The north and north-west winds are very nitrous and piercing cold and clear, or else stormy. The south-east and south, hazy and sultry hot. Their winter is a fine clear air, and dry, which renders it very pleasant. Their frosts are short, but sometimes very sharp, that it will freeze the rivers over three miles broad; nay, the secretary of state assur'd me, says Mr. CLAYTON, it had frozen Patowmack river, over-against his house, where it is near nine miles over. He adds, I have observ'd it freezes there the hardest when from a moist south east, on a sudden the wind passing by the nore, a nitrous sharp nore-west blows, not with high gusts, but with a cutting brisk air; and those valleys then that seem to be shelter'd from the wind, and lie warm, where the air is most stagnant and moist, are frozen the hardest and seized the soonest, and there the fruits are more subject to blast than where the air has a free motion. Snow falls sometimes in pretty great quantities, but rarely continues there above a day or two. Their spring is about a month earlier than in England; in April they have frequent rains; May and June the heat increases, and it is much like our summer, being mitigated

CHAP.
II.

Diseases.

Remedies.

mitigated with gentle breezes that rise about nine of the clock, and decrease and incline as the sun rises and falls. July and August those breezes cease, and the air becomes stagnant, that the heat is violent and troublefome. In September the weather usually breaks suddenly, and there falls generally very considerable rains. When the weather breaks many fall sick, this being the time for cachexies, fluxes, scorbutical dropfies, gripes, or the like; which I have attributed to this, says Mr. CLAYTON, that by the extraordinary heat, the ferment of the blood being rais'd too high, and the tone of the stomach relaxed, when the weather breaks the blood palls, and like over-fermented liquors is depauperated, or turns eager and sharp, and there is a crude digestion, whence the abovenamed distempers may be supposed to ensue; and then chalybiates, that raise the decay'd ferment, are no bad practice, after which, I conceive, armoniack spirits might be very beneficial. But their doctors are so learned, that I never met with any of them, says this gentleman, that understood what armoniack spirits were. Two or three of them one time ran me clear down by consent, that they were vomitive, and that they never used any thing for that purpose but Crocus Metallorum, which indeed every house keeps, and if their finger ach they immediately give three or four spoonfuls thereof; if this fail they give them a second dose, then perhaps purge them with fifteen or twenty grains of the rosin of jallop, afterwards sweat them with venice-treacle, powder of snake-root, or Gascoin's powder: and when these fail, Conclamatum est. 'Tis wonderful, he adds; what influence the air has over mens bodies, whereof I had myself sad assurances; for though I was in a very close warm room, where was a fire constantly kept, yet there was not the least alteration or change, whereof I was not sensible when I was sick of the gripes; and when a very ingenious gentlewoman was visited with the same distemper, I had the opportunity of making very considerable observations. I stood at the window and could view the clouds arise; for there small fleeting clouds will arise and be swiftly carry'd cross the whole element; and as these clouds arose and came nigher her torments were increased, which were grievous as a labouring woman's; there was not a cloud but lamentably affected her, and that at a considerable distance; but by her shrieks it seem'd more or less according to the bigness and nearness of the clouds. The thunder, says Mr. CLAYTON, is attended often with fatal circumstances here. I was with my lord HOWARD of Effingham, the governor, when they brought word that Dr. A. was kill'd therewith after this manner: he was smoaking a pipe of tobacco, and looking out of his window, when he was struck dead, and immediately became so stiff that he did not fall, but stood leaning in the window, with the pipe in his mouth, in the same posture he was in when struck: and these things are remarkable, that it generally breaks in at the gable end of the houses, and often kills persons in or near the chimney's range, darting most fiercely down the funnel of the chimney, more especially if there be a fire (I speak here confusedly of thunder and lightning) for when they do any mischief, the crash and lightning are at the same instant, which must be from the nearness of the cloud. One time, when the thunder split the mast of a boat at James town, I saw it break from the cloud, which it divided in two, and seem'd as if it had shot them immediately a mile asunder to the eye. It is dangerous when it thunders standing

Frequent
and terrible
thunder.

in a narrow passage, where there is a thorough wind, or in a room betwixt two windows, tho' several have been kill'd in the open fields. 'Tis incredible to tell how it will strike large oaks, shatter and shiver them, sometimes twisting round a tree, as if it struck the tree backwards and forwards. I had noted a fine spreading oak in James town island; in the morning I saw it fair and flourishing, in the evening I observ'd all the bark of the body of the tree, as if it had been artificially peel'd off, was orderly spread round the tree in a ring, whose semi-diameter was four yards, the tree in the center; all the body of the tree was shaken and split, but its boughs had all their bark on, few leaves were fallen, and those on the boughs as fresh as in the morning, but gradually afterwards wither'd, as on a tree that is fallen. I have seen several vast oaks and other timber trees twisted, as if it had been a small willow that a man had twisted with his hand; which I could suppose had been done by nothing but the thunder. I have been told by several planters, that thirty or forty years since, when the country was not so open, the thunder was more fierce, and that some times after violent thunder and rain the roads would seem to have perfect casts of brimstone: and he seems to be of opinion, that the fierce and frequent thunders they had formerly, proceeded from the air's being more stagnant when the motion of the winds was impeded by the trees, before the country was clear'd.

CHAP.
II.

CHAP. III.

Of the Provinces and chief towns of Virginia, and of the Buildings of the Indians.

HOW the country was divided when the Indians had the dominion of it does not appear, only the first adventurers inform us, that there were a great many petty monarchs in it, who commanded on the several rivers; and that the most potent frequently subdu'd his weaker neighbours, and held them in subjection during his life, after which every principality usually return'd to the original proprietor; but I shall be more particular on this head in the chapter assign'd for the history of this country.

CHAP.
III.
Provinces
and chief
towns.

Virginia is at present divided into twenty-five counties, (viz.) 1. James county. 2. Henrico county. 3. Prince George. 4. Charles county. 5. Surrey. 6. Isle of Wight. 7. Nanfamund. 8. Norfolk. 9. Princess Anne. 10. York county. 11. Warwick. 12. Elizabeth. 13. New Kent. 14. King William. 15. King and Queen. 16. Gloucester. 17. Middlesex. 18. Essex. 19. Richmond. 20. Stafford. 21. Westmorland. 22. Lancaster. 23. Northumberland. 24. Accomack; and 25. Northampton.

1. James county lies on both sides of James river, and is bounded by New-Kent on the north, by York county on the east, by Surrey on the south, and Henrico county on the west, and contains five parishes (viz.) 1. James town. 2. Williamsburg. 3. Wallingford, all which lie on the North side of James river. 4. Merchants Hundred; and 5. Bruton, on the south side of the river.

1. James Town, the capital of this county and of the whole province, is situated in a peninsula on the north side of James river, about forty miles from the mouth of it, the river being at this place about a mile broad. There are not above three or fourscore houses at present in it, and those

■ English Plantations
▲ Indian Plantations and Houses

CHAP. III. those most of them publick houses, kept for the entertainment of sea-faring people who resort hither; for it is not agreeable to the humour or business of the Virginian planters to live in Towns. Every man of substance almost chuses to reside upon his estate, and have his farms and plantations under his eye; and when they have amassed as much wealth as satisfies them, they either remain in the place they acquir'd it, or return to England; but seldom reside in the little towns of Virginia. Another reason which makes James town now so inconsiderable is, the removing the courts of justice and the seat of the government to Williamsburgh: And lastly, James town suffer'd very much in the rebellion during the reign of King Charles II. when it was almost entirely burnt down to the ground. Before that misfortune happen'd, 'tis said, there were several spacious streets and handsome buildings in James town, and the government seem'd to be set upon peopling and improving it, by obliging all shipping to unload their merchandize at this place, but that order was never obey'd. Few towns are capable of being made stronger than James town, as it is situated on a peninsula, which, at high water, is a perfect island, and there is no approaching it but on one side, which might easily be render'd inaccessible; but the fortifications I perceive are mean.

Williamsburgh. 2. Williamsburgh, heretofore call'd Middle Plantation, is situated about seven miles from James town, further within land; and this, tho' the seat of the government, and the place where their parliament or general assembly meets, is but a very small place, consisting only of thirty or forty houses that are not contiguous. Governor Nicholson did all that lay in his power to increase the buildings and enlarge the town, in the year 1689; particularly he built a town-house, to which he gave the name of the Capitol. A fine college also was erected here, and a good revenue settled upon it; but this was unfortunately burnt down. There are some redoubts and batteries of guns erected for the defence of the place, but of no great consequence; what the late orders for the repairing and strengthening our fortifications in America may produce, we shall see in a little time. This county contains 108,362 acres of land.

I shall not pretend to give the boundaries of the rest of the counties, only observe in what part of the province they lie, with the parishes and the number of acres contain'd in them.

Henrico county. 2. Henrico county is situated the most westerly of all those that lie on the south of James river, and contains the two parishes of Henrico and Bristol, in which are 148,787 acres of land.

Prince George, and Charles counties. 3. and 4. Prince George and Charles counties are situated over-against Henrico county, on the north side of James river, in which are the three parishes of Martin Brandon, Wyanoke, and Westover, containing 161,239 acres of land; and twenty miles higher, above the falls of James river, is the Monacan town, where the French refugees are settled.

Surrey county. 5. Surrey county is situated over-against James county, on the south side of James river, containing the two parishes of Southwark and Lyons creek, in which are 111,050 acres of land.

Isle of Wight county. 6. Isle of Wight county, is situated south east of Surrey county, on the south side of James river, containing the two parishes of Warwick-Squeak and Newport, in which are 142,796 acres of land.

VOL. III.

CHAP. III. 7. Nanfamd county, which lies south of the Isle of Wight county, containing the three parishes of Upper-Parish, Lower-Parish, and Chukkatuck, in which are 131,172 acres of land. In this county rises the river of Nanfamd, which running to the north-east falls into James river, near Bennet's creek.

8. Norfolk county lies south-east of Nanfamd county, extending to the borders of Carolina, and contains only the parish of Elizabeth, in which are 112,019 acres of land. In this county rises the river Elizabeth, which running due north falls into James river, between the east and West Bay.

9. Princess Anne county lies north-east of Norfolk, having the bay of Chesepeak on the north, and the ocean on the east, and contains only the parish of Lynhaven, in which are 98,305 acres of land. Cape Henry is a promontory on the north east part of this county.

10. York county, situate between York and James rivers on the east of James county, in which are the three parishes of York, Hampton, and New-Pokoson, and contains 60,767 acres of land.

11. Warwick county lies contiguous to York county, and south east of it between the same rivers, in which are the two parishes of Denby and Mulberry Island, containing 38,444 acres of land. In this county rises the river of Pokoson, which running to the eastward discharges itself into the mouth of York river.

12. Elizabeth county lies contiguous to Warwick county, and to the eastward of it, having the bay of Chesepeak on the north, and the Mouth of James river on the south. It hath but one parish, call'd Elizabeth, in which was a city of the same name, but it is of late years dwindled to a village. This county contains 29,000 acres of land.

13. New-Kent lies north of James county on the southern branch of York river, and contains the two parishes of Blissland and St. Peters, in which are 171,314 acres of land, being one of the largest and most populous counties in Virginia. In the west part of this county are some hills of glittering sand, which the first adventurers mistook for gold, and loaded home a ship with it, and to their great mortification it prov'd but common earth.

14. King William county is contiguous to New-Kent, and lies to the westward of it, the river Pamunky (being the southern branch of York river) running through it. It contains only the parish of St. John's, in which are 84,324 acres of land.

15. King and Queen county lies on the south of King William county, and is contiguous to it, and contains the two parishes of Stratton Major and St. Stephen's, in which are 131,716 acres of land. In this county rises the river Chicohomony, and running eastward falls into James river, near Bromfield's plantation.

16. Gloucester county is situated between the mouth of York river and Prankitank river, having the bay of Chesepeak on the east, and contains the four parishes of Perfo, Abington, Ware, and Kingston, in which are 142,450 acres of land.

17. Middlesex county lies north of Gloucester, having the river Raphanock on the north, and the river Prankitank on the south, containing only the parish of Christ-Church, in which are 49,500 acres of land.

23 M

18. The

CHAP. III.

Essex
county.

18. The county of Essex lies on the river Raphanock, north-west of Middlesex, containing the three parishes of South-Farnham, Sittingburn, and St. Mary's, in which are 140,920 acres of land. Upon the confines of this county and that of Middlesex there is a great swamp or bog almost sixty miles in length, call'd Dragons Swamp, cover'd with bushes and flags, in which harbour wild beasts and game in abundance.

Dragons
Swamp.

Rich-
mond and
Stafford
counties.

19. and 20. Richmond and Stafford counties lie north-west of Essex, upon the same river Raphanock, and contain the three parishes of North-Farnham, St. Paul's, and Overworton.

Westmor-
land coun-
ty.

21. Westmorland county lies eastward of the last, between the two rivers of Raphanock and Patowmack.

Lancaster
county.

22. Lancaster county lies on the north shore of the river Raphanock, near the mouth, being divided into two parts by the river Cartomain, and contains the two parishes of Christ-Church and St. Mary White-Chapel.

Northum-
berland
county.

23. Northumberland county is bounded by the mouth of Patowmack river on the north, and by the bay of Chesepeak on the east, containing the two parishes of Fairfield-Bawtry, and Wicomico.

Acomac
county.

24. Acomac county lies in the peninsula on the opposite side of the bay of Chesepeak, having part of Maryland on the north, the Atlantic Ocean on the east and south, and the bay of Chesepeak on the west, in which is the parish of Acomac only; but contains, however, 200,923 acres of land, being the largest county of Virginia, but not so well peopled as those on the west-side of the bay.

North-
ampton
county.

25. Northampton county lies south of that of Acomac, and forms the south part of the peninsula on which the promontory call'd cape Charles is situated. This is a long narrow county lying between the ocean and the bay of Chesepeak, in which is but one parish, call'd Hungers, containing 99,384 acres of land.

Numbers
of people.

In all which counties, it is computed there may be at this day about an hundred thousand souls, besides servants and slaves, which are above three times that number.

Indian vil-
lages and
buildings.

As to the towns of the Indians, I don't find they had any thing that deserved the name of a town even in their greatest prosperity, before the English came among them. They liv'd dispers'd in small villages of ten or twelve huts a-piece (scarce any of them exceeding thirty such houses) either in the woods or on the banks of rivers, where they had little plantations of Indian corn and roots, scarce sufficient to supply their respective families half the year, subsisting the remainder of it by hunting, fishing, and fowling, and the fruits of the earth, which grow spontaneously in great plenty there.

The materials of their houses were poles cover'd with bark or matts; the poles being let into the ground in a circular form were bent inward, and made the hut of the shape of a bee-hive: The hearth or fire-place was in the middle of it, about which they lay upon matts, or the skins of beasts. The palaces of their greatest men were no better than ordinary barns, in which were several partitions made by matts, and might therefore be call'd so many rooms, in the furthest of which was placed their favourite idol, and sometimes two or more, which they carry'd with them on every enterprize, and whenever they removed. The length of these barns (or palaces, as some call them) were from twelve to twenty-four yards

in length, and usually half as broad as they were long. Their furniture consisted of their skins and furs, some earthen pots and pans; gourds and calabashes cut asunder serv'd them for tubs, pails, cups, and dishes.

CHAP. III.

The country was then very thinly inhabited, these small villages being usually several miles asunder, as appears by the concurrent relations of the first adventurers, collected by HACKLUIT and PURCHASE.

Captain SMITH, one of the first adventurers, says, the land is not populous within sixty miles of James town. There are about seven thousand people, but of men fit for war scarce two thousand: seven or eight hundred are the most that have been seen together: so that there is little reason to charge the English with destroying such numbers, as some have done either ignorantly or maliciously. The middle of America, between the tropicks, where the Spaniards fix'd themselves, indeed was very populous, but towards the north and south there were few inhabitants. Even at this day those parts of Florida which have never been under the subjection of any Europeans, and consequently have not been destroy'd by them, live in the like little villages, and are very thinly peopled.

CHAP. IV.

Of the persons and habits of the Virginians, their genius and temper, arts, manufactures, food, exercise, and diversions, diseases, and remedies.

AS to the persons of the Virginians, their stature is much the same with the people of Europe. In some provinces there are huge lusty fellows like the Germans, whom some people are pleas'd to call a gigantick race, and there are others as little as the French, but all in general well made, strong and active. They are born tolerably white, but take a great deal of pains to darken their complexion by anointing themselves with grease, and lying in the sun. They also paint their faces, breasts, and shoulders of various colours, but generally red. Their hair and eyes are black, the men cutting theirs in several forms; and persons of condition have always a long lock behind. The women wear their hair long, sometimes loose and flowing, and at others twisted and adorn'd with beads, shells, and feathers. The men suffer no hair on their chins, or any part of their bodies. Their features are good, especially those of the women, their limbs clean and strait, and scarce ever any crooked or deform'd persons among them. Their noblemen and chiefs wear a coronet adorn'd with feathers, and sometimes a whole fowl stuff'd and dry'd on their heads, their ornaments being ear-rings of copper, chains of shells, feathers, and beads about their necks, and bracelets of the same about their arms.

CHAP. IV.
Persons of the Vir-
ginians.

Their cloathing is only a piece of a skin about their waist that reaches down to their knees; and those of condition have the skin of a deer or some other beast for a mantle, and another piece of skin serves them for shoes or buskins.

Habits.

Their characters are given us variously by different travellers; which, I presume, proceeds from the various circumstances the Indians or our people were in. When they were friends with our people and entertain'd them hospitably; then they were all that was good, and when in a state

Genius
and Tem-
per.

CHAP. IV. of hostility, no character was thought bad enough for them; but I think they all agree, that the Virginians did not want wit or natural parts.

Mr. WHITAKER, chaplain to the colony of Virginia, observes, that the Indians are neither so ignorant or so innocent as some suppose them, but are a very understanding generation, quick of apprehension, sudden in dispatch, subtle in their dealings, exquisite in their inventions, and industrious in their labour: That the world has not better marksmen with bow and arrow than the natives, who kill birds flying, fishes swimming, and wild beasts running, and shoot their arrows with such prodigious force, that one of them shot an Englishman quite through, and nail'd both his arms to his body with the same arrow. And he saw a boy of twelve or thirteen years of age kill a bird with an arrow.

In the character captain SMITH gives of them, he says, they are strong, nimble, and hardy; and when they are at war, or engaged in an enterprize, they will lie all night abroad in the hardest winters under a tree, making fires about them.

That they are inconstant, crafty, quick of apprehension, and very ingenious, some bold, some timorous, but all of them cautious, circumspect, and savage: That they are soon mov'd to anger, and so malicious that they seldom forget an injury.

However, the same captain SMITH acknowledges the English were hospitably entertain'd when they landed first in Virginia, before the natives had any apprehension the English came to invade their country, and usurp the dominion of it: And the reason he gives them an ill character in other places seems to be, because they would not tamely suffer the yoke to be put about their necks by foreigners. But if we would judge rightly of these people, I think we ought to observe how they treated ours before any injury was offer'd them. And it appears that in the first voyage that was made thither by captain PHILIP AMIDAS, and captain ARTHUR BARLOW, in the year 1584, they were here feasted and carest'd beyond their expectations. The polite and most hospitable people of Europe could not have used them better. They relate, that on their coming to an anchor near Cape Hatteras, an Indian came on board, to whom they gave some wine and a dish of meat; and that thereupon the Indian returning to his boat, caught them as many fish as it would hold, and brought them.

That the next day, the brother of one of their kings came to the sea-side with forty or fifty attendants, and setting himself down over-against the ship, Mr. AMIDAS and several more of the English went on shore with their arms. Whereupon this Prince, without being terrify'd at their warlike appearance, invited them to set down on the matt his servants had provided, and made a great many signs to exprets his joy at their arrival: After which they traffick'd with the natives for their deer-skins, furs, and other peltry, giving them dishes, kettles, hatchets, knives, and other implements in return for them.

That afterwards, the Prince brought his wife and several other women on board the ship, where the English entertain'd them in the best manner they could; and the lady, in return, invited them on shore, and gave them venison roast and boil'd, fish, melons, and other fruits; and the captain, who was one of the company that was thus feasted by the natives, and wrote this relation, says, they found the people most gentle, loving, and faithful, void of all guile and treachery.

As to arts and sciences they understood but little. CHAP. IV. They knew no more of letters than the rest of the Americans, but appear'd very tractable and capable of learning any thing. There were no companies or societies of mechanicks or artificers amongst them, but every family did their own business. They all understood how to build their huts, make their cloaths, sow and plant their grounds; and the greatest of them busied themselves in these works; their Princes were not exempted. King POWHATON, according to captain SMITH, made his own robes, shoes, bows, arrows, pots, and pans, as well as the meanest of his subjects.

They did not know the use of iron, and the copper they had only serv'd them for ornaments. Their edg'd tools were sharp stones, or shells, set in wood. They burnt down the timber they used, hollow'd the trunks of their great trees with fire, of which they made their canoes, or country boats, all of a piece, scraping them smooth with stones or shells, and some of these boats were thirty foot in length.

They were infinitely surpris'd at the effects of the loadstone; the compass, and mathematical instruments, the burning-glass, the perspective-guns, clocks and fire-works amazed these people; they looked upon them to be the works of the gods rather than men, or at least that the men that made them must be taught by the gods; which gave them an uncommon veneration for the English when they arrived upon their coasts, and made them ready to listen to whatever was propos'd.

The Virginians reckoned their years by winters, and their months by the moon, and some say they reckoned every spring and autumn a new year, beginning it at either equinox, which was the occasion that so many of their people were reckoned upwards of an hundred when the English came amongst them. They kept their accounts with a notch'd stick, and reckoned from one to ten, and so to an hundred, as we do; but large sums confounded them.

Their usual food was hommony, which is Indian corn boiled to a pulp, and comes the nearest buttered wheat of any thing I can compare it to: They eat also venison, fish, and fowl, great part of their time being employ'd in hunting and taking them; for they had no tame cattle or fowls. They both broil and stew their meat, and their fish they dress with the scales on, and without gutting them. They eat also peas and beans, and several other kinds of pulse and roots, and among the rest the cassavi root, of which they make bread, as in other parts of America; 'tis said they eat snakes also and other vermin, with as great a gust as any other flesh.

On rejoicing days they sing and dance in a ring, taking hands, as other Americans do, and are much delighted with masquerades; one of which captain SMITH gives a particular relation of, being performed for his diversion when he was in the court of King POWHATON. Diversions

They carried him into a field by a woodside, and having seated him and his company on matts by a fire, thirty young women issued out of the woods perfectly naked, only some leaves to hide what all the world conceal, their bodies painted red, white, and black, and all manner of colours, and on their heads every one a pair of stags horns, having bows and arrows in their hands and quivers at their backs. Thus accoutred, these ladies took hands, danced and sung about the fires and the strangers, and having continued this exercise for an hour, they retired

CHAP. IV. retired into the woods, where they invited the captain and his friends to as elegant a feast of fish, flesh, fowl, and fruits, as Indians were capable of making, some of the nymphs singing and dancing, while others attended them; and if we may credit this traveller, making love to him with so much fondness, that he was perfectly furfeited with it.

Diseases and remedies. The natives are generally healthful and long-lived, subject to but few diseases, and those chiefly proceeding from colds, which they endeavour to get off by sweating; but they are sometimes swept away by epidemical distempers, occasioned by unkindly seasons; and the small-pox proves as fatal to them as the plague. As to the Europeans that live amongst them, fevers and agues, the gripes, and fluxes are the most common distempers here, as in the rest of the British plantations, the occasion whereof, and the methods of cure, sir HANS SLOAN, who resided some time in Jamaica, has given very particular accounts of, and from him I shall take the liberty to communicate them to my readers when I come to the description of that island, and only observe here, that the bark is an infallible remedy for their fevers and agues.

CHAP. V.

Of the Virginian animals.

CHAP. V. **THE** description Mr. CLAYTON has given us of these is so full that little can be added to it, and therefore I shall give it the reader in his own words, viz.

Animals. There were neither horses, cows, sheep, or swine in all the country before the coming of the English; but now there is good store of horses, though they are very negligent and careless about the breed. It is true, there is a law, that no horse shall be kept stoned under a certain size, but it is not put in execution. Such as they are there is good store, and as cheap or cheaper than in England, worth about five pounds a-piece. They never shoe them, or stable them in general; some few gentlemen may be something more curious, but it is very rare; yet they ride pretty sharply, a planter's pace is a proverb, which is a good hand-gallop. The Indians have not yet learned to ride, only the King of Pamunkie had got three or four horses for his own saddle, and an attendant, which I think should in no wise be indulged; for I look on the allowing them horses much more dangerous than even guns and powder.

Kine. Wild bulls and cows there are now in the uninhabited parts, but such only as have been bred from some that have strayed and become wild, and have propagated their kind, and are difficult to be shot, having a great acuteness of smelling. The common rate of a cow or calf is fifty shillings un-fight un-seen; be she big or little, they are never very curious to examine that point.

Sheep. Their sheep are of a midling size, pretty fine fleec'd in general, and most persons begin to keep flocks, which hitherto has not been much regarded because of the wolves that destroy them; so that a piece of mutton is a finer treat than either venison, wild-goose, duck, widgeon, or teal.

Elks. Elks: I have heard of them beyond the inhabitants, and that there was one presented to sir WILLIAM BERKLY, which he kept some time; but they are not common.

Deer. There are abundance of brave red deer; so that a good woodsman, as they call them, will keep his house with venison. The Indians make artifi-

CHAP. V. cial sorts of heads of boughs of trees, which they consecrate to their gods, and these they put on to deceive the deer when they go a shooting or hunting as they call it, and by mimicking the feeding of the deer, they by degrees get within shot.

Swine they have now in great abundance. Shoats, Hogs, or porkrels, are their general food, and I believe as good as any Westphalia; certainly far exceeding our English.

Raccoon: I take it to be a species of a monkey, Raccoons. something less than a fox, grey hair'd, its feet formed like a hand, and the face too has likewise the resemblance of a monkey's, besides, being kept tame, are very apish. They are very prejudicial to their poultry, as I remember.

An opossum: As big, and something shaped like Opossum. our badgers, but of a lighter dun colour, with a long tail something like a rat, but as thick as a man's thumb. The skin of the female's belly is very large, and folded so as to meet like a purse; wherein they secure their young whilst little and tender, which will as naturally run thither as chickens to a hen; and in these false bellies they will carry their young. These also feed on and devour corn.

Hares: Many will have them to be a Hedge-Hares. rabbit, but I know not what they mean thereby. I take them to be a perfect species of Hares, because I have seen Leverets there with the white spot in the head, which the old ones have not; so it is in England, and the down is perfectly of the colour of our hares; they sit as our hares do, and make no holes and burrows in the earth: True, they are but about the bigness of an English rabbit, and run no faster: They generally take into some hollow tree within a little space; which then the people catch by gathering the withered leaves, and setting them on fire within the hollow of the tree, and smoaking them so till they fall down. Sometimes they take long briars and twist them in the down and skin, and so pull them forth.

Their Squirrels are of three sorts, the first is the great Fox-squirrel, much larger than the English, and are grey almost as a common rabbit. These are very common. I have eaten of them at the best gentlemen's tables, and they are as good as a rabbit. The second is the Flying-squirrel, of a lighter dun colour, and much less than the English squirrel. The skin on either side of the belly extended is very large betwixt the fore-leg and hind-leg, which helps them much in their skipping from one bough to another, that they will leap farther than the Fox-squirrel, tho' much less; yet this is rather skipping than flying, tho' the distinction be well enough. The third is the Ground-squirrel. I never saw any of this sort; only I have been told of them, and have had them described to me to be little bigger than a mouse, finely spotted like a young fawn; by which I further apprehend, they are an absolute sort of dor-mouse, only different in colour.

Musk-rats: In all things shaped like our water-rats, only something larger, and are an absolute species of water-rats, only having a curious musky scent. I kept one for a certain time in a wooden chest: Two days before it died it was extraordinary odoriferous, and scented the room very much, but the day that it died, and a day after the scent was very small; yet afterwards the skin was very fragrant; the stones also smelt very well. They build houses as beavers do in the marshes and swamps (as they call them) by the water-sides, with two or three ways into them, and they are finely

CHAP. V. finely daub'd within. I pull'd one in pieces purposely to see the contrivance; there were three different lodging rooms, very neat, one higher than another, as I conceive purposely made for retirement when the water rises higher than ordinary: They are considerably large, having much trash and lumber to make their houses withal. I suppose they live mostly on fish.

Batts. Batts: As I remember, at least two sorts, one a large sort with long ears, and particularly long stragling hairs: The other much like the English, something larger I think; very common.

Lions. I had never heard of any lions; they told me of a creature killed whilst I was there in Gloucester county, which I conceived to be a sort of pard, or tyger.

Tyggers. Bears: There are but few in the inhabited part of Virginia. Towards Carolina there are many more. There was a small bear killed within three miles of James city, the year that I left the country; but it was supposed to have strayed and swam over James river. They are not very fierce. Their flesh is commended for a very rich sort of pork; but the lying side of the bear, as I remember, is but half the value of the other, weight for weight.

Wild cats. There are several sorts of wild-cats, and poll-cats.

Beavers. Beavers build their houses in like manner as the musk-rats do, only much larger, and with pieces of timber make dams over rivers, as I suppose, either to preserve their furs dry in their passage over the rivers, or else to catch fish by standing to watch them thereon, and jumping upon them on a sudden. They are very subtle creatures, and if half the stories be true that I have been told, they have a very orderly government among them. In their works each knows his proper work and station, and the overseers beat those young ones that loiter in their business; and will make them cry and work stoutly. These will be further described in New England.

Wolves. Of wolves there are great store; you may hear a company hunting in an evening, and yelping like a pack of beagles; but they are very cowardly, and dare scarce venture on any thing that faces them; yet if hungry, will pull down a good large sheep that flies from them. I never heard that any of them adventured to set on man or child.

Foxes. Foxes: They are very much like ours, only their furr is much more grised or grey; neither do I remember ever to have seen any fox-holes; but of this I am not positive.

Dogs. Every house keeps three or four mungrel dogs to destroy vermin, such as wolves, foxes, raccoons, opossums, &c. But they never hunt with hounds; I suppose because there are so many branches of rivers that they cannot follow them. Neither do they keep grey-hounds, because they say, that they are subject to break their necks by running against trees, and any cur will serve to run their hares into a hollow tree, where after the aforesaid manner, they catch them.

Tortoises. They have great store both of land and water-tortoises, but they are very small, I think. I never saw any in that country to exceed a foot in length. There is also another sort of land-tortoise, different from the common sort, with a higher-ridged back, and speckled with red sort of spots.

Frogs. Frogs they have of several sorts; one of a prodigious largeness, eight or ten times as big as any in England; and it makes a strange noise, something like the bellowing of a bull, or betwixt that and

the hollow sounding noise that the English bittern makes.

Another very common sort which they call toads, because black; but I think differs nothing from our black frog. They have toads also, like ours in England, and another small sort of frog, which makes a noise like pack-horse bells all the spring long. Another little green frog that will leap prodigiously, which they therefore call the flying-frog. There is still heard in the woods a shrill sort of noise, much like that which our shrew-mouse makes, but much sharper. I could never learn the certainty what it was that made this noise. It is generally in a tree, and some have asserted to me that it was made by the green frog, yet I scarcely believe it. Mr. BANISTER assured me that it was made by a sort of Scarabæus-beetle, that is, I think, full as big as the humming-bird; but neither do I believe that, and for this reason, because I never saw that beetle so low as the salts, but always as high up in the country as the freshes, and that noise is frequent all over the country.

Lizards are grey and very common here; the Lizards snakes feed much on them, for I have taken several of them out of the bellies of snakes.

Snakes: About seven several sorts. The rattle-snake, so called from certain rattles at the end of the tail. These rattles seem like so many perished joints, being a dry husk over certain joints; and the common opinion is, that there are as many rattles or joints as the snake is years old. I killed four or five, and they had eleven, twelve, or thirteen joints each; and the young ones have no rattles of a year or two old, but they may be known notwithstanding, being very regularly diced or chequered black and grey on the backs. The old ones shake and shiver these rattles with wonderful nimbleness when they are in any ways disturbed. Their bite is very deadly, yet not always of the same force, but more or less mortal according as the snake is in force or vigour; and therefore in June or July much worse, and more mortal than in March and April. This snake is a very majestic sort of creature, and will scarce meddle with any thing unless provoked; but if any thing offend it, it makes directly at them. I was told a pleasant story of an old gentleman, Colonel CLEYBORN, as I remember, was his name, the same that sent the rattle-snakes to the Royal-society some years since: He had an odd fancy of keeping some of the snakes always in barrels in the house; and one time an Indian pretending to charm them so as to take them by the neck in his hand without biting of him, the old gentleman caused a rattle-snake to be brought forth; the Indian began his charm with a little wand, whisking it round and round the rattle-snakes head, bringing it by degrees nigher and nigher, and at length flung the switch away, and whisked his hand about in like manner, bringing his hand still nigher and nigher by taking less circles, when the old gentleman immediately hit the snake with his crutch, and the snake snap'd the Indian by the hand, and bit him very sharply betwixt the fingers, which put his charm to an end, and he roared out, but stretched his arm out as high as he could, calling for a string, wherewith he bound his arm as hard as possibly he could, and clapp'd a hot burning coal thereon and singed it stoutly, whereby he was cured, but look'd pale a long while after. And I believe this truly one of the best ways in the world of curing the bite either of a viper or mad dog. I was with the honourable 'squire BOYLE, when he made certain experiments

CHAP. V. **P**riments of curing the bite of vipers with certain East-India snake-stones, that were sent him by King JAMES the second, the Queen, and some of the nobility; purposely to have him try their virtue and efficacy: For that end he got some brisk vipers, and made them bite the thighs of certain pullets, and the breasts of others. He apply'd nothing to one of the pullets, and it died within three minutes and a half, as I remember; but I think they all recovered to which he apply'd the snake-stones, tho' they turn'd wonderful pale, their combs, &c. immediately, and they became extreme sick, and purg'd within half an hour, and the next morning all their flesh was turn'd green to a wonder; nevertheless they recovered by degrees. The manner of the application was only by laying on the stone, and by two cross bits of a very sticking diachylum plaister, binding it on; which he let not lie on past an hour or two, and I think not so long; then took the stone off and put it into milk for some time; for some stones were of much stronger virtue than others. I proposed a piece of unquench'd lime-stone to be apply'd, to see whether it might not prove as powerful, but know not whether ever it was try'd. But here one telling Mr. BOYLE the story of this Indian, he approv'd the method of cure, and said, an actual cautery was the most certain cure. The poison both of a viper and mad-dog (as I conceive) kill by thickning of the blood, alter the manner that runnet congeals milk when they make cheese. Vipers, and all the viperous brood, as rattle-snakes, &c. that are deadly, have, I believe, their poisonous teeth fistulous, for so I have observ'd the vipers teeth are, and the rattle-snakes very remarkably; and therefore they kill so very speedily by injecting the poison through these fistulous teeth into the very mass of blood; but the bite of mad dogs is oft of long continuance before it get into and corrupt the mass of blood, for that it sticks only to the out-sides of the teeth; and therefore when they bite through any thickness of cloaths, it rarely proves mortal, the cloaths wiping the poison off before it comes to the flesh.

Colonel SPENCER, the secretary of state in Virginia, a very ingenious gentleman, told me that his servant brought him word once that a sow having farrow'd, a rattle-snake was got into the den and had kill'd the pigs. The colonel went to see the snake, which they said was still coyl'd in the den ; there followed him two or three mungrel curs, and they set one of the dogs at the snake, which was too quick for the dog and snapt him by the nose ; whereupon he set a howling, and run immediately into the adjacent river and died very shortly after. Another of the dogs upon the like attempt was bit by the snake also, and fell a howling, and frothing, and tumbling ; but he not dying so soon as the other dog did, they fetch'd some of the herb which they call dittany, as having a great traditionary virtue for the cure of poisons. They pounded it, and adding a little water expressed the juice, and gave the dog frequently thereof, nevertheless he died within a day or two. The howlings of the dogs he supposed gave notice to the sow, and made her come furiously bristling, and run immediately into her den, but being likewise bit by the snake, she set up a miserable squeak, and ran also into the river and there died.

A gentlewoman, who was a notable female doctor, told me, that a neighbour having been bit by a rattlesnake, swell'd excessively. Some days afterwards she was sent for, who found him swell'd

beyond what she thought it had been possible for
the skin to contain, and very thirsty. She gave
him oriental Bazaar, shav'd with a strong decoo-
tion of the aforesaid dittany, whereby she reco-
ver'd the person. To the best of my remem-
brance it was he that told me. Asking him after-
wards what he felt when the snake first bit him,
he said it seem'd as if a flash of fire had run through
his veins.

Besides the rattle-snake, there is the blowing-snake, an absolute species of a viper, but larger than any that I have seen in Europe. It is so call'd because it seems to blow and spread its head, and swell very much before it bites, which is very deadly. It is remarkable there is none of their snakes which make any of that hissing noise that ours in England make, but only shoot out their tongues, shaking them as ours do, without any noise at all. This is a short thick sort of a snake.

There is another sort of deadly snake, call'd the red-snake. I once narrowly escaped treading on the back of one of them. They are of an ugly dark brown colour, inclining to red; their bellies are of a more dusky white, with a large streak of vermilion red on either side. This too is of the viper kind, but is not so short, and its tail is more taper and small.

The horn-snake is, as they say, another sort of The horn-
deadly snake. I never saw any of them unless once, snake.
shortly after my arrival in that country. I could
not see the horn, which they say it has in its front,
wherewith it strikes, and if it wounds is as deadly
as the rattle-snake's bite. This, I think, may not
improperly be refer'd to the dart-snakes.

The black-snake, I think, is the largest of all the black-snakes, but I am sure the most common. I have kill'd several of them full six foot long. Their bite is not deem'd mortal, but it swells and turns to a running sore; they feed upon lizards, mice, rats, frogs, and toads, which I have taken out of their bellies. I was once a limpling in the woods on a fair sun-shine day, when I saw a snake crawling on a tree that was fallen, and licking with its forked tongue as it mov'd. I stood still to observe it, and saw it lick up small insects and flies with wonderful nimbleness, catching them betwixt the forks of its tongue.

The corn-snake is most like the rattle-snake of The corn-
all others in colour ; but the chequers are not so snake.
regular, neither has it any rattles. They are most
frequent in the corn-fields, and thence I suppose so
call'd. The bite is not so venomous as the black-
snake's.

The water-snake is a small snake. I never saw any of them above a yard long, though I have seen sometimes forty or fifty at once. They are of an ugly dark blackish colour. They say they are the least venomous of any.

To this account of Mr. CLAYTON's, if I add Sir HANS SLOAN's remarks on the same animals, and the instances he produces of the effects their bite has upon other creatures, I presume it will not be unacceptable.

The various relations, says that gentleman, not only of curious and credible authors who have given us accounts of Virginia, Carolina, and the neighbouring countries, but also the testimonies of several men of integrity by word of mouth concerning what they call charms, enchantments, or fascinations by snakes, have often seem'd to me greatly surprizing, without my being able to satisfy myself of the true cause of such appearances.

CHAP. V. These opinions are the greatest support of a common notion, that several chronical wasting diseases, and such disorders of the nerves as are not easily accounted for, not only in men but in cattle, are believed to be the effects of an evil eye, of old malicious women, &c. thought to be witches and sorcerers, or assisted by the devil.

In particular, as to Rattle snakes, they all agree in their relations, that those snakes keeping their eyes fix'd on any small animal, as a squirrel, bird, or such like, tho' sitting upon the branch of a tree of a considerable height, shall, by such steadfast or earnest looking, make or cause it to fall dead into their mouths. This is a thing so well attested, that they think there is no reason to question their belief of it.

Mr. READ, an eminent merchant in the city of London, had a rattle-snake sent him alive in a box with some gravel from Virginia, which he did me the favour to give me. It had liv'd three months before without any sustenance, and had in that time parted with its outer coat, or Exuvie, which was found amongst the gravel. Mr. RANBY, a very ingenious surgeon and anatomist, undertook the lodging it; and Captain HALL, a very understanding and observant person, who had liv'd many years in that country in great repute, ventured to take the snake out of the box, notwithstanding that the poison from the bite thereof is almost present death; for he gave us an instance of a person bitten, who was found dead at the return of a messenger going to the next house to fetch a remedy or antidote, though he was not gone above half an hour. Nay, so certain are the mortal effects of this poison, that sometimes the waiting till an iron can be heated in order to burn the wound, is said to have proved fatal. This gentleman told me, he thought the securest way was immediately to cut out the part where the wound was made; for he had seen several who had carry'd these hollow scars about them, as marks of the narrow escape they had had, and never felt any inconvenience afterwards.

Though providence hath produc'd a creature so terrible to other animals, yet it seems to have provided it with the rattle at its tail, that the noise thereof might give warning to them to get out of its way.

I desired an experiment should be try'd before several physicians, which was accordingly done in the garden belonging to their college in London. The captain, by keeping the head fast with a forked stick, and making a noose, which he put about the tail of the snake ty'd it fast to the end of another stick, wherewith he took him out of the box and laid him upon the grass-plat; then a dog being made to tread upon him, he bit the dog, who thereupon howled very bitterly, and went away some few yards distant from the snake, but in about one minute of time he grew paralytick in the hinder legs, after the manner of dogs who have the Aorta Descendens ty'd. He died in less than three minutes time, as is related by Mr. RANBY in an account of this experiment in *Philos. Trans.* N^o. 401. p. 377. and by Captain HALL, N^o. 399. p. 309.

In my opinion, the whole mystery of their enchanting or charming any creature is chiefly this, that when such animals as are their proper prey, namely, small quadrupedes, or birds, &c. are surpris'd by them, they bite them, and the poison allows them time to run a small way, as our dog did, or perhaps a bird to fly up into the next tree, where

the snakes watch them with great earnestness till they fall down, or are perfectly dead, when having lick'd them over with their spawl or spittle, they swallow them down, as the following accounts relate.

Some people in England (says Colonel BEVERLEY, in his history of Virginia, edit 2. p. 260. Lond. 1722, 8vo.) are startled at the very name of the rattle-snake, and fancy every corner of that province so much pester'd with them that a man goes in constant danger of his life that walks abroad in the woods; but this is as gross a mistake as most of the other ill reports of this country; for in the first place, this snake is very rarely seen, and when that happens it never does the least mischief unless you offer to disturb it, and thereby provoke it to bite in its own defence: But it never fails to give you fair warning by making a noise with its rattle, which may be heard at a convenient distance. For my own part, I have travelled the country as much as any man in it of my age, by night and by day, above the inhabitants as well as among them, and yet before the first impression of this book I had never seen a rattle-snake alive and at liberty in all my life: I had seen them indeed after they had been kill'd or pent up in boxes to be sent to England. The bite of this viper, without some immediate application, is certainly death; but remedies are so well known that none of their servants are ignorant of them. I never knew any kill'd by these or any other of their snakes, although I had a general knowledge all over the country, and had been in every part of it. They have several other snakes which are seen more frequently, and have very little or no hurt in them, viz. such as they call black-snakes, water-snakes, and corn-snakes. The black-viper-snake, and the copper-belly'd-snake, are said to be as venomous as the rattle-snake, but they are seldom seen. These three poisonous snakes bring forth their young alive, whereas the other three sorts lay eggs, which are hatch'd afterwards, and that is the distinction they make, esteeming only those to be venomous which are viviparous. They have likewise the horn-snake, so called from a sharp horn it carries in its tail, with which it assaults any thing that offends it with that force, that, as it is said, it will strike its tail into the butt end of a musket, from whence it is not able to disengage itself.

All sorts of snakes will charm both birds and squirrels; and the Indians pretend to charm them, (the snakes.) Several persons have seen squirrels run down a tree directly into a snake's mouth. They have likewise seen birds fluttering up and down, and chattering at these snakes, till at last they have dropped down just before them.

In the end of May, 1715, stopping at an orchard by the road-side to get some cherries, being three of us in company, we were entertained with the whole process of a charm between a rattle-snake and a hare, the hare being better than half grown. It happened thus: One of the company, in his search for the best cherries, espied the hare sitting, and although he went close by her, she did not move, till he (not suspecting the occasion of her gentleness) gave her a lash with his whip; this made her run about ten foot, and there sit down again. The gentleman not finding the cherries ripe, immediately returned the same way, and near the place where he struck the hare, he espied a rattle-snake. Still, not suspecting the charm, he goes back about twenty

CHAP. V.

Colonel Beverley's account of the rattle-snake.

CHAP. V. yards to a hedge to get a stick to kill the snake, and at his return found the snake removed, and coiled in the same place from whence he had moved the hare. This put him into immediate thoughts of looking for the hare again, and soon espied her about ten foot off the snake, in the same place to which she had started when he whipped her. She was now lying down, but would sometimes raise herself on her fore-feet, struggling as it were for life, or to get away; but could never raise her hinder parts from the ground, and then would fall flat on her side again, panting vehemently. In this condition the hare and snake were when he called me, and tho' we were all three come up within fifteen foot of the snake, to have a full view of the whole, he took no notice at all of us, nor so much as gave a glance towards us. There we stood at least half an-hour, the snake not altering a jot, but the hare often struggling, and falling on its side again, till at last the hare lay still, as dead, for some time; then the snake moved out of his coil, and slid gently and smoothly towards the hare, his colours at that instant being ten times more glorious and shining than at other times: As the snake moved along, the hare happened to fetch another struggle, upon which the snake made a stop, lying at his length till the hare lay quiet again for a short space, and then he advanced again till he came up to the hinder parts of the hare, which in all this operation had been towards the snake; there he made a survey all over the hare, raising part of his body above it, then turned off, and went to the head and nose of the hare; after that to the ears, took the ears in his mouth, one after the other, working each apart in his mouth, as a man does a wafer to moisten it; then returned to the nose again, and took the face into his mouth, straining and gathering his lips sometimes by one side of his mouth, sometimes by the other. At the shoulders he was a long time puzzled, often hauling and stretching the hare out at length, and straining forward first one side of his mouth, then the other, till at last he got the whole body into his throat; then we went to him, and taking the twist-band off from my hat, I made a noose, and put it about his neck: this made him at length very furious, but we having secured him, put him into one end of a waller, and carried him on horseback five miles to Mr. JOHN BAYLOR's house, where we lodged that night, with a design to have sent him to Dr. Cock at Williamsburgh; but Mr. BAYLOR was so careful of his slaves, that he would not let him be put into his boat, for fear he should get loose and mischief them; therefore the next morning we killed him, and took the hare out of his belly. The head of the hare began to be digested, and the hair falling off, having lain about eighteen hours in the Snake's belly.

I thought this account of such a curiosity would be acceptable, and the rather because, tho' I live in a country where such things are said frequently to happen, yet I never could have any satisfactory account of a charm, tho' I have met with several persons who have pretended to have seen them. Some also pretend that those sort of snakes influence children, and even men and women by their charms. But this that I have related of my own view, I aver (for the satisfaction of the Learned) to be punctually true, without enlarging or wavering in any respect, upon the faith of a Christian.

CHAP. V. In my youth I was a bear-hunting in the woods above the inhabitants, and having straggled from my companions, I was entertained at my return with the relation of a pleasant rencounter between a dog and a rattle-snake about a squirrel. The snake had got the head and shoulders of the squirrel into his mouth, which being something too large for his throat, it took him up some time to moisten the furr of the squirrel with his spawl to make it slip down. The dog took this advantage, seized the hinder parts of the squirrel, and tugged with all his might. The snake on the other-side would not let go his hold for a long time, till at last fearing he might be bruised by the dog's running away with him, he gave up his prey to the dog. The dog eat the squirrel, and felt no harm.

Another curiosity concerning this viper, which I never met with in print, I will also relate from my own observation.

Some time after my observation of the charm, my waiting-boy being sent abroad on an errand, also took upon himself to bring home a rattle-snake in a noose. I cut off the head of this Snake, leaving about an inch of the neck with it. This I laid upon the head of a tobacco hogs-head (one STEPHEN LANKFORD, a carpenter, now alive, being with me.) Now you must note, that these snakes have but two teeth, by which they convey their poison, and they are placed in the upper jaw, pretty forward in the mouth, one on each side. These teeth are hollow and crooked, like a cock's spur; they are also loose or springing in the mouth, and not fastened in the jaw bone, as all the other teeth are; the hollow has a vent also through, by a small hole, a little below the point of the teeth. These two teeth are kept lying down along the jaw, or shut like a spring-knife, and don't shrink up, as the talons of a cat or panther. They have also over them a loose thin film or skin of a flesh-colour, which rises over them when they are raised; which I take to be only at the will of the snake to do injury. This skin does not break by the rising of the tooth only, but keeps whole till the bite is given, and then is pierced by the tooth, by which the poison is let out. The head being laid upon the hogshead, I took two little twigs, or splinters of sticks, and having turned the head upon its crown, opened the mouth, and lifted up the fang or springing tooth on one side several times; in doing of which I at last broke the skin: the head gave a sudden champ with its mouth breaking from my sticks, in which I observed that the poison ran down in a lump like oil round the root of the tooth; then I turned the other side of the head, and resolved to be more careful to keep the mouth open on the like occasion, and observe more narrowly the consequence; for it is to be observed, that tho' the heads of snakes, terrapins (a sort of tortoise) and such like vermine be cut off, yet the body will not die in a long time after; the general saying is, till the sun sets. After opening the mouth on the other side, and lifting up that fang also several times, he endeavoured to give another bite or champ, but I kept his mouth open, and the tooth pierced the film, and emitted a stream like one full of blood in blood-letting, and cast some drops upon the sleeve of the carpenter's shirt, who had no waistcoat on. I advised him to put off his shirt, but he would not, and received no harm; and tho' nothing could then be seen of

CHAP. V. of it upon the shirt, yet in washing there appeared five green specks, which every washing appeared plainer and plainer, and lasted as long as the shirt did, which the carpenter told me was about three years after. The head we threw afterwards down upon the ground, and a sow came and eat it before our faces, and received no harm. Now I believe had this poison lighted upon any place of the carpenter's skin that was scratched or hurt, it might have poisoned him. I take the poison to rest in a small bag or receptacle in the hollow at the root of these teeth; but I never had the opportunity afterwards to make a further discovery of that.

I will likewise give you a story of the violent effects of this sort of poison, because I depend on the truth of it, having it from an acquaintance of mine of good credit, one Colonel JAMES TAYLOR of Metapony, still alive. He being with others in the woods a surveying, just as they were standing to light their pipes, they found a rattle-snake, and cut off his head and about three inches of the body; then with a green stick which he had in his hand, about a foot and an half long, the bark being newly peeled off, urged and provoked the head, till it bit the stick in fury several times. Upon this the Colonel observed small green streaks to rise up along the stick towards his hand; he threw the stick upon the ground, and in a quarter of an hour the stick of its own accord split into several pieces, and fell asunder from end to end. This account I had from him again at the writing hereof. BEVERLEY's history of Virginia, p. 260 to 267.

Father LABAT likewise tells us (in his *Nouveau voyage aux isles de l'Amerique*, tom. IV. p. 96 and 106, edit. Paris, 1728, in 8vo.) that Serpents when they bite their prey, retire to avoid being hurt by them, and when dead, cover them with their spittle, extend their feet along their sides and tails, if quadrupedes, and then swallow them.

A certain viper-catcher who suffered himself to be bitten before forty gentlemen of the university of Cambridge last month (July, 1737) for the slender reward of twelpence he received of every one of the spectators, having provoked a viper to fasten upon his wrist, said he felt at that instant a most exquisite pain as high as his elbow, and was in no small consternation, tho' he had been bitten a great many times before, both accidentally in catching vipers, and designedly for a reward, and particularly before some gentlemen of the Royal-society.

He kept stroaking down his arm to the wrist from the time he was wounded, but applied nothing to it except common salad-oil, and did not do this till half an hour after he was bitten, and his arm was pretty much swelled, and the next day he appeared perfectly well.

Give me leave to add, in relation to the horn-snake, that I saw a letter lately which Mr. WILKINSON, fellow of Emmanuel-college, received from his brother, then at Virginia, who assured him that trees had been killed by this snake's striking his horn into them; which does not seem more improbable than the splitting of a stick that has been penetrated by the tooth of a rattle-snake; but as to the business of charming, I have very little faith in it, unless, as I have hinted in treating of the East-India serpents, that birds may be delighted with the sparkling eyes of snakes, as they are with the fowler's glass, or as a moth is

VOL. III.

with the flame of a candle, and be taken in flying to the snake to satisfy their curiosity. CHAP. V.

As to the feathered race, says Mr. CLAYTON, already cited, there are three sorts of eagles; the largest I take to be that they call the grey eagle, being much of the colour of our kites or lead.

The second is the bald eagle, for the body and part of the neck being of a dark brown, the upper part of the neck or head is covered with a white sort of down; whereby it looks very bald, whence it is so named.

The third is the black-eagle, resembling most the English-eagle. They build their nests generally at the top of some old tree, naked of boughs, and nigh the river-side, and the people fell the tree generally when they take the young. They are most frequently sitting on some tall tree by the river-side, whence they may have a prospect up and down the river, as I suppose to observe the fishing-hawks; for when they see the fishing-hawk has struck a fish, immediately they take wing, and it is sometimes very pleasant to behold the sight; for when the fishing-hawk perceives herself pursued, she will scream and make a terrible noise, till at length she lets fall the fish to make her own escape, which the eagle frequently catches before it reach the earth or water. These eagles kill young lambs, pigs, &c.

The fishing-hawk is an absolute species of a king's-fisher, but full as large or larger than our jay, much of the colour and shape of a king's-fisher, tho' not altogether so curiously feathered: It has a large crop as I remember. There is a little king's-fisher, much the same in every respect with ours.

If I much mistake not, I have seen both goshawk, and falcon; besides, there are several sorts of the lesser kind of stannels.

There is likewise the kite and the ring-tale.

I never heard the cuckow there to any remembrance.

There is both a brown owl and white owl, much about as large as a goose; which often kills their hens and poultry in the night. The white owl is a very delicate feathered bird; all the feathers upon her breast and back being snow-white and tipped with a punctal of jet-black; besides, there is a barn-owl, much like ours, and a little sort of screech-owl.

There is both the raven and the carrion-crow. I do not remember I saw any rooks there.

The night-raven, which some call the Virginian bat, is about the bigness of a cuckow, feathered like them, but very short legs, not discernible when it flies, which is only in the evening, scudding like our night-raven.

There is a great sort of ravenous bird that feeds upon carrion, as big very nigh as an eagle, which they call a turkey-bustard; its feathers are of a dusky black; it has red gills, resembling those of a turkey, whence it has its name. It is nothing of the same sort of bird with our English turkey-bustard, but is rather a species of the kites, for it will hover on the wing something like them, and is carnivorous. The fat thereof, dissolved into an oil, is recommended mightily against old aches and Sciatica pains.

I think there are no jackdaws, nor any magpies. They there prize a magpy as much as we do their red-bird.

CHAP. V. The *Pica Glandaria*, or Jay, is much less than our English Jay, and of another colour; for it is all blue where ours is brown, the wings marbled as curiously as ours are; it has both the same cry and sudden jetting motion.

Wood-peckers. There are great variety and curiosity in the Wood-peckers. There is one as big as our Mag-pye, with blackish brown feathers, and a large scarlet tuft on the top of the head. There are four or five sorts of Wood-peckers more variegated with green, yellow, and red heads, others spotted black and white, most lovely to behold.

Turkies. There are wild Turkies extreme large: they talk of Turkies that have been killed which have weighed betwixt fifty and sixty weight. The largest that ever I saw weighed something better than thirty-eight pound. They have very long legs, and will run prodigiously fast. I remember not that ever I saw any of them on the wing except it were once. Their feathers are of a blackish shining colour, that look in the sun-shine like a Dove's neck.

Poultry without rumps. Hens and Cocks are for the most part without tails and rumps; and as some have assured me, our English Hens, after some time being kept there, have their rumps rot off; which I am the apter to believe, being all their Hens are certainly of an English breed. I am sorry I made no anatomical observations thereof, and remarks about the use of the rumps in birds, which at present I take to be a couple of Glands, containing a sort of juice for the varnishing the feathers, having observed all birds have much recourse with their bills to the rumps when they dress their plumes, whereby they scud through the air more nimbly in their flight.

Partridges. Partridges there are much smaller than ours, and resort in covies as ours do. Their flesh is very white, and much excels ours in my mind; sed de gustibus non est disputandum.

Doves. Their Turtle-doves are of a dusky blue colour, much less than our common Pigeon; the whole train is longer much than the tails of our Pigeons, the middle feather being the longest. There is the strangest story of a vast number of these Pigeons that came in a flock, a few years before I came thither; they say they came through New-England, New-York, and Virginia, and were so prodigious in number as to darken the sky for several hours in the place over which they flew, and brake massive boughs there they light, and many like things which I have had asserted to me by many eye-witnesses of credit, that to me it was without doubt, the relations being very sober persons, and all agreeing in a story. Nothing of the like ever happened since, nor did I ever see past ten in a flock together, that I remember. I am not fond of such stories, and had suppressed the relating of it, but that I have heard the same from very many.

Thrush. The Thrush and Fieldfare are much like ours, and are only seen in winter there, according as they are here.

Mocking-birds. Their Mocking-birds may be compared to our Singing-thrushes, being much of the same bigness. There are two sorts, the grey and the red; the grey has feathers much of the colour of our grey Plovers, with white in the wings like a Mag-pye. This has the much softer note, and will imitate in its singing the notes of all birds that it hears, and is accounted much the finest singing bird in the world. This Mocking-bird, having

its name from mimicking all other birds in singing, is a wonderful mettled bird, bold and brisk, and yet seems to be of a very tender constitution, neither singing in winter, nor in the midst of summer; and with much difficulty are any of them brought to live in England.

The red Mocking-bird is of a dusky red, or rather brown; it sings very well; but has not so soft a note as the grey Mocking-bird.

Of the Virginia Nightingale, or Red-bird, there are two sorts; the cocks of both sorts are of a pure scarlet, the hens of a dusky red. I distinguish them into two sorts; for the one has a tufted top on the head, the other is smooth feathered. The boys catch them, and sell them to the merchants for about six-pence a piece, by whom they are brought to England. They are something less than a Thrush.

There is a bird very injurious to corn they call a Blackbird. I look on it as a sort of Starling, for they cry something like them; but do not sing, are much about the same bigness, have flesh blackish like theirs. They resort in great flocks together. They are as black as a Crow all over to their bills, only some of them have scarlet feathers in the pinions of their wings. Query, whether a distinct species.

They have a Lark nothing differing from our common Lark. They have another bird which they call a Lark, that is much larger, as big as a Starling; it has a soft note, feeds on the ground, and, as I remember, has the specifical character of a long heel. It is more inclined to yellow, and has a large half moon on its breast of yellow. If it have not a long heel, query, whether a species of the Yellow-hammer.

They have a Martin, very like, only larger than ours, that builds after the same manner. The honourable Colonel Bacon has remarked for several years, that they constantly come thither upon the 10th of March; one or two of them appearing before, being seen hovering in the air for a day or two, then go away, and, as he supposed, returned with the great flock. The Colonel delighted much in this bird, and made holes like Pigeon holes at the end of his house with boards purposely for them.

Their Swallow differs but little from ours. Swallow.

They have a bird called a Blue-bird, of a curious azure colour, about the bigness of a Chaffinch. Blue bird.

There are other sorts of Finches, variegated with orange and yellow feathers, very beautiful.

Sparrows, not much different from the English, but build not in the eaves of houses, that ever I saw.

The Snow-bird, which I take to be much the same with our Hedge-sparrow. This is so called because it seldom appears about houses, but against snow or very cold weather.

The Humming-bird, which feeds upon the honey of flowers. I have been told by some persons that have kept of these Humming-birds alive, and fed them with water and sugar; they are much the smallest of all birds, have long bills and curiously coloured feathers, but differ much in colour. Humming-bird.

Herons, three or four several sorts, one larger than the English, feathered much like a Spanish Goose.

Another sort that only comes in summer, milk white, with red legs, very lovely to behold.

The

CHAP. V. The Bittern is there less than in England, and does not make that sounding noise, that ever I heard.

Bittern. Curlews, something less than our English, tho' bigger than a Wimbrel.

Sand-piper. The Sand-piper, much resembling the English.

Saipe. The Snipes, two sorts, one resembling ours, the other much less.

Tewits. The Tewits are smaller than the English, and have no long toppins, but just like a young one that begins to fly.

Wild Swans, Geese, and Ducks, &c. There are great number of wild Swans, wild Geese, and Brent-geese all winter in mighty flocks, wild Ducks innumerable, Teal, Wigeon, Sheldrakes, Virginia Dippers, the black Diver, &c.

Cormorants. There are in Virginia a great many Cormorants, several sorts of Gulls, and in and about the bay many Bannets.

Fish. There is no place abounds with sea and river fish more than Virginia. In February, March, April, and May, there are shoals of Herrings come up into their very brooks, some of the size of ours, but for the most part much larger. There are also plenty of Cod-fish, and the Stingrafs is said to be peculiar to this country, being so called from having a sting in its tail. It is esteemed good food. In their rivers there are the Old-wife, the Sheeps-head, an excellent fish, Trouts, Green-fish, Sturgeons in great plenty, Place, Flounders, Whittings, Carp, Pikes, Mulletts, and Perch: And for Shell-fish they have Oysters, Crabs, Cockles, and Shrimps: Of those that are not eaten they have in their seas Whale, Dog-fish, Sharks, Porpus's, Gar-fish, and Sword-fish.

Herrings. There is also a fish they call the Toad-fish, from his swelling monstrously when he is taken out of the water; and the Rock-fish, some species whereof are poisonous, and have been fatal to those that have eaten them; tho' others, which are not easy so to be distinguished from the former, are very wholesome food.

Cod-fish, Stingrafs, &c. There is also a fish they call the Toad-fish, from his swelling monstrously when he is taken out of the water; and the Rock-fish, some species whereof are poisonous, and have been fatal to those that have eaten them; tho' others, which are not easy so to be distinguished from the former, are very wholesome food.

Trout, Sturgeons, Carp, Perch, &c. And for Shell-fish they have Oysters, Crabs, Cockles, and Shrimps: Of those that are not eaten they have in their seas Whale, Dog-fish, Sharks, Porpus's, Gar-fish, and Sword-fish.

Oysters, Whales. There is also a fish they call the Toad-fish, from his swelling monstrously when he is taken out of the water; and the Rock-fish, some species whereof are poisonous, and have been fatal to those that have eaten them; tho' others, which are not easy so to be distinguished from the former, are very wholesome food.

Toad-fish. There is also a fish they call the Toad-fish, from his swelling monstrously when he is taken out of the water; and the Rock-fish, some species whereof are poisonous, and have been fatal to those that have eaten them; tho' others, which are not easy so to be distinguished from the former, are very wholesome food.

Rock-fish. There is also a fish they call the Toad-fish, from his swelling monstrously when he is taken out of the water; and the Rock-fish, some species whereof are poisonous, and have been fatal to those that have eaten them; tho' others, which are not easy so to be distinguished from the former, are very wholesome food.

Skip-jack. The Skip-jack, so named from his skipping out of the water, is tolerably good food. And the Tobacco-pipe-fish, so called from its being long and slender like a Tobacco-pipe.

Tobacco-pipe fish. Colonel BEVERLEY, also, who has furnished us with the above-said Description of the Rattle-snake, gives us the following account of some of the rest of the Virginian animals, and their management of them, (viz.)

Cattle. When I come to speak of their cattle (says that gentleman) I cannot forbear charging my countrymen with exceeding ill husbandry in not providing sufficiently for them all winter, by which means they starve all their young cattle, or at least stint their growth; so that they seldom or never grow so large as they would do if they were well managed; for the humour is there, if people can but save the lives of their cattle, tho' they suffer them to be never so poor, in the winter, yet they will presently grow fat again in the spring, which they esteem sufficient for their purpose. And this is the occasion that their Beef and Mutton are seldom or never so large or so fat as in England; and yet with the least feeding imaginable they are put into as good case as can be expected; and it is the same with their Hogs.

Fish. Their fish is in vast plenty and variety, and extraordinary good in their kind. Beef and Pork are commonly sold there from one penny to two-pence the pound, or more, according to the time of year; their fattest and largest Pullets at six-pence a-piece, the Capons at eight pence or nine pence

CHAP. V. a-piece, their Chickens at three or four shillings the dozen, their Ducks at eight-pence or nine-pence a-piece, their Geese at ten-pence or a shilling, their Turkey-hens at fifteen or eighteen-pence, and their Turkey-cocks at two shillings or half-a-crown; but Oysters and wild-fowl are not so dear as the things I have reckoned before, being in their season the cheapest victuals they have. Their Deer are commonly sold from five to ten shillings, according to the scarcity and goodness.

All the troublesome vermine that ever I heard of any body complain of are either Frogs, Snakes, Musqueto's, Chinchies, Seed-ticks; or Red-worms, by some called Potatoe-lice; of all which I shall give an account in their order.

Some people have been so ill informed as to say, that Virginia is full of Toads; tho' there never yet was seen one Toad in it. The marshes, fens, and watry grounds are indeed full of harmless Frogs, which do no hurt, except by the noise of their croaking notes; but in the upper part of the country, where the land is high and dry, they are very scarce. In their swamps and running streams they have Frogs of an incredible bigness, which are called Bull-frogs, from the roaring they make. Last year I found one of these near a stream of fresh water of so prodigious a magnitude, that when I extended its legs I found the distance betwixt them to be seventeen inches and a half. If any are good to eat, these must be the kind.

Musqueto's are long-tailed Gnats, such as are in all fens and low grounds in England, and I think have no other difference from them than the name. Neither are they in Virginia troubled with them any where but in their low grounds and marshes. These insects, I believe, are stronger and continue longer there (by reason of the warm sun) than in England. Whoever is persecuted with them in his house, may get rid of them by this easy remedy: Let him but set open his windows at sunset and shut them again before the twilight be quite shut in, all the Musqueto's in the room will go out at the windows.

Chinchies are a sort of flat Bug, which lurks in the bedsteads and bedding, and disturbs people's rest a-nights. Every neat house-wife contrives there by several devices to keep her beds clear of them. But the best way I ever heard effectually to destroy them is, by a narrow search among the bedding early in the spring, before these vermin begin to knit and run about; for they lie snug all the winter, and are in the spring large and full of the winter's growth, having all their seed within them, and so they become a fair mark to find, and may with their whole breed be destroyed. They are the same as they have in London near the shipping.

Seed-ticks and Red-worms are small insects that annoy the people by day as Musqueto's and Chinchies do by night; but both these keep out of your way if you keep out of theirs; for Seed-ticks are no where to be met with but in the track of cattle, upon which the great Ticks fasten and fill their skins so full of blood that they drop off, and wherever they happen to fall they produce a kind of Egg, which lies about a fortnight before the Seedlings are hatched. These Seedlings run in swarms upon the next blade of grass that lies in their way, and then the first thing that brushes that blade of grass gathers off most of these vermin, which stick like burs upon any thing that touches them. They void their eggs at their mouth.

Red-

CHAP.

V.

Red-worms.

Red-worms lie only in old dead trees and rotten logs, and without sitting down upon such, a man never meets with them, nor at any other season but only in the midst of summer. A little warm water immediately brings off both Seed-ticks and Red-worms, tho' they lie ever so thick upon any part of the body. But without such remedy they will be troublesome; for they are so small that nothing will lay hold of them but the point of a pen-knife, needle, or such like; but if nothing be done to remove them, the itching they occasion goes away after two days.

Sheep.

Their Sheep increase well and bear good fleeces, but they generally are suffered to be torn off their backs by briars and bushes instead of being shorn, or else are left rotting upon the dung-hill with their skins.

Bees.

Bees thrive there abundantly, and will very easily yield to the careful house-wife a full hive of honey, and besides lay up a winter store sufficient to preserve their stocks.

Cattle and pasture.

The Bees, when any care is taken of them in the winter, come to good perfection. They have noble marshes there, which, with the charge of draining only, would make as fine pastures as any in the world; and yet there is hardly an hundred acres of marsh drained throughout the whole country.

Hogs.

Hogs swarm like vermine upon earth, and are often accounted such, inasmuch that when an inventory of any considerable man's estate is taken by the executors the Hogs are left out, and not lifted in the appraisement. The Hogs run where they list, and find their own support in the woods without any care of the owner, and in many plantations it is well if the proprietor can find and catch the Pigs or any part of a farrow when they are young to mark them; for if there be any marked in a gang of Hogs they determine the property of the rest, because they seldom miss their gangs, but as they are bred in company so they continue to the end, except sometimes the Boars ramble.

Ship-worms.

In the month of June annually there rise up in the salt vast beds of Seedling-worms, which enter the ships, sloops, or boats where-ever they find the coat of pitch, tarr, or lime worn off the timber; and by degrees eat the plank into cells like those of an honey-comb. These Worms continue thus upon the surface of the water from their rise in June until the first great rains after the middle of July, but after that do no fresh damage 'till the next summer season, and never penetrate farther than the plank or timber they first fix upon.

The damage occasioned by these Worms may be four several ways avoided.

1. By keeping the coat (of pitch, lime, and tallow, or whatever else it is) whole upon the bottom of the ship or vessel; for these worms never fasten nor enter but where the timber is naked.

2. By anchoring the large vessels in the strength of the tide during the worm-season, and hailing the smaller a-shore, for in the current of a strong tide the Worms cannot fasten.

3. By burning and cleaning immediately after the worm-season is over, for then they are but just stuck into the plank, and have not buried themselves in it; so that the least fire in the world destroys them entirely, and prevents all damage that would otherwise ensue from them.

4. By running up into the freshes with the ship or vessel during the five or six weeks that the Worm is thus above water; for they never enter

or do any damage in fresh water, or where it is not very salt.

CHAP. VI.

Of the Virginian soil and vegetables, viz. of their forest and fruit-trees, plants, corn, herbage, roots, and husbandry; and of their stones, earth, and minerals.

THIS country, upon the first discovery of it was found to consist, like many others, either of forests or bogs. The forests contain'd abundance of noble timber of various kinds, which grew to an unusual height and bulk, much beyond any thing we see in Europe; the trees standing at such a distance from each other that a coach and six might drive through them with pleasure. The chief of them were Oaks, Cedars, Firrs, Cypress, Elm, Ash, and Walnut, which had no boughs to a very great height; the Oaks being so large as to measure two foot square, and sixty foot high. There was no underwood or bushes among the timber; but a great deal of this in their bogs and morasses, mix'd with long Grass, Flags and Sedge. They had also Beech, Poplar, Hazel, Eldern, and Willow, with trees which yield gums, and several sorts of sweet wood, and woods used in dying, with Sassafras, Sarsaparilla, &c.

Among their fruits they had Grapes that grew wild, and the European Grape comes to great perfection here, and yet they have never made any quantities of wine; the reason usually given for which, is, that it will not keep.

Cherries are very plentiful, being of three sorts, one of which grows in bunches like Grapes, another sort is black, and a third is called the Indian Cherry.

They have several sorts of Plumbs of their own growth from the bigness of a Damson to that of a Pear, the largest much resembling the taste of an Apricot; and they have a wild Plumb like our white Plumb; but English Plumbs do not ripen kindly here.

Peaches are very large, and so plentiful, that they are given to the Hogs in some places: And there is no place were Apples and Pears abound more. They have also the Chinquamine, a fruit that resembles a Chestnut; the Macoquex, not unlike an Apple; the Mattaquesumach, or Fig; the Indian Mattacocks, a sort of Strawberry; and the common Figs grow very well here, tho' the soil is not so favourable to Oranges and Lemons. There are a sort of Acorns that yield a sweet oil, and Quinces are so plentiful that they make a great deal of Liquor, as well as Marmalade of them.

Their Grass is long coarse stuff, of which they scarce ever make hay; but their cattle browse upon it both winter and summer, having very little fodder besides, except the leaves of the Indian Corn, which are given them very sparingly. Silk-grass grows here spontaneously, and the soil is extremely proper for Hemp and Flax, and yet they have no manufacture of Silk or Linnen.

As to their bread Corn it is of two sorts, 1. English Wheat; and 2. Maiz, or Indian Corn. The English Wheat, Mr. CLAYTON observes, generally yields between fifteen and thirty fold increase, the ground being only once ploughed, and that without any dung or manure; whereas it is esteemed a good crop that yields eight fold increase in England, so much more fruitful is the Virginian soil than ours.

CHAP.
VI.Indian
corn.

The Indian corn is not unlike our peas in taste, but grows in a great ear or head as big as the handle of a large horse-whip, having from three hundred to seven hundred grains in one ear, and sometimes one grain produces two or three such ears or heads. It is of various colours, red, white, yellow, blue, green, and black, and some speckled and striped; but the white and yellow are most common. The stalk is as thick as an ordinary walking cane, and grows six or eight foot high in joints, having a sweet juice in it, of which a syrup is sometimes made, and from every joint there grow long leaves of the shape of sedge leaves. The manner of planting it is in holes or trenches about five or six feet distant from each other; the earth is opened with a hough (and of late years with a plough) four inches deep, and four or five grains thrown into each hole or trench, about a span distant from each other, and then cover'd with earth; they keep it weeding from time to time, and as the stalk grows high they keep the mould about it like the hillocks in a hop ground. They begin to plant in April, but the chief plantation is in May, and they continue to plant till the middle of June. What is planted in April is reap'd in August, what is planted in May is reap'd in September, and the last in October. They make both bread and strong liquor of it, and several sorts of dishes, of which hommony, already mention'd, is the chief.

Husbandry

Soil.

Mr. CLAYTON observ'd, that they had only cultivated their highest and barrenest lands when he was there, leaving the richest vales untouched, because they understood not any thing of draining; so that the richest meadow lands, which are one third of the country, are boggy morasses and swamps, whereof they make little advantage, but lose in them abundance of their cattle, especially at the first of the spring, when the cattle are weak and venture too far after young grafs. Whereas a vast improvement might be made of these morasses. The generality of Virginia is a sandy land, with a shallow soil; so that after they have cleared a fresh piece of ground out of the woods it will not bear tobacco past two or three years, unless cow-penned; for they manure their ground by keeping their cattle, as in the south you do your sheep every night, confining them in hurdles, which they remove when they have sufficiently dunged one spot of ground, but they cannot improve much thus: Besides, it produces a strong sort of tobacco, in which the smokers say they can plainly taste the fulsomeness of the dung; therefore every three or four years they must be for clearing a new piece of ground out of the woods, which requires much labour and toil, it being so thick grown all over with massy timber. Thus their plantations run over vast tracts of ground, each being ambitious to engross as much as he can, that he may be sure to have enough to plant, and for their stocks and herds of cattle to range and feed in. Plantations of a thousand, two thousand, or three thousand acres are common, whereby the country is thinly inhabited, their living solitary and unfociable, trading confused and dispersed, besides other inconveniencies. Whereas they might improve two hundred, or three hundred acres to more advantage, and would make the country much more healthy; for those that have three thousand acres have scarce cleared six hundred acres thereof, which is peculiarly termed the plantation, being surrounded with the two thousand four hundred acres of woods; so that there can be no free or even motions of the air, but the air is kept either stagnant, or the lofty sulphurous particles of the air, that are higher than the tops of the

Plantations too large, and ill managed.

VOL. III.

trees, which are above as high again as the generality of the woods in England, descending when they pass over the cleared spots of ground, must needs, in the violent heat of summer, raise a preternatural ferment, and produce bad effects. Nor is it any advantage to their stocks or crops; for did they but drain their swamps and low lands, they have a very deep soil, that would endure planting twenty or thirty years, and some would scarce ever be worn out; for they might lay them all winter, or when they pleased, in water; and the product of their labour would be double or treble, whether corn or tobacco, though (when I have discoursed the same to several, and in part shewn them how their particular grounds might be drained at a very easy rate) they have either been so conceited of their old way, and so sottish as not to apprehend, or so negligent as not to apply themselves thereto. But on the plantation where I lived, I drained a good large swamp, which fully answered expectation. The gentlewoman where I lived was a very ingenious lady, who one day discoursing the overseer of her servants about pitching the ensuing year's crop, the overseer was naming one place where he designed to plant thirty thousand plants, another place for fifteen thousand, another for ten thousand, and so forth; the whole crop designed to be about an hundred thousand plants: Having observed the year before he had done the like, and scatter'd his crop up and down the plantation, at places a mile and a half asunder, which was very inconvenient, and whereby they lost much time; I interposed, and asked why they did not plant all their crop together? The fellow smiled as it were at my ignorance, and said, there was very good reason for it. I replied, that was it I enquired after; he returned, the plantation had been an old planted plantation, and being but a small plat of ground was almost worn out, so that they had not ground all together that would bring forth tobacco. I told him then, that they had better ground than ever yet they had planted, and more than their hands could manage. He smiled again, and asked me where? I then named such a swamp. He then said scornfully, he thought what a planter I was; that I understood better how to make a sermon than manage tobacco. I reply'd, with some warmth, tho' I hoped so, that was impertinence, and no answer. He then said, that the tobacco there would drown, and the roots rot. I reply'd, that the whole country would drown if the rivers were stopp'd, but it might be laid as dry as any land in the plantation. In short, we discoursed it very warmly, until he told me he understood his own business well enough, and did not desire to learn of me. But the gentlewoman attended somewhat better to my reasoning, and got me one day to go and shew her how I projected the draining of the swamp, and thought it so feasible, that she was resolved to have it done, and therefore desired me I would again discourse her overseer; which I did several times, but he would by no means hearken thereto, and was so positive, that she was forced to turn him away, and to have her servants set about the work: And with three men in thirteen days I drained the whole swamp, it being sandy land, soaks and drains admirably well, and what I little expected, laid a well dry at a considerable distance. Now to teach her how she might make her tobacco that grew in the swamp less, for it produced so very large that it was suspected to be of the Aranoko kind, I told her tho' the complaint was rare, yet there was an excellent remedy for that in letting every plant bear eight or nine leaves instead of four or five, and she would have more

CHAP.
VI.

23 P

tobacco

CHAP. VI. tobacco and left leaves. Now you must know they top their tobacco, that is, take away the little top bud when the plant has put forth as many leaves as they think the richness of the ground will bring to a substance; but generally when it has shot forth four or six leaves, and when the top bud is gone, it puts forth no more leaves, but side branches, which they call suckers, which they are careful ever to take away that they may not impoverish the leaves. I have been more tedious in the particulars, the fuller to evince how resolute they are, and conceitedly bent to follow their own practice and custom rather than to receive directions from others, though plain, easy, and advantageous. There are many other places as easy to drain as this, tho' of larger extent, and richer soil, for some of which I have given directions, and have only had the return perhaps of a flout afterwards. Even in James town island, which is much of an oval figure, there is a swamp runs diagonal-wise over the island, whereby are lost at least one hundred and fifty acres of land, which would be meadow, and turn to as good account as if it were in England: Besides, it is the great annoyance of the town, and no doubt but it makes it much more unhealthy. If therefore they only scoured the channel, made a pretty ordinary trench all along the middle of the swamp, and placed a sluice at the mouth where it opens into the back creek, for the mouth of the channel there is narrow, has a good hard bottom, and is not past two yards deep when the flood is out, as if nature had designed it before hand; they might thus drain all the swamp absolutely dry, or lay it under water at their pleasure.

But now to turn to the reflections of improving and manuring of land in Virginia. Hitherto, as I have said, they have used none but that of cow-penning, yet I suppose they might find very good marle in many places. I have seen both the red and blue marle at some breaks of hills. This would be the properest manure for their sandy land, if they spread it not too thick, theirs being, as I have said, a shallow sandy soil, which was the reason I never advised any to use lime, tho' they have very good lime of oyster-shells; but that's the properest manure for cold clay land, and not for a sandy soil. But as most lands have one swamp or another bordering on them, they may certainly get admirable sitch wherewith to manure all their up-lands: But this, say they, will not improve ground, but clods and grows hard. 'Tis true, it will do so for some time, a year or two at the first; but did they cast it in heaps, and let it lie for two or three years, after a frost or two had seiz'd it, and it had been well pierced therewith, I doubt not but it would turn to good account.

Dairies.

They neither house nor milk any of their cows in winter, having a notion that it would kill them; yet I persuaded the aforementioned lady where I liv'd, to milk four cows the last winter that I staid in the country, whereof she found so good effect, that she assur'd me she would keep to my advice for the future; and also, as I had further urged, house them too, for which they have mighty conveniencies, their tobacco-houses being empty ever at that time of the year, and may easily be fitted in two or three days time, without any prejudice, whereby their cattle would be much shelter'd from those pinching sharp frosts that some nights on a sudden become very severe. I had another project for the preservation of their cattle prov'd very successful, I urged the lady to sow her wheat as early as possible she could, so that before winter it might be well rooted, to be early and flourishing at the first of the spring; so that she might turn thereon her weak cattle, and such as should at any time be swamp'd, whereby

they might be recruited and sav'd, and it would do the wheat good also. I advised her likewise to save and carefully gather her Indian corn tops and blades, and all her straw, and whatever else could be made fodder for her cattle; for they get no hay, tho' I was urging that too, and to sow saint-foin; for being a sandy soil, I am confident it would turn to a very good account. They have little or no grass in winter, so that their cattle are pin'd and starved, and many that are brought low and weak when the spring begins venture too far into the swamps after the fresh grass, where they perish; so that some persons lose ten, twenty, or thirty head of cattle in a year.

But as it is the excellence of the Virginian tobacco which distinguishes this from all countries, it is fit I should give some farther account of their management in the husbandry and curing of this plant, which they have brought to that perfection.

Husbandry of tobacco.

The tobacco seeds are first sown in beds, where having remain'd a month, the plants are transplanted into little hillocks, like those in our hop grounds, the first rainy weather: And being grown a foot high there, within the space of another month they top them and prune off all the bottom leaves, leaving only seven or eight on the stalks, that they may be the better fed, and these leaves in six weeks time will be in their full growth. The planters prune off the suckers, and clear them of the horn-worm twice a week, which is call'd worming and suckering, and this work lasts three weeks or a month, by which time the leaf from green begins to turn brownish, and to spot and thicken, which is a sign of its ripening. As fast as the plants ripen they cut them down, and leave them in the field for half a day, then heap them up and let them lie and sweat a night, and the next day carry them to the tobacco-house, where every plant is hang'd up at a convenient distance from each other, for about a month or five weeks; at the end of which time, they strike or take them down in moist weather when the leaf gives, or else it will crumble to dust: after which they are laid upon sticks, and cover'd up close in the tobacco-house for a week or a fortnight to sweat; and then opening the bulk in a wet day the servants strip them and sort them, the top leaves being the best, and the bottom the worst tobacco. The last work is to pack it in hogsheads, or bundle it up, which is also done in a wet season; for in curing of tobacco, wet seasons are as necessary as dry to make the leaf pliant.

To this account of the Virginian soil and vegetables, I shall here add Colonel BEVERLEY's observations on the same subject.

Colonel Beverley's account of the soil and vegetables.

The soil (says this gentleman) is of such variety, according to the difference of situation, that one part or other of it seems fitted to every sort of plant that is requisite either for the benefit or pleasure of mankind. And were it not for the high mountains on the north-west, which are supposed to retain vast magazines of snow, and by that means cause the wind from that quarter to descend a little too cold upon them, 'tis believed that many of those delicious summer fruits, growing in the hotter climates, might be kept there green all the winter without the charge of housing, or any other care than what is due to the natural plants of the country when transplanted into a garden; but as that would be no considerable charge, any man that is curious might, with all the ease imaginable, preserve as many of them as would gratify a moderate luxury; and the summer affords genial heat enough to ripen them to perfection.

There

CHAP.
VI.
Various
soils.

There are three different kinds of land, according to the difference of situation, either in the lower parts of the country, the middle, or that on the heads of the rivers.

Trees.

1. The lands towards the mouths of the river are generally of a low, moist, and fat mould, such as the heavier sort of grain delights in, as rice, hemp, Indian corn, &c. This also is varied here and there with veins of a cold, hungry, sandy soil of the same moisture, and very often lying under water. But this also has its advantages, for on such land generally grow the huckle-berries, cran-berries, chinkapins, &c. These low lands are for the most part well stor'd with oaks, poplars, pines, cedars, cypresses, and sweet-gums, the trunks of which are often thirty, forty, fifty, some sixty or seventy foot high, without a branch or limb. They likewise produce a great variety of ever-greens, unknown to me by name, besides the beautiful holly, sweet-myrtle, cedar, and the live-oak, which for three quarters of a year is continually dropping its acorns, and at the same time budding and bearing others in their stead.

Springs,
&c.

The land higher up the rivers throughout the whole country is generally a level ground, with shallow vallies full of streams and pleasant springs of clear water, having interspersed here and there among the large levels some small hills and extensive vales. The mold, in some places, is black, fat, and thick laid, in others looser, lighter and thin. The foundation of the mold is also various, sometimes clayey, then gravel and rocky stone, and sometimes marle. The middle of the necks or ridges between the rivers is generally poor, being either a light sand, or a white or red clay with a thin mold; yet even these places are stor'd with chesnuts, chinkapins, acorns of the shrub-oak, and a reedy-grass in summer, very good for cattle. The rich lands lie next the rivers and branches, and are stor'd with large oaks, walnuts, hickories, ash, beech, poplar, and many other sorts of timber of surprising bigness.

The upper
lands.

The heads of the rivers afford a mixture of hills, vallies, and plains, and some richer than other, whereof the fruits and timber trees are also various. In some places lie great plats of low and very rich ground, in other large spots of meadows and savanna's, wherein are hundreds of acres without any tree at all, but yield reeds and grass of incredible height: And in the swamps and sunken grounds grow trees as vastly big as I believe the world affords, and stand so close together, that the branches or boughs of many of them lock into one another; but what lessens their value is that the greatest bulk of them are at some distance from water-carriage. The land of these upper parts affords greater variety of soil than any other, and as great variety in the foundations of the soil or mold, of which good judgment may be made by the plants and herbs that grow upon it. The rivers and creeks do in many places form very fine large marshes, which are convenient supports for their flocks and herds.

Flowers.

Of spontaneous flowers they have an unknown variety; the finest crown imperial in the world; the cardinal flower, so much extoll'd for its scarlet colour, is almost in every branch; the moccasin flower, and a thousand others not yet known to English herbalists. Almost all the year round the levels and vales are beautify'd with flowers of one kind or other, which make their woods as fragrant as a garden.

There is also found the fine tulip-bearing laurel-tree, which has the pleasantest smell in the world, and keeps blossoming and seeding several months together; it delights much in gravelly branches of crystal streams, and perfumes the very woods with

its odour. So also do the large tulip-tree, which we call a poplar; the locust, which resembles much the jessamine, and the perfuming crab-tree, during their season.

CHAP.
VI.

A kitchen garden don't thrive better or faster in any part of the universe than there. They have all the culinary plants that grow in England, and in greater perfection than in England. Besides these they have several roots, herbs, vine-fruits, and salad-flowers, peculiar to themselves; most of which will neither increase nor grow to perfection in England: These they dish up various ways, and find them very delicious sauce to their meats both roast and boil'd, fresh and salt; such are the Indian cresses, red-buds, sassafras-flowers, cymnells, melons, and potatoes.

Kitchen-gardens.

You may raise apples from the seed, which never degenerate into crabs there, but produce as good, or perhaps better fruit than the mother tree (which is not so in England) and are wonderfully improved by grafting and managing; yet there are very few planters that graft at all, and much fewer that take any care to get choice fruits.

Apples.

The fruit-trees are wonderfully quick of growth, so that in six or seven years time from the planting a man may bring an orchard to bear in great plenty, from which he may make store of good cyder, or distil great quantities of brandy, for the cyder is very strong and yields abundance of spirit; yet they have very few that take any care at all for an orchard; nay, many that have good orchards are so negligent of them as to let them go to ruin, and expose the trees to be torn and bark'd by the cattle.

Cydet.

Peaches, nectarines, and apricots, as well as plumbs and cherries, grow there upon standard trees. They commonly bear in three years from the stone, and thrive so exceedingly that they seem to have no need of grafting or inoculating, if any body would be so good a husband. And truly I never heard of any that did graft either plumb, nectarine, peach, or apricot, in that country, till very lately.

Peaches,
&c.

Peaches and nectarines I believe to be spontaneous somewhere or other on that continent, for the Indians have and ever had greater variety and finer sorts of them than the English. The best sort of these cling to the stone, and will not come off clear, which they call plumb-nectarines and plumb-peaches, or cling-stones. Some of these are twelve or thirteen inches in the girth. These sorts of fruits are raised so easily there that some good husbands plant great orchards of them purposely for their hogs, and others make a drink of them, which they call mobby, and either drink it as cyder, or distil it off for brandy. This makes the best spirit next to grapes.

Mobby.

Grape vines of the English stock, as well as those of their own production, bear most abundantly if they are suffer'd to run near the ground, and increase very kindly by slipping; yet very few have them at all in their gardens, much less endeavour to improve them by cutting and laying. But lately some vineyards have been attempted, and one is brought to perfection, yielding seven hundred and fifty gallons a year. The wine drinks at present greenish, but the owner doubts not of good wine in a year or two more, and takes great delight that way.

Grapes.

When a single tree happens in clearing the ground to be left standing with a vine upon it, open to the sun and air, that vine generally produces as much as four or five others that remain in the woods. I have seen in this case more grapes upon one single vine than would load a London cart. And for all this the people, till of late, never removed any of them into their gardens, but

con-

CHAP. VI. contented themselves, throughout the whole country, with the grapes they found thus wild.

Flowers. A garden is no where sooner made than there, either for fruits or flowers. Tulips from the seed flower the second year. All sort of herbs have there a perfection in their flavour beyond what I ever tasted in a more northern climate: And yet they have not many gardens in that country fit to bear the name of gardens.

Corn. All sorts of English grain thrive and increase there as well as in any other part of the world; as for example, wheat, barley, oats, rye, peas, rape, &c. And yet they don't make a trade of any of them. Their peas indeed are troubled with wivels, which eat a hole in them; but this hole does neither damage the seed nor make the peas unfit for boiling: And such as are sow'd late, and gather'd after August, are clear of that inconvenience.

Rice. Rice has been try'd there, and is found to grow as well as in Carolina; but it labours under the same inconvenience, the want of a community to husk and clean it, and after all to take it off the planters hands.

Flax. Flax, hemp, cotton, and silk-worms have thriven there formerly, when encouragement was given for making linen, silk, &c. But now all encouragement of such things is taken away, or entirely dropp'd by the assemblies; and such manufactures are always neglected when tobacco bears any thing of a price.

Silk-grass. Silk-grass is there spontaneous in many places. I need not mention what advantage may be made of so useful a plant, whose fibres are as fine as flax, and much stronger than hemp.

Gums. Sugar-trees. The woods produce great variety of incense and sweet gums, which distill from several trees; as also trees bearing honey and sugar; but there is no use made of any of them, either for profit or refreshment.

Naval stores. All sorts of naval stores may be produced there, as pitch, tarr, rosin, turpentine, plank-timber, and all sorts of masts and yards, besides sails, cordage, and iron; and all these may be transported by an easy water-carriage.

CHAP. VII.

The history of Virginia.

CHAP. VII. **History.** **Virginia discover'd by Cabot.** THE north-east part of the continent of America was first discover'd, as has been observ'd already, by SEBASTIAN CABOT, a native of Bristol. He was the son of JOHN CABOT, a Genoese or Venetian pilot, who resided in that city, and had made a great many voyages in the service of the court of England, or of English merchants, and gain'd a mighty reputation for his skill in maritime affairs, which induc'd King HENRY VII. to employ him, in the year 1497, to find out a north-west passage to China; which tho' CABOT was not so fortunate to accomplish, yet he discover'd all the north-east coast of America, from cape Florida in 25 degrees north latitude to 67 and an half, from whence England claim'd a right to that country prior to the Spaniards or any other European power: And the reason no attempt was made to plant or send colonies to North-America for a considerable time, CABOT himself informs us, was the wars that happen'd immediately after.

It seems strange, however, that neither in the reign of HENRY VII, or in that of his son HENRY VIII, or in the reign of EDWARD VI, or Queen MARY, nor till the latter end of the reign of Queen ELIZABETH, which was near an hundred years after this discovery of CABOT's, the English should en-

deavour to make any settlements in this country; **CHAP. VII.** but I presume we were diverted from it for some time by our wars with Scotland or France, as CABOT intimates, and afterwards by the various changes that were made in religion, which engag'd our whole attention at home, till the Protestant religion was establish'd here by Queen ELIZABETH. And when this was effected, she was engag'd in supporting the Protestants of France, the Low-countries, and Scotland, against the Popish powers; so that it was late in her reign before she was at leisure to cast her eyes upon North-America.

In the mean time the Spaniards from Mexico invaded Florida, and made themselves masters of that part of it which lies upon the gulph of Mexico, as far as the Atlantic ocean. The French also made some attempts to settle themselves near cape Florida, but were driven from thence by the Spaniards, who notwithstanding abandon'd this country themselves for many years, except the south-west part of it, which they retain'd on account of it's silver mines, giving it the name of New-Mexico: For the Spaniards seem'd to slight every country in America how fruitful soever, that did not produce gold or silver; and this I presume was the reason that it remain'd in a manner deserted for so many years, and might have remain'd so much longer, if Queen ELIZABETH had not at length observ'd, that the most effectual way to distress the Spaniards was to interrupt their trade with America, and intercept the galleons that annually brought their plate from thence.

This induc'd her to fit out several squadrons of men of war under the command of DRAKE, HAWKINS, RALEGH, and other brave sea commanders, to cruise on the coast of North-America, and surprise their ports and shipping there; in which expeditions the English became well acquainted with this fruitful and beautiful country of Florida: And Mr. RALEGH being inform'd there were gold mines in it, obtain'd a patent or grant from Queen ELIZABETH, in the year 1584, of all such parts of it as he should discover and plant from 33 to 40 degrees north latitude: And because this was the first patent that ever was granted to any Englishman, authorizing him to send colonies to the continent of America, and will furnish us with abundant matter for our reflections as to the justice and expedience of possessing ourselves of that country, I shall here give an abstract of it.

"ELIZABETH, by the grace of God, of England, France, and Ireland, Queen, defender of the faith, &c. To all people to whom these presents shall come, greeting. Know ye, that of our special grace and mere motion, we have given and granted, and by these presents, for us, our heirs and successors, do give and grant to our trusty and well-beloved WALTER RALEGH, Esq; and to his heirs and assigns for ever, free liberty at all times, for ever hereafter, to discover and view such remote heathen and barbarous lands and territories not actually possess'd of any Christian prince, or inhabited by Christian people, as to him or them shall seem good: And the same to have, hold, occupy and enjoy to him, his heirs and assigns, for ever, with all prerogatives, jurisdictions, royalties, privileges, and franchises thereunto belonging by sea or land: And the said WALTER RALEGH, his heirs and assigns, are hereby empower'd to build and fortify on such lands, &c. at their discretion, any statute against the departing or remaining out of the realm, or any other statutes to the contrary notwithstanding.

"And

CHAP.
VII.

“ And we do likewise empower the said WALTER RALEGH, his heirs and assigns, to take and lead in the said voyage, or to inhabit there as many of our subjects as shall willingly accompany him or them, with sufficient shipping and necessities for their transportation. So that they be not restrain'd by us, or our successors.

“ And further, the said WALTER RALEGH, his heirs and assigns, shall hold, occupy, and enjoy all such lands and countries so to be discover'd and possess'd, and the cities, towns, castles, and villages in the same, with the royalties, franchises, and jurisdictions thereof, with full power to dispose of them in fee simple, or otherwise, to any of our subjects, reserving to us, our heirs and successors, the fifth part of all the gold and silver ore that shall be acquired or gotten in such countries: And the same shall be holden of us, our heirs and successors by homage, and the payment of the said fifth part in lieu of all services.

Rendering
a fifth of
the gold in
lieu of all
services to
the crown.

“ And moreover we do by these presents grant, that the said WALTER RALEGH, his heirs and assigns, may encounter, expulse, and resist all such persons as shall, without his or their license, attempt to inhabit in the said countries, or within two hundred leagues of the places where they shall abide or fix themselves, within the space of of six years next ensuing; or who shall attempt to annoy him or them by sea or land, empowering the said WALTER RALEGH, his heirs and assigns, to take and surprize all such persons, with their ships, vessels, goods, and furniture, as without their license shall be found trafficking in any harbour, within the limits aforesaid, and to detain and possess them as lawful prize.

“ And we do further grant to the said WALTER RALEGH, his heirs and assigns, full power and authority to correct, punish, pardon, and govern, as well in cases capital as criminal and civil, all such of our subjects as shall adventure themselves in the said voyages or inhabit such lands or countries, according to such laws and statutes as shall be established by him and them for the better government of the said people, so as such laws be as agreeable to the laws of England as may be, and be not contrary to the Christian faith professed in the church of England, and so as the said people remain subject to the crown of England.

“ Witness ourself at Westminster, 25 March in the twenty-sixth year of the Queen, anno 1584.”

While this commission was preparing, Mr. RALEGH formed a society among his friends and acquaintance, who contributed large sums, and provided two ships to go upon this discovery, with all manner of necessities for such an enterprise: The command of which being given to Captain PHILIP AMIDAS and Captain ARTHUR BARLOW, they set sail from the west of England on the 27th of April, 1584, and the 10th of May arrived at the Canaries, from whence they bent their course to the Caribbee Islands, which they made on the 10th of June, keeping a more southerly course than they needed to have done, as they themselves observed afterwards, apprehending that the current ran so strong to the northward on the coast of Florida or Virginia, that there was no stemming it; and that mistake made them go two or three thousand miles out of their way: However, they arrived at the island of Wokokon, near the coast of Virginia, or rather of North-Carolina (of which this country is now reckoned a part) and took

kon.

VOL. III.

possession thereof in the name of Queen ELIZABETH, whom they proclaimed rightful Queen and Sovereign of the same, to the use of Mr. RALEGH, according to her Majesty's grant. But they soon discovered it to be but an island of twenty miles in length, and six in breadth, and lying in 34 degrees odd minutes north latitude; the land producing cedars, cypresses, pines, and vast quantities of grapes; nor was there any want of deer, hare, rabbits and wild fowl.

After they had continued here three days, an Indian came on board them, and was entertained in the ship, after which he caught some fish and presented to the English; and the next day GRANGANIMO, the brother of WINOINA, King of Wingandacoa (as the neighbouring continent was called) came down with forty or fifty of his people to the sea-side. Whereupon several English officers went over to him, and were invited to sit down with him on the mats that were spread for that purpose, the Prince striking his head and his breast, and making a great many signs to signify they were heartily welcome, as they apprehended. Whereupon they made him some small presents, as they did to four of his people, who sat on the lower end of the same mat; but the Prince took away the things from his men, intimating that they were his servants, and that all presents were to be made to him: And having taken leave of the English, he returned with more of his people two days after, bringing deer-skins, buff, and other peltry to trade with them. Whereupon they shewed GRANGANIMO all their merchandize, of which nothing pleased him so much as a bright pewter-dish: He took it up, clapped it upon his breast, and having made a hole in the brim, hung it about his neck, intimating it would be a good shield against his enemies arrows. This pewter-dish they exchanged for twenty skins, worth twenty nobles, and a copper-kettle for fifty skins, worth as many crowns. They offered also a very advantageous exchange for their axes, hatchets, and knives, and would have given any thing for their swords, but the English would not part with them.

They traf-
fick with
the Indi-
ans.

Two or three days after, the King's brother came on board their ships, and eat and drank with them, and seemed to relish their wine and food very well, and some few days after he brought his wife and daughter, and several more of his children with him. His wife had good features, but was not tall; she appeared exceeding modest, and had a cloak or mantle of a skin with the furr next her body, and another piece of a skin before her. About her head she had a coronet of white coral, and in her ears pendants of pearls about as big as peas, hanging down to her middle, and she had bracelets on her arms. Her husband also wore a coronet or band of white coral about his head sometimes, but usually a coronet of copper, or some other shining metal, which at first our adventurers imagined to be gold, but were mistaken. His hair was cut short, but his wife's was long.

Mutual ci-
vilities.

The rest of his habit was like his wife's. The other women of the better sort, and the Prince's children, had several pendants of shining copper in their ears. The complexion of the people in general being tawny and their hair black. The Prince's wife was usually attended by forty or fifty women to the sea-side; but when she came on board (as she did often) she left them on shore, and brought only two or three with her.

The King's brother, they observed, was very just to his engagements; for they frequently delivered him

CHAP.
VII.

him merchandize upon his word, and he ever came within the day and delivered what he had promised for them. He sent them also every day as a present, a brace of bucks, with hares, rabbits, and fish, the best in the world; together with several sorts of fruits, such as melons, walnuts, cucumbers, gourds, peas, and several kinds of roots, as also Maiz, or Indian corn.

Afterwards seven or eight of the English officers went in their boat up the river Occam, twenty miles to the northward, and came to an island called Roanoak, where they were hospitably entertained by GRANGANIMO's wife in his absence. She pressed them to stay on shore all night, and when they refused she was much concerned they should be apprehensive of any danger, and sent the provision on board their boat which she had provided for their supper, with mats for them to lie upon: And the captain who wrote the relation it seems, was of opinion they might safely have continued on shore; for a more kind and loving people he thought there could not be in the world, as he expressed himself.

The Virginians an inoffensive hospitable people.

These Indians having never seen any Europeans before, were mightily taken with the whiteness of their skins, and took it as a great favour if any Englishman would permit any of them to touch his breast. They were amazed also at the magnitude and structure of their ships, and at the firing of a musket they trembled, having never seen any fire-arms before.

The English continued to trade with the Indians till they had disposed of all the goods they had brought, and loaded their ships with skins, sassafras and cedar. They procur'd also some pearls from them, and a little tobacco, which they found the Indians very fond of. After which they parted with this people in a very friendly manner, and return'd home to England, taking with them MANTRO and WANCHESE, two Indians, who appear'd desirous to embark for England with them; and having made a very profitable voyage, they gave Mr. RALEGH and the rest of their employers such a glorious account of the country as made them impatient till they had provided ships for another voyage. The tobacco the Captains AMIDAS and BARLOW brought home with them in this voyage was the first that had been seen in England, and was soon cry'd up as a most valuable plant, and a sovereign remedy for almost every malady. But to proceed.

The English return home.

Mr. RALEGH and his friends having fitted out a fleet consisting of seven ships, and given the command of it to Sir EDWARD GREENVILLE, they set sail from Plymouth, on the 9th of April 1585, and made the Canary Islands on the 14th of the same month, from whence they steer'd to the Antilles, which they made the 7th of May, and on the 12th came to an anchor at the island of Porto Rico, where they put their men on shore and took in fresh water and provisions; and setting sail again on the 29th of May they arrived at the island of Wokokon on the 26th of June, where the Admiral's ship was cast away going into the harbour, but himself and the crew saved.

A second voyage by Sir Edward Greenville.

They arrived at Wokokon.

Make discoveries on the continent.

The Admiral with several of his officers, attended with a good guard, went over to the continent on the 11th of July, and came to the town of Secotan, where they were hospitably entertain'd by the natives; but some pilfering Indian having stolen a silver cup from the English, which the natives promis'd to restore; and neglecting to do it, the Admiral, in his return plunder'd one of their towns and burnt it with all the corn growing in their

Burn an Indian town.

fields; at which the country being incens'd the Admiral set sail from the island of Wokokon on the 21st of July, and arriv'd at Cape Hatteras, where GRANGANIMO, brother to King WINGINA, came on board the fleet, and had a friendly conference with the Admiral; after which the English landed on the island of Roanoak, in the mouth of Albermarle river. Here the fleet remained about six weeks, during which time Sir EDWARD GREENVILLE took a view of the neighbouring continent again, and made experiments of the goodness of the soil by several sorts of grain he sow'd, which came up very kindly during his stay there: And on the 25th of August he set sail for England, leaving one hundred and eight men upon the island of Roanoak, under the command of Captain RALPH LANE, with directions to make further discoveries, promising them such supplies and reinforcements as might enable them to subdue the neighbouring continent.

CHAP.
VII.

Sail to the island of Roanoak.

A colony of an hundred and eight men left there.

Sir EDWARD GREENVILLE was no sooner sail'd for England, but Mr. LANE made preparations with his boats (for I don't perceive one ship was left him) to discover the continent on the north and west; and to the north he view'd the coast from the island of Roanoak almost to cape Henry, at the entrance of the bay of Chesepeak, being about an hundred and forty miles, in which he met with no opposition from the natives; but afterwards communicating his design of making a discovery as far to the westward up the river Morotock, or Albermarle, to his friend King WINGINA, the sovereign of the opposite continent, that Prince was alarmed and gave notice to the neighbouring Princes, his allies, to be upon their guard; for the English intended nothing less, as he conceived, than to make an entire conquest of their country, and to extirpate the inhabitants, or to make them slaves; and orders were immediately dispatch'd through the whole country to carry off or destroy all their corn and provisions, and to retire from the banks of the river Morotock with their wives and families, that the English might find no subsistence.

Sir Edward Greenville returns to England. The English make discoveries to the northward.

Propose the doing the same to the westward, which alarms the Indians.

However, King WINGINA, or PAMISPAN, as he is sometimes call'd, still pretended great friendship for the English, and promis'd Mr. LANE to furnish him with guides in this expedition; and to incite him to undertake it, told him, there were great quantities of gold to be found towards the head of the river Morotock, about thirty or forty days journey to the westward, and that some few days march beyond the head of that river, they would arrive at a great ocean; for as the English had made WINGINA acquainted with their intended expedition, weakly imagining they should be supported in the enterprize by his advice and assistance; the penetrating Indian discerning that the principal views of the English were to rob them of their treasures, to make a conquest of the country, and find a passage to some ocean they apprehended lay west of Virginia, encourag'd Captain LANE to believe that their expectations would not be disappointed, but that they would find some gold or mineral like it in their mountains, and arrive at the ocean they mentioned within the space of forty days, where they would meet with pearls of an uncommon size; for he propos'd by such representations to draw the English far up the river into the inland country, where they would run a great hazard of being famish'd before they could get back to Roanoak; their fire-arms being such a terror to the Indian Princes, that they despair'd of overcoming these invaders but by some such stratagem.

A confederacy form'd against the colony.

Mr.

CHAP.
VII.

Mr. LANE not imagining King WINGINA, his Indian friend, had sagacity enough to discover the bottom of his designs, but still had the same friendship for the English he had hitherto professed, enter'd upon the expedition to the westward with the guides WINGINA had lent him; and not doubting but he should be able to purchase corn and flesh of the natives who inhabited the banks of the river Morotock, he took little provision with him; but to his great surprize he found the whole country abandoned, and that there was no food to be met with: And as he advanced he observed the natives made fires to give notice of his approach, and fled with all their effects. So that our adventurers, after they had rowed four days up the river, were reduced to great straits, having nothing left to subsist on but the flesh of two mastiff-dogs they killed. Whereupon they hastened to the mouth of the river again, to which they were by good fortune carried down in much less time than they went up, and arrived at the island of Roanoak on Easter-day, 1586; where they found WINGINA and his Indians, who still made great professions of friendship for the English, but immediately entered into another conspiracy with their allies to destroy them: And the first step WINGINA took towards it was to prohibit the natives to furnish the English with provisions; for want of which he was sensible they must divide themselves into several parties to procure food by hunting and fishing. Then he appointed a general rendezvous of the Indians near the coast, ordering them on the 10th of June, in the night-time, to embark in their canoes and make a descent on the island of Roanoak; at which instant he promised them to set fire to the huts of the English, and as they would be reduc'd to a small number by their sending detachments to the neighbouring islands in search of food, he did not doubt but the natives would be able to knock those on the head who remain'd at Roanoak, when they should run out of their houses naked and unarm'd to avoid the flames. But this conspiracy being discover'd to captain LANE by SKYCO, the son of MENATONON, an Indian Prince, with whom captain LANE had contracted an intimate friendship, the captain resolv'd to be before-hand with WINGINA, and on the last of May surprized him with several more of the Indian Chiefs, and cut them in pieces. And on the 8th of June following, Sir FRANCIS DRAKE arriv'd on the coast with a fleet of men of war under his command; which had been employed in attacking and plundering the Spanish towns and harbours in North-America.

The country destroyed and abandoned by the natives. The party sent on the discovery in danger of being starved.

A second conspiracy against them.

Admiral Drake arrives at Roanoak.

Takes up the colony and carries them home.

The Admiral being directed to give the colony at Roanoak all the assistance he could, agreed to leave with them a ship and some men and provisions, to enable them to make further discoveries on the continent; but understanding on what ill terms they were with the natives, and that it would be impossible to establish a colony there without a much greater force now the Indians were become their enemies, he ordered them to return to England the following August, which was no sooner agreed on than there arose a storm, in which the whole fleet was in danger of shipwreck, and the ship and provisions the Admiral had given them was driven out to sea and lost. Whereupon he thought fit to take Mr. LANE and his company to England with him; and thus ended the first attempt of Mr. RALEGH to settle a colony on the American coast.

It was but a few days after Sir FRANCIS DRAKE had carry'd away Captain LANE and

his company from the island of Roanoak, before a ship arriv'd with men, ammunition, and provisions for the colony; but not finding any European there or in the adjacent islands or continent, they concluded the colony had been destroyed, and returned to England.

About a fortnight after the last ship had left the island of Roanoak, Sir EDWARD GREENVILLE arriv'd there with three ships, and a much more ample supply of ammunition and provisions, and made all the enquiry he was able after the colony, but could hear nothing of them; however, he left fifteen men, with ammunition and provision for two years, and returned to England.

In the beginning of the year 1587, Sir WALTER RALEGH fitted out three ships more, on board of which he put one hundred and fifty men, besides mariners, giving the command of them to Captain JOHN WHITE, whom he appointed governor, but added twelve assistants, incorporating them by the name of the Governor and Assistants of the city of Raleigh in Virginia. This little squadron set sail from Portsmouth on the 28th of April, 1587, and the 19th of June following made the Caribbee islands, landing the planters at the island of Santa Cruz to refresh them and take in fresh water: And re-imbarking their people three days after, they set sail again and arriv'd at Cape Fear (in Carolina) on the 16th of July, where they were in great danger of being cast away; for they did not see the cape till they were within a cable's length of it. From Cape Fear they stood to the northward, and arrived at Cape Hatteras, near the island of Roanoak, on the 22d of July; whereupon they sent a party of men to search the island of Roanoak for the fifteen men Sir RICHARD GREENVILLE had left there the year before, but could find none of them, nor any signs of their having been there, unless the bones of one man they supposed had been killed. But at the north end of the island they found the fort which had been erected by Captain LANE, and the first colony with several of their houses undemolished; the lower rooms however were over-run with melons, and deer feeding on them.

Sir WALTER RALEGH had ordered Captain WHITE and the colony not to fix themselves at Roanoak, but to sail northward as far as the bay of Chespeak, and erect a town there; but this was oppos'd by FERDINANDO the Spanish pilot, to whose care the fleet was committed, under pretence that it was too late in the year to look out for another port. Whereupon Governor WHITE and the rest of the planters determin'd to stay at Roanoak, and to repair the fort and houses they found there. They had not been on shore a week before Mr. GEORGE HOW, one of the court of assistants, stragling a mile or two from the fort, was desperately wounded with sixteen arrows by a party of Indians, who had concealed themselves in the reeds and flags by the sea-side, and seeing him disabled, they beat out his brains with their wooden swords and clubs.

On the 30th of July, twenty men, under the command of Captain STAFFORD, were detach'd to the island of Croatan, with MENTEO the Indian, whose mother and relations dwelt in that island, to enquire after the fifteen men, and to renew their ancient friendship with the people of that island. The natives seem'd at first prepared to oppose Captain STAFFORD's landing; but upon his marching towards them with his musketeers they fled: Whereupon MANTEO call'd to his countrymen, telling them the English came as friends; and

An Englishman surpris'd and killed by the Indians.

A detachment sent to Croatan.

CHAP. VII. and the Indians knowing his voice returned, and throwing away their bows and arrows, bid the Captain welcome, and afterwards conducted him to their town, entertaining him and his people in the best manner they could; but they desir'd the English would give them some badge or mark whereby they might be distinguished from their Indian enemies when they met with them out of the island, for want of which several of their friends had been hurt and wounded the year before by Captain **LANE** and his people. This Captain **STAFFORD** agreed to, and afterwards directed the Croatans to go over to the continent and acquaint the inhabitants of Secotan, Pomeiok, &c. that if they would accept of the friendship of the English, and enter into an alliance with them, all past injuries should be forgot, which the chiefs of the Croatans promised to do, and to return within seven days with the answer of the Weroances, or heads of those tribes (to which our adventurers were pleas'd to give the titles of Kings).

Some account of the fifteen English that were lost.

They understood also from the inhabitants of Croatan, that the fifteen men Sir **EDWARD GREENVILLE** had left at Roanoak the year before, had been surpris'd by the people of Secotan and some other Indian powers, who coming over to the island as friends, took an opportunity to set fire to their houses, and murdered some of them as they run out unarm'd to avoid the flames: However, eight or nine of the English escap'd to the water-side, and went over in their boat to a little island on the right-hand of Cape Hatteras; that the English some time after removed from the said island, but whither they went, or what became of them they could not tell.

An expedition against Secotan.

Captain **STAFFORD** afterwards returned, and acquainting governor **WHITE** with what he had done, it was resolv'd to wait seven days for the answer of the Weroances of Secotan, &c. before they enter'd upon further action. But the seven days being expired, and none of the Weroances of Secotan, &c. appearing, nor any answer to their message being brought by the men of Croatan, as they had promis'd, the Governor took four and twenty men with him, well arm'd, and went over to the continent on the 8th of August, in the evening, determining to be reveng'd on the people of Secotan and their allies for driving the fifteen English from Roanoak, and murdering Mr. How: And having been inform'd where one of their principal towns was, he attack'd it in the night-time, with an intent to destroy all the men in it; but instead of his enemies he found his friends of Croatan possess'd of the place, and hurt and wounded several of them before he discover'd his mistake; for the people of Secotan, after they had murder'd How, expecting this visit, had retir'd to the in-land country with precipitation, and left their corn, tobacco, and fruits behind them, which the people of Croatan had been gathering in: And this was the reason they did not return within the seven days, as they had promis'd. They readily acknowledged therefore that the mischief they had received was by mistake, and that they themselves were the occasion of it by not keeping their words.

The Indians on the sea-coast run away.

Manteo baptized, and made Governor of Croatan.

Governor **WHITE** being returned to Roanoak on the 13th of August, **MANTEO** the Indian was baptized, and constituted Lord of the island of Roanoak, and of the opposite continent of Desamongapeak, as Sir **WALTER RALEGH** had order'd; and on the 18th of the same month, Mrs. **ELEANOR DARE**, wife of Mr. **ANANIAS DARE**, one of the court of assistants, and daughter of Governor **WHITE**, was deliver'd of a daughter,

ter, afterwards baptized by the name of **VIRGINIA**. And now all the planters stores and provisions being landed, and the ships ready to sail, the colony determin'd to send back two of the court of assistants to England to solicit for further reinforcements and supplies, those they had with them not being thought sufficient to establish a colony on the continent, as the Indians were most of them their profess'd enemies. But at length it was thought most proper to depute Governor **WHITE** himself, who had the greatest interest at the court of England, and on whose diligence and application they could most rely: And with great reluctance he was prevail'd on to undertake this office, apprehending his reputation might suffer if he had left the colony and return'd to England before he had effected any thing.

CHAP. VII. Mrs. Dare deliver'd of her daughter Virginia.

Governor White sent to England for supplies.

Captain **WHITE** setting sail for England, arriv'd there at a time when the nation was alarm'd with the rumour of the intended Spanish invasion, which was attempted the following summer, 1588, to oppose which the Queen and the whole kingdom were employ'd, especially **DRAKE**, **RALEGH**, and the rest of the sea commanders. And as the state seem'd to be in imminent danger, all lesser enterprizes were neglected or postpon'd, and consequently Governor **WHITE**'s application in behalf of the unhappy colony he had left in America was very little attended to, insomuch that he was not able to obtain leave for any ships to be sent thither till the beginning of the year 1590: And then all that he could procure was an order that three small men of war, which were going to cruize against the Spaniards in the West-Indies, should take some re-inforcements and provisions on board for the colony at Roanoak; which order they were far from obeying as they ought to have done, for they only took Governor **WHITE** on board, refusing to carry either planters or provisions thither. Sir **WALTER RALEGH** either had not interest enough at this time to cause his orders to be obey'd, or was employ'd in enterprizes wherein he expected to acquire more wealth or glory than in supporting his Virginian colony, which occasioned his neglecting those unfortunate people who had been induc'd to hazard their lives and all that was dear to them in his service.

White arrives in England a little before the Spanish invasion in 1588.

Above two years before he could get any ships sent to Roanoak.

Mr. **WHITE** relates, that the commanders of the men of war with whom he went to America, having spent most of the summer in cruizing among the Spanish islands, did not arrive at Roanoak till the middle of August, 1590; and that searching the island of Roanoak they found, by some inscriptions cut on the trees and beams of the houses, that the colony was removed to the island of Croatan. But before they removed they had buried their chests, and great part of their effects, which the Indians afterwards dug up and spoiled. Governor **WHITE**, with much importunity, procur'd the consent of the Captains of the men of war to follow the colony to Croatan: But the weather growing tempestuous they were in great danger of shipwreck, and lost most of their anchors and cables. Whereupon they sail'd directly to England, and left the colony to shift for themselves; and whether they were famish'd, or cut in pieces by the Indians, or perished in attempting to get home by sea, I could never learn, for they have never been heard of from that day to this. This must render people exceeding cautious how they engage in such enterprizes on the faith and promises of courtiers to support them. The safety of the state, a project of more importance, or the prospect of gaining greater treasures another way,

The colony removed to Croatan.

Where they perished, being abandoned by Sir Walter Raleigh.

CHAP. way, are too often thought sufficient reasons for
VII. abandoning our distressed friends: And indeed, during the year 1588, when the whole kingdom was at stake, there might be some colour for Sir WALTER's not sending re-inforcements to his colony; but when that was over, and an invasion no longer feared, he might, one would have thought, have cast an eye towards a company of men who had run the greatest hazard, relying upon his word and honour to sustain them. He might, surely, have re-inforced his colony, or brought them back, considering the figure he then made in the court of England and royal navy: But I doubt, the capture of the galleons, the plunder of Cades, and the gold-mines of Guiana, which he went in search of soon after, put the Virginian colony too much out of his head, after he found himself disappointed in his principal view of possessing mountains of gold in Virginia.

Sir Walter charged with levity as well as avarice.

Goes in search of other gold mines at Guiana.

Sir WALTER also seems chargeable with levity as well as avarice, since after he had obtained the property of Virginia by letters patents from Queen ELIZABETH, and had sent several colonies thither, he became in a short time so regardless of that country, or the fate of those who had embarked in that enterprize in confidence of being supported by him, that he went in search of other gold-mines in Guiana, the magazine of all rich metals (as he terms it) and made some voyages in person thither, in which he was however miserably disappointed, and discovered great weakness and credulity in the accounts he had left behind him of that country; for he was made to believe there was more gold and precious stones in Guiana than in Mexico and Peru; though it appears there is less of either there than in any part of Spanish America. He was made to believe also that one of the nations of Guiana were a headless people, and that their mouths were in the middle of their breasts, and their eyes in their shoulders; of which he tells us, there was no doubt to be made, he having been assured of it from a cloud of witnesses. Whatever prudence and conduct Sir WALTER may have discovered on other occasions, the prospect of gold-mines and mountains of precious stones he expected to find in Guiana seem to have disordered his brain to a very great degree; for after repeated disappointments, he never desisted his search, until at length it prov'd fatal to him.

PURCHASE indeed relates, that while he was endeavouring in person to discover the gold-mines of Guiana, he did order some vessels to enquire after his colony at Roanoke, but was deceived by those he employed, who never went the voyage, except one MACE, who undertook it in the year 1602, and was killed by the natives on his going on shore with several of his crew, the rest escaping with difficulty.

Thus it appears but too evident, that Sir WALTER RALEGH's expectations of discovering immense treasures in Guiana were in a great measure the ruin of our first attempts to settle colonies in Virginia.

He seems in raptures when he first visited those shores, which he endeavours to make his friends believe were all gold and precious stones.

I am assured, says Sir WALTER, by such Spaniards as have seen Manoa, the imperial city of Guiana, and which they (the Spaniards) call El Dorado, or the Golden-city, that for the greatness, the riches, and excellent situation, it exceeds all the world. All the vessels and utensils of the Emperor's house are of gold and silver, with statues of gold resembling giants. There are also
VOL. III. NUMB. CXXX.

the figures of all animals, beasts, birds, and fishes, CHAP. as big as the life. There is not any vegetable but VII. they have the figure of it in gold; and golden-billets lie piled up on heaps, in imitation of fire-wood. And in another place he relates, that there were mountains of diamonds in Guiana; which it is evident he believed himself, though in fact there was never any such city as Manoa, or such an Emperor as he mentions, and very little gold to be met with in Guiana, as the French and Dutch will inform us, who have settlements in that very country, which he places between the equator and five degrees of north latitude, or between the rivers Oronoque and Amazon. However, his expectations of finding it what he describes was no doubt the reason of his neglecting those colonies which he had sent to Virginia: That he was conscious of the distress they must be reduced to appears by his telling the Spaniards, in one of the voyages he made to Guiana, that he was bound for Virginia, to relieve the people he left there: And he informs us, that he had an intention to have visited them in his return from Guiana, if the winds had favoured him.

And it is not the most improbable conjecture, that the reason Queen ELIZABETH did not assist him with her ships and forces to subdue this golden country, as he had represented it to be, was, that he had deceived her once before, by representing Virginia as such which he now neglected. She had found his weak side. She discerned his avarice and credulity, and did not think fit to hazard her ships or subjects until she had better proofs of the reality of those treasures. These are some of the reasons that this Princess made no further attempts to settle colonies in America in her reign, though she lived a dozen years or more after WHITE's last expedition to Virginia. She was too wise a Princess to be deceived twice by one person in the same case, and no private adventurers would undertake to send colonies thither after they saw such a body of men abandoned by their employers.

As Sir WALTER himself observes, it was the hopes of gold that was the principal and almost only motive to these undertakings. Our people had observed the success of the Spaniards, and imagined that gold and silver-mines were as common in America as Lead-mines are in Europe. The first adventurers, whether English or Spanish, had no view or thought of finding any thing else in that new world but gold and silver, that would answer the expence and hazard of such voyages. They did not dream at that time, that the Virginian tobacco would be as profitable as a gold-mine, as we found it afterwards to be, when we purchased with it most of the merchandize of Europe as with ready money. Nor did they foresee that extensive and profitable traffick that is now carried on between Europe and the plantations; which is, in reality, a greater advantage to some powers than the mines of Peru and Mexico are to the Spaniards.

I have been the more particular in this part of the history relating to the first attempts of the English to settle colonies on the coast of Virginia, because I find Colonel BEVERLEY and Mr. OLDMIXON, who have written the history of it, have omitted many material facts, and do not seem to have entered into the real motives of deserting that enterprize in the reign of Queen ELIZABETH.

Mr. OLDMIXON also has committed some mistakes in the short relation he gives us; for first he tells us, that several of the colony left at Roanoke, under 17.

CHAP. VII. under the command of Captain LANE, were cut off by the natives, whereas there was not one of Captain LANE's men killed by them. He adds also, that they remained at Roanoak until August, 1586, when it appears Sir FRANCIS DRAKE took them on board in June 1586, and carried them to England.

He makes Captain WHITE to constitute a government, consisting of a Governor and twelve Counsellors, whereas WHITE himself was appointed Governor by Sir WALTER RALEGH, and twelve Assistants given him before he left England, who were incorporated by the name of the Governor and Assistants of the city of Raleigh in Virginia.

He relates, that Mrs. DARE, who was delivered of the first child on the coast of Virginia, was the daughter of Mr. ANANIAS DARE; but it seems she was the daughter of Governor WHITE, and wife of Mr. DARE, one of the court of Assistants.

The colony is likewise represented to be in great distress before Governor WHITE returned to England, whereas he did not remain at Roanoak above two or three months at most, returning to England the latter end of the year 1587, in which time the provisions they carried with them could not be spent; and it appears to have been Autumn, when the corn and fruits were ripe, of which they received large supplies from the continent while Governor WHITE was there, and had then plenty of fish upon the coast. The reason of sending Governor WHITE to England was to procure a reinforcement of troops, and supplies of ammunition and provisions, without which it was foreseen they could not establish themselves on the continent, as they were then in a state of hostility with the Indians, who would neither treat or traffick with them after they found the English intended to usurp the dominion of their country, and had taken upon them to put to death some of their Weroances or great men.

Mr. OLDMIXON relates also, that after two years, Governor WHITE procured three ships to be fitted out with men and provisions for the colony of Roanoak; whereas, according to Mr. WHITE's own account of that matter, all that he could procure of the government was, to permit three men of war, which were going to cruize in the Spanish West-Indies, to call at Roanoak, and complains that they refused to take either men or provisions on board, and would not so much as let him carry a servant with him.

Mr. OLDMIXON adds, that the misfortunes of this colony were the occasion that no further attempts were made to plant Virginia in this reign; whereas it is agreed on all hands, that no body knew what their fate was until a great while afterwards. Sir WALTER did not suppose the Virginian colony was lost in the year 1594, for in that very year he tells us, he had some thoughts of calling on them in his return from Guiana; and PURCHASE observes he sent a bark to enquire after them so late as the year 1602.

An enquiry by what right Christian Princes invade Pagan countries. Give me leave, before I proceed further in this history, to make some reflections on that authority Christian Princes and States have heretofore assumed and exercised (and which some still claim) of invading and usurping the dominion of all infidel nations, and treating the natives as their slaves and vassals, and to consider the right they pretend to of excluding both Christians and Pagans from all countries whither they have sent any colonies.

CHAP. VII. The Pope seems first to have assumed an authority of disposing of such countries as were in the possession of Infidels or Hereticks by virtue of the powers he pretends to derive from JESUS CHRIST: And in this all Christian Princes appear to have acquiesced when he granted the east to the Portuguese and the west to the Spaniards. No European power pretended to disturb either of those crowns in the enjoyment of what they possessed themselves of in the heathen world for many years. But the Pope's power of transferring infidel kingdoms to whom he pleased was no sooner called in question than every sovereign Prince in Europe assumed the like authority, and in all their patents for discovery granted their subjects the dominion and property of every Pagan country they should invade; being induced to it, I presume, by the Turkish maxim, that dominion is founded in grace, or in other words, that unbelievers could have no right to this world any more than the next. This seems to have been the universal opinion of both Protestants and Papists when Queen ELIZABETH granted Sir WALTER RALEGH a patent to subdue and govern those Pagan countries he should discover; the tenour of that patent implying as much: though, at this day, we are generally agreed, that Christian Princes have nothing to do to invade or enslave Heathen nations, but that Pagan Princes and States have as good a right to their countries, their liberties and possessions as the best and most powerful Christian Monarchs have to their dominions in this part of the world; and consequently all the invasions and usurpations that have been made upon the Heathen world by Christians were unjust, and the conquest of them upon such unjust grounds could give none of them a right to the territories of those Pagan powers, or to the properties of their subjects, so long as there were any heirs remaining to claim their respective rights; which the Spaniards, Portuguese, and Dutch, seem to have been so conscious of, that they in a manner extirpated the nations they conquered to defeat all prior claims, and thus by excess of villainy have, as they imagine, derived a right to themselves by way of occupancy: The possessor being deemed by some to have the best right where none can shew a better, especially after a long and uninterrupted possession. But this can never be sound doctrine surely in regard to kingdoms, inasmuch as it encourages wicked usurpers to be still greater villains in order to establish themselves. One would rather be inclined to believe that any neighbouring nation had a right to such ruined and abdicated kingdoms, and that it was incumbent on all other powers to unite in driving the usurper from a country he had thus barbarously invaded and destroyed.

On the other hand it is said, that America was but thinly inhabited in comparison of this part of the world, and there was room enough both for them and us: That no Prince or private man can have a right to exclude all others from a country too large for the present possessors to enjoy or cultivate: And that by teaching the natives husbandry and other arts, we shewed them the way to live elegantly, and to make five hundred acres of land of more value than twenty thousand, which were before nothing but bogs or forests, and inhabited by wild beasts more than men. It could never be the design of the creation that the earth should remain the property of a few huntsmen, unimproved and uncultivated, as America must have done if the Europeans had been excluded from sending colonies thither.

CHAP. VII. To this it is reply'd, that we ought not however to have intruded ourselves by force to the prejudice of the original inhabitants, but to have proceeded in the method some of the ancients did. We ought to have insinuated ourselves into their good opinion, to have shewn them the beauty and the excellence of the Christian religion, and the benevolent principles it taught: We ought to have convinced them how beneficial the European arts and sciences would be to them and their country, and then we should not have failed of being received with kindness, and even veneration, as CERES and BACCHUS anciently were: We should have been looked upon as good angels, or at least as the great benefactors of mankind; and admitted and even invited to share their country with them for the sake of the improvements we might make in it. But admitting we had a right to fix ourselves in any vacant parts of America, we certainly could have none to drive the natives from the rest, and insult and tyrannize over them: And I have not observ'd any instance from our first attempts to settle colonies there to this day, where we have treated the natives with humanity and benevolence, but they have been ready to resign to us as much of their respective countries as we could plant and cultivate, upon very moderate considerations.

And as for that other piece of tyranny so generally practis'd by the Spaniards, Dutch, and Portuguese, namely, the excluding the natives from conversing or trafficking with any other people but their own, and the debarring all other nations from entering their ports, I cannot see the justice of it. Every free people in this part of the world have certainly the liberty of trading with those of another without asking leave of the Spaniards or the Dutch, notwithstanding those powers may have colonies in some part of the said continent or islands. How their possessing a town or two upon the Indian coast can give them a right of excluding all other European nations from resorting thither and trafficking with the natives, or what right any European powers can have to lie with their ships before the Indian harbours, and to oppose and even murder the natives for attempting to sell the produce of their country to foreigners, as the Dutch do in the East-Indies, and the Spaniards in America, is not easy to conceive.

Such reflections as these are not only natural but unavoidable upon enquiring into the original of our American colonies.

I proceed now to the remaining part of the Virginian history; and though I cannot approve the conduct of our nation in all places, yet it will appear that we have us'd less violence and oppression in the settlements we have made than any other nation, and in many places have fairly contracted with the inhabitants for what we have obtained, and given them what they esteem'd a valuable consideration for the lands they transferred to us.

In the year 1607, on the 20th of March, Captain GILBERT also sail'd from Plymouth with thirty-two mariners and landmen; the landmen being commanded by Captain GOSNOLD, and assigned for a colony. They arriv'd in that part of Virginia now call'd New-England, being in 41 degrees north latitude, on the 14th of May following; where there came on board them several of the natives in an European boat, some of them also being clothed like Europeans, the boat and cloaths having been given them by some fishermen who were off Newfoundland; but

most of them had mantles of Deer-skins. They afterwards sail'd to the southward, and came to a promontory call'd Cape Cod, from the shoals of Cod-fish they met with there, and that name it retains to this day. Here Captain GOSNOLD went on shore, and found Peas, Strawberries, and other fruits growing, and saw a great deal of good timber. They sail'd from this point to the southward, and arriv'd at another promontory, which they call'd Gilbert's Point, the name of the captain of the ship, the shores appearing full of people. Some of them came on board, and tho' they were peaceable enough, they were observ'd to be thievish. The English afterwards bending their course to the south-west, they came to an uninhabited island in 41 degrees, to which they gave the name of Martha's Vineyard; and to another island, a little further to the southward, they gave the name of Elizabeth Island, and these islands are still call'd by those names.

Upon Elizabeth Island, lying about four miles from the continent, Captain GOSNOLD propos'd to settle with his little colony, and to that end went on shore there on the 28th of May. He found the island cover'd with timber and underwood, among which were oak, ash, beech, walnut, hazel, cedars, cypress, and sassafras. And as to fruits, here were cherries, vines, gooseberries, strawberries, raspberries, ground-nuts, and Peas; and also variety of roots and salad-herbs. Here, in the middle of a fresh water lake, which surrounded a little rocky island, containing an acre of ground, they began to erect a house and fort capable of receiving twenty men,

A fort erected by the English

While this was doing, Captain GOSNOLD sail'd over to the continent, where he found a great many people, and was treated very courteously by them, every one making a present of what he had about him, such as skins, furs, tobacco, chains and necklaces of copper, shells, and the like for which the English gave them some toys, and returned to their fort.

Two or three days afterwards, one of the Indian Chiefs, with fifty stout men armed with bows and arrows, came over from the continent to the island in their country boats, and there being then but eight Englishmen on shore, they stood upon their guard until the natives gave them to understand they came in a friendly manner to visit them. Whereupon they were invited to eat and drink, and sat down to dinner with the English on their heels, expressing a great deal of good humour. The Indians made them another visit two or three days after, when they behaved themselves very peaceably also; but one of the natives having stolen a shield, was made to return it, and they seem'd apprehensive the English would revenge it; but finding them still easy and sociable, they were merry together, and parted again in a friendly manner. But as two of the English were straggling by the sea-side two days after, to get Crabs, four Indians attacked them, and wounded one of the English with an arrow; whereupon the other Englishman disarm'd the aggressor, and the rest run away. This seems to have been the only quarrel there was between the English and the Indians in this voyage; however, the colony which was design'd to be left there, who were twenty in number, being apprehensive it would be difficult for them to subsist till supplies and re-inforcements came from England, if the natives should prove their enemies, especially as their provisions, upon examination, appear'd much shorter than was expected, it was resolv'd to abandon their little fort

in the island, and return (all of them) to England. Having therefore taken on board some Cedar and Sassafras, Beaver-skins, Deer-skins, black Fox-skins, and other peltry they had receiv'd of the natives for the goods they carry'd thither; they set sail from the island of Elizabeth on the 18th of June, arriving at Exmouth in Devon, on the 23d of July following, without having lost one man; but they made no attempt to find their unhappy countrymen, who had been left at Roanoak, in the year 1587.

The next year (1603) the reverend Mr. HACKLUIT, Prebendary of the Cathedral of Bristol, a gentleman of an enterprising genius, who compiled the first collection of voyages that ever was published in English, having convers'd with some of the last adventurers, propos'd to the merchants of Bristol the sending some ships on the same voyage; which they consented to, and he agreed to become an adventurer with them: But as Sir WALTER RALEGH had a patent for the planting Virginia, it was thought proper to send Mr. HACKLUIT and some others to him to obtain his leave for making the voyage; which he readily granted under his hand and seal, together with all the profits they should make by it, having no longer any thoughts of planting that country himself.

Being thus authoris'd to traffick to Virginia, our adventurers fitted out a small Vessel, called the Speedwell, burthen fifty ton, and man'd with thirty hands, of which MARTIN PRINCE, an expert mariner, was appointed commander. They also sent another small bark with him of twenty-six ton, and carrying fourteen hands; both which vessels being victual'd for eight months, they put on board a cargo consisting of cloathing both Linnen and woollen, hats, shoes, stockings, carpenters tools, implements of husbandry and gardening, looking-glasses, pins, needles, thread, and other haberdashers wares; knives, scissars, fish-hooks, bells, beads, and other glittering toys, which they apprehended most acceptable to the Indians; with which they set sail from King's-Road, near Bristol, on the 20th of March, 1603-4; but being put back by contrary winds, they run into Milford-Haven, where they lay till the 10th of April (in which interval they heard of the death of QUEEN ELIZABETH, that happen'd on the 24th of March 1603-4) when setting sail again, they arriv'd on the coast of Virginia (now New-England) in 43 degrees north latitude; from whence they bent their course south-west till they came into 41 degrees, and going on shore there, cut a good quantity of Sassafras and carried it on board; but lest they should be surpris'd in the woods by the natives while they were at work, they erected a little fort or redoubt, wherein they left their effects and four or five men to guard them while the rest were at work. The natives came and traffick'd with the English, forty or fifty in a company, and sometimes upwards of an hundred, who eat and drank and were very merry with our adventurers, especially when they observ'd a lad in their company playing upon a Guittar. They would get round about him, and taking hands, dance twenty or thirty in a ring, after the American manner. Our adventurers observ'd, that the natives were more afraid of two mastiff Dogs they carried with them than of twenty men; and when they design'd to get rid of their company they let loose one of these Mastiffs; whereupon the natives would shriek out and run away to the woods; but 'tis probable this usage, and the erecting a fortification in their country, made the Indians at length look upon the English as their enemies;

for our adventurers inform us, that a party of CHAP. VII. Indians came and surrounded their fort a few days after, when most of them were absent, and would probably have surpris'd it, if the Captain of the ship had not fir'd two Guns and alarm'd the workmen in the woods, who thereupon return'd to the relief of the fort. The Indians pretended indeed they had no hostile intentions; but our people never cared to trust them afterwards. And the day before the English embark'd, the natives came down again in great numbers and set fire to the woods where they had cut the Sassafras; which 'tis probable, was designed to let the English know, they would preserve nothing in their country which should invite such guests to visit them again; for no doubt the great guns and fire-arms had rendered the English very terrible to them as well as their dogs.

As to the produce of the soil, Captain PRINCE made the same observations as Captain GOSNOLD had done in the former voyage, adding, that the natives wore their hair tied up and adorned with a great many feathers, flowers, and glittering toys; and that the men had nothing before their nudities but a piece of skin of a hand-breadth, which was fastened to their girdles before and behind, and brought between their legs; and to these girdles, which were made of Snake-skins, they also hung their Tobacco-pouches. They saw but two of their women, who wore aprons made of skins that reached down to their knees, and had mantles of bear-skins, which they hung on one shoulder. Their boats were made of the bark of the birch-tree, much of the form of ours, but larger, and sewed together with Osier-twigs, the seams being covered with a kind of rosin or turpentine of a very fragrant smell: And these vessels were so exceeding light, that one of them, which would carry nine men, did not weigh sixty pounds.

The latter end of July, our adventurers loaded their least bark with sassafras, and sent her home to England; and on the 9th of August they set sail with their other ship, having gotten a cargo of skins and furs, for which they truck'd away the cloathing and hard ware they carried thither. They arrived at the soundings, in the chaps of Pringe the chanel, within five weeks after they left the coast of Virginia, where they met with contrary winds, so that they did not come to King's-Road till the 2d of October, 1604; the Speedwell, the biggest ship, having been out six months in this voyage, and the least ship, called the Discoverer, five months and a half.

In the year 1605, two enterprising noblemen The Lords (viz.) HENRY Earl of Southampton, and THOMAS South- Lord Arundel, equipp'd a ship called the Archangel, and gave the command of it to Captain ampton and Arundel send a ship to Virginia. Captain Weymouth's voyage. GEORGE WEYMOUTH, who set sail from the Downs on the 31st of March, and came upon the coast of Virginia, or rather New-England, on the 14th of May following, being then, as he found by observation, in 43 degrees of north latitude. From whence he stood to the southward, and arrived at a good harbour, not far from the mouth of HUDSON's river, in 41 degrees odd minutes; and because they discovered this harbour on Whit Sunday they gave it the name of Pentecost Harbour.

Here they traded with the natives to great advantage, getting forty Beaver-skins for the value of five shillings in knives and other cutlers wares. Several of the Indians came on board and were entertained, and some of the English went on shore, and lay in the Indian houses all night; but always took that caution to keep some of the natives

CHAP.

lish.

tives on board as hostages; and these people not using the like caution, when the English had finished their business they surprised three or four of the natives and detained them on board, resolving to carry them to England; of which their friends being apprized, used various stratagems to make reprisals by taking some of the English, but had no opportunity; for our adventurers never went on shore afterwards, but in a body and well armed, nor would they venture far into the country, having discovered an ambush of several hundred Indians that lay ready to intercept their retreat; whereupon our adventurers cry out mightily of the treacherous disposition of the Indians; whereas they themselves were much more guilty of treachery in surprising and running away with several of the natives. It was natural to expect the Indians would revenge this piece of violence if they could have met with an opportunity, either upon themselves or the next Europeans that visited their coast, and whenever they have upon the like provocations endeavoured to do themselves justice, our people never fail to exclaim against the treachery and barbarity of the Indians, who have much more reason to complain of the Europeans for their invasions and treachery than we have to exclaim against them for retaliating such injuries.

Captain
Wey-
mouth re-
turns to
England.

There happened nothing more worth mentioning in this voyage, but that our adventurers having made a very good market, set sail for England on Sunday the 16th of June, and made the islands of Scilly, near the land's end of England, on the 16th of July following.

The enterprizing and mercantile part of the nation being by this time sufficiently apprized that a very advantageous commerce might be carried on with North-America, tho' they should not meet with gold and silver, as the Spaniards had done in that part of the world, and Sir WALTER RALEGH's patent being forfeited by his attainder in the first year of this reign, several gentlemen and merchants petitioned his majesty King JAMES I. for a patent to enable them to raise a joint stock, in order to settle colonies in Virginia, observing that this could never be done effectually but by a company or corporation.

King
James's
patent for
planting
Virginia.

Whereupon King JAMES, by his letters patents, dated the 10th of April, 1606, reciting, that Sir THOMAS GATES and Sir GEORGE SUMMERS, Knights; RICHARD HACLUIT Clerk, Prebendary of Westminster, EDWARD-MARIA WINGFIELD, THOMAS HANHAM, and RALEGH GILBERT, Esquires; WILLIAM PARKER and GEORGE POPHAM, Gentlemen, and divers others, his loving subjects, had petitioned him for leave to send colonies to Virginia, and such other parts of America, as either appertained to this crown, or which were not actually possessed by any other Christian Prince or people, and lying between 34 and 45 degrees of northern latitude, and within an hundred miles of the sea-coast; and for the speedy accomplishment of the said plantation, intended to divide themselves into two several companies, the one consisting of the adventurers of the city of London, who were desirous to fix themselves between the 34th and 41st degrees of north latitude; and the other, consisting of the adventurers of the cities of Bristol and Exeter, and the town of Plymouth, who were desirous to settle between 38 and 45 degrees on the coast of Virginia in America. His Majesty, in order to promote so noble a work, which might tend to the glory of God by propagating the Christian Religion among the Infidels and Sav-

VOL. III.

ges, and bring them to humanity and civility, did graciously accept their petition: And for himself, his heirs and successors, did grant and agree, that the said Sir THOMAS GATES, Sir GEORGE SUMMERS, RICHARD HACLUIT, and EDWARD-MARIA WINGFIELD, adventurers of the city of London, and all others that should associate with them, should be called the first colony, and might begin their first plantation at any place upon the said coast of Virginia or America, where they should think fit, between 34 and 41 degrees of latitude; and should have all the lands, woods, rivers, ports, fishings and hereditaments whatsoever to the same belonging or appertaining, from the first seat of their plantation for fifty miles either way along the coast north and south, and an hundred miles to the westward within land, with all the islands over-against the said coast, for the space of an hundred miles at sea, with all the lands, ports, rivers, harbours, fishings and mines thereto belonging or appertaining; and liberty to build, plant, and fortify thereon: And that no other subjects of this crown should be permitted to settle themselves on the lands to the westward of this colony without their leave. And his Majesty did grant to the aforesaid THOMAS HANHAM, RALEGH GILBERT, WILLIAM PARKER, and GEORGE POPHAM, of the cities of Bristol and Exeter, and town of Plymouth, in the county of Devon, and all others that should associate with them, that they should be called the second colony, and might begin their first plantation upon the said coast of Virginia or America, where they should think fit, between 38 and 45 degrees of latitude, and enjoy all the lands, ports, rivers, fishing, and hereditaments thereto belonging, with the like extent of land and sea from the seat of their plantation, as was granted to the first colony.

And it was provided, that the respective colonies should not plant within the space of one hundred miles of each other.

That each company should have a council consisting of thirteen persons, in whom the government should be lodged; but limited by certain articles under the privy-seal.

They were impowered also to dig mines in and beyond their respective limits to the west-ward, paying the crown a fifth of all gold, and a fifteenth of all copper-ore they should get. They were also impowered to seize all ships that should trade within their respective limits, to coin money, raise forces for their defence, &c.

The London adventurers, or the first company, were no sooner authorized to send colonies to Virginia by this patent but they fitted out three vessels, (viz.) one of an hundred tons, another of forty, and a pinnace of twenty tons, in which were sent an hundred and ten land-men, with arms, ammunition, tools and implements for building, fortification and tillage, cloathing, toys, and other merchandize, to traffick with the Indians, and every thing proper for a colony: The command of this little squadron being committed to Captain CHRISTOPHER NEWPORT, an excellent seaman, and one who was used to West-India voyages; but the orders for the government of the colony, and the names of the members of the council, who were to have the administration of affairs when they arrived in Virginia, were sealed up, and directed not to be opened until they went on shore.

They set sail from London on the 20th of December, 1606, but the wind not being favourable, they made it the 5th of January before they

London adven-
turers.

CHAP.
VII.

reached the Downs, and were detained here and upon the coast of England several weeks more. After which they bent their course to the Canary Islands, where they took in fresh water, and then sailed to the Caribbee Islands, where they arrived on the 23d of February. They set their men on shore on several of these islands, and remained amongst them a month and upwards, but chiefly on the island of Nevis, where their men lived upon the provisions they found in the island.

On the 3d of April they set sail from Nevis, and on the 29th of the same month discovered the land of Virginia, and the same day were so fortunate as to enter the bay of Chesapeake, between the two Capes; the southermost of which they named Cape Henry, and the northermost Cape Charles, in compliment to the two Princes, the King's sons; which Capes are about seven leagues (not nine leagues, as I said by mistake in describing their situation) asunder.

They could not possibly have found a better place for their purpose (tho' they were driven thither by a storm, and hit upon it by accident) there being more commodious rivers and harbours in this bay than in any part of North America; the want whereof, in a great measure, defeated Sir WALTER RALEGH's attempts of settling colonies on this coast.

They land
at Cape
Henry, in
37 degrees
north lati-
tude.

A skirmish
with the
natives.

They landed first on the south side, near Cape Henry, which lies in 37 degrees north latitude, and found it a very fruitful and delightful country; which while some of the gentlemen were taking a view of with uncommon pleasure after the fatigue of a tedious and tempestuous voyage, they fell into an ambuscade of Indians, who shot a shower of arrows from the woods and desperately wounded two of the English; but upon the firing a volley of small shot they took to their heels and fled, giving notice by fires from place to place of the arrival of our adventurers.

Point
Comfort.
Possession
taken of
the coun-
try.

The water, upon founding the south side of the entrance of the bay, being found so shallow that their ships could not come near the shore, it was resolved to try the opposite coast, where they found the chanel close to the land to be eight or ten fathom deep. Whereupon they named that point of land Point Comfort, and brought their ships thither, having the day before erected a cross at Cape Henry, and formally taken possession of the country in the name of King James I.

The Eng-
lish enter-
tained by
the na-
tives.

At their landing on Cape Comfort, five of the natives appear'd at a distance, and seem'd very much afraid of the English, till Captain NEWPORT made signs of peace and friendship, when they laid down their bows and arrows, and came forwards with a great deal of courage, inviting the English to their town, which they pointed to, and call'd by the name of Keccughan; and a party of our adventurers going thither with them were entertain'd very hospitably. They brought them also pipes and tobacco to smook, and danced and sung after the manner of their country, to divert their new guests; of whom, however, they seem'd to have some apprehensions, for when the English first came to the town, they set up a lamentable howling, and laying their faces on the ground tore it up with their nails; which the English then look'd upon as some religious ceremony, but I am apt to think, by their howling and gestures, they rather express'd their fears that those foreigners would one day subdue their country, being acquainted with the execution they had done with their fire-arms in the first encounter they had with their countrymen on the other side the bay. The entertainment being ended, Captain

NEWPORT made the natives some presents of beads and other toys, and then return'd to his ship.

CHAP.
VII.

As to the colony, the first business they enter'd upon after they landed was to open their orders, where they found the following gentlemen appointed of the council (viz.) BARTHOLOMEW GOSNOLD, EDWARD WINGFIELD, CHRISTOPHER NEWPORT, JOHN SMITH, JOHN RATCLIFFE, JOHN MARTIN, and GEORGE KENDALL, of whom WINGFIELD was chosen President, but they thought fit to leave Captain SMITH out of the council; for it seems the rest of the gentlemen were so set against him that they had confined him prisoner ever since their leaving England; which PURCHASE insinuates was occasioned by their envy at his superior talents, and because the company in England seemed to rely more on his skill and experience than on any of the rest: And it appears, that the planters themselves were so convinced of his abilities afterwards, that they were obliged not only to admit him into their council, but in a manner to resign the administration into his hands, after they had by their perpetual jarra and weak management almost ruined the company's affairs. To proceed.

On the 4th of May, Captain NEWPORT had an interview with one of their Weroances, or Kings, as the English call them, named PASPAHE, and the day following with RAPAHANNA, the Weroance or Chief of another tribe, who invited the English to his town, and treated them handsomely. The next three or four days they sailed up the river Powhatan, to which they gave the name of James river, in search of a proper place to settle the colony; and having pitched upon one between forty and fifty miles from the mouth of the river, they landed all the men there that were intended to be left in the country, and began to erect a slight fort, which they barricadoed with trees, and built some few huts, to which they gave the name of James town.

The place they chose was a peninsula, two thirds thereof being encompassed by the river Powhatan, and the other third by a small narrow river, capable however of receiving vessels of an hundred tons almost as far as the main river, and at spring tides it over-flows and runs into the river Powhatan, making the place a perfect island, containing about two thousand acres of firm land, besides, a great deal of marshy ground; which situation was looked upon as a great security against the attacks of the Indians.

The colo-
ny fix at
James
Town.

The very first night the English landed, the natives surrounded the island with their canoes; but finding our adventurers upon their guard and ready to receive them, they fled. On the 18th of May, the Weroance PASPAHE, in whose country they were settled, came to their quarters, attended by an hundred armed Indians; and observing the English stand to their arms, would have had them laid them down; but the colony apprehending he had some hostile intentions, refused, and one of his company stealing a hatchet, the person from whom he took it struck the savage, and took it from him; whereupon his countrymen were preparing to revenge the affront, and the English to defend their companion, when the Weroance suddenly rose up and departed in a great rage: However, he sent a buck to the fort as a present soon after, and pretended to be their friend, offering them as much of his country as they desired for a plantation; but I find the colony remained jealous of this Weroance, suspecting he only waited for an opportunity to surprise them.

On

CHAP. VII. On the 15th of June, 1607, their fort was finished, being of a triangular figure, with three bastions and four or five pieces of artillery mounted on each. And now they thought themselves strong enough to resist all the power of the natives. They planted also two pieces of ground on the peninsula with Indian corn to serve them the succeeding winter; and Captain NEWPORT, on the 22d of June, 1607, returned to England, leaving in the colony one hundred and four effective men, who soon began to find the want of the ships, from which they had hitherto purchased bread, flour, and strong liquors, and remained in pretty good health: But the fruits of the country being now the principal part of their food, and very little good liquor stirring, many of the colony fell sick of fluxes and fevers, and several died, among whom were Captain GOSNOLD, one of the council, and some other gentlemen of quality; and others were cut off by the natives in the woods, as they wandered in search of fruits or game, and the rest were in a manner shut up and besieged in their fort, where, with continual watching, bad diet, and want of good lodging, they were reduced to a very miserable condition, and by the month of September had buried fifty of the colony: The rest also had perished if the natives had continued their attacks; but it seems they were now become more pacifick, and consented to traffick with the English again, giving them venison, wild-fowl, corn, and other provisions for their merchandize. But every man endeavouring to under-sell his neighbour, and the Indians imagining they had been cheated and imposed upon therefore in their former bargains, broke off all commerce and intercourse with the colony again, and they were a second time reduced to a starving condition. Whereupon every one turned his eyes upon Captain SMITH as the only man that could extricate them out of these difficulties; and having deposed their president, they made choice of another, who committed the conduct of their affairs entirely to the Captain. This gentleman having made some addition to their fortifications, to secure the colony against the attacks of the Indians, and made their houses and lodgings more commodious, he took seven armed men with him in his boat, and went down the river in order to purchase corn of the more distant tribes of Indians, who refusing also to sell him any, he went to their houses and took their corn away by force. Whereupon three or fourscore of the savages assembled, and marching with their idol carried before them, charged the English with their bows and arrows. The Captain returned their compliment with a volley of his muskets, loaded with pistol shot. Whereupon they run away leaving their idol behind them; and this brought them to a capitulation, wherein they agreed, that upon restoring their God they would furnish them with as much corn as they wanted: And having loaded his boat, he returned in triumph to the fort, where he found the president and some others had formed a design to abandon the plantation, and return in the pinnace to England: But having now plenty of corn, and abundance of wild-fowl in the rivers, as the winter came on, these thoughts were laid aside for the present; and Captain SMITH proceeded on another expedition to make discoveries and bring in more corn for the colony, in which he had several successful encounters with the forces of the Werowance of Powhatan; but going on shore in a certain creek with only two of his men, he fell into an ambuscade of his enemies, the two men were killed, and himself falling into a bog was taken prisoner by APACONCANOUGH, POWHATON'S

general, and being brought before that Prince, **CHAP. VII.** he ordered his brains to be beaten out with clubs, an usual execution among the savages: However, his life was saved by the intercession of PACAHUNTA, POWHATON'S daughter, who was so enamoured with the Captain that she took him in her arms, and vowed she would die with him if he suffered, and at length prevailed upon her father not only to give him his life but his liberty, and furnish him with whatever he wanted; and the Captain returning to the fort was frequently visited by this lady, who revealed to him the stratagems of his enemies, and defeated the designs of the Indians against the fort, tho' 'tis said she was not more than fourteen or fifteen years of age when she transacted these affairs.

In the mean time the colony had laid another plot to abandon the plantation, which the Captain returned just time enough to prevent; but upon his arrival, POWHATON'S people bringing to the fort great plenty of corn, venison, wild-fowl, and all manner of provisions, all of them altered their minds, and determined to wait till they received fresh supplies from Europe: Nor was it long after Captain SMITH'S return to the fort before Captain NEWPORT came from England with supplies of men and provisions; but the Phoenix, commanded by Captain NELSON, which came in company with him till they made the land of Virginia, was driven back as far as the Caribbee Islands by stormy weather, and did not arrive at James Town till some time afterwards.

Captain NEWPORT had received directions from the company in England to endeavour to cultivate a friendship with the Indian Princes, and particularly with POWHATON, who is stiled Emperor by our adventurers, the rest paying him some kind of homage, tho' all of them seem to have been sovereigns in their respective territories.

To POWHATON, therefore, the company sent a crown of gilded copper, a bed, and chair of state, with robes and other ensigns of majesty, ordering the colony to see him solemnly crowned, upon condition that he would acknowledge the King of Great-Britain his sovereign, without resigning however any part of his dominions to him or his subjects, except what they should purchase of him or his vassals for a valuable consideration; which POWHATON agreeing to, Captain NEWPORT, and Captain SMITH marched with three or fourscore more of the colony to POWHATON'S capital, where they crowned and enthroned the Indian Monarch in the best manner their circumstances would admit of; and the other Princes, who attended his coronation, had presents made them, and promised also to acknowledge the King of Great-Britain their sovereign, several of them accepting of copper and other merchandize for such parts of their respective territories as they yielded to the English; but great complaints were made by some against Captain NEWPORT'S conduct in paying too great a submission towards POWHATON, and suffering him to take all manner of English merchandize at his own price, whereby the value of English goods was sunk; and would purchase nothing to any advantage: And POWHATON and his vassal Princes became exceeding insolent in their demands. The Captain is also censured for embezzling the provisions he brought for the use of the colony, and selling those very provisions the company sent them at extravagant prices, making a perfect tavern of his ship for three or four months he remained in the country, and eating up part of those stores with his

VII.

seamen which were designed for the supply of the colony, whereby they were reduced to great straits as soon as he was gone, and must have perished if Captain SMITH had not taken some extraordinary measures for their preservation; for the colony relying on the late treaty of alliance concluded with the Indians, imagined they should be supplied with corn and flesh from the country by way of barter or truck for their goods, and had neglected to plant corn, or lay up any provisions against a time of need; from which they were chiefly diverted by an affair which they apprehended would make all their fortunes at once, namely, the gathering the gilded sand they found in a neighbouring rivulet, which they took to be gold, and were so confident of it that they loaded Captain NEWPORT'S ship home with it, tho' it proved to their great disappointment common dust. But they sent home also certain specimens of pitch, tar, glass, and soap-ashes, which had been made by some Poles and Germans the company hired to go to Virginia to promote these manufactures; and these might have turned to good account if the colony had not been diverted from proceeding in them by other pursuits.

The colony send home common sand for gold-dust. Pitch, tar, and glass made in Virginia. The English take corn by force from the natives.

Captain Smith makes further discoveries.

Defeats several Indian Princes.

In the mean time Captain SMITH observing to what low circumstances the colony was reduced again, and that the Indians refused to sell them provisions unless at extravagant prices, he made several incursions into their country, and compelled the natives to bring him in both corn and flesh at the former prices, representing to the council that the Indians were not to be dealt with in any other manner; they must either resolve to abandon the country or exert their authority, and shew the Indians they were in a condition to force provisions from them, if they refused. This he looked upon as the only way to preserve the colony from starving, and to plant the country to advantage: And the council not being able to find out any other expedients for their preservation, thought fit to concur in the Captain's measures. He afterwards proceeded to rebuild James Town, which had been destroyed by a fire while he and Captain NEWPORT were attending on POWHATON. He also caused a sufficient quantity of Indian corn to be planted, to serve them the following year: And the ship Phoenix arriving soon after with provisions from Europe, the colony was now in no want of any thing. Whereupon Captain SMITH left the council to take care of the fort, and went with a party upon further discoveries up the several bays and rivers; at which all the Indian nations were greatly alarmed, no longer doubting but that the design of the English was to make an entire conquest of their country, and therefore opposed him wherever they thought themselves strong enough, and laid ambuscades in the woods and bogs, to cut off his retreat; but he was so fortunate as to escape all their stratagems, defeated several bodies of Indians, and made PASPAHE and several more of their Chiefs prisoners. In these excursions he discovered the country of the Monacans, that of the Acomacks on the eastern side of the bay of Chesapeake; the nations of Wicomoco and Patowmack, and even the Sasquehannah Indians at the head of the bay of Chesapeake; and so harassed the territories of the Emperor POWHATON that he and his vassal Princes were glad to make their submission, and to accept of such a peace as SMITH was pleased to grant them.

I shall not go about to justify this conduct of SMITH any further than it was necessary; but if we would lay the saddle upon the right horse, the original cause of these outrages must be ascribed either to the company in England, who made so little

provision for the colony that they had no way to subsist but by rapine, or upon some of those they employed, who took no care to plant corn, or lay in provisions at the proper seasons, whereby they were reduced to the wretched circumstances already mentioned: And the roguery of the Captains and Agents employed to carry over supplies to the colony was still another occasion of their distress; for it seems they frequently applied such stores to their own use, and what was worse, sold them to the colony at extravagant rates; and under all these wants and mismanagements it was no wonder there were divisions among them, which was another reason they had no better success, and were forced to plunder the country instead of planting it.

Captain SMITH observes, that two thirds of the adventurers came over with a view of finding every thing provided to their hands without any care or labour of their own, and were subsisted by the labours of the other industrious third, until he compelled them all to take share in the work, and then he soon planted ground enough to subsist the colony in plenty: And by moderate exercise and good food saw them not only restored to their healths, but in a very flourishing condition; and as there was now no longer any necessity of procuring food from the Indians by violence, they lived and trafficked very amicably together; and the Weroances suffered him to make several other settlements in their country. When their affairs were in this prosperous situation, there arrived six or seven ships from England, with between three and four hundred planters, and such ample supplies of ammunition and provision as would have enabled the colony to have made an entire conquest of Virginia, or at least to have procured what terms they saw fit of the Indians, if they had been under any command; but as things were managed, this supply only brought the affairs of the colony into confusion. For the company in England imagining that the divisions among the council in Virginia, in whom the government there was lodged, were the occasion of most of the mismanagements that had happened, procured a new patent from King JAMES, whereby they were empowered to appoint a Governor, with a more ample authority than they had by the preceding patent, and prevailed on the Lord DE LA WAR to accept of the government of their new colony, who thereupon made Sir THOMAS GATES, Sir GEORGE SUMMERS, and Captain NEWPORT his deputies until his arrival: And these gentlemen set sail from England with nine ships and five hundred men in the month of May, 1609. All the three deputy governors being embarked in one ship, were unfortunately cast away on the islands of Bermudas, being then uninhabited, but they and all the people escaped to the shore, where finding plenty of provisions they took possession of these islands for the crown of England; and from Sir GEORGE SUMMERS they have been ever since called the Summer-Islands.

Lord De la War appointed governor.

Sir George Summers and the two other deputies cast away on the islands of Bermudas.

In the mean time the rest of their fleet arrived safe in the bay of Chesapeake, with the re-inforcement abovementioned, where they found Captain SMITH president; but gave out they were not obliged to obey him, since there was another commission granted, which had superseded his, and they expected the arrival of the Deputy-governors every day.

Part of their fleet arrive in Virginia.

However Captain SMITH kept them in tolerable good order while he remained amongst them; and made some new settlements, particularly at Nanamund, and the falls of James River; but being unfortunately blown up with gun-powder, as he

was

CHAP.
VII.

was out upon discovery, he was so mangled and wounded that he was forced to return to England; after which there happened such divisions among the English again that every thing was neglected which tended either to their defence or subsistence; and they were reduced by the sword, sickness or famine, from five hundred to three or four score, when Sir THOMAS GATES and Sir GEORGE SUMMERS arrived from Bermudas to their relief; having built two vessels with such materials as they found upon that island, to transport them and their people to Virginia; where meeting with nothing but complaints from the colony, and seeing little likelihood of succeeding in the plantation, as they wanted provisions and all other necessities, they agreed to return to England with the colony; and were actually sailing out of the bay when the Lord DE LA WAR arrived from England, and obliged them all to go back to James Town.

The Lord DE LA WAR, upon his arrival, reprimanded the planters for their divisions, idleness, and ill conduct, which had occasioned their misfortunes; advising them to reform, or he should be compelled to draw the sword of justice and cut off the delinquents: Declaring, however, he had much rather draw his sword in their defence and protection; and telling them, for their encouragement, that he had brought them such plenty of provisions that they would be in no danger of wanting for the future, if they were not wanting to themselves in providing such things as the country produced: Then he proceeded to constitute a council, consisting of Sir THOMAS GATES, his Lieutenant-General; Sir GEORGE SUMMERS, his Admiral; the honourable GEORGE PERCY, one of his Captains; Sir FERDINANDO WEINMAN, his Master of the Ordnance, and CHRISTOPHER NEWPORT, his Vice-Admiral. These and the rest of his officers having taken the oaths to the government, and entered on their several employments, his next care was to furnish his people with flesh; for notwithstanding there were not less than five or six hundred hogs in the plantation when Captain SMITH went to England; there was not one left alive at this time: They had been either eaten by the colony, or killed by the Indians, who, to distress them, had also driven all the deer and other game out of the country; and the English were so ill provided with nets, that though there was plenty of fish in their rivers, they knew not how to take them.

The company had sent over a supply of cloathing, biscuit, flour, beer, and other liquors; but taking it for granted that they had hogs, venison, fowl and fish enough in the country, had made no provision of flesh. Whereupon Sir GEORGE SUMMERS, the Admiral, was dispatched to Bermudas to bring over live hogs from thence; for there Sir GEORGE found plenty of in that island when he was cast away there, though there were no people upon it. The Governor also set some to fishing within the bay, and others without, where there were shoals of Cod-fish; but their nets and tackle were so defective that they could not catch any; whereupon he endeavoured to settle a correspondence with POWHATON and other Indian Princes, that he might purchase flesh of them for other English goods; and in some of these negotiations he succeeded, particularly with the King of Patowmack, one of the most potent of the Indian Princes. But notwithstanding he represented to POWHATON that he had already promised to acknowledge the King of England for his sovereignty, accepted of a crown and sceptre, and other

CHAP.
VII.
ensigns of royalty from him, with presents of great value; this Prince would give him no other answer, but that he expected the English should depart his country, or confine themselves within the limits of James Town Island, and not range through every part of the country; as they continued to do, only with a view of subduing it, as he apprehended; threatening to issue his orders to cut them off and destroy them, if ever they were found without the limits he prescribed them; and commanded the messengers his lordship sent to him not to see his face again unless they brought him a coach and six horses; for in these he had been informed by some Indians, who had been in England, their great Weroances were drawn in.

The Lord DE LA WAR finding he was to expect no friendship from POWHATON, determined he should fear him: Having taken an Indian prisoner, therefore, he cut off his right-hand, and sent him to his master POWHATON, letting him know that he would serve all his subjects in that manner, and burn all the corn in his country (which was ripe at this time) if he did not forbear all acts of hostility for the future; which had so good an effect that the colony lived in peace and plenty for some time, every day making fresh discoveries, and forming new alliances with some Indian Princes. And thus the company's affairs being happily established again by the conduct of the Lord DE LA WAR, Sir THOMAS GATES was sent to England to give an account of the state of the colony, the ships being freighted home with cedar, black walnut, and iron ore; which returns appeared so inconsiderable, that the company were in suspense whether they should not send for the Lord DE LA WAR and the colony home: However, they first desired Sir THOMAS GATES's opinion upon it; who told them, that these were not the only returns they were to expect; that if they would send over men who understood how to make pitch, and tar, and plant hemp and flax, they might furnish England with all manner of naval stores; and that it would be very easy also to set up a manufacture of silk, the country abounding in mulberry-trees as well as silk-grass; that the soil was exceeding fruitful, producing corn, grass, grapes, and other fruits in abundance; that European cattle and poultry multiplied prodigiously; and there was great plenty of venison, fish and fowl, which they could never want when they should be provided with boats, nets, and engines to take them: The company need then be at very little charge to support the colony. On the contrary, they would in a short time meet with returns answerable to their expectations. Whereupon the company resolved to proceed with alacrity to improve their Virginian plantation, in which resolution they were confirmed by the Lord DE LA WAR, who returned to England about this time (Anno 1610.) for the recovery of his health.

He acquainted the company, that he had no intention to abandon their service; but as soon as his health was restored he would return to his government again. In the mean time he had left Mr. GEORGE PERCY his Deputy-governor, a man of great honour and resolution, in whose conduct they might confide, till Sir THOMAS GATES should return thither: That Captain ARGOLL had settled a trade with several of the Indian Chiefs; and for the defence of the colony he had erected three forts more than he found there, viz. two near Point Comfort; and a third at the falls of James River, adjoining to which were large fields

he had ordered to be planted with Indian vines, and roots; so that there was no danger of the colony's being in any distress for the future, if they were not wanting to themselves.

Dale carries over a supply.

On the 10th of May, 1611, Sir THOMAS DALE arrived at Virginia with three ships and supplies of men, cattle, and provisions, and immediately set his people to work to plant corn (which the colony had neglected, tho' it was late in the spring) and had a tolerable good crop.

Gates's administration.

Sir THOMAS GATES arrived in August following with six ships, three hundred and fifty planters, and a proportionable supply of cattle, ammunition and provisions, taking the government upon him as Deputy to the Lord DE LA WAR, who still remained sick in England. This gentleman planted and fortified Henrico County, to the westward of James Town, and made lines, defended with palisades, to preserve their cattle from the Indians; for still King POWHATON refused the alliance of the English, and harried and plundered their plantations which lay exposed. Whereupon Captain ARGOLL took an opportunity of surprising his celebrated daughter, the Princess PACAHUNTA, in the year 1612, and carried her to James Town, where she was treated however according to her quality, and the eminent services she had done the English: And still continuing her good offices, the King her father was, after two years, reconciled to the colony, and consented to her marrying Mr. JOHN ROLF, an English gentleman. And had more of our people inter-married with the Indians, I am inclined to think it would have been the most effectual way of establishing the colony in peace; for POWHATON is said to look upon this match as a sincere mark of the friendship of the English. But our adventurers appear'd unaccountably squeamish in this particular. They seem'd to despise and abhor such alliances, which rendered the natives averse to us afterwards. Whereas, if the English had continued to inter-marry with them, they would in time have become one nation, and those massacres and other calamities that ensued had infallibly been avoided. The natives probably would have embraced the Christian religion voluntarily, as this Princess did. But to proceed.

The Princess Pacahunta married to Mr. Rolf.

A peace being concluded with King POWHATON upon this marriage, in the year 1613, the English and his subjects lived in a good understanding, and trafficked together for some time: And the Chickahomny Indians, another tribe, by their example also concluded a peace with the colony which now appeared in a very flourishing condition: And in the year 1616, Sir THOMAS DALE leaving the administration of the government to Captain YARDLY, returned to England, carrying Mr. ROLF and the Princess his wife with him, where King JAMES's Queen and court paid her the same honours that were due to a European lady of the same quality, after they were informed by Captain SMITH what services she had done the English nation, and particularly how she had saved the Captain's life when his head was upon the block. But it seems before this Princess married Mr. ROLF, she had been given to understand, that Captain SMITH was dead; for he was the first man that she had set her affections upon, and I make no doubt he had promised to marry her when he was in her father's court; for when he came to wait upon her, on her arrival in England, she appeared surprised, turned away from him with the utmost scorn and resentment, and it was some hours before she would be prevailed with to speak to

A peace between the English and King Powhatan.

him. She could not believe any man would have deceived her for whom she had done so much, and run so many hazards; and when she did vouchsafe to hear his excuses, she still reproached him with ingratitude. In all her behaviour, 'tis said, she behaved herself with great decency and suitable to her quality, and mighty expectations there were of the future services she would have done the English upon her return to her own country; but she was taken ill at Gravesend, as she was about to embark for Virginia, and died in that town a very devout Christian, 'tis said, leaving one only son, named THOMAS ROLF, whose posterity now flourish in Virginia, and enjoy lands descended to them as heirs of the Princess PACAHUNTA. But to return.

The Princess Pacahunta comes to England.

Captain YARDLY, during his administration, first promoted the planting of tobacco, finding there began to be a great demand for it in Europe, which brought an immediate gain to the company; but 'tis said he did not so much regard the buildings and fortifications, and planting of corn, as he ought to have done. On the contrary, he entered into the greatest intimacy with the Indians, employed them in hunting and fishing for the colony, and they lived together very sociable in his time. Captain ARGOLL, who succeeded him, did not approve of this familiarity and confidence in the natives, but repaired the forts that were running to decay, and affected to render himself more formidable to the Indians than his predecessor. Both these gentlemen seem to have been but deputies to the Lord DE LA WAR; for in the year 1618, that nobleman embarked again for his government of Virginia with a reinforcement of two hundred men, and supplies for the colony; but meeting with contrary winds, which rendered the passage more tedious than usual, the ship's company became sickly, and his Lordship died in the voyage, with thirty or forty planters more that embarked with him. Whereupon Mr. ARGOLL was continued some time longer in the government, which he spent in making discoveries on the coast of New-England and New-Scotland, or Acadia; and finding the French had made some settlements there he expelled them from thence, the crown of England claiming those countries as parts of Virginia. (This year (1618) also died the famous POWHATON, being succeeded in his empire by his brother ITOPATIN; but he being a weak Prince, OPPACONCANOUGH, King of Chickahomny, afterwards usurp'd the empire, reducing several more of the neighbouring Weroances under his dominion; however, both OPPACONCANOUGH and ITOPATIN renewed the peace with the English on the death of POWHATON.

Captain Yardly first encourages the planting tobacco.

Argoll governor.

Lord De la War dies.

The French driven from New-England. Powhatan dies.

Sir George Yardly's second government.

Governor ARGOLL, being recalled from Virginia soon after his expedition to the northward, left the administration in the hands of Captain POWELL, to whom Captain YARDLY succeeded, having been knighted by King JAMES. He carried over with him a reinforcement of twelve hundred men, and proportionable supplies of cattle and provisions. I presume the company were by this time sensible of the advantage of planting tobacco; and as Sir GEORGE YARDLY first put them upon it, thought him the properest person to encourage that plantation.

Sir GEORGE, upon his arrival, applied himself to render the government as like that of England as possible. He increased the number of the council, intending they should supply the place of a house of lords, and summoned an assembly of burgesses from every settlement in the country.

The government settled as in England.

CHAP. VII. country. The first assembly or parliament set at James Town in Virginia, in May, 1620, and then composed but one house, though they afterwards separated, and sat as the parliament do in England in two houses; and Mr. BEVERLEY insinuates that the views of the upper and lower house have been different ever since.

The first assembly, 1620. Negroes were first brought over to Virginia this year in a Dutch ship, and proving extremely serviceable in planting tobacco, more were imported annually from Guinea: And now Sir GEORGE proceeded to parcel out the lands, allotting to the company a certain proportion in several districts for the support of the government; other portions were allotted for the use of a college and schools intended to be erected. Glebes were assigned in every parish for the support of the ministers, and the planters had their respective shares allotted them; whereupon, 'tis said, they became exceeding industrious, and began to vie with each other in planting, building, and other improvements; and encouragements were offered to all such as should come and settle in Virginia, and increase the colony. Whereupon fresh supplies of men and cattle continually arrived, and new settlements were daily made in all parts of the country. Salt-works were set up at Cape Charles, on the eastern shore, and an iron-work at Falling-Creek in James River, where they found the iron-ore good, and had near brought that work to perfection. At this time, says my

The colony flourishes. author, (Mr. BEVERLEY) the same of the riches and plenty in which the English lived at Virginia was exceeding great, and ascribes their happiness in a great measure to the prudent conduct of Sir GEORGE YARDLY, but condemns him however for neglecting the fortifications; and indeed if he took upon him to parcel out the lands of the Indians among the English without their leave, and gave them no valuable consideration for them, it could not be expected the natives should long remain their friends; however, during this government, I meet with no complaint or misunderstanding on either side, which makes me of opinion these allotments were made with the consent of the Indians; and if the succeeding governor had behaved himself in the like friendly manner towards the natives, possibly none of those heart-burnings or massacres which followed had ever happened.

Wyat's government. Sir GEORGE YARDLY's government of three years expiring in the year 1621, he was succeeded by Sir FRANCIS WYAT, a young gentleman, who arrived in James town in the month of October, with twelve hundred planters; and the same year fifty men more were carried thither by Captain NEWPORT, whom he planted in a part of the country to which he gave his own name. But there was, it seems, such quantities of tobacco exported from Virginia at this time, that orders were sent from England, that no planters should be permitted to send over more than an hundred weight of tobacco in one year. They were advised to apply themselves to the making of pot-ash and other manufactures; to plant more corn, and improve their stocks of cattle instead of running too much upon tobacco.

Courts of justice instituted. In the year 1622, according to Colonel BEVERLEY, inferior courts were first instituted by the general assembly under the name of country courts, for the trial of civil and criminal causes, reserving an appeal to the Governor and Council, which remained still the supreme court of judicature. The Colonel proceeds to give us an account

CHAP. VII. of the massacre, which happened the same year, wherein he observes, that the great increase of the planters, and the long quiet the English had enjoyed among the Indians since the marriage of the Princess PACAHUNTA with Mr. ROLF, had lulled all men into a fatal security. The English became every where familiar with the Indians, eating, drinking, and sleeping amongst them; by which means they were perfectly acquainted with all our English strength and the use of our arms, knowing at all times when and where to find our people, whether at home or in the woods, in bodies or dispersed, in condition of defence or indefensible. This exposing of their weakness gave them occasion to think more contemptibly of the English than otherwise perhaps they would have done; for which reason they became more hardy to attempt any thing against them.

Thus, upon the loss of one of their leading men (a War-captain as they call him) who was supposed to be justly put to death, however their King OPPACONCANOUGH appeared enraged, and in revenge laid the plot of a general massacre of the English, to be executed on the 22d of March, 1622, a little before noon, at a time when our men were all at work abroad in their plantations, dispersed and unarmed. This conspiracy was to have taken effect upon all the several settlements at one and the same instant, except on the eastern shore, whither this plot did not reach. The Indians had been made so familiar with the English as to borrow their boats and canoes to cross the river when they went to consult with their neighbouring Indians upon this execrable conspiracy; and to colour their design the better, they brought presents of deer, turkeys, fish, and fruits to the English the evening before. The very morning of the massacre they came freely and unarmed among them, eating with them, and behaving themselves with the same freedom and friendship as formerly, till the very minute they were to put their plot in execution; then they fell to work all at once, every where surprising and knocking the English on the head, some with their hatchets, which they call tomamahawks, others with the hoes and axes of the English themselves, shooting at those who escaped the reach of their hands; sparing neither age nor sex, but destroying man, woman, and child, according to their cruel way of leaving none behind to resent the outrage. But whatever was not done by surprise that day was left undone, and many that made early resistance escaped.

By the account taken of the Christians murdered that morning, they were found to be three hundred and forty-seven, most of them falling by their own instruments and working-tools.

The massacre had been much more general had not this plot been providentially discovered to the English some hours before the execution. It happened thus:

Two Indians, that used to be employed by the English to hunt for them, happened to lie together the night before the massacre in an Englishman's house where one of them was employed. The Indian that was the guest fell to persuading the other to rise and kill his master, telling him that he would do the same by his own the next day: Whereupon he discovered the whole plot that was designed to be executed on the morrow. But the other, instead of entering into the plot and murdering his master, got up (under pretence of going to execute his comrade's advice) went into his

CHAP. VII. his master's chamber, and revealed to him the whole story that he had been told. The master hereupon arose, secured his own house, and before day got to James Town, which together with such plantations as could receive notice time enough, were saved by this means; the rest also who happened to be watchful in their defence escaped. Captain CROSHAW in his vessel at Patowmack had notice given him by a young Indian, by which means he came off untouched.

The occasion of this massacre.

The occasion of OPPACONCAUGH's furious resentment was this: The War-captain mentioned before to have been killed was called NEMATTANOW. He was an active Indian, a great warrior, and in much esteem amongst them; inasmuch, that they believed him to be invulnerable and immortal, because he had been in many conflicts and escaped untouched from them all. He was also a very cunning fellow, and took great pride in preserving and increasing this their superstition concerning him; affecting every thing that was odd and prodigious to work upon their admiration; for which purpose, he would often dress himself up with feathers after a fantastick manner, and by much use of that ornament obtained among the English the nick-name of Jack of the Feather.

Nemattanow's character.

This NEMATTANOW coming to a private settlement of one MORGAN, who had several toys, he had a mind to persuade him to go to Pamunky to dispose of them. He gave him hopes what mighty bargains he might meet with there, and kindly offered him his assistance. At last MORGAN yielded to his persuasion, but was no more heard of; and it is believed that NEMATTANOW killed him by the way, and took away his treasure; for within a few days this NEMATTANOW returned to the same house with MORGAN's cap upon his head, where he found two sturdy boys, who asked for their master, and would have had him before a justice of peace, but he refused to go, and very insolently abused them; whereupon they shot him down, and as they were carrying him to the Governor he died.

As he was dying he earnestly pressed the boys to promise him two things; 1st, that they would not tell how he was killed; and 2dly, that they would bury him among the English. So great was the pride of this vain infidel, that he had no other views but the being esteemed after his death (as he had endeavoured to be while he was alive) invulnerable and immortal; though his increasing faintness sufficiently convinced him of the falsity of both. He imagined, that being buried among the English perhaps might conceal his death from his own nation, who might think him translated to some happier country. Thus he pleased himself to the last gasp with the boys promises to carry on the delusion. The killing this Indian champion was all the provocation given to that haughty and revengeful man OPPACONCAUGH to act this bloody tragedy, and to take such indefatigable pains to engage in such horrid villany all the Kings and nations bordering upon the English settlement on the western shore of Chesapeake.

This massacre (adds Mr. BEVERLEY) gave the English a fair pretence of endeavouring the total extirpation of the Indians, but more especially of OPPACONCAUGH and his nation: Accordingly they set themselves about it, making use of the Roman maxim (faith is not to be kept with hereticks) to obtain their ends; for after some months fruitless pursuit of them who could but too dextrously hide themselves in the woods,

CHAP. VII. the English feigned a desire of peace, giving them all manner of fair words and promises of oblivion, designing thereby (as their own letters now on record, and their own actions thereupon prove) to draw the Indians home, and entice them to plant their corn near their habitations adjoining to those of the English, and then to cut it up when the summer should be too far spent, and so to leave them no hopes of another crop that year; by which means they proposed to bring them to want necessities and starve. And the English did accordingly bring the Indians to plant their corn at their usual habitations, whereby they gained an opportunity of repaying them some part of the debt in their own coin; for they fell suddenly upon them, cut to pieces such of them as could not make their escape, and afterwards totally destroyed their corn.

And massacre the Indians in their turn.

Another effect of the massacre of the English was the reducing all the settlements again to six or seven in number for their better defence. Besides, it was such a disheartening to some good projects then just advancing, that to this day, they have never been put in execution; namely, the glass-houses in James Town, and the iron-work at Falling-Creek, which has been already mentioned. The massacre fell so hard upon this last place, that none escaped but a boy and a girl, who with great difficulty hid themselves.

The glass-manufacture and iron-work ruined.

The superintendant of this iron-work had also discovered a vein of lead-ore, which he kept private, and made use of to furnish all the neighbours with bullets and shot: But he being cut off with the rest, and the secret not having been communicated, this lead-mine could never after be found, till Colonel BRAD some years ago prevailed with an Indian, under pretence of hunting, to give him a sign, by dropping his Tommahawk at the place (he not daring publicly to discover it for fear of being murdered.) The sign was accordingly given, and the company at that time found several pieces of good lead-ore upon the surface of the ground, and marked the trees thereabouts; notwithstanding which, I know not by what witchcraft it happens, but no mortal to this day could ever find that place again, tho' it be upon part of the Colonel's own possessions; and so it rests till time and thicker settlements discover it.

A lead-mine discovered.

Thus the company of adventurers having, by frequent acts of mismanagement, met with vast losses and misfortunes, many grew sick of it, and parted with their shares, and others came into their places, and promoted the sending in fresh recruits of men and goods; but the chief design of all parties concerned was to fetch away merchandize from thence, aiming more at sudden gain than to form any regular colony, or establish a settlement in such a manner as to make it a lasting happiness to the country.

Several gentlemen went over upon their particular stocks, separate from that of the company, with their own servants and goods, each designing to obtain land from the government as Captain NEWPORT had done, or at least to obtain patents according to the regulation for granting lands to adventurers; others sought their grants of the company in London, and obtained authorities and jurisdictions, as well as land, distinct from the authority of the government; which was the foundation of great disorder, and the occasion of their following misfortunes. Among others, one Captain MARTIN having made very considerable preparations towards a settlement, ob-

Grants to particular persons independent of the company.

Occasions confusion.

tained

CHAP. VII. tained a suitable grant of land, and was made one of the council there; but he grasping still at more, and aiming at dominion as well as boundless possessions, caused so many differences, that at last he put all things into distraction; and the Indians still seeking revenge, took advantage of the dissensions, and fell foul again on the English, gratifying their vengeance with new blood-shed.

Another massacre.

The company dissolved. The crown appoints a Governor, &c.

The fatal consequences of the company's misadministration cried so loud, that King CHARLES I. coming to the crown of England, expressed a tender concern for the poor people that had been betrayed thither and lost; upon which consideration he dissolved the company in the year 1626, reducing the country and government under his own immediate direction, appointing the Governor and Council himself, and ordering all patents and process to issue in his own name, reserving to himself a quit-rent of two shillings for every hundred acres of land, and so pro rata.

The country being thus taken into the King's hands, his Majesty was pleased to re-establish the constitution by a Governor, Council, and Assembly, and to confirm the former methods and jurisdictions of the several courts, as they had been appointed in the year 1620, and placed the last resort in the assembly. He likewise confirmed the rules and orders made by the first assembly for apportioning the land and granting patents to particular adventurers.

This was a constitution according to their hearts desire, and things seemed now to go on in a happy course for encouragement of the colony: People flocked over thither apace, every one took up land by patent to his liking, and, not minding any thing but to be masters of great tracts of land, they planted themselves separately on their several plantations; nor did they fear the Indians, but kept them at a greater distance than formerly; and they, for their parts, seeing the English so sensibly increase in number, were glad to keep their distance and be peaceable.

This liberty of taking up land, and the ambition each man had of being lord of a vast, tho' unimproved territory, together with the advantage of the many rivers which afford a commodious road for shipping at every man's door, has made the country fall into such an unhappy settlement and course of trade, that to this day they have not any one place of cohabitation among them that may reasonably bear the name of a town.

The constitution being thus firmly established, and continuing its course regularly for some time, people began to lay aside all fears of any future misfortune. Several gentlemen of condition went over with their whole family, some for bettering their estates, others for religion, and other reasons best known to themselves; among these the noble CECILIUS CALVERT, Lord Baltimore, a Roman-catholic, thought, for the more quiet exercise of his religion, to retire with his family into that new world; for this purpose, he went to Virginia, to try how he liked the place; but the people there looked upon him with an evil eye, on account of his religion, for which alone he sought this retreat, and by their ill treatment discouraged him from settling in that country.

Upon that provocation his Lordship resolved upon a farther adventure, and finding land enough up the bay of Chesapeake, which was likewise blessed with many brave rivers, and as yet altogether uninhabited by the English, he began to think of making a new plantation of his own; and for his

more certain direction in obtaining a grant of it, he **CHAP. VII.** undertook a journey northward, to discover the land up the bay, and observe what might most conveniently square with his intent.

His lordship finding all things in this discovery according to his wish returned to England; and because the Virginia settlements at that time reached no farther than the south side of Patowmack river, his Lordship got a grant of the propriety of Maryland, bounding it to the south by Patowmack river, on the western shore, and by a line from Point Look-out on the eastern shore; but died himself before he could embark for the promised land.

Lord Baltimore obtains a grant of Maryland.

Maryland had the honour to receive its name from Queen MARY, royal consort of King CHARLES I.

The old Lord Baltimore being thus taken off, and leaving his designs unfinished, his son and heir, in the year 1633, obtained a grant or patent, and went over in person to plant this new colony.

By this unhappy accident a country which nature had so well contrived for one became two separate governments. This produced a most unhappy inconvenience to both; for these two being the only countries under the dominion of England that plant tobacco in any quantity, the ill consequence to both is, that when one colony goes about to prohibit the trash or mend the staple of that commodity, to help the market, then the other, to take the advantage of that market, pours into England all they can make, both good and bad, without distinction. This is very injurious to the other colony, which had voluntarily suffered so great a diminution in the quantity, to mend the quality; and this is notoriously manifested from that incomparable Virginia law appointing sworn agents to examine their tobacco.

Neither was this all the mischief that happened to Virginia upon this grant, for the example of it had dreadful consequences, and was in the end one of the occasions of another massacre of the Indians; for this precedent of my Lord Baltimore's grant which intrenched upon the charters and bounds of Virginia, was hint enough for other courtiers (who never intended a settlement as my Lord did) to find out something of the like kind to make money of. This was the occasion of several very large defalcations from Virginia, within a few years afterwards, which were forwarded and assisted by the contrivance of the Governor Sir JOHN HARVEY; inasmuch, that not only the land itself, quit-rents and all, but the authorities and jurisdictions that belonged to the colony, were given away; nay, sometimes in those grants he included the very settlements that had been before made.

Other parts of Virginia separated from it.

As this gentleman was irregular in this, so he was very unjust and arbitrary in his other methods of government: He exacted with rigour the fines and penalties which the unwary assemblies of those times had given chiefly to himself, and was so haughty and furious to the council and the best gentlemen of the country, that his tyranny grew at last insupportable; so that in the year 1639, the council sent him prisoner to London, and with him two of their number to maintain the articles against him. This news being brought to King CHARLES I. his Majesty was very much displeased, and without hearing any thing caused him to return Governor again; but by the next shipping he was graciously pleased to change him; and so made amends for this man's male administration, by sending the good and just Sir WILLIAM BERKLEY to succeed him.

CHAP.
VII.A third
massacre.

While these things were transacting there was so general a dissatisfaction, occasioned by the oppressions of Sir JOHN HARVEY, and the difficulties in getting him out, that the whole colony was in confusion. The subtle Indians, who took all advantages, resented the incroachments upon them by his grants: They saw the English uneasy and disunited among themselves, and by the direction of OPPACONCANOUGH their King, laid the groundwork of another massacre, wherein by surprize they cut off near five hundred Christians more. But this execution did not take so general effect as formerly, because the Indians were not so frequently suffered to come among the inner habitations of the English; and therefore the massacre fell severest on the south-side of James river, and on the heads of the other rivers, but chiefly of York river, where this OPPACONCANOUGH kept the seat of his government.

OPPACONCANOUGH was a man of large stature, noble presence, and extraordinary parts; tho' he had no advantage of literature (that being no where to be found among the American Indians;) yet he was perfectly skilled in the art of governing his rude countrymen. He caused all the Indians, far and near, to dread his name, and had them all entirely in subjection.

This King, in SMITH's history, is called brother to POWHATON, but by the Indians he was not so esteemed: For they say he was a Prince of a foreign nation, and came to them a great way from the south-west. And by their accounts we suppose him to have come from the Spanish-Indians, somewhere near Mexico, or the mines of St. Barbe. But be that matter how it will, from that time till his captivity, there never was the least truce between the Indians and the English.

Sir WILLIAM BERKLEY, upon his arrival shewed such an opposition to the unjust grants made by Sir JOHN HARVEY, that very few of them took effect, and such as did were subjected to the settled conditions of the other parts of the government, and made liable to the payment of the full quit-rents. He encouraged the country in several essays of pot-ash, soap, salt, flax, hemp, silk, and cotton. But the Indian war ensuing upon this last massacre, was a great obstruction to these good designs, by requiring all the spare men to be employed in defence of the country.

OPPACONCANOUGH, by his great age and the fatigues of war (in which Sir WILLIAM BERKLEY followed him close) was now grown so decrepid that he was not able to walk alone, but was carried about by his men wherever he had a mind to move. His flesh was all macerated, his sinews slackened, and his eye-lids became so heavy that he could not see, but as they were lifted up by his servants. In this low condition he was when Sir WILLIAM BERKLEY hearing that he was at some distance from his usual habitation, resolved at all adventures to seize his person, which he happily effected; for with a party of horse he made a speedy march, surprized him in his quarters, and brought him prisoner to James Town; where by the Governor's command he was treated with all the respect and tenderness imaginable. Sir WILLIAM had a mind to send him to England, hoping to get reputation by presenting his Majesty with a royal captive, who at his pleasure could call into the field ten times more Indians than Sir WILLIAM BERKLEY had English in his whole government. Besides, he thought this ancient Prince would be an instance of the healthiness and long life of the natives in that country. However,

Oppacon-
canough
taken pri-
soner.

he could not preserve his life above a fortnight; for one of the soldiers resenting the calamities the colony had suffered by this Prince's means, basely shot him through the back after he was made prisoner, of which wound he died.

CHAP.
VII.

He continued brave to the last moment of his life, and shewed not the least dejection at his captivity. He heard one day a great noise of the treading of people about him, upon which he caused his eye-lids to be lifted up, and finding that a croud of people were let in to see him, he called in high indignation for the Governor, who being come, OPPACONCANOUGH scornfully told him, that had it been his fortune to take Sir WILLIAM BERKLEY prisoner, he should not meanly have exposed him as a shew to the people.

After this Sir WILLIAM BERKLEY made a new peace with the Indians, which continued for a long time unviolated, inasmuch that all thoughts of future injuries from them were laid aside; but he

A peace
with the
Indians.

himself did not long enjoy the benefit of this profound peace, for the unhappy troubles of King CHARLES the first increasing in England, proved a great disturbance to him and all his people. They, to prevent the infection from reaching that country, made severe laws against the Puritans, tho' there were as yet none among them. But all correspondence with England was interrupted, the supplies lessened, and trade obstructed. In a word, all people were impatient to know what would be the event of so much confusion.

The grand
rebellion
in Eng-
land.

At last the King was traiterously beheaded in England, and OLIVER installed Protector. However, his authority was not acknowledged in Virginia for several years after, till they were forced to it by the last necessity. For in the year 1651, by CROMWELL's command, Captain DENNIS, with a squadron of men of war, arrived there from the Caribbe-Islands, where they had been subduing Barbadoes. The country at first held out vigorously against him; and Sir WILLIAM BERKLEY, by the assistance of such Dutch vessels as were then there, made a brave resistance. But at last DENNIS contrived a stratagem which betrayed the country. He had got a considerable parcel of goods aboard which belonged to two of the council, and found a method of informing them of it. By this means they were reduced to the dilemma either of submitting or losing their goods. This occasioned factions among them, so that at last, after the surrender of all the other English plantations, Sir WILLIAM was forced to yield to the Usurper on the terms of a general pardon. However, it ought to be remembered to his praise, and to the immortal honour of that colony, that it was the last of all the King's dominions that submitted to the usurpation, and afterwards the first cast it off; and Sir WILLIAM never took any post or office under the Usurper.

Virginia
the last of
the King's
dominions
that sub-
mitted to
the Usur-
per.

OLIVER had no sooner subdued the plantations but he began to contrive how to keep them under, that so they might never be able for the time to come to give him further trouble. To this end he thought it necessary to break off their correspondence with all other nations, thereby to prevent their being furnished with arms, ammunition, and other warlike provisions. According to this design he contrived a severe act of parliament, whereby he prohibited the plantations from receiving or exporting any European commodities but what should be carried to them by Englishmen, and in English-built ships. They were absolutely forbid corresponding with any nation or colony not subject to the crown of England; nei-

The ordi-
nance con-
cerning
navigation
to the
planta-
tions.

CHAP. VII. ther was any alien suffered to manage a trade or factory; in all which things the plantations had been till then indulged for their encouragement.

Notwithstanding this act of navigation, the Protector never thought the plantations enough secured, but frequently changed the Governors to prevent their intriguing with the people; so that during the time of the usurpation they had no less than three Governors there, namely, **DIGGS**, **BENNET**, and **MATTHEWS**.

The strange arbitrary curbs he put upon the plantations exceedingly afflicted the people. He had the inhumanity to forbid them all manner of trade and correspondence with other nations at a time when England itself was in distraction, and could neither take off their commodities, nor supply them sufficiently with its own. Neither had they been ever used to supply them with half the commodities they expended, or to take off above half the tobacco they made. Such violent proceedings made the people desperate, and inspired them with a desire to use the last remedy to relieve themselves from the lawless usurpation. In a short time afterwards a fair opportunity happened; for Governor **MATTHEWS** died, and no person was substituted to succeed him in the government. Whereupon the people applied themselves to **SIR WILLIAM BERKLEY**, (who had continued at this time upon his own plantation in a private capacity) and unanimously re-chose him their Governor.

The Virginians first throw off the usurper's yoke.

SIR WILLIAM BERKLEY had all along retained an unshaken loyalty for the Royal Family, and therefore generously told the people, that he could not approve of the Protector's rule, and was resolved never to serve any body but the lawful heir to the crown; and that if he accepted the government it should be upon their solemn promise, after his example, to venture their lives and fortunes for the King, who was then in France.

This was no great obstacle to them, and therefore with an unanimous voice they told him, that they were ready to hazard all for the King. Now this was actually before the King's return to England, and proceeded from a brave principle of loyalty, for which they had no example. **SIR WILLIAM BERKLEY** embraced their choice, and forthwith proclaimed **CHARLES** the second, King of England, Scotland, France, Ireland, and Virginia, and caused all process to be issued in his name. Thus his Majesty was actually King in Virginia, before he was so in England. But it pleased God to restore him soon after to the throne of his ancestors; and so that country escaped being chastised for throwing off the usurpation.

Upon the King's restoration he sent **SIR WILLIAM BERKLEY** a new commission with leave to return to England, and a power to appoint a deputy in his absence; for his majesty in his exile had received intelligence of this gentleman's loyalty, and during that time had renewed his commission.

Upon this **SIR WILLIAM BERKLEY** appointed Colonel **FRANCIS MORRISON** Deputy-Governor, and went for England to wait on his Majesty, by whom he was kindly received. At his return he carried his Majesty's pressing instructions for encouraging the people in husbandry and manufactures, but more especially to promote silk and vineyards. There is a tradition that the King, in complement to that colony, wore at his coronation a robe made of the silk that was sent from thence. But this was all the reward the country had for their loyalty; for the parliament was pleased to renew the act contrived by the Usurper for discouraging

the plantations, with severer restraints and prohibitions by bonds, securities, &c.

CHAP. VII.

During the time of **SIR WILLIAM BERKLEY**'s absence, Colonel **MORRISON** had, according to his directions, revised the laws, and compiled them into one body, ready to be confirmed by the assembly at his return. By these laws the church of England was confirmed in the established religion, the charge of the government sustained, trade and manufactures were encouraged, a town projected, and all the Indian affairs settled.

Several beneficial laws confirmed after the restoration.

The parishes were likewise regulated, competent allowances were made to the ministers to the value of about fourscore pounds a year, besides glebes and perquisites; and the method of their preferment was settled. Convenient churches and glebes were provided, and all necessary parish-officers instituted. Some steps were made also towards a free-school and college, and the poor were effectually provided for.

For support of the government, the duty of two shillings per hoghead on all tobacco's, and that of one shilling per ton port-duty on shipping, were made perpetual; and the collectors were obliged to account for the same to the general assembly.

Duties.

For encouragement of manufactures, prizes were appointed for the makers of the best pieces of linen cloth, and a reward of fifty lb. of tobacco was given for each lb. of silk. All persons were enjoined to plant mulberry-trees for the food of the silk-worm, according to the number of acres of land they held. Tan-houses were set up in each county at the county charge, and publick encouragement was given to a salt-work on the eastern shore. A reward was appointed in proportion to the tonnage of all sea vessels built there, and an exemption allowed from all fees and duties payable by such shipping.

Silk and linen manufactures encouraged.

Leather.

Salt.

Ship-building.

The King had commanded that all ships trading to Virginia should go to James Town, and there enter before they broke bulk; but the assembly, from the impracticableness of that command, excused all except the James River ships from that order, and left the others, in the rivers they were bound to, to ride dispersed as the commanders pleased; by whose example the James River ships were no sooner entered with the officer in James Town, but they all dispersed themselves to unload and trade all over the river. By this means the design of towns was totally baulked, and this order proved only an ease to the officer of James River, and a means of creating a good place to him.

Peace and commerce with the Indians was settled by a law, and their boundaries prescribed. Several other acts were made suiting the necessity of the government, so that nothing then seemed to remain but the improvement of the country and encouragement of those manufactures the King had been pleased to recommend, together with such others as should be beneficial.

The limits between the English and the Indians settled.

SIR WILLIAM BERKLEY, at his return gave a sanction to this body of laws, and being then again in full possession of his government, and at perfect peace with the Indians, set all hands industriously to work in making country improvements. He passed a new act for encouragement in James Town, whereby several houses were built therein at the charge of several counties. However, the main ingredient for the advancement of towns was still wanting, namely, the confinement of all shipping and trade to them only; by defect of which all the other expedients availed nothing; for most of the buildings were soon converted into houses of entertainment.

The only way to promote the building of towns.

CHAP.
VII.
Laws a-
gainst the
sectaries.

Anno 1663, divers sectaries in religion beginning to spread themselves there, great restraints were laid upon them under severe penalties to prevent their increase.

This made many of them fly to other colonies, and prevented abundance of others from going over to seat themselves among them. And as the former ill treatment of my Lord Baltimore kept many people away, and drove others to Maryland, so the present severities towards the Nonconformists kept off many more who went to the neighbouring colonies.

A plot of
the Re-
publicans
against the
govern-
ment.

The rigorous circumspection of their trade, the prosecution of the sectaries, and the little demand of tobacco, had like to have had very fatal consequences: For the poor people becoming thereby very uneasy, their murmurings were watched and fed by several mutinous and rebellious Oliverian soldiers that were sent thither as servants. These depending upon the discontented people of all sorts, formed a villainous plot to destroy their masters and afterwards to set up for themselves.

This plot was brought so near to perfection that it was the very night before the designed execution e'er it was discovered; and then it came out by the relenting of one of their accomplices, whose name was BIRKENHEAD. This man was servant to Mr. SMITH of Purton in Gloucester County, near which place, (viz.) Poplar-Spring, the miscreants were to meet the night following, and put in execution their horrid conspiracy.

Detected.

Upon this discovery by BIRKENHEAD, notice was immediately sent to the Governor at Green-Spring; and the method he took to prevent it was by private orders that some of the militia should meet before the time at the place where the conspirators were to rendezvous, and seize them as they came singly up to it; which orders being happily executed their devilish plot was defeated. However, there were but a few taken, because several of them making their escape turned back such of their fellows as they met on the road, and prevented most of them from coming up or being discovered.

Four of these rogues were hanged, but BIRKENHEAD was gratified with his freedom and a reward of two hundred pounds sterling.

For the discovery and happy disappointment of this plot an anniversary thanksgiving was appointed on the 13th of September, the day it was to be put in execution: And it is great pity some other days are not commemorated as well as that.

The news of this plot being transmitted to King CHARLES the second, his Majesty sent his royal commands to build a fort at James Town, for the security of the Governor, and to be a curb upon all such traitorous attempts for the future; but the country thinking the danger over, only raised a battery of some small pieces of cannon.

The plan-
tations to
receive
their mer-
chandise
and provi-
sions only
from Eng-
land.

Another misfortune happened to the plantations this year, which was a new act of parliament in England, laying a severer restraint upon their supplies than formerly. By this act they could have no foreign goods which were not first landed in England, and carried directly from thence to the plantations; the former restraint of importing them only by Englishmen in English built shipping not being thought sufficient.

This was a misfortune which cut with a double edge; for 1st, it reduced their staple tobacco to a very low price; and 2dly, it raised the value of European goods to what the merchants pleased to put upon them.

The Vir-
ginians
prohibit
the plant-
ing tobac-
co.

For this their assembly could think of no remedy but to be even with the merchants, and

make their tobacco scarce by prohibiting the plant-
ing of it for one year; and during that idle year
to invite the people to enter upon manufacturing
flax and hemp. But Maryland not concurring in
this project, they were obliged in their own defence
to repeal the act of assembly again, and return to
their old drudgery of planting tobacco without pro-
fitting by it.

CHAP.
VII.

The country thus missed of their remedy in the stint of tobacco, which on the contrary multiplied exceedingly by the great increase of servants. This, together with the abovementioned curbs on trade, exasperated the people, because now they found themselves under a necessity of exchanging their commodities with the merchants of England on their own terms. The assembly therefore again attempted the stint of tobacco, and passed another act against planting it for one year; and Carolina and Maryland both agreed to it. But some accident hindering the agent of Carolina from giving notice thereof to Maryland by the day appointed, the Governor of that province proclaimed the act void, altho' every body there knew that Carolina had fully agreed to all things required of them. But he took advantage of this nice punctilio because of the loss such a diminution would have been to his annual income; and so all people relaps'd again into the disease of planting tobacco.

Virginia was more nettled at this ill usage from Maryland than at her former absolute denial; but was forced to take all patiently, and by fair means get relief if she could. They therefore appointed agents to re-assume the treaty, and submitted so low as to send them to St. Marys, then the residence of the Governor of Maryland, and the place where the assemblies met. Yet all this condescension could not hold them to their bargain. The Governor said, he had observed his part of the agreement, and would not call an assembly any more upon that subject.

In this manner two whole years were spent, and nothing could be accomplished for their relief. In the mean while England was studious to prevent their receiving supplies from any other country. To do that more effectually, it was thought expedient to confine the trade of that colony to one place. But that being not found practicable because of the many great rivers that divide their habitations, and the extraordinary conveniencies of each, his Majesty sent directions to build forts in the several rivers, and enjoined all the ships to ride under those forts: And farther ordered, that those places should only be the ports of trade.

Forts or-
dered on
several ri-
vers for
ships to
ride un-
der.
Which
took place
for one
year only.

This instruction was punctually observed for a year, and preparations were made for forts by casting up breast-works in such places as the assembly appointed, and the shipping did for that time ride at those places. But the great fire and plague happening in London immediately upon it made their supplies that year very uncertain; and the terror the people were in lest the plague should be brought over with the ships from London, prevented them from residing at those ports, for fear of being all swept away at once; and so every body was left at liberty again.

Still no favour could be obtained for the tobacco trade, and the English merchants afforded but a bare support of cloathing for their crops. The assembly was full enough of resentment, but overlooked their right way of redress. All they could do was to cause looms and workhouses to be set up in the several counties at the county charge. They renewed the rewards of silk, and
put

CHAP. VII. put great penalties upon every neglect of making flax and hemp. About this time they sustained some damage by the Dutch war, for which reason they ordered the forts to be re-built with brick. But having yet no true notion of the advantage of towns they did not oblige the ships to ride under them; which thing alone, well executed, would have answered all their desires.

Further discoveries attempted. Sir WILLIAM BERKLEY, who was always contriving and industrious for the good of the country, was not contented to set a useful example at home by the essays he made of pot-ath, flax, hemp, silk, &c. but was also resolved to make new discoveries abroad amongst the Indians.

The Appalachian mountains.

For this end he employed a small company of about fourteen English and as many Indians, under the command of Captain HENRY BATT, to go upon such an adventure. They set out together from Appamattox, and in seven days march reached the foot of the mountains. The mountains they first arrived at were not extraordinary high or steep, but after they had passed the first ridge they encountered others that seemed to reach the clouds, and were so perpendicular and full of precipices, that sometimes in a whole day's march they could not travel three miles in a direct line. In other places they found large level plains and fine savanna's three or four miles wide, in which were an infinite quantity of turkies, deer, elks, and buffaloes, so gentle and undisturbed that they had no fear at the appearance of the men, but would suffer them to come almost within reach of their hands. There they also found grapes so prodigiously large that they seemed more like bullace than grapes. When they traversed these mountains they came to a fine level country again, and discovered a rivulet that descended backwards. Down that stream they travelled several days till they came to old fields and cabbins where the Indians had lately been, but were supposed to have fled at the approach of BATT and his company. However, the Captain followed the old rule of leaving some toys in their cabbins for them to find at their return, by which they might know they were friends. Near to these cabbins were great marshes, where the Indians which Captain BATT had with him made a halt, and would positively proceed no farther. They said, that not far from that place lived a nation of Indians that made salt and sold it to their neighbours; that this was a great and powerful people which never suffered any strangers to return that had once discovered their towns. Captain BATT used all the arguments he could to get them forward, but in vain; and so to please those timorous Indians the hopes of this discovery were frustrated, and the detachment was forced to return. In this journey it is supposed that BATT never crossed the great ridge of mountains, and kept up under it to the southward; but of late years the Indian traders have discovered on this side the mountains, about five hundred miles to the southward, a river they called Oukfusky, full of broad sunken grounds and marshes, but falling into the bay or great gulph between Cape Florida and the mouth of the Mississippi; which I suppose to be the river where BATT saw the Indian cabbins and marshes, but is gone to from Virginia without ever piercing the high mountains, and only encountering the point of an elbow, which they make a little to the southward of Virginia.

Discoveries as far as the gulph of Mexico.

Upon Captain BATT's report to Sir WILLIAM BERKLEY he resolved to make a journey himself, that so there might be no hindrance for want of sufficient authority, as had been in the afore said expedi-

CHAP. VII. tion. To this end he concerted matters for it, and had pitched upon his Deputy-Governor. The assembly also made an act to encourage it. But all these preparations came to nothing by the confusion that happened there soon after by BACON's rebellion: And since that, there has never been any such discovery attempted from Virginia, unless when Governor SPOTSWOOD found a passage over the great ridge of mountains and went over them himself.

The occasion of this rebellion is not easy to be discovered; but 'tis certain there were many things that concurred towards it; for it cannot be imagined that upon the instigation of two or three traders only, who aimed at a monopoly of the Indian trade, as some pretend to say, the whole country would have fallen into so much distraction, in which people did not only hazard their necks by rebellion, but endeavoured to ruin a Governor whom they all entirely loved, and had unanimously chosen; a gentleman who had devoted his whole life and estate to the service of the country, and against whom, in thirty-five years experience, there had never been one single complaint. Neither can it be supposed that upon so slight grounds they would make choice of a leader they hardly knew, to oppose a gentleman that had been so long and so deservedly the darling of the people. So that in all probability there was something else in the wind, without which the body of the country had never been engaged in that insurrection.

Four things may be reckoned to have been the main ingredients towards this intestine commotion (viz.) First, The extreme low price of tobacco, and the ill usage of the planters in the exchange of goods for it, which the country, with all their earnest endeavours, could not remedy. Secondly, The splitting the colony into properties, contrary to the original charters, and the extravagant taxes they were forced to undergo to relieve themselves from those grants. Thirdly, The heavy restraints and burdens laid upon their trade by act of parliament in England. Fourthly, The disturbance given by the Indians; of all which in their order.

First, Of the low price of tobacco, and the disappointment of all sort of remedy, I have spoken sufficiently before.

Secondly, Of splitting the country into properties.

King CHARLES the Second, to gratify some nobles about him, made two great grants out of that country. These grants were not of the uncultivated wood-land only, but also of plantations, which for many years had been seated and improved under the encouragement of several charters granted by his royal ancestors to that colony. Those grants were distinguished by the names of the northern and southern grants of Virginia, and the same men were concerned in both. They were kept dormant some years after they were made, and in the year 1674 begun to be put in execution. As soon as ever the country came to know this, they remonstrated against them, and the assembly drew up an humble address to his Majesty, complaining of the said grants as derogatory to the previous charters and privileges granted to that colony by his Majesty and his royal progenitors. They sent to England Mr. Secretary LUDWELL and Colonel PARK as their Agents, to address the King to vacate these grants: And the better to defray that charge, they laid a tax of fifty pounds of tobacco per poll for two years together, over and above all other taxes, which

Bacon's rebellion.

The grievances which occasioned it.

CHAP. VII. was an excessive burden. They likewise laid amer-
 cements of seventy, fifty, or thirty pounds of tobacco, as the cause was, on every law case tried throughout the country. Besides all this, they applied the ballance remaining due upon account of the two shillings per hogshead and fort duties to this use; which taxes and amer-
 cements fell heaviest on the poor people, the effect of whose labour would not cloath their wives and children. This made them desperately uneasy, especially when after a whole years patience under all these pressures they had no encouragement from their Agents in England to hope for remedy, nor any certainty when they should be eased of those heavy impositions.

Thirdly. Upon the back of all these misfortunes came out the act of 25 Car. II. for better securing the plantation trade. By this act several duties were laid on the trade from one plantation to another. This was a new hardship, and the rather because the revenue arising by this act was not applied to the use of the plantation wherein it was raised, but given clear away; nay, in that country it seemed to be of no other use but to burden the trade, or create a good income to the officers; for the collector had half, the comptroller a quarter, and the remaining quarter was subdivided into salaries till it was lost.

By the same act also very great duties were laid on the fisheries of the plantations, if manufactured by the English inhabitants there, while the people of England were absolutely free from all customs: Nay, tho' the oil, blubber, and whalebone, which were made by the inhabitants of the plantations, were carried to England by English and in English-built ships, yet it was held to a considerable duty more than the inhabitants of England paid.

These were the afflictions that country laboured under when the fourth accident happened, viz. the disturbance offered by the Indians to the frontiers.

This was occasioned: First, by the Indians on the head of the bay. Secondly, by the Indians on their own frontiers.

First. The Indians at the head of the bay drove a constant trade with the Dutch in Monadas, now called New-York; and to carry on this they used to come every year by the frontiers of Virginia to hunt and purchase skins and furs of the Indians to the southward. This trade was carried on peaceably while the Dutch held Monadas, and the Indians used to call on the English in Virginia on their return, to whom they would sell part of their Furrs, and with the rest go on to Monadas. But after the English came to possess that place, and understood the advantages the Virginians made by the trade of their Indians, they inspired them with such a hatred to the inhabitants of Virginia, that instead of coming peaceably to trade with them, as they had done for several years before, they afterwards never came but only to commit robberies and murders among them.

Secondly. The Indians upon their own frontiers were likewise inspired with ill thoughts of them; for their Indian Merchants had lost a considerable branch of their trade they knew not how, and apprehended the consequences of Sir WILLIAM BERKLEY's intended discoveries (espoused by the assembly) might take away the remaining part of their profit. This made them very troublesome to the neighbouring Indians, who, on their part, observing an unusual uneasiness in the English, and being terrified by their rough usage, immediately suspected some wicked design

CHAP. VII. against their lives, and so fled to their remoter habitations. This confirmed the English in their belief that they had been the murderers, till at last they provoked them to be so in earnest.

This addition of mischief to minds already full of discontent, made people ready to vent all their resentment against the poor Indians. There was nothing to be got by tobacco, neither could they turn any other manufacture to advantage; so that most of the poorer sort were willing to quit their unprofitable employments and go volunteers against the Indians.

At first they flocked tumultuously, running in troops from one plantation to another without a head, till at last the seditious humour of Colonel NATHANIEL BACON led him to be of the party. This gentleman had been brought up at one of the Inns of court in England, and had a moderate fortune. He was young, bold, active, of an inviting aspect, and powerful elocution. In a word, he was every way qualified to head a giddy and unthinking multitude. Before he had been three years in the country he was, for his extraordinary qualifications, made one of the council, and in great honour and esteem among the people. For this reason he no sooner gave countenance to this riotous mob, but they all presently fixed their eyes upon him for their General, and accordingly made their addresses to him. As soon as he found this, he harangued them publicly: He aggravated the Indian mischiefs, complaining that they were occasioned for want of a due regulation of their trade: He recounted particularly the other grievances and pressures they lay under, and pretended that he accepted of the command with no other intention but to do them and the country service, in which he was willing to encounter the greatest difficulties and dangers. He farther assured them he would never lay down his arms till he had revenged their sufferings upon the Indians, and redressed all their other grievances.

By these insinuations he wrought his men into so perfect an unanimity that they were one and all at his devotion. He took care to exasperate them to the utmost, by representing all their misfortunes. After he had begun to muster them he dispatched a messenger to the Governor, to whom he aggravated the mischiefs done by the Indians, and desired a commission of General to go out against them. This gentleman was in so great esteem at that time with the council, that the Governor did not think fit to give him a flat refusal; but sent him word he would consult the council and return him a farther answer.

In the mean time BACON was expeditious in his preparations, and having all things in readiness began his march, depending on the authority the people had given him. He would not lose so much time as to stay for his commission, but dispatched several messengers to the Governor to hasten it.

On the other hand, the Governor, instead of a commission, sent positive orders to him to disperse his men and come in person to him on pain of being declared a rebel.

This unexpected order was a great surprize to BACON, and not a little trouble to his men; however, he was resolved to prosecute his first intentions, depending upon his strength and interest with the people; nevertheless he intended to wait upon the Governor, but not altogether defenseless. Pursuant to this resolution he took about forty of his men down with him in a sloop to James town, where the Governor was with his council.

Matters

CHAP. VII. Matters did not succeed there to Mr. BACON's satisfaction; wherefore he expressed himself a little too freely, for which being suspended from the council, he went away in a huff with his sloop and followers. The Governor filled a long boat with men, and pursued the sloop so close, that Colonel BACON removed into his boat to make more haste: But the Governor had sent up by land to the ships at Sandy Point where he was stopped and sent down again. Upon his return he was kindly received by the Governor, who knowing he had gone a step beyond his instructions in having suspended him, was glad to admit him again of the council; after which he hoped all things might be pacified.

Notwithstanding, Colonel BACON still insisted upon a commission to be General of the volunteers, and to go out against the Indians, from which the Governor endeavoured to dissuade him but to no purpose; because he had some secret project in view. He had the luck to be countenanced in his importunities by the news of fresh murders and robberies committed by the Indians. However, not being able to accomplish his ends by fair means, he stole privately out of town, and having put himself at the head of six hundred volunteers, marched directly to James town, where the assembly was then sitting. He presented himself before the assembly, and drew up his men in battalia before the house wherein they sat. He urged to them his preparations, and alledged, that if the commission had not been delayed so long, the war against the Indians might have been finished.

The Governor relenting this insolent usage worst of all, and now absolutely refused to grant him any thing, offering his naked breast against the arms of his followers. But the assembly fearing the fatal consequence of provoking a discontented multitude ready armed, who had the Governor, council, and assembly entirely in their power, addressed the Governor to grant BACON his request. They prepared themselves the commission, constituting him General of the forces of Virginia, and brought it to the Governor to be signed.

The Governor With much reluctance the Governor signed it, and thereby put the power of war and peace into BACON's hands. Upon this he marched away immediately, having gained his end, which was in effect a power to secure a monopoly of the Indian trade to himself and his friends.

As soon as General BACON had marched to such a convenient distance from James town, that the assembly thought they might deliberate with safety, the Governor, by their advice, issued a proclamation of rebellion against him, commanding his followers to surrender him and forthwith disperse themselves, giving orders at the same time for raising the militia of the country against him.

The people being much exasperated, and General BACON by his address and eloquence having gained an absolute dominion over their hearts, they unanimously resolved, that not a hair of his head should be touched, much less to surrender him as a rebel. Therefore they kept to their arms, and instead of proceeding against the Indians they marched back to James town, directing their fury against such of their friends and countrymen as should dare to oppose them.

The Governor seeing this fled over the bay to Accomack, whither he hoped the infection of BACON's conspiracy had not reached: But there, instead of that people's receiving him with open arms in remembrance of the former services he had done them, they began to make terms with him

for redress of their grievances, and for the ease and liberty of trade against the acts of parliament abovementioned. Thus Sir WILLIAM, who had been almost the idol of the people, was, by reason of their calamity and jealousy, abandoned by all except some few, who went over to him from the western shore in sloops and boats, among which Major ROBERT BEVERLY was the most active and successful commander; so that it was some time before he could make head against BACON; but left him to range through the country at discretion.

General BACON at first held a convention of such of the chief gentlemen of the country as would come to him, especially of those about Middle Plantation, who were near at hand. At this convention they made a declaration to justify his unlawful proceedings, and obliged people to take an oath of obedience to him as their General. Then by their advice, on pretence of the Governor's abdication, he called an assembly by writs signed by himself and four others of the council.

By this time the Governor had got together a small party to side with him. These he furnished with sloops, arms and ammunition, under command of Major ROBERT BEVERLY, in order to cross the bay and oppose the malecontents. By this means there happened some skirmishes, in which several were killed and others taken prisoners. Thus they were going on by a civil war to destroy one another, and lay waste their infant country, when it pleased God, after some months confusion, to put an end to their misfortunes as well as to BACON's designs by his natural death.

He died at Dr. GREEN's in Gloucester county, but where he was buried was never yet discovered; tho' afterwards there was great enquiry made with design to expose his bones to publick infamy.

In the mean while those disorders occasioned a general neglect of husbandry, and a great destruction of the stocks of cattle; so that people had a dreadful prospect of want and famine. But the malecontents being thus disunited by the loss of their General, in whom they all confided, they began to squabble among themselves, and every man's business was how to make the best terms he could for himself.

Lieutenant General INGRAM (whose true name was JOHNSON) and Major General WALKLEY surrendered on condition of pardon for themselves and their followers; tho' they were both forced to submit to an incapacity of bearing office in that country for the future.

Peace being thus restored, Sir WILLIAM BEVERLY returned to his former seat of government and every man to his several habitation.

While this intestine war was fomenting there, the Agents of the country in England could not succeed in their remonstrance against the propriety grants, tho' they were told that those grants should be revoked; but the news of their civil war reaching England about the same time, the King would then proceed no farther in that matter; so the Agents thought it their best way to compound with the proprietors. Accordingly, they agreed with them for four hundred pounds a man, which was paid, and so all the clamour against those grants ended, neither was any more heard of them until above a dozen years afterwards.

But all those Agents could obtain after their composition with the Lords was merely the name of a new charter, granting only so much of their former constitution as mentioned a residence of the

Bacon takes an oath of his followers and summons an assembly.

Bacon dies, which puts an end to the rebellion.

CHAP.
VII.

the Governor and Deputy, a granting of escheat lands for two pounds of tobacco per acre composition; and that the lands should be held of the crown in the same tenure as East-Greenwich, that is free and in common soccage, and have their immediate dependance on the crown.

A regi-
ment ar-
rives in
Virginia
from Eng-
land.

When this storm, occasioned by BACON, was blown over, and all things quiet again, Sir WILLIAM BERKLEY called an assembly for settling affairs in the country, and for making reparation to such as had been oppressed. After which a regiment of soldiers arrived from England, which were sent to suppress the insurrection; but they coming after the business was over, had no occasion to exercise their courage. However, they were kept on foot there about three years after, and in the Lord COLEPEPPER's time paid off and disbanded.

The confusion occasioned by the civil war, and the advantage the Indians made of it in butchering the English upon all their frontiers, caused such a desolation and put the country so far back that to the year 1704 they had seated very little beyond the boundaries that were then inhabited. At that time James Town was burnt down to the ground by RICHARD LAURENCE, one of BACON's Captains, who, when his own men, that abhorred such barbarity, refused to obey his command, he himself became the executioner and fired the houses with his own hands.

This unhappy town did never after arrive to the splendour it then had; and now it is almost deserted, by removing, in Governor NICHOLSON's time, the assembly and general court from thence to Williamsburgh, an inland place about seven miles from it.

With the regiment above-mentioned arrived commissioners, to enquire into the occasion and authors of this rebellion; and Sir WILLIAM BERKLEY came to England, where from the time of his arrival his sickness obliged him to keep his chamber till he died; so that he had no opportunity of kissing the King's hand. But his Majesty declared himself well satisfied with his conduct in Virginia, and was very kind to him during his sickness, often enquiring after his health, and commanding him not to hazard it by too early an endeavour to come to court.

Sir Willi-
am Berk-
ley dies in
England.Jeffreys
Governor.

Upon Sir WILLIAM BERKLEY's voyage to England, HERBERT JEFFREYS, Esq; was appointed Governor. He made formal articles of peace with the Indians, and held an assembly at Middle Plantation, wherein they settled and allowed a free trade with the Indians, but restrained it to certain marts to which the Indians should bring their commodities; and this also to be under such certain rules as were by that assembly directed. But this method was not agreeable to the Indians, who had never before been under any regulation. They thought that if all former usages were not restored the peace was not perfect; and therefore did not so much rely upon it, which made those new restrictions useless.

Governor JEFFREYS's time was very short there; he being taken off by death the year following.

Chicheley
Governor.

After him Sir HENRY CHICHELEY was made Deputy-governor in the latter end of the year 1678. In his time the assembly, for the greater terror of the Indians, built magazines at the heads of the four great rivers, and furnished them with

land were wont to send thither in order for its being shipped off for England. But in that I think Virginia mistook her interest; for had they permitted this custom to become habitual; and thus ingrossed the shipping, as would soon have happened, they could easily have regulated the trade of tobacco at any time, without the concurrence of those other colonies, and without submitting to their perverse humours as formerly.

CHAP.
VII.The Vir-
ginians
mistake
their in-
terest.

The spring following, THOMAS LORD COLEPEPPER arrived there Governor, and carried with him some laws which had been drawn up in England to be enacted in their assembly: And coming with the advantage of restoring peace to a troubled nation, it was not difficult for him to obtain whatever he pleased from the people. His influence too was the greater by the power he had of pardoning those who had a hand in the disorders committed in the late rebellion.

Lord
Colepep-
per Go-
vernor.

In his first assembly he passed several acts very obliging to the country, (viz.) First, an act of naturalization, whereby the power of naturalizing foreigners was placed in the Governor. Secondly, an act for cohabitation and encouragement to trade and manufactures, whereby a certain place in each country was appointed for a town, in which all goods imported and exported were to be landed and shipped off, bought and sold; which act was kindly brought to nothing by the opposition of the tobacco merchants of England. Thirdly, an act of general pardon and oblivion, whereby all the transgressions and outrages committed in the time of the late rebellion were entirely remitted, and reparation allowed to people that should be evil spoken of on that account.

The Eng-
lish mer-
chants dis-
courage
the build-
ing towns
in Virgi-
nia.

By passing some laws that obliged the country, the Lord COLEPEPPER carried on that which was very pleasing to himself, (viz.) the act for raising a publick revenue for the better support of the government. By this he got the duties contained therein to be made perpetual, and that the money which before used to be accounted for to the assembly, should from thenceforth be disposed of by his Majesty's sole direction, for the support of the government. When this was done, he obtained of the King, out of the said duties, a salary of two thousand pounds per annum, instead of one thousand which was formerly allowed. Also one hundred and sixty pounds per annum for house-rent, besides all the usual perquisites.

The Go-
vernor ob-
tains a sa-
lary of
2000 l.
per ann.

In those submissive times his Lordship reduced the greatest perquisite of his place to a certainty, which before that was only gratuitous; that is, instead of the masters of ships making presents of liquors or provisions towards the Governor's house-keeping, as they were wont to do, he demanded a certain sum of money, remitting that custom. This rate has ever since been demanded of all commanders as a duty, and is twenty shillings for each ship or vessel under an hundred tons, and thirty shillings for each ship upwards of that burden, to be paid every voyage or port-clearing.

This noble Lord seemed to lament the unhappy state of the country in relation to their coin. He was tenderly concerned that all their cash should be drained away by the neighbouring colonies, which had set so low an estimate upon it as Virginia; and therefore he proposed the raising of it.

Coin.

This was what the country had formerly de-

C H A P. VII. he would do it by proclamation. This they did not approve of, well knowing if that were the case, his Lordship and every other Governor would at any time have the same prerogative of altering it, and so people should never be at any certainty, as they quickly after found from his own practice; for his drift was only to make advantage of paying the soldiers. Money for that purpose being put into his Lordship's hands, he provided light pieces of eight, which he with this view had bought at a cheap rate. When this contrivance was ripe for execution he extended the royal prerogative, and issued forth a proclamation for raising the value of pieces of eight from five to six shillings, and as soon as they were admitted current at that value, he produced an order for paying, and disbanding the soldiers. Then those poor fellows, and such as had maintained them, were forced to take their pay in those light pieces of eight at six shillings. But his Lordship soon after himself found the inconvenience of that proclamation, for people began to pay their duties and their ship-money in coin of that high estimate; which was like to cut short his Lordship's perquisites, and so he was forced to make use of the same prerogative to reduce the money again to its former standard.

An artifice of the Governor to defraud the people

Which affects their salaries.

In less than a year the Lord COLEPEPPER returned to England, leaving Sir HENRY CHICHELEY Deputy-governor.

The country being then settled again, made too much tobacco, or too much trash tobacco for the market; and the merchants would hardly allow the planter any thing for it.

This occasioned much uneasiness again, and the people from former experience despairing of succeeding in any agreement with the neighbouring governments, resolved a total destruction of the tobacco in that country, especially of the sweet-scented; because that was planted no where else. In pursuance of which design they contrived that all the plants should be destroyed while they were yet in the beds, and after it was too late to sow more.

The Virginians destroy their tobacco.

Accordingly the ring-leaders in this project began with their own first, and then went to cut up the plants of such of their neighbours as were not willing to do it themselves. However, they had not resolution enough to go through with their work.

This was judged sedition and felony. Several people were committed upon it, and some condemned to be hanged: And afterwards the assembly passed a law to make such proceedings felony for the future (whatever it was before) provided the company kept together after warning by a Justice.

After this accident of plant-cutting, the Lord COLEPEPPER returned and held his second assembly, in which he contrived to gain another great advantage over the country. His Lordship, in his first voyage thither, perceiving how easily he could twist and manage the people, conceived new hopes of retrieving the propriety of the Northern-neck, as being so small a part of the colony. He conceived that while the remainder escaped free, which was far the greater part, they would not engage in the interest of the lesser number, especially considering the discouragements they had met with before in their former solicitation; though all this while, and many years afterwards, his Lordship did not pretend to lay publick claim to any part of the propriety.

It did not square with this project that appeals

should be made to the general-assembly, as till then had been the custom. He feared the burgessees would be too much in the interest of their countrymen, and adjudge the inhabitants of the Northern-Neck to have an equal liberty and privilege in their estates with the rest of Virginia, as being settled upon the same foot. In order therefore to make a better pennyworth of those poor people, he studied to overturn this odious method of appealing to the assembly, and to fix the last resort in another court.

To bring this point about, his Lordship contrived to blow up a difference in the assembly between the council and the burgessees, privately encouraged the burgessees to insist upon the privilege of determining all appeals by themselves exclusive of the council; because they having given their opinions before in the general-court, were for that reason unfit judges in appeals from themselves to the assembly. This succeeded according to his wish, and the burgessees bit at the bait under the notion of privilege, never dreaming of the snake that lay in the grass, nor considering the danger of altering an old constitution so abruptly. Thus my Lord gained his end, for he represented that quarrel with so many aggravations, that he got an instruction from the King to take away all appeals from the general-court to the assembly and cause them to be made to him in council, if the thing in demand was of three hundred pounds value, otherwise no appeal from the general-court.

Of this his Lordship made sufficient advantage; for in the confusion that happened in the end of King JAMES the second's reign, viz. in October, 1688, he having got an assignment from the other patentees, gained a favourable report from the King's council at law upon his patent for the Northern-Neck.

When he had succeeded in this, his Lordship's next step was to engage some noted inhabitant of the place to be on his side. Accordingly he made use of his cousin, Secretary SPENCER, who lived in the same Neck, and was esteemed as wise and great a man as any of the council. This gentleman did but little in his Lordship's service, and only gained some few strays that used to be claim'd by the Coroner in behalf of the King.

Upon the death of Mr. Secretary SPENCER, he engaged another noted gentleman, an old stander in that country, though not of the Northern-Neck, Colonel PHILLIP LUDWELL, who was then in England. He went over with this grant in the year 1690, and set up an office in the Neck, claiming some escheats; but he likewise could make nothing of it. After him Colonel GEORGE BRENT and Colonel WILLIAM FITZ-HUGH, that were noted lawyers and inhabitants of the said Neck, were employed in that affair, but succeeded no better than their predecessors. The people in the mean while complained frequently to their assemblies, who at last made another address to the King, but there being no agent in England to prosecute it, that likewise miscarried. At last Colonel RICHARD LEE, one of the council, a man of note, an inhabitant of the Northern-Neck, privately made a composition with the proprietor for his own land. This broke the ice, and several were induced to follow so great an example; so that by degrees they were generally brought to pay their quit-rents into the hands of the proprietor's agents. And at last it was managed for them by Colonel ROBERT CARTER, another of the council, and the greatest freeholder in that propriety.

C H A P. VII.

Lord Cole-pepper promotes divisions among the Virginians.

Deprives the assembly of the privilege of hearing appeals.

Lord Cole-pepper gains the propriety of the Northern Neck by artifice.

ons.

To return to my Lord COLEPEPPER's government. I cannot omit an uſeful thing which his Lordſhip was pleaſed to do with relation to their courts of juſtice. It ſeems nicety of pleading, with all the juggle of Weſtmiſter-hall was creeping into their courts. The clerks began in ſome caſes to enter the reaſons with the judgments, pretending to ſet precedents of inviolable form to be obſerved in all future proceedings. This my Lord found fault with, and retrenched all dilatory pleas as prejudicial to juſtice, keeping the courts cloſe to the merits of the cauſe, in order to bring it to a ſpeedy determination, according to the innocence of former times, and cauſed the judgments to be entered up ſhort, without the reaſon, alledging, that their courts were not of ſo great experience as to be able to make precedents to poſterity, who ought to be left at liberty to determine according to the equity of the controverſy before them.

In his time alſo were diſmantled the forts built by Sir HENRY CHICHELEY at the heads of the rivers, and the forces there were diſbanded, as being too great a charge. The aſſembly appointed ſmall parties of light horſe in their ſtead, to range by turns upon the frontiers; theſe being choſen out of the neighbouring inhabitants might afford to ſerve at eaſier rates, and yet do the buſineſs more effectually. They were raiſed under the title or name of Rangers.

After this the Lord COLEPEPPER returned again for England, his ſecond ſtay not being much longer than the firſt; and Sir HENRY CHICHELEY being dead, he proclaimed his kiſman Mr. Secretary SPENCER, Preſident, though he was not the eldeſt member in the council.

The next year, being 1684, upon the Lord COLEPEPPER's reſuſing to return to Virginia, FRANCIS Lord HOWARD of Eſſingham was ſent over Governor. In order to increaſe his perquiſites, he impoſed the charge of an annual under ſeal of twenty ſhillings each for ſchool-maſters, five pounds for lawyers at the general-court, and fifty ſhillings each lawyer at the county-courts. He alſo extorted an exceſſive fee for putting the ſeal to all probates and wills and letters of adminiſtration, even where the eſtates of the deceased were of the meanest value. Neither could any be favoured with ſuch adminiſtration or probate without paying that extortion. If any body preſumed to remonſtrate againſt it, his Lordſhip's behaviour towards that man was very ſevere. He kept ſeveral perſons in priſon and under confinement from court to court, without bringing them to trial; which proceedings and many others were ſo oppreſſive, that complaints were made thereof to the King, and Colonel PHILLIP LUDWELL was appointed agent to appear againſt him in England; whereupon the ſeal-money was taken off.

During the firſt ſeſſion of aſſembly in this noble Lord's time, the duty on liquors imported from the other Engliſh plantations was firſt impoſed. It was then laid on pretence of leſſening the levy by the poll for payment of publick taxes, but more eſpecially for re-building the State-houſe, which had not been re-built ſince LAURENCE burnt it in BACON's time.

This duty was at firſt laid on wine and rum only at the rate of three-pence per gallon, with an exemption of all ſuch as ſhould be imported in the ſhips of Virginia owners; but the like duty has ſince been laid on other liquors alſo, and is raiſed to

four-pence per gallon on wine and rum, and one penny per gallon on beer, cyder, lime-juice, &c. and the privilege of Virginia owners taken away, to the great diſcouragement of their ſhipping and home trade.

This Lord, though he pretended to no great ſkill in legal proceedings, yet he made great innovations in their courts, pretending to follow the Engliſh forms. Thus he created a new court of chancery diſtinct from the general-court, which had ever before claimed that juriſdiction. He erected himſelf into a Lord-chancellor, taking the gentlemen of the council to ſit with him as mere associates and adviſers, not having any vote in the cauſes before them. And that it might have more the air of a new court, he would not ſo much as ſit in the ſtate-houſe where all the other publick buſineſs was diſpatched, but took the dining-room of a large houſe for that uſe. He likewiſe made arbitrary tables of fees peculiar to this high court. However, his Lordſhip not beginning this project very long before he left the country, all theſe innovations came to an end upon his removal, and the juriſdiction returned to the general-court again in the time of Colonel NATHANIEL BACON, whom he left Preſident.

During that gentleman's preſidency, which began in 1689, the project of a college was firſt agreed upon. The contrivers drew up their ſcheme and preſented it to the Preſident and Council. This was by them approved and referred to the next aſſembly; but Colonel BACON's adminiſtration being very ſhort, and no aſſembly call'd all the while, this pious deſign could proceed no further.

Anno 1690, FRANCIS NICHOLSON, Eſq; being appointed Lieutenant-governor under the Lord Eſſingham, arrived there. This gentleman diſcourſed freely of country improvements, inſtituted publick exerciſes, and gave prizes to all thoſe that ſhould excel in the exerciſes of riding, running, ſhooting, wreſtling, and cudgel-playing. When the deſign of a college was communicated to him, he promiſed it all imaginable encouragement. The firſt thing deſired of him in its behalf, was the calling of an aſſembly; but this he could by no means agree to, being under obligations to the Lord Eſſingham to ſtave off aſſemblies as long as he could, for fear there might be farther representations ſent over againſt his Lordſhip; who was conſcious to himſelf how uneaſy the country had been under his deſpotick adminiſtration.

When that could not be obtained, then they propoſed that a ſubſcription might paſs through the colony, to try the humour of the people in general, and ſee what voluntary contributions they could get towards it. This he granted, and he himſelf, together with the council, ſet a generous example to the other gentlemen of the country; ſo the ſubſcriptions at laſt mounted to about two thouſand five hundred pounds, in which ſum is included the generous benevolences of ſeveral merchants of London.

Anno 1691, an aſſembly being called, this deſign was moved to them, and they eſpouſed it heartily; and ſoon after made an addreſs to King WILLIAM and Queen MARY in its behalf, and ſent the reverend Mr. JAMES BLAIR, their agent, to England, to ſolicit their Majeſties charter for it.

It was propoſed that three things ſhould be taught in this college, viz. languages, divinity, and natural philoſophy.

The

CHAP. VII. The assembly was so fond of Governor NICHOLSON at that time, that they presented him the sum of three hundred pound as a testimony of their good disposition towards him. But he having an instruction to receive no present from the country, they drew up an address to their Majesties, praying that he might have leave to accept it, which was granted; and he gave one half thereof to the college.

A college erected.

Their Majesties were well pleased with that pious design of the plantation, and granted a charter according to the desire of Mr. BLAIR their agent.

Their Majesties were graciously pleased to give near two thousand pound sterling, the ballance then due upon the account of quit-rents, towards the founding the college; and towards the endowing of it they allowed twenty thousand acres of choice land, together with the revenue arising by the penny per pound on tobacco exported from Virginia and Maryland to the other plantations.

It was a great satisfaction to the archbishops and bishops to see such a nursery of religion founded in that new world; especially for that it was begun in an episcopal way, and carried on wholly by zealous conformists to the church of England.

In this first assembly, Lieutenant-Governor NICHOLSON passed acts for encouragement of the linen manufacture, tanning, currying, and shoe-making. He also in that session passed a law for cohabitation and improvement of trade.

Before the next assembly he tacked about, and was quite the reverse of what he was in the first, as to cohabitation. Instead of encouraging ports and towns, he spread abroad his dislike of them, and went among the people finding fault with those things which he and the assembly had unanimously agreed upon the preceding session: Such a violent change there was in him that it proceeded from some other cause than barely the inconstancy of his temper. He had received directions from those English merchants, who well knew that cohabitation would lessen their consigned trade.

The building towns in Virginia discouraged again.

Andros Governor.

In February 1692, Sir EDMUND ANDROS arrived governor. He began his government with an assembly which over-threw the good designs of ports and towns: But the groundwork of this proceeding was laid before Sir EDMUND's arrival. However, this assembly proceeded no farther than to suspend the law till their Majesties pleasure should be known. But it seems the merchants in London were dissatisfied and made publick complaints against it, which their Majesties were pleased to hear, and afterwards referred the matter back to the assembly again, to consider if it were suitable to the circumstances of the country, and to regulate it accordingly. But the assembly did not then proceed any farther in it, the people themselves being infected by the merchants letters.

At this session Mr. NEAL's project for a post-office, and his patent of post-master general in those parts of America were presented. The assembly made an act to promote that design, but by reason of the inconvenient distance of their habitations and want of towns this project fell to nothing.

With Sir EDWARD ANDROS was sent over the college charter, and the subsequent assembly declared that the subscriptions which had been made to the college were due and immediately demandable. They likewise gave a duty on the exportation of skins and furs for its more plentiful

endowment, and the foundation of the college was laid.

CHAP. VII.

The subscription money did not come in with the same readiness with which it had been under-written. However, there was enough given by their Majesties and gathered from the people to keep all hands at work, and carry on the building, the foundation whereof they then laid; and the rest upon suit had judgment given against them.

Sir EDMUND ANDROS was a great encourager of manufactures. In his time fulling-mills were set up by act of assembly. He also gave particular marks of his favour towards the propagating of cotton, which since his time has been much neglected. He was likewise a great lover of method and dispatch in all sorts of business, which made him find fault with the management of the secretary's office; and indeed with very good reason, for from the time of BACON's rebellion till then there was never any office in the world more negligently kept: Several patents of land were entered blank upon the record, many original patents, records, and deeds, with other matters of great consequence, were thrown loose about the office, and suffered to be dirtied, torn, and eaten by the moths and other insects. But upon this gentleman's accession to the government he immediately gave directions to reform all these irregularities; he caused the loose and torn records of value to be transcribed into new books, and ordered conveniences to be built within the office for preserving the records from being lost and confounded as before. He prescribed methods to keep the papers dry and clean, and to reduce them into such order as that any thing might be turned to immediately. But all these conveniences were burnt soon after they were finished in October 1698, together with the office itself and the whole State-house: But his diligence was so great in that affair, that tho' his stay afterwards in the country was very short, yet he caused all the records and papers which had been saved from the fire to be sorted again, and registered in better order than ever they had been before. In this condition he left them at his quitting the government.

Sir Edmund Andros a good Governor

He made several orders to rebuild the State-house in the same place; and had his government continued six months longer, 'tis probable he would have effected it after such a manner as might have been least burthen some to the people, designing the greatest part at his own cost.

Sir EDMUND ANDROS being upon a progress one summer, called at a poor man's house in Stafford county for water; there came out to him an ancient woman, and with her a lively brisk lad about twelve years old. The lad was so ruddy and fair that his complexion gave the governor a curiosity to ask some questions concerning him; and to his great surprise was told that he was the son of that woman at seventy-six years of age. His excellency smiling at this improbability, enquired what sort of man had been his father. To this the good woman made no reply, but instantly ran and led her husband to the door, who was then above an hundred years old. He confirmed all that the woman had said about the lad, and notwithstanding his great age was strong in his limbs and voice, but had lost his sight. The woman, for her part, was without complaint, and seemed to retain a vigour very uncommon at her years. Sir EDMUND was so well pleased with this extraordinary account, that after having made himself known to them, he offered to take care of the

the lad ; but they would by no means be persuaded to part with him : However, he gave them twenty pounds.

In November 1698, FRANCIS NICHOLSON, Esq; was removed from Maryland to be governor of Virginia ; but he went not then with that smoothness on his brow he had carried with him when he was appointed lieutenant-governor. He talked then no more of improving manufactures, towns, and trade ; but instead of encouraging the manufactures, he sent over inhuman memorials against them, opposite to all reason. In one of these he remonstrates, that the tobacco of that country often bears so low a price that it would not yield cloaths to the people that make it ; and yet presently after, in the same memorial, he recommends it to the parliament to pass an act forbidding the plantations to make their own cloathing, which in other words is desiring a charitable law that the planters shall go naked. In a late memorial concerted between him and his creature Colonel QUARRY, 'tis most humbly proposed, That all the English colonies on the continent of North America be reduced under one government and under one Vice-roy, and that a standing army be there kept on foot to subdue the Queen's enemies, surmising that they were intending to set up for themselves.

He began his government with a shew of zeal for the church. In the latter end of his time one half of the intended building, that is, two sides of the square, were carried up and finished ; in which were allotted the publick hall, the apartments and conveniencies for several masters and scholars, and the publick offices for the domesticks : The masters and scholars were also settled in it ; and it had its regular visitations from the visitors and governors thereof.

Soon after this accession to the government, he procured the assembly and courts of judicature to be removed from James Town, where there were good accomodations for people, to Middle-Plantation where there were none. There he flattered himself with the fond imagination of being the founder of a new city. He marked out the streets in many places so as that they might represent the figure of a W, in memory of his late Majesty King WILLIAM, after whose name the town was called Williamsburgh. There he procured a stately fabrick to be erected, which he placed opposite to the college, and graced it with the magnificent name of The Capitol.

In the second year of this gentleman's government there happened an adventure very fortunate for him, which gave him much credit, and that was the taking of a pyrate within the capes of that country.

It fell out that several merchant-ships were got ready and fallen down to Lynhaven Bay, near the mouth of James River, in order for sailing. A pyrate being informed of this, and hearing that there was no man of war there except a sixth rate, ventured within the capes, and took several of the merchant-ships. But a small vessel happened to come down the bay, and seeing an engagement between the pyrate and a merchant-man, made a shift to get into the mouth of James River where the Shoreham, a fifth-rate man of war, was newly arrived. The sixth-rate, commanded by Captain JOHN ALDRID, was then on the careen in Elizabeth River, in order for her return to England.

The Governor happened to be at that time at Kiquotan sealing up his letters, and Captain PAS-

SENGER, commander of the Shoreham, was a-shore CHAP. VII. to pay his respects to him. In the mean while news was brought that a pyrate was within the capes ; upon which the Captain was in haste to go aboard his ship, but the Governor stayed him a little, promising to go along with him. The Captain soon after asked his excuse, and went off, leaving him another boat if he pleased to follow. It was about one o'clock in the afternoon when the news was brought, but it was night before his Excellency went on board, staying all that while a-shore upon some weighty occasions. At last he followed, and by break of day the man of war was fairly out between the capes and the pyrate, where, after ten hours sharp engagement, the pyrate was obliged to strike and surrender upon the terms of being left to the King's mercy.

Now it happened that three men of this pyrate's gang were not on board their own ship at the time of the surrender, and so were not included in the articles of capitulation, but were tried in that country. In summing up the evidence against them (the Governor being present) the Attorney-General extolled his Excellency's mighty courage and conduct, as if the honour of taking the pyrate had been due to him. Upon this Captain PASSENGER took the freedom to interrupt Mr. Attorney in open court, and said he was commander of the Shoreham, that the pyrates were his prisoners, and that no body had pretended to command in that engagement but himself. He farther desired, that the Governor, who was then present, would do him the justice to declare whether he had given the least word of command all that day, or directed any one thing during the whole fight. This his Excellency acknowledged was true, and fairly yielded the honour of that exploit to the Captain.

This Governor likewise gained some reputation by another instance of his management, whereby he let the world know the violent passion he had to publish his own fame.

To get honour in New-York, he had zealously recommended to the court of England the necessity that Virginia should contribute a certain quota of men, or else a sum of money towards the building and maintaining a fort at New York. The reason he gave for this was, because New-York was their barrier, and as such it was but justice they should help to defend it. This was by order of his late Majesty King WILLIAM proposed to the assembly ; but upon the most solid reasons they humbly remonstrated, That neither the forts then in being, nor any other that might be built in the province of New-York, could in the least avail to the defence and security of Virginia ; for that either the French or the northern Indians might invade that colony and not come within an hundred miles of any such fort. The truth of these objections are obvious to any one that ever looked on the maps of that part of the world : But the secret of the whole business in plain terms was this : Those forts were necessary for New-York, to enable that province to engross the trade of the neighbouring Indians, which Virginia had sometimes shared in when the Indians rambled to the southward.

Now the glory of Colonel NICHOLSON got in that affair was this : After he had represented Virginia as republican and rebellious for not complying with his proposal, he said publickly, that New-York should not want the nine hundred pounds tho' he paid it out of his own pocket, and soon after took a journey to that province.

When

CHAP.
VII.A ga'co-
nade of
Governor
Nichol-
son's.

When he arrived there he blamed Virginia very much; but pretending earnest desires to serve New-York, gave his own bills of exchange for nine hundred pounds to the aforesaid use, but prudently took a defeasance from the gentleman to whom they were given; specifying, That till her Majesty should be graciously pleased to remit him the money out of the quit-rents of Virginia, those bills should never be made use of. This was an admirable piece of sham generosity, and worthy of the great pains he took to proclaim it. I my self have frequently heard him boast that he gave this money out of his own pocket, and only depended on the Queen's bounty to repay him; tho' the money is not paid by him to this day.

Neither was he contented to spread abroad this untruth there, but he also foisted it into a memorial of Colonel QUARRY's to the council of trade, in which are these words: As soon as Governor NICHOLSON found the assembly of Virginia would not see their own interest, nor comply with her Majesty's orders, he went immediately to New-York, and out of his great zeal to the Queen's service and the security of her province, he gave his own bills for nine hundred pounds to answer the quota of Virginia, wholly depending on her Majesty's favour to reimburse him out of the revenues of that province.

Certainly his Excellency and Colonel QUARRY, by whose joint wisdom and sincerity this memorial was composed, must believe that the council of trade have very imperfect intelligence how matters pass in that part of the world, or else they would not presume to impose such a banter upon them.

He misre-
presents
the Virgi-
nians and
the rest of
the plan-
tations at
court.

But this is nothing if compared to some other passages of that unjust representation, wherein they took upon them to describe the people of Virginia to be both numerous and rich, of republican notions and principles, such as ought to be corrected and lowered in time; and that then or never was the time to maintain the Queen's prerogative, and put a stop to those wrong pernicious notions which were improving daily, not only in Virginia but in all her Majesty's other governments. A frown now from her Majesty will do more than an army hereafter, &c.

With these inhuman false imputations did those gentlemen afterwards introduce the necessity of a standing-army.

Governor
Nott.

Thus did Governor NICHOLSON continue to rule till August 1705, when EDWARD NOTT, Esq; arrived Governor and gave ease to the country by a mild rule. His commission was to be Governor-General, but part of his salary was paid my Lord Orkney as chief. Governor NOTT had the general commission given him because it was suggested that that method, viz. the supreme title would give the greater awe, and the better put the country to rights.

Governor NOTT called an assembly the fall after his arrival, who past the general revival of the laws which had been too long in hand: But that part of it which related to the church and clergy Mr. Commissary could not be pleased in; wherefore that bill was dropt, and so it lies at this day.

This assembly also passed a new law for ports and towns, grounding it only upon encouragements, according to her Majesty's letter to that purpose; but it seems this also could not please the Virginia Merchants in England, for they complained against it to the crown, and so it was also suspended.

VOL. III.

This assembly also passed the law making slaves a real estate; which made a great alteration in the nature of their estates, and becomes a very good security for orphans, whose parents happen to die intestate.

CHAP.
VII.Slaves
made a
real estate.

This assembly also voted a house to be built for the Governor's residence, and laid duties to raise the money for it; but his Excellency lived not to see much effected therein, being taken off by death in August 1706. In the first year of his government the college was burnt down to the ground.

After this Governor's death, there being no other nominated by her Majesty to succeed him, the government fell into the hands of EDMUND JENINGS, Esq; the President, and the council, who held no assembly during his time, neither did any thing of note happen here, only we heard that Brigadier ROBERT HUNTER received commission to be Lieutenant-Governor under GEORGE, Earl of Orkney the Chief, and set out for Virginia, but was taken prisoner into France.

Earl of
Orkney
Governor.

During Brigadier HUNTER's confinement in France, a new commission issued to Colonel ALEXANDER SPOTSWOOD to be Lieutenant-Governor, who arrived in Virginia anno 1710, and improved the colony beyond imagination. His conduct, according to Colonel BEVERLEY, produced wonders. And it was the happiness of Virginia that this gentleman's administration was of a longer duration than usual, whereby he had an opportunity of putting in practice the prudent schemes he had laid; in which he was supported and encouraged by the Earl of Orkney, who died Governor of Virginia in the year 1737.

Spot-
wood De-
puty-Gov-
ernor.

CHAP. VIII.

Of the civil government of Virginia, both Indian and English.

BEFORE I proceed to describe their civil government, give me leave to observe, that the boundaries of the several counties in Virginia have been much altered since they were first laid out, and some others added to them, as Colonel BEVERLEY informs us. The description therefore already given of them, which was taken from Mr. OLDMIXON's history of this country, must of necessity be corrected by the Colonel's Present State of Virginia; who relates, that in the new modelling of the subdivisions of this province they contrived it so that each county might be situated on some single river for the benefit of trade and shipping.

CHAP.
VIII.The
bounda-
ries of the
counties
corrected
by Bever-
ley.

That in the northern neck of land, which lies between the rivers Patowmack and Rappahannock, which is the property of the Lord COLLEPPER's family, are contained six counties.

1. Lancaster, in which are two parishes, namely Christ-Church and St. Mary White-Chapel.
2. Northumberland, two parishes, viz. Fairfield-Boutracy and Wiccocomoco.
3. Westmoreland, two parishes, viz. Copely and Washington.
4. Stafford, two parishes, viz. St. Paul and Over-worton.
5. Richmond, one parish, viz. North-Farnham, and part of another, viz. Sittenburn.
6. King George County, one parish, named Han-over, the other part of Sittenburn.

In the neck between Rappahannock and York Rivers are contained six other counties, viz. 1. Gloucester, in which are four parishes, viz. Pef-so, Abingdon, Ware, and Kingston. 2. Mid-

CHAP. VIII. **Essex**, only one parish, viz. Christ-Church. 3. **King and Queen**, two parishes, viz. Stratton-Major and St. Stephen's. 4. **King William**, two parishes, viz. St. John's and St. Margaret's. 5. **Essex**, three parishes, viz. South-Farnham, St. Anne, and St. Mary's. 6. **Spotsylvania**, one parish, viz. St. George.

In the neck between York and James Rivers there are seven counties and part of an eighth; the seven entire counties are, 1. Elizabeth City, in which is only one parish, named also Elizabeth City Parish. 2. The county of Warwick, in which are two parishes, viz. Denby, and Mulberry-Island. 3. York, in which are two parishes, viz. Charles and York-Hampton, and part of a third called Bruton. 4. James-City, in which are three parishes, and part of two others, viz. James City, part of Wilmington, Merchants Hundred, and the other half of Bruton. 5. New Kent, two parishes, viz. Blisland and St. Peter's. 6. Charles City, two parishes, viz. Westover and part of Wilmington. 7. Hanover, one parish, viz. St. Paul's; and 8. Part of Henrico county on the north side of James River, by which river the parishes are also divided, there being two parishes in the whole county, viz. Henrico and St. James's, and part of a third called Bristol.

On the south side of James River are seven counties, and the other part of Henrico; the seven counties beginning at the bay, as I have done in all the rest, are, 1. Prince's Anne, in which is but one parish, namely, Lynhaven. 2. Norfolk, also one parish, called Elizabeth River. 3. Nan-samund, in which are three parishes, viz. Lower Parish, Upper-Parish, and Chickaluck. 4. Isle of Wight, in which are two parishes, viz. Warwick Squeeke Bay and New Port. 5. Surrey, two parishes, viz. Lyon's-Creek and Southwark. 6. Prince George, in which is one parish, viz. Martin-Brandon, and the other part of Bristol Parish in Henrico. 7. Brunswick, a new county, constituted towards the southern pass of the mountains, on purpose that by extraordinary encouragements the settlements may send up that way first, as is given also to Spotsylvania County for the northern pass. It is made one parish by the name of St. Andrew.

On the eastern shore, that is, on the east side of the great Bay of Chesepeak, the place where Sir WILLIAM BERKLEY retired to in the rebellion, without withdrawing from his government (as Mr. OLDMIXON declares he did) are two countries. 1. Northampton, having one parish, named Hungers. 2. Accomack, having one parish, named also Accomack.

In all, there are at present twenty-nine counties and fifty-four parishes.

Other mistakes of Mr. Oldmixon corrected by Colonel Beverley.

The Colonel also in his present state of Virginia, points out some other mistakes Mr. OLDMIXON has made in the geography of Virginia; observing that Prince George County, which lies on the south side of James River, Mr. OLDMIXON places on the north; and that he places some part of James City County on the south side of James River; whereas not an inch of it has been placed on that side of the river these threescore years.

That the same gentleman makes Elizabeth and Warwick Counties lie upon York River, whereas both of them lie upon James River, and neither of them comes near York River: That he placed King William County on both sides of Pamunky River, whereas it lies all on

the north side of Pamunky River; and tho' he placed King and Queen County upon the south of New Kent, at the head of Chickahomony River, that county lies north of New Kent, and there are two large rivers and two entire counties between the head of Chickahomony River and King and Queen county: And whereas he says that York and Rapahanock Rivers issue out of low marshes, it is very certain those rivers have their sources in the highest ridge of mountains, as he (Colonel BEVERLEY) avers upon his own view of them.

Some of these mistakes of Mr. OLDMIXON's I was so unfortunate to follow in describing the Virginian Counties; but since I have added Colonel BEVERLEY's corrections I hope I shall be forgiven. I should not have followed this gentleman of all men in his essays on religion or politics, or in his history of the STUARTS; but as there was nothing of party in describing the situation or subdivisions of an American province, I thought I might have given some credit to him, especially when he assures us, p. 278 of his history, that he was well acquainted with the modern surveys of that country. If I was cautious how I took his word before, I shall be much more so after he has led me into these errors, which I committed before I could get the last edition of Colonel BEVERLEY's present state, or I had laid Mr. OLDMIXON's history of Virginia entirely aside; for what he has valuable relating to that country I perceive he was obliged to the Colonel for.

I proceed now to enquire into the Virginian Government; and first that of the Indians, which according to Colonel BEVERLEY, is monarchical, but the crown descends to the next brother, and not to the son of the preceding monarch: And if there are no sons, to the sisters successively and their respective issue, according to their seniority. The Prince is restrained by no laws, but acts arbitrarily; and the usual punishment for capital offences is the knocking out the offenders brains with clubs. But tho' the civil power is lodged in the King, there is another Weroance, or great man, who is their General, and has the conduct of all military affairs: And neither the one nor the other of these transacts any thing of consequence without consulting their Priests and Prophets (or Conjurers) as our people call the latter: But the same person, I perceive is sometimes Priest, Prophet and Physician; and some parts of Florida the Priest is their General also.

But to qualify any man for a post, either in the state or army, he is obliged to undergo very severe discipline, which is called Huskanawing. The sons of some of the best families at sixteen or eighteen years of age are carried by their Priests into some solitary wood, and there shut up for several months in a kind of cage of a conick form; not suffered to converse with any man but their Tutors, or to eat any thing more than will just keep them alive; but they are obliged to drink a certain intoxicating liquor, which makes them rave like madmen, and forget every thing that ever happened, if we may believe them. But whatever effect the liquor may have; or how great soever the change may be that is wrought in their Pupils; the end of all this is, as the Indians themselves relate, to extinguish all childish impressions, and that partiality to persons and things which is so natural to all men; and to eradicate such prepossessions and unreasonable prejudices as they may have

CHAP. VIII.

CHAP. VIII. have imbibed, alledging, that until this is done they are by no means fit for ministers or magistrates. These gentlemen, thus disciplined are called Cockrouses, and of them the King's council is always composed, and no others are ever advanced to any post in the government civil or military.

Properties. As to their goods or personal estate, every man claims a right to what he possesses as well as to the fruits of his labour and his cloathing: His plantation and the buildings he erects on it are esteemed his property also so long as he remains in that part of the country, but no longer; for the whole territory belonging to one King or Tribe is really no more than one great common, no man claiming a distinct property in any part any longer than while he actually uses it. When he removes, another is at liberty to settle on the same spot of ground: But every Prince or Tribe has their respective territories bounded by some wood, river, or other natural fence, and will not suffer their neighbours to encroach upon them; tho' I can't perceive they made any other use of their lands before the arrival of the English than to hunt and take the wild beasts, game and fowl they found upon them; unless it were that every man had a little garden or spot of ground wherein he planted just corn and roots enough for the use of his own family. They had no sort of tame cattle to graze in their field until the English arrived.

The Government of the English in Virginia. As to the Government of the English in Virginia, this is formed upon the same model as that of England, and has a very near resemblance to it. The legislative authority is lodged in the Governor, the Council, and the house of Representatives: And the Governor has a negative as the King has here, but their acts must be ratified afterwards by his Majesty in England: However, they are of force in Virginia immediately upon receiving the Governor's assent, until his Majesty's pleasure is known.

The Governor. The Governor is appointed by his Majesty during pleasure, and is obliged to act according to his instructions. He calls assemblies by the advice of the council, but prorogues and dissolves them by his own authority: He presides in all councils of state, where he also has a negative.

He appoints Commissioners or Justices to administer justice in the County-courts by the consent of the council: He grants commissions to all the officers of the militia, and is himself vested with the title and office of Lieutenant-General, having the sole command of that body.

He tests all proclamations, disposes of all unpatented lands agreeably to his instructions and the laws of the country; and the seal of the colony for this and all other matters of state is in his keeping.

He is also constituted Vice-Admiral by a commission from the Admiralty of England: The issues of the publick revenue must bear his test; and his salary is two thousand Pound per annum, besides perquisites, computed to amount to near one thousand pound more.

On the death of the Governor, the administration devolves on the President and Council. The members of the council are appointed by letters or instructions from his Majesty, which only directs them to be sworn of that body: Their usual number is twelve, and if there happens to be under nine resident in the country, the Governor is empowered to swear such gentlemen as he thinks fit to make up that number.

CHAP. VIII. All bills which come from the assembly must have their assent; but I do not find any bills brought in by the council and sent down to the lower house, as is practised in the English house of Lords frequently. There is an annual sum of three hundred and fifty pound distributed among the members of the council, in proportion to the trouble they are at in attending general courts and assemblies.

The free-holders of every country elect two General Burgeesses to present them in the general assembly.

James city elects one, and the college one; so that there are in all sixty Burgeesses. They are summoned by writs issued from the Secretary's office under the seal of the colony, and tested by the Governor, being directed to the respective Sheriffs, and bearing date forty days before their return: The writs and notice of the intended election being published in every church and chapel of each county two Sundays successively; and controverted elections are determined by the house as in England.

A Speaker is also chosen, and freedom of speech and other privileges allowed the assembly on the Speaker's application to the Governor, as in the British parliament to the King: And a speech is made, acquainting them with the occasion of their meeting; which is usually once a year, or oftner if the Governor sees fit.

Having treated of their assembly or high court of parliament, I come naturally to enquire into the constitution of their other courts; which are chiefly two, viz. the General-court and their respective County-courts.

The General-court consists of the Governor and Council, or any five of them, who are the judges of it and take cognizance of all causes, whether civil, criminal or ecclesiastical; from whence there is no appeal, unless the matter in dispute exceed the value of three hundred pounds sterling; and then there lies an appeal to the King and Council, and is there determined by a committee of the Privy Council, called the Lords of appeals. But in criminal cases there is no appeal from this court, only the Governor is empowered to pardon all crimes save treason and murder; and even in these instances may relieve the criminal from time to time until the King's pleasure is known.

The General-court is held annually on the 15th of April and the 15th of October, each term or session continuing eighteen days, exclusive of Sundays; and these were formerly the only times of goal-delivery; but at this day the Governor appoints Commissioners for the trial of criminal causes.

In the General-court civil causes are not tried by a jury of the county where the parties live, but by gentlemen summoned from all parts to attend the General-court; but in criminal cases the Sheriff is ordered to summon six of the nearest neighbours to the prisoner, who may be supposed to be best acquainted with his life and conversation; to which six, are added six more of the gentlemen summoned to attend the court; and the prisoner is allowed his challenge, as in England.

Civil causes are usually brought to a trial and determined in the third term or session; so that a year and half puts an end to suits in the General-court, and three or four months in the County-court, the latter being held monthly: And where any one appeals from the County-court to the General-court, the appeals are tried and determined at the next General-court.

Every

CHAP.
VIII

Every one is allowed to plead his own cause by himself or his friends, or by his attorney or council, at his option; and though the suitor may appeal from the county-court to the general-court, the general-court does not take cognizance of any cause originally, where the matter in dispute is not of the value of ten pounds sterling, or two thousand pounds of tobacco.

Judges of
the county-
courts.

The Judges or Commissioners of the county-courts receive their commissions from the Governor, and are Justices of Peace in their respective counties, being eight or more in number. They are authorized to determine all civil causes in law or equity, and such criminal causes as do not affect life or member; and in the case of hog-stealing they are empowered to condemn the offender to lose his ears for the second offence; their proceedings resembling those of the general-court, except that here every cause is tried by a jury of the same county where the parties live, or the facts are committed.

Orphans

This monthly court hath also the care of orphans, and of their estates and effects, and put out apprentices, and provide for such orphans as are in low circumstances: And in September annually audit the accounts of orphans, and enquire into their education and maintenance, putting some to school and others to trades, as they see proper: and where they find children neglected or hardly used, they remove them to other masters; and when poor orphans have served the time they were bound for, their masters are obliged to furnish them with a stock of cattle, tools, &c. to enable them to begin the world with to a certain value; the boys being bound till twenty-one, and the girls till eighteen years of age, when the maids, if they behave well, usually get good husbands, and live plentifully.

Public
officers.

Of the public officers, there are three besides the Governor, which have their commissions immediately from his Majesty, viz. the Auditor of the revenue, the Receiver-general, and the Secretary of state.

Auditor.

1st. The Auditor audits all the public accounts, and transmits the state of them to England; his salary being 6 per cent. of the publick money.

Receiver-
general.

2dly. The Receiver-general sells the publick tobacco, and issues the money or the produce of it by the King's order; his salary also being 6 per cent.

Secretary.

3dly. The Secretary, who keeps the publick records, viz. all judgments of the general-court, and deeds and other writings proved therein; issues all writs relating thereto; makes out and records all patents of lands, and takes the returns of all inquests of escheat. In his office also is kept a register of all commissions of administration and probates of wills, of marriages, births, and burials; of all persons who leave the country, and of all houses of entertainment, &c. From this office issues the writs for electing Burgesses, and here are kept authentick copies of all proclamations. His revenue arises from fees for business done in his office, and amounts one year with another to seventy thousand pounds of tobacco, out of which he pays twelve hundred and fifty to Clerks.

The Bishop's
Commissary.

There are two other public officers, viz. the Ecclesiastical Commissary, who visits the several churches of the province, and receives his authority from the Bishop of London, Ordinary of all the plantations: And, 2. The Treasurer of the

Treasurer
of the province.

province, who is appointed by the general assembly to receive such sums as are raised by their acts.

CHAP.
VIII

There is also a Judge of the admiralty; but he is appointed from time to time, as business happens, and is not a standing officer.

Judge of
the Admir-
alty.

The rest of the public officers are Escheators, Sheriffs of counties, Coroners, Collectors, Surveyors of lands, Clerks of courts, and others of less moment.

Other offi-
cers.

The constant publick revenues are of five sorts. 1st. A rent reserved by the crown out of all lands granted by patent, which is called his Majesty's quit-rent, being two shillings for every hundred acres so granted, and two pence an acre for all lands escheated to the crown (which is paid by all except the inhabitants of the Northern-Neck, who hold of my Lord COLEPEPPER's family, the proprietors of that district) which quit-rents amount to about 1500 l. sterling per annum, and are left in bank there against any sudden emergency; except it be sent for to England.

Revenues
of Virginia.

2dly. A revenue granted by an act of assembly for the support of the government arising first by two shillings per hoghead for every hoghead exported. 2dly, By a rate of fifteen pence per ton for every voyage a ship makes. 3dly, By a duty of six pence per head for every passenger brought into the country. 4thly. By fines and forfeitures imposed by several acts of assembly; by waifs and strays, compositions for escheated lands and goods, &c. which revenue amounts to three thousand pounds per annum and upwards, and is disposed of by the Governor and Council for defraying the expences of the government; which accounts may be inspected by the general assembly.

A duty of
two shil-
lings per
hoghead.
Fifteen
pence per
ton.
Six pence
per passen-
ger.
Fines,
waifs, and
strays,
composi-
tions.

3dly. Revenues arising by act of assembly reserved to their own disposal, viz. a duty on liquors importing from the neighbouring plantations, and upon all slaves and servants imported. The duty on liquors four pence per gallon for rum, brandy or wine; and one penny for beer, cyder, and other liquors. The duty on servants and slaves, twenty shillings for each servant not a native of England, and five pounds for each slave or negroe.

A duty on
foreign li-
quors. On
slaves and
servants.

4thly. The revenue granted to the college by a duty on skins and furs exported; raising about an hundred pounds per annum.

A duty for
the col-
lege on
skins and
furs.

5thly. The revenue raised by British acts of parliament on the trade there, being a duty of one penny per lb. on all tobacco exported to the plantations and not carried directly to England; which was given by an act of W. & M. to the college, but does not raise two hundred pounds per annum.

One pen-
ny per lb.
on tobac-
co for the
college.

But these are trifles compared to the duties laid upon tobacco imported into England by act of parliament, which do not amount to less than two hundred thousand pounds sterling one year with another; which is all applied to the support of the crown and government of England, its mother country; which, no doubt, will have a suitable regard for a daughter that makes such noble and grateful returns.

Duties laid
on tobac-
co in Eng-
land.

The most usual way of raising money in Virginia next to those already mentioned (of laying duties upon trade and shipping) is by a poll-tax, assessing a certain rate or portion of tobacco on the head of every taxable or titheable person, as they call them.

Poll-tax in
Virginia
on all
titheable
persons.

5

Tithe-

CHAP. VIII. Titheable persons are all negroes male and female, above sixteen years of age, and white men of that age; but white women and white children under sixteen are not deemed titheable or subject to a poll-tax, either for the support of the government, or towards any county or parish-rates.

And that it may be known what titheable persons there are in each county, every master of a family is obliged, under a severe penalty, to bring a true list of every titheable person in his family to the Justices of the peace at their respective sessions. These poll-taxes and levies are of three kinds. 1st. Such as are enacted by the general assembly for the support and defence of the government. 2dly. Such as are ordered to be raised by the Justices of peace of each county at their respective sessions for building and repairing their court-houses, prisons, &c. And, 3dly. Parish levies, which are assessed by the vestries of the respective parishes, for the building and adorning churches and chapels, building parsonage-houses, buying glebes, and raising a revenue for the Minister, Reader, Clerk, and Sexton.

Tenures of lands. The next head proper to be treated of in this place is that of tenures. And it appears that their lands are holden by free and common socage, according to the custom of East-Greenwich, and are granted by letters patents under the seal of the colony tested by the Governor. And these grants are obtained by petition: 1st, upon a survey of lands that have never been granted to any one before: 2dly, on a lapse: And 3dly, where lands are escheated to the crown.

How a right of land is obtained.

Lands are said to be lapsed when any man who has obtained a patent or grant of them does not plant them within three years, as his patent requires. But if within three years after the date of his patent, or before another prefers a petition for them, he plant the lands, they cannot afterwards be forfeited unless by attainder, when they return to the crown, and the Governor and council grant them to whom they please, reserving only a rent of two pounds of tobacco per acre to the crown for such escheated lands.

Every man has a right to a grant of fifty acres of land in consideration of his personal transportation to Virginia; and if he carries his family with him, he is entitled to the like number of acres for his wife and every one of his children: But where there is nothing of this nature stipulated with the person who transports himself, a right to fifty acres of land may be purchased for five shillings when he comes there.

It is the business of the Surveyor to lay out and mark the boundaries of every man's plantation who has obtained a right; a copy whereof, with the Surveyor's certificate, being brought to the Secretary (if there be no objection to it) a patent is made out of course, which gives the patentee an estate in fee-simple, subject to a quit-rent of twelve pence for every fifty acres, provided he plant three acres of every fifty within three years, and build a house, and keep a stock of black cattle, sheep or goats thereon; which conditions if he does not perform, the land lapses, and the Governor grants it to whom he sees fit upon a petition preferred.

Naturalization. Foreigners are naturalized, and have all the privileges of Englishmen allowed them in Virginia on taking the oaths to the government there.

Laws. The laws of England are generally in force in VOL. III.

Virginia; and not only the acts of parliament of Great-Britain, but even orders of council have the force of laws in most of the plantations.

Some of the laws enacted by their general assembly, and peculiar to Virginia, are these that follow.

When a person is sued for a debt he may discount whatever appears due to him from the plaintiff, and shall be obliged to pay no more than the ballance of the account.

Acts of assembly.

Upon suspicion of any person's intention to remove out of the country, in order to conceal or withdraw himself from his creditors, any Justice of peace, upon complaint, may issue out an attachment against so much of his estate as amounts to the value of the debt claimed by the creditor, he giving security to pay the defendant such damages as shall be awarded in case he (the creditor) be cast.

None shall practise as an attorney unless licensed by the Governor; and no licensed attorney shall demand or receive for bringing any cause to judgment in the general-court more than five hundred pounds of tobacco, and in the county-court one hundred and fifty; and if any attorney refuse to plead for the said fees he shall forfeit as much as his fees should have been.

Attorneys fees.

No man shall be debarred by this act from pleading and managing his own cause.

Every person refusing to have his child baptized by a lawful Minister, forfeits two thousand pounds of tobacco.

Baptism.

The baptizing slaves or their children shall not alter their condition as to bondage or freedom.

Slaves.

No county shall send above two Burgesses to the general-assembly, provided that James City, being the capital, may elect one; and every county that will lay out an hundred acres of land, and people it with an hundred titheable persons, shall have the like privilege.

Burgesses.

A Burgess not appearing in the assembly on the day of the return forfeits three hundred pounds of tobacco. No Burgess is to be arrested during a session, or within ten days after a dissolution or adjournment.

None but free-holders and house-keepers to have voices in elections.

Every county not sending two Burgesses forfeits ten thousand pounds of tobacco.

The allowance to every Burgess is one hundred and twenty pounds of tobacco per diem, and for travelling charges, ten pounds of tobacco per diem for every horse, or the charges of a water-passage.

No horse or mare to be imported from any other plantation on pain of forfeiture.

Horses.

Surgeons and Physicians are obliged to declare upon oath what drugs have been taken by the patient, and then the court will allow 50 per cent. above the value of the drugs, and as much for cure and attendance as the court sees fit: And if any one neglects his patient he shall be fined at discretion.

Physicians fees.

For laws relating to the church, see the chapter of religion.

Church.

The Governor, and one or two of the council commissioned by him, shall go the circuit annually in August, and visit the county-courts, hearing and determining the causes depending in them.

Circuit.

CHAP. VIII. Manuf. c- tures.	Encouragements were enacted, anno 1682, for the planting and manufacturing hemp and flax, and for those that should make hats and stockings; but they still receive these and almost every other kind of manufacture from England.	dian; and whoever shall defraud or injure them shall make them satisfaction.	CHAP. VIII.
Debts.	A debt acknowledged before two Commissioners (quorum unus) to be of the nature of a judgment.	No person shall buy or receive any commodity of an Indian without the Governor's license.	
Convey- ances.	Conveyances of lands in Virginia made in England to be sent over thither by the first shipping, and recorded there, or otherwise to be deemed fraudulent.	No person of what quality soever, shall presume to imprison an Indian King, without a special warrant from the Governor and two of the council: And no encroachments shall be made on the Indians lands.	
Corn.	Every man, for each titheable person in his family, shall plant two acres of corn or pulse on pain of five hundred pounds of tobacco for every acre neglected; provided that the sowing one acre of English wheat shall excuse the planting two acres of Indian corn or pulse as aforesaid.	No Indian shall come into the English bounds without a badge in their company to shew what King they belong to; and if any injury be done by them, his King or Chief shall be answerable for it.	
General- court.	The court held by the Governor and council, and called the general-court, to be held three times a year: The first on the 20th of March, and to continue eighteen days besides Sundays; the second on the 20th of September, and to continue twelve days; and the third on the 20th of November, and to sit twelve days.	When a tributary Indian King has notice of the march of any strange Indians near the English colonies, he shall acquaint the next Officer of the militia with it; and if the friendly Indians desire assistance, a party shall be immediately sent to support them by the Colonel of the militia.	
County- court.	Four gentlemen at least to be commissioned by the Governor to act as Justices of the peace in every county: And the courts of the said Justices to be called County-courts; which shall not take cognizance of any cause under the value of two hundred pounds of tobacco, or twenty shillings sterling; but matters under that value shall be determined by a single Justice of peace.	No Indian servant shall be sold for a slave; and no Indian shall be entertained by any one without the leave of the Governor.	
By-laws.	Two men shall be chosen in every parish, who being returned by the church-wardens shall sit in the several county-courts, and have equal voices with the Justices for making of by-laws.	No man shall sell arms, powder or shot to the Indians, on pain of forfeiting ten thousand pounds of tobacco,	
Hog-steal- ing.	Any person who shall steal or unlawfully kill a hog that is not his own shall forfeit a thousand pounds of tobacco to the owner, and as much to the informer; and he that brings home a hog without his ears shall be adjudged a hog-stealer, and the receiver shall be punished as the thief.	Where an Englishman is murdered by Indians, the next Indian town shall be answerable for it with their lives and liberties.	
	The second offence of hog-stealing to be punished with loss of ears, after two hours standing in the pillory; and the third is made felony.	The Weroance, or General of the Indians, shall not be chosen by them, but the English Governor shall appoint such persons as he can confide in to be commander in chief of the Indian towns; and in case any town disobey such commands, they shall be treated as rebels.	
Fences.	Every planter shall make a sufficient fence about his ground, at least four foot and an half high.	No Indian or Negroe, baptized and enfranchised, shall be capable of purchasing a Christian servant.	
Servants.	Where a freeman is punishable by a fine, a servant shall receive corporal punishment, viz. for every five hundred pounds of tobacco twenty lashes, unless his master will pay the penalty.	Proof by Indians shall be good to convict other Indians of hog-stealing; and the Indians who keeping hogs shall put such a mark on them as shall be appointed by the adjacent counties.	Hog-steal- ing.
Fornica- tion.	A man or woman committing fornication shall pay each of them five hundred pounds of tobacco; and if either of them be a servant, the master to pay the five hundred pounds of tobacco, and the servant to serve half a year beyond his time; and if the master refuse to pay it, the servant is to be whipped. If a bastard be born of a woman servant, she shall serve her master two years beyond her time, or pay him two thousand pounds of tobacco, and the father shall give security to keep the child.	No marriage shall be reputed valid which is not solemnized by a lawful Minister, according to the book of Common-prayer; and none shall marry without a license from the Governor or his Deputy, or banns thrice published. The children of other marriages deemed illegitimate, and their parents to be punished as for fornication. Servants who procure themselves to be married without the consent of their masters, shall each of them serve their respective masters a year beyond their time: And if a freeman marries a servant without the master's leave, he shall forfeit fifteen hundred pounds of tobacco to the master, or one year's service.	Marriage.
Convey- ances.	Conveyances of lands, cattle, or goods, shall be registered in the general-court or county-court within six months after alienation, or be deemed fraudulent.	Forty titheables obliged to set out one man and horse in the militia.	Militia.
Indians.	Hides, wool, and iron, are prohibited to be exported.	Ministers, see religion.	
	No Englishman shall purchase land of an In-	Children begotten by an Englishman on a Negroe woman to be slaves, of free, according to the condition of the mother: And if a christian commits fornication with a Negroe the offender shall pay double the fine imposed on fornication.	Slaves.
		Negroe women, though enfranchised, liable to pay taxes.	
		No Negroe may carry any weapon or club, or go off his master's ground without a certificate from his master or overseer.	
		A Negroe or slave lifting up his hand against any christian, to receive thirty lashes.	

CHAP. VIII. If a Negroe or slave hide himself from his master's service, and resist those that are authorized to apprehend him, it shall be lawful to kill him.

Notice to be given when any one leaves the country. No master of a ship shall transport any person out of the country without a pass from the Secretary, on pain of paying all his debts and a thousand pounds of tobacco to the Secretary: And all persons, before they can obtain passes, must set up their names at the monthly-court ten days before their departure, or have their names published two Sundays in every parish of the county, or give security for the payment of their debts.

Possession. Five years peaceable possession shall be deemed a good bar to any claim of lands, except as to orphans, feme-coverts, and persons out of the country, or non sane.

Scolds. Scolds are ordered to be ducked by an act of assembly.

Servants. Servants, coming into the country without indenture, shall serve five years if upwards of sixteen, and all under that age till they are twenty-four.

Servants absenting themselves from their masters service shall make satisfaction by serving after their times expired double the time of the service so neglected, or longer if the court so determine.

If an English servant run away in company with Negroes, who cannot make satisfaction by an addition of time, the English, after their own time is expired, shall serve the masters of the said Negroes as long as the Negroes should have done; if they had not been slaves.

Servants receiving immoderate correction, or not being provided with competent cloathing, diet, or lodging, may complain to a Commissioner of the county, who is impowered to redress the grievance.

A servant laying violent hands on his master, to serve a year beyond his time.

None may traffick with a servant without his master's leave under severe penalties.

Servants bringing goods with them, or having goods assigned to them in the country, shall have the property thereof and liberty to-dispose of them to their own use.

A woman servant got with child to serve two years after her time is expired.

No master shall make any bargain with his servant, but before a Justice of peace.

Religion. Servants and sacraments, see religion.

Sheriffs. None but a Commissioner shall be Sheriff of a county; and such Commissioners shall execute the office successively.

Commissioners of every county shall be answerable for all publick levies and taxes laid on the country, and for the Sheriff's due performance of his office; and are impowered therefore to take security of him on his admission.

Any one of the council of state may sit in any court in Virginia, and have a voice as the Justices have.

No person to have any post till he has been resident three years. No person not born in this country shall have an office here till he has been resident three years, unless by the King's immediate commission.

Convicts disabled. No person convicted of felony in England or elsewhere shall be capable of bearing any office civil or military.

Whoever shall build a vessel, and fit her out for the sea in this country, shall receive of the

publick a premium of fifty pounds of tobacco per ton.

Masters of ships shall provide four months victuals for their passengers in setting out from England, and take care that poor servants do not want bedding during the voyage.

For the better taking alarms on the approach of an enemy, the firing guns at merry meetings are prohibited.

In the year 1662 the planters were enjoined to Silk plant a certain number of mulberry-trees in order to set up a silk manufacture, and encouragements were given for the making of silk but they have long since laid aside all attempts of this nature.

If a slave resist his master, or those who correct him by his master's orders, and he, by the extremity of the correction, chance to die, the persons correcting him shall be indemnified.

All servants imported by shipping, who are not Christians, shall be slaves for life; and such as come by land shall serve twelve years; and if boys and girls till they are thirty.

All ministers officiating in any publick cure, and six of their respective families, shall be exempted from publick taxes.

None shall buy or sell but by English weights and measures.

The widow may make choice of any third part of the real estate, where her husband dies intestate, and shall have a third of the personal estate, where there are not more than two children; but where there are more the personal estate shall be divided equally between the mother and the children.

CHAP. IX.

Of the religion both of the Indians and English, and of their marriages, women, children, slaves, and funeral rites.

THE first account we meet with of the religion of the Virginians is that given us by Mr. HARRIOT, an officer of Sir WALTER RALEGH's, whom he employed in the discovery of that country.

Mr. HARRIOT relates, that the Indians believed there were many gods of various orders and degrees, though but one only supreme God, who had existed from all eternity, and by whom every thing in the universe was produced into a being: That he first made gods of a superior order to be his ministers and instruments in the succeeding creation and government of the world: That he afterwards created the sun, moon, and stars, which are gods of an inferior class, who were to be ministers and agents of those of the higher order: That then the waters were created, out of which the gods formed all other creatures, visible and invisible; but last of all, a woman, who being impregnated by one of the gods, had children, from whom all the rest of mankind proceeded; but how long it was since the creation they do not pretend to know.

They believed that all their gods were of human form, and therefore represented them as such in the images they made, and placed in their temples; in some of which he had seen one, and in others two or three; and that the Indians worshipped, prayed, sung, and made offerings to them.

They

IX.

A state of
rewards
and pun-
ishments.

They believe, that as soon as the soul is departed from the body (according to its behaviour in this world) it is either carried to heaven, the habitation of the gods, to enjoy perpetual happiness, or else to a great pit or gulph; which as well as their paradise they take to be in the most western part of the world, there to burn and be tormented for ever, which place of torment they call Popogossö; and for the confirmation of their opinion, they related, that a few years before the arrival of the English the grave of a certain wicked man, who had been buried the day before, being seen to move, he was taken up alive, and declared that his soul had been carried to the very entrance of Popogossö; but that he was saved by one of the gods, who ordered him to return and tell his friends what they should do to avoid that place of torment: That another, who was buried the same year the English came thither, being taken in like manner out of his grave, declared that his soul, immediately after death, was conducted along a spacious road, planted on each side with beautiful groves and the most delicious fruits, such as he had never seen before, or was able to describe. This road led him to magnificent buildings, near which he met his father, who commanded him to return to his friends, and instruct them what they should do to obtain the pleasures of that place.

The opi-
nion the
Indians at
first enter-
tained of
the Eng-
lish and
their reli-
gion.

That this he learned from their Priests (with some of whom he was very intimate) and this he took to be the sum of their religion: That upon his acquainting them with the principles of the Christians, they gave that religion the preference to their own; nay, the Weroances and great men, when they were sick, would desire the English, whom they looked upon as a kind of inferior deities, to mediate with heaven, that their lives might be spared, or that after death they might enjoy eternal bliss: Such was the opinion they at first entertained of the English; and had it not been for the unhappy conduct of some of our first adventurers, it had been then the easiest matter in the world to have brought the Indians to have embraced our religion and submitted to our government, without using any manner of force. Our ships and artillery, our fire-arms, our clocks and other pieces of mechanism were so amazing, so much beyond any thing they were acquainted with, that they looked upon them as more than human productions; esteeming them either the works of gods, or of men exceedingly favoured and instructed by the gods.

Worship
of the sun.

Mr. WHITE, who was Governor of one of the first colonies, sent to Virginia by Sir WALTER RALEGH, relates, that they worshipped the sun with great solemnity: That at break of day, before they eat or drank, men, women, and children upwards of ten years of age, went to the water and bathed until the sun arose, and then offered tobacco to this planet; and that they did the like at sun-set.

The next gentleman who gives us an account of the religion of the Virginians is Captain SMITH, who was very instrumental in establishing the first colony at James Town, and had the government of it a considerable time.

But as Colonel BEVERLEY has included great part of Mr. SMITH's narrative in the relation he gives of the religious rites and ceremonies of the Virginians, I shall in the first place present the reader with what the Colonel has given us on this head.

I do not pretend (says Colonel BEVERLEY) to have dived into all the mysteries of the Indian religion, nor have I had such opportunities of learning them as Father HENNEPIN and Baron LA-MONTAN had by living much among the Indians in their towns; and because my rule is to say nothing but what I know to be truth, I shall be very brief upon this head.

CHAP.
IX.
Colonel
Beverley's
account of
their reli-
gion.

In the writings of these two gentlemen I cannot but observe direct contradictions, altho' they travelled the same country, and the accounts they pretend to give, are of the same Indians. One makes them have very refined notions of a Deity; and the other does not allow them so much as the name of a God: For which reason I think myself obliged sincerely to deliver what I can warrant to be true upon my own knowledge, it being neither my interest nor any part of my vanity to impose upon the world.

I have been at several of the Indian Towns, and conversed with some of the most sensible of them in Virginia; but I could learn little from them, it being reckoned sacrilege to divulge the principles of their religion; however, the following adventure discovered something of it: As I was ranging the woods with some other friends, we fell upon their Quiccofan (which is their house of religious worship) at a time when the whole town was gathered together in another place, to consult about the bounds of the lands given them by the English.

Thus finding ourselves masters of so fair an opportunity (because we knew the Indians were engaged) we resolved to make use of it and to examine their Quiccofan, the inside of which they never suffer any Englishman to see; and having removed about fourteen logs from the door with which it was barricado'd, we went in, and at first found nothing but naked walls and a fire-place in the middle: This house was about eighteen foot wide and thirty foot long, built after the manner of their other cabins, but larger, with a hole in the middle of the roof to vent the smoke, the door being at one end. Round about the house at some distance from it were set up posts, with faces carved on them and painted. We did not observe any window or passage for the light, except the door and the vent of the chimney. At last we observed that at the farther end about ten foot of the room was cut off by a partition of very close matts, and it was dismal dark behind that partition. We were at first scrupulous to enter this obscure place; but at last we ventured, and groping about we felt some posts in the middle; then reaching our hands up these posts we found large shelves, and upon these shelves three matts, each of which was rolled up and sewed fast: These we handed down to the light, and to save time in unlacing the leams we made use of a knife, and ripped them without doing any damage to the matts. In one of these we found some vast bones, which we judged to be the bones of men; particularly we measured one thigh-bone, and found it two foot and nine inches long. In another matt we found some Indian Tomahawks finely grayed and painted. These resembled the wooden faulchion used by Prize-fighters in England, except that they have no guard to save the fingers. They were made of a rough heavy wood, and among these Tomahawks was the largest that ever I saw. There was fastened to it a wild turkey's beard, painted red, and two of the longest feathers of his wings hung dangling at it by a

They

so shy
when the
first adven-
turers ar-
rived.

thing

CHAP. IX. string of about six inches long, tied to the head of a Tomahawk.

In the third matt there was something which we took to be their idol, tho' of an underling sort, and wanted putting together. The pieces were these, first, a board three foot and a half long, with one indenture at the upper end like a fork, to fasten the head upon; from thence half way down were half hoops nailed to the edges of the board, at about four inches distance, which were bowed out to represent the breast and belly: On the lower half was another board, of half the length of the other, fastened to it by joints or pieces of wood, which being set on each side stood out about fourteen inches from the body, and half as high. We supposed the use of those to be for the bowing out of the knees when the image was set up. There were pack'd up with these things red and blue pieces of cotton cloth, rolls made up for arms, thighs, and legs bent too at the knees. It would be difficult to see one of these images at this day, because the Indians are extremely shy of exposing them. We put the cloaths upon the hoops for the body, and fastened on the arms and legs, to have a view of the representation; but the head and rich bracelets which it is usually adorned with were not there, or at least we did not find them. We had not leisure to make a very narrow search, for having spent about an hour in this enquiry, we feared the business of the Indians might be near over, and that if we staid longer we might be caught offering an affront to their superstition; for this reason we wrapt up those holy materials in their several matts again, and laid them on the shelf where we found them. This image, when dressed up, might look very venerable in that dark place where it is not possible to see it but by the glimmering light that is let in by lifting up a piece of the matting, which we observed to be conveniently hung for that purpose; for when the light of the door and chimney glance in several directions upon the image through that little passage, it must needs make a strange representation, which these poor people are taught to worship with a devout ignorance. There are other things that contribute towards carrying on this imposture. First, the chief Conjuror enters within the partition in the dark, and may, undiscerned, move the image as he pleases. Secondly, A Priest of authority stands in the room with the people to keep them from being too inquisitive, under the penalty of the Deity's displeasure and his own censure.

Their idol bears a several name in every nation, as OKEE, QUICCO, KIWASA. They do not look upon it as one single being, but reckon there are many of the same nature. They likewise believe that there are titular Deities in every town.

There are still some things in Captain SMITH's relation that Colonel BEVERLEY hath not mentioned, as I remember, or at least in the manner the Captain expresses himself, particularly, that the Virginians do not only worship the DEVIL, whom they call OKEE, but converse familiarly with him.

That they adore every thing they fear, as fire, water, thunder, great guns, fire-arms, and horses; and some of them seeing an English boar, according to SMITH, appeared ready to adore him.

He makes also the head-dress and ornaments of their Priests to be the same with those Mr. BEVERLEY L. III. NUMB. CXXXIII.

CHAP. IX. VERLEY assigns to their Conjurors, and says their devotions are generally sung; that they assemble about a great fire, singing and dancing, shouting, and making a most hideous noise with their rattles for some hours; after which they sit down and spend the rest of the day in feasting, having made an offering of the first piece to the fire, as it is said the better sort do at every meal. Some relate, that they do not so much as take a pipe of tobacco but they offer the first fumes of it to the sun, or to the fire, as incense.

From these several accounts of the religion of the Virginians, it may be observed, that there are some things in which all travellers agree, tho' they differ in many, and there is scarce any one writer consistent with himself throughout.

They all agree, that the Indians acknowledge one God, the creator of all things, who is infinitely happy in himself, but has little or no regard to the trifling concerns of men, having committed the government of the world to certain inferior Deities or Dæmons, to whom therefore they pay their devotions; and these our travellers have denominated DEVILS: But if the Indians pray to these Dæmons, and depend on them for health, victory, and fruitful seasons, which they dispense to mankind, in their opinion, as well as afflictions and calamities, why we may not call these imaginary Deities Gods as well as those the Greeks and Romans paid their devotions to, I cannot conceive; tho' we admit both the one and the other to be false Gods, or rather no Gods.

Again; their Priests are frequently called Conjurors, and some make the Priest and the Conjuror distinct officers; but it is admitted that both of them perform the same religious rites sometimes; both pretend to foretel future events, to command the elements, and do abundance of supernatural things, and both of them are Physicians: So that I am apt to think they are of the same tribe and order, and only receive different denominations according as they apply themselves to this or that part of their office; tho' it seems probable from these relations, that before a Priest is admitted to be a Prophet or Pawawer, he is obliged to undergo a very severe discipline: And for ought I perceive, he is neither allowed to act as a Priest or Prophet until he is advanced in years. Those writers seem to be under a mistake who relate, that their Priests are elected out of the best families; for it is very evident the priesthood is hereditary amongst them. Those young noblemen that undergo the discipline of Huskanawing, it appears, are designed for Cock-rouses, or Ministers of State, and Generals, and not for the priesthood.

Nor is the Indian creed in all particulars consistent with itself; for if they apprehend God to be unconcerned at their behaviour in this life, how comes it to pass that they believe he consigns the good to Paradise and the wicked to an eternity of torments? If he does this he must inspect their actions and have a regard to their everlasting welfare, tho' it should be admitted he has committed the conduct of their affairs in this life to his Angels, or, in the language of the vulgar to Devils.

As to the state of the Christian religion in Virginia, Colonel BEVERLEY has given us the following account of it.

There is in each parish a convenient church built either of timber, brick, or stone, and decently adorned with every thing necessary for the celebration of divine service.

CHAP. IX. They usually dance with rattles in their hands.

Remarks on their several relations.

The state of the Christian religion in Virginia.

How does our author know this?

Captain Smith's account of their religion.

CHAP.
IX.

If a parish be of greater extent than ordinary, it hath generally a chapel of ease, and some of the parishes have two such chapels, besides the church, for the greater convenience of the parishioners. In these chapels the Minister preaches alternately, always leaving a reader to read prayers when he can't attend himself.

The people are generally of the Church of England, which is the religion established by law in that country, from which there are very few dissenters; yet liberty of conscience is given to all other congregations pretending to christianity, on condition they submit to all parish duties. They have but one set conventicle amongst them, namely, a meeting of quakers in Nanfamund County; others that have lately been being now extinct: And 'tis observed by letting them alone they decrease daily.

The maintenance for a Minister there is appointed by law at sixteen thousand pounds of tobacco per annum (be the parish great or small) as also a dwelling-house and glebe, together with certain perquisites for marriages and funeral-sermons. That which makes the difference in the benefices of the clergy is the value of the tobacco, according to the distinct species of it, or according to the place of its growth. Besides, in large and rich parishes, more marriages will probably happen, and more funeral-sermons.

The fee, by law, for a funeral-sermon is forty shillings, or four hundred pounds of tobacco; for a marriage by license twenty shillings, or two hundred pounds of tobacco; and where the banns are proclaimed only five shillings, or fifty pounds of tobacco.

When these salaries were granted, the assembly valued tobacco at ten shillings per hundred, at which rate the sixteen thousand pounds comes to fourscore pounds sterling; but in all parishes where the sweet-scented grows, since the law for appointing Agents to view the tobacco was made, it has generally been sold for double that value, and never under.

In some parishes likewise there are, by donation, stocks of cattle and Negroes on the glebes, which are also allowed the Minister for his use and encouragement, he only being accountable for the surrender of the same value when he leaves the parish.

For the well governing of these and all other parochial affairs, a vestry is appointed in each parish. These vestries consist of twelve gentlemen of the parish, and were first chosen by the vote of the parishioners; but upon the death of any have been continued by the survivor's electing another in his place. These in the name of the parish make presentation of Ministers, and have the sole power of all parish assessments. They are qualified for this employment by subscribing to be conformable to the doctrine and discipline of the Church of England. If there be a Minister incumbent, he always presides in the vestry.

For the ease of the vestry in general, and for discharging the business of the parish, they chuse two from amongst themselves to be Church-wardens, which must be annually changed, that the burthen may lie equally upon all. The business of these Church-wardens is to see the orders and agreements of the vestry performed to collect all the parish tobacco, and distribute it to the several claimers; to make up the accounts of the parish, and to present all profaneness and immorality to the County-courts, and there prosecute it.

CHAP.
IX.

By these the tobacco of the Minister is collected, and brought him in hogsheds convenient for shipping, so that he is at no farther trouble but to receive it in that condition. This was ordained by the law of the country for the ease of the Ministers, that so they being delivered from the trouble of gathering in their dues, may have the more time to apply themselves to the exercises of their holy function, and live in a decency suitable to their order. It may here be observed, that the labour of a dozen Negroes does but answer this salary, and seldom yields a greater crop of sweet-scented tobacco, than is allowed to each of their Ministers.

Probates of wills and administrations are, according to their law, petitioned for in the County-courts, and by them security taken and certified to the Governor, which, if he approves the commission, is then signed by them without fee. Marriage-licenses are issued by the Clerks of these courts, and signed by the Justice in commission, or by any person deputed by the Governor, for which a fee of twenty shillings must be paid to the Governor. The power of induction upon presentation of Ministers is also in the Governor.

In the year 1642, when the sectaries began to spread themselves so much in England, the assembly made a law against them, to prevent their preaching and propagating their doctrines in that colony. They admitted none to preach in their churches but Ministers ordained by some reverend Bishop of the Church of England; and the Governor for the time being, as the most suitable publick person among them, was left sole judge of the certificates of such ordination, and so he has continued ever since.

The only thing I have heard the clergy complain of there, is what they call precariousness in their livings; that is, they have not inductions generally, and therefore are not intitled to a freehold; but are liable, without trial or crime alledged, to be put out by the vestry: And tho' some have prevailed with their vestries to present them for induction, the great number of their Ministers have no induction, yet they are very rarely turned out without some great provocation; and then, if they have not been abominably scandalous, they immediately get other parishes: For there is no benefice whatsoever in that country that remains without a Minister if they can get one, and no qualified Minister ever yet returned from that country for want of preferment. They have frequently several vacant parishes.

The college, as has been hinted, was founded by their late Majesties King WILLIAM and Queen MARY in the year 1692, towards the founding of which they gave one thousand nine hundred eighty-five pounds, fourteen shillings and ten pence. They gave more towards the endowment of it twenty thousand acres of land, the revenue of one penny per pound on tobacco exported to the plantations from Virginia and Maryland, and the Surveyor-General's place of that colony then void, and appointed them a Burgess to represent them in the assemblies. The land hitherto has yielded little or no profit, the duty of one penny per pound brings in about two hundred pounds a year, and the Surveyor-General's place about fifty pounds a year; to which the assembly have added a duty on skins and furs exported, worth about one hundred pounds a year.

By the same charter likewise their Majesties granted a power to certain gentlemen, and the survivors of them as Trustees, to build and establish

The clergy's condition precarious here.

The college endowed.

CHAP.
IX.

blish the college by the name of William and Mary College; to consist of a President, and six Masters or Professors, and an hundred Scholars, more or less, graduates or non-graduates, enabling the said Trustees as a body-corporate to enjoy annuities spiritual and temporal of the value of two thousand Pounds sterling per ann. with a proviso to convert it to the building and adorning the college, and then to make over the remainder to the President and Masters, and their successors; who are now become a corporation; and by the said patent enabled to purchase and hold to the value of two thousand pounds a year, and no more.

The Visitors of the college.

The persons named in the charter for Trustees are made Governors and Visitors of the college, and to have a perpetual succession by the name of Governors and Visitors, with power to fill up their own vacancies happening by the death or removal of any of them. Their complete number may be eighteen, but not to exceed twenty, of which one is to be Rector, and annually chosen by themselves on the first Monday after the 25th of March.

They have the nomination of the President and Masters of the college, and all other Officers belonging to it; and the power of making statutes and ordinances for the better rule and government thereof. The building is to consist of a quadrangle, two sides of which are not yet carried up. In this part are contained all conveniences of cooking, brewing, baking, &c. and convenient rooms for the reception of the President and Masters, with many more Scholars than are as yet come to it; in this part are also the hall and school-room.

The college burnt.

The college was intended to be an entire square when finished; two sides of this was finished at the latter end of Governor NICHOLSON's time; and the Masters and Scholars, with the necessary house-keepers and servants were settled in it, and so continued till the first year of Governor NOTT's time, in which it happened to be burnt (no-body knows how) down to the ground, and very little saved that was in it; the fire breaking out about ten o'clock at night in a publick time.

The Governor and all the gentlemen that were in town came up to the lamentable spectacle, many getting out of their beds; but the fire had got such power before it was discovered, and was so fierce, that there was no hopes of putting a stop to it; and therefore no attempts made to that end.

Rebuilt.

In this condition it lay till the arrival of Colonel SPOTSWOOD, in whose time it was raised again to the same bigness as before, and settled.

There had been a donation of large sums of money by the honourable ROBERT BOYLE, Esq; to this college, for the education of Indian children therein. In order to make use of this, they had formerly bought half a dozen captive Indian children slaves, and put them to the college; this method did not satisfy this Governor, as not answering the intent of the donor; so to work he goes among the tributary and other neighbouring Indians, and in a short time brought them to send their children to be educated, and brought new nations, some of which lived four hundred miles off, taking their children for hostages and education equally, at the same time setting up a school in the frontiers convenient to the Indians, that they might often see their children under the first management, where they learned to read, paying fifty Pounds per annum out of his own pocket to the School-master there; after which many were brought to the college, where they

Schools erected for the natives.

were taught until they grew big enough for their hunting and other exercises, at which time they were returned home, and smaller taken in their stead.

CHAP.
IX.

There are large tracts of land, houses, and other things granted to free-schools for the education of children in many parts of the country; and some of these are so large that of themselves they are a handsome maintenance to a master: But the additional allowance which gentlemen give with their sons renders them a comfortable subsistence. These schools have been founded by the legacies of well-inclined gentlemen, and the management of them hath commonly been left to the direction of the County-court, or to the vestry of the respective parishes. In all other places where such endowments have not been already made, the people join and build schools for their children, where they may learn upon very easy terms. As to the condition of the poor in this country, they live in so happy a climate, and have so fertile a soil, that no body is poor enough to beg or want food; tho' they have abundance of people that are lazy enough to deserve it. I remember the time when five pounds were left by a charitable testator to the poor of the parish he lived in, and it lay nine years before the executors could find one poor enough to accept of this legacy; but at last it was given to an old woman. So that this may in truth be termed the best poor man's country in the world. But as they have no body that is poor to beggary, so they have few that are rich, their estates being regulated by the Merchants in England; who, it seems, know best what is profit enough for them in the sale of their Tobacco and other trade.

The condition of the poor in Virginia.

When it happens that by accident or sickness any person is disabled from working, and so is forced to depend on the alms of the parish, he is then very well provided for, not at the common rate of some countries (I presume he means England) that give but just sufficient to preserve the poor from perishing; but the unhappy creature is received into some charitable planter's house, where he is at the publick charge boarded plentifully.

Many when they are crippled, or by long sickness become poor, will sometimes ask to be free from levies and taxes; but very few others do ever ask for the parish alms, or indeed so much as stand in need of them.

Mr. BEVERLEY, in speaking of the Virginian women, says, that their dress is but little different from that of the men, except in the tying of their hair: But the ornaments of women of distinction are deep necklaces, pendants, and bracelets made of small cylinders of conch-shell, which they call Peak: That they keep their skins clean and shining with Oil, whereas the men are usually daubed all over with paint or grease.

Of their women.

That the women are remarkable for their small round breasts, which scarce ever hang down, even when they come to be old: And as they commonly go naked from the navel upwards, and from the middle of the thigh downwards, they have the advantage of discovering their fine limbs and shape.

The Indians solemnize their marriages publickly, and esteem their vows made at that time sacred and inviolable, as Mr. BEVERLEY informs us; but he does not give us any account of the manner of solemnizing them. He adds, that either man or woman may obtain a divorce where they cannot agree: But so great is the scandal of a divorce,

Divorce

CHAP. IX.  voice, that married people very seldom let their quarrels proceed to a separation. However, when this does happen, they esteem all the ties of matrimony dissolved, and either party is at liberty to marry elsewhere; but while the contract continues disloyalty is esteemed the most unpardonable crime in either party.

Upon a divorce the children go with the one or the other, according to the affections of the parents for them ; for children are not reckoned a burthen here, but rather a part of their treasure ; and if they happen to disagree about dividing their children, they part them as equally as may be, allowing the man his choice.

And whereas it is reported that young Indian females may prostitute themselves for peak, beads, or almost any toy, he looks upon this to be a calumny; for if a single woman have a child, it is such a disgrace that she can never get her a husband afterwards. But the Colonel seems to except some cases, for page 159, he says, where an Indian of quality visits a neighbour, after he has been entertained with feasting and dancing, a brace of young beautiful virgins are chosen to wait upon him at night, who undress the happy man, and as soon as he is in bed gently lay themselves down by him; and they esteem it a breach of hospitality not to submit to every thing he desires. But he adds, that this kind ceremony is only used to men of great distinction: And the young women are so far from suffering in their reputations by this piece of civility, that they are envied by their companions, as having had the greatest honour in the world done them when they were singled out for that purpose.

Children. When a child is born, instead of keeping it warm, and swaddling it up in a great many cloaths, as European nurses do, they plunge it over head and ears in cold water, and then bind it naked to a board with a hole for evacuation; but the board is lined with cotton, wool, furs, or other soft covering to make the child's lodging the easier; for it remains thus fastened to the board several months, being only taken off every day to be washed and cleaned. While the child is thus fastened to the board, they either lay it flat on its back, or set the board leaning against something, or else they hang it up by a string on the bough of a tree, or against a wall: And when it is let loose from the board they suffer it to crawl about on all fours, till it is able to go alone, except when the woman goes abroad; and then she takes her child at her back, naked, if it be in summer, having one of the legs under her arm, and the opposite hand of the child in hers, over her shoulder, the child hanging about the neck with the other hand; but in the winter she carries her child in her mantle or watchcoat, as the beggars do theirs in blankets, leaving only the head exposed to the air.

**English
woman.**

As to the English women, Mr. BEVERLEY observes, that the colony was at first put to hard shifts, very few going over with the adventurers, who seemed to have an aversion to the Indian women, either on account of their paganism or their complexions; and some, perhaps, were apprehensive such wives would conspire with their relations and countrymen to destroy the colony. But so soon as the colony was settled, and the planters were in good circumstances, a great many girls went over thither from England, in expectation of making their fortunes, carrying certificates with them of their chaste behaviour on this

side the water; for without such certificates, the
Colonel insinuates, the cautious planters, though
in never so much distress for wives, would not
admit them to their beds. If they were but mo-
derately qualified in other respects in those days
they might depend upon being well married.
The Planters were so far from expecting money
with a woman, that it was a common thing to
buy a deserving wife, who came over thither a
servant, at the price of an hundred Pounds, if she
carried good testimonials with her. But after-
wards, when the fruitfulness of Virginia was bet-
ter known, and the dangers incident to an infant
settlement were over, people in good circumstances
went over thither with their families, either to
improve their estates, or to avoid persecution at
home: And particularly in the time of the grand
rebellion several good Cavalier families retired thi-
ther, as those of the other side did upon the resto-
ration of King CHARLES the second: Yet Vir-
ginia had but few of the latter, having distinguish-
ed herself by her loyalty in adhering to the royal
family after all other people had submitted to the
usurpation. The round-heads, for the most part
therefore went to New-England.

The distinction usually made between servants and slaves is, that the first are but temporary servants and usually Christians; whereas the latter with their posterity are perpetually slaves, unless they happen to be enfranchised.

The custom, in relation to temporary servants, where they have no indentures that limit the time of their service is, that if such servants be under nineteen years of age, they must be brought into court to have their ages adjudged; and from the ages they are judged to be of they must serve until twenty-four, but if they be adjudged upwards of nineteen, they are then only to be servants for five years.

Male servants and slaves of both sexes are employed together in tilling and manuring the ground, in sowing and planting tobacco, corn, &c. Some distinction is made between them in their cloaths and food, but the work of both is no other than what the overseers, the freemen, and the planters themselves do.

Sufficient distinction is also made between the female servants and slaves; for a white woman is rarely or never put to work in the ground if she be good for any thing else: And to discourage all planters from using any woman so, their law makes female servants working in the ground titheable, while it suffers all other white women to be absolutely exempted; whereas on the other hand it is a common thing to work a woman slave out of doors; nor does the law make any distinction in her taxes, whether her work be abroad or at home.

Because I have heard (adds the Colonel) how strangely cruel and severe the service of this country is represented in some parts of England, I cannot forbear affirming that the work of their servants and slaves is no other than what every common freeman does: Neither is any servant required to do more a day than his overseer. And I can assure you, with great truth, that generally their slaves are not worked near so hard nor so many hours in a day as the husbandmen and day-labourers in England. An overseer is a man that hath served his time, and acquired the skill and character of an experienced planter; and is therefore entrusted with the direction of the servants and slaves.

CHAP. IX. But to complete this account of servants, I shall give you a short relation of the care their laws take that they may be used as tenderly as possible.

By the laws of their country.

1. All servants whatsoever have their complaints heard without fee or reward; but if the master be found faulty the charge of the complaint is cast upon him; otherwise the business is done *ex officio*.

2. Any Justice of peace may receive the complaint of a servant, and order every thing relating thereto until the next county-court; where it will be finally determined.

3. All masters are under the correction and censure of the county-courts, to provide for their servants good and wholesome diet, cloathing, and lodging.

4. They are always to appear upon the first notice given of the complaint of their servants; otherwise to forfeit the service of them until they do appear.

5. All servants complaints are to be received at any time in court without process, and shall not be delayed for want of form; but the merits of the complaint must be immediately enquired into by the Justices; and if the master cause any delay therein, the court may remove such servants if they see cause until the master will come to trial.

6. If a master shall at any time disobey an order of court made upon any complaint of a servant, the court is empowered to remove such servant forthwith to another master, who will be kinder; giving to the former master the produce only (after fees deducted) of what such servant shall be sold for by publick outcry.

7. If a master should be so cruel as to use his servant ill that is fallen sick or lame in his service, and thereby rendered unfit for labour, he must be removed by the Church-wardens out of the way of such cruelty, and boarded in some good planter's house, until the time of his freedom, (the charge of which must be laid before the next county-court, which has power to levy the same from time to time upon the goods and chattels of the master;) after which the charge of such boarding is to come upon the parish in general.

8. All hired servants are entitled to these privileges.

9. No master of a servant can make a new bargain for service or other matter without the privity and consent of the county-court, to prevent the master's over-reaching or terrifying such servant into an unreasonable compliance.

10. The property of all money and goods sent over thither to servants, or carried in with them, is reserved to themselves, and remains entirely at their disposal.

11. Each servant, at his freedom, receives of his master ten bushels of corn (which is sufficient almost for a year,) two new suits of cloaths, both linen and woolen, and a gun of twenty shillings value; and then becomes as free in all respects, and as much intitled to the liberties and privileges of the country as any other of the inhabitants or natives are, if such servants are not aliens.

12. Each servant has then also a right to take up fifty acres of land where he can find any unpatented.

This is what the laws prescribe in favour of servants; by which you may find that the cruelties and severities imputed to that country are an unjust reflection; for no people more abhor the

VOL. III.

thoughts of such usage than the Virginians, nor take more precaution to prevent it now, whatever it was in former days.

As to convicted malefactors, who are transported to the plantations to serve a certain number of years, Mr. BEVERLEY observes, that the greedy planter is always ready to buy them; but he is of opinion they will in the end prove very destructive to that country, there having been a great many robberies and murders committed there of late years; which he looks upon as the effect of that law.

CHAP. X.

Of their fortifications, wars, and forces; and of their shipping, foreign trade, and coin; as also of their roads and way of travelling; and of their stones, earthen, and minerals.

THE fortifications of the Indians consist only of a wooden palisadæ or stockade, about ten or twelve foot high, and when they would make themselves very safe (says Colonel BEVERLEY) they have a triple palisadæ, with which they sometimes encompass their whole town; but for the most part only their King's houses, and as many more as they judge sufficient to harbour all their people upon the approach of an enemy. And within these fortresses they never fail to secure their idols and sacred relics, with the embalmed bodies of their deceased Princes. In choosing the ground for their fort, they always take care to have water enough, and a spacious parade to draw up their troops; in which they make a fire every evening and dance round it, either in devotion or for their diversion, or both; for I find travellers are not agreed about it.

The same writer informs us, that when the Indians are about to enter upon a war or any other important enterprize, the King summons a convention of his great men to assist at a grand council, which, in their language, is called a Matchacomoco. At these assemblies it is the custom, especially when a war is expected, for the young men to paint themselves irregularly with black, red, white, and other motly colours, making one half of their face red (for instance,) and the other half black or white, with great circles of a different hue round their eyes, with monstrous mustaches, and a thousand fantastical figures all over the rest of their body; and to make themselves appear yet more ugly and frightful, they strew feathers, down, or the hair of beasts upon the paint while it is still moist and capable of making those light substances stick fast on. When they are thus formidably equipped, they rush into the Matchacomoco, and instantly begin some very grotesque dance, holding their arrows or tomahawks in their hands, and all the while singing the ancient glories of their nation, and especially of their own families, threatening and making signs with their tomahawks what a dreadful havoc they intend to make amongst their enemies.

Notwithstanding these terrible airs they give themselves, they are very timorous when they come to action, and rarely perform any open or bold feats; but the execution they do is chiefly by surprise and ambuscade.

As in the beginning of a war they have assemblies for consultation, so Colonel BEVERLEY observes, upon any victory or other great success,

CHAP.
X.Treaties
and com-
mies.he pipe
calamet
peace.

they have publick meetings again for processions and triumphs; which are accompanied with all the marks of a wild and extravagant joy.

They use formal embassies for treating, and are very ceremonious in concluding of peace, burying a tomahawk, raising an heap of stones, or planting a tree on the place, in token that all enmity is buried with the tomahawk, that all the desolations of war are at an end, and that friendship shall flourish among them like a tree.

They have a peculiar way of receiving strangers, and distinguishing whether they come as friends or enemies, tho' they do not understand each others language: And that is by a singular method of smoking tobacco, in which these things are always observed:

1. They take a pipe much larger and bigger than the common tobacco-pipe, expressly made for that purpose, with which all towns are plentifully provided; they call them the pipes of peace.

2. This pipe they always fill with tobacco before the face of the strangers and light it.

3. The chief man of the Indians, to whom the strangers come, takes two or three whiffs, and then hands it to the chief of the strangers.

4. If the stranger refuses to smoke it is a sign of war.

5. If it be peace, the chief of the strangers takes a whiff or two in the pipe, and presents it to the next great man of the town they come to visit. He, after taking two or three whiffs, gives it back to the next of the strangers, and so on alternately until they have passed all the persons of note on each side, and then the ceremony is ended.

After a little discourse, they march together in a friendly manner into the town, and then proceed to explain the business upon which they come. This method is as general a rule among all the Indians of those parts of America, as the flag of truce is among the Europeans. And tho' the fashion of the pipe differ as well as the ornaments of it, according to the humour of the several nations, yet it is a general rule to make those pipes remarkably bigger than those for common use, and to adorn them with beautiful wings and feathers of Birds, as likewise with peak, beads, or other toys.

Such a pipe is a pass and safe conduct among the allies of the nation which has given it: And in all embassies the Ambassador carries that calamet or pipe, as the symbol of peace, which is always respected; for the savages are generally persuaded that some great misfortune would befall them if they violated the publick faith of the calamet.

Fortifica-
tions of
the Eng-
lish.

I come in the next place to treat of the forts and forces of the English in Virginia: And I find they formerly had forts at the heads of the rivers in the up-land country, to defend them against the incursions of the Indians, and others at the mouths of the rivers, and at the entrance of the bay of Chesapeake, for the security of their shipping against pyrates and enemies; but these have been suffered to decay, and they at this day depend altogether on the militia at land, and the men of war that are sent thither from England, to defend them against any attacks from the seaward. Having nothing therefore to observe in regard to their fortifications, give me leave, before I enquire into their militia, to take notice of some elegant buildings they have erected of late years at Williamsburgh; which may now very well be deemed the capital of Virginia, as it is the seat of the Governor.

There are, according to Mr. BEVERLEY,

three fine publick buildings lately erected, which, according to his opinion, are the most magnificent of any in English America, viz. 1. The college, which has been already described. 2. The capitol, or state-house, where the general assembly sits: And, 3. The Governor's house.

CHAP.
X.Some pub-
lick build-
ings lately
erected.

In the capitol the council and general-courts are held, and here are apartments for the great officers and others; and not far from it stands the publick prison for criminals, having a large open yard contrived for the health of the prisoners; and at the end of it is another prison for debtors. The Governor's house is not the largest of these buildings, but by far the most beautiful. This was enacted to be built by the general assembly in Governor NOTT's time; but was finished and elegantly adorned, in the manner we see it at present, by Governor SPOTSWOOD. In his time also was built a new brick church and magazine of arms; he also altered the plan of the town, which had been laid out in the whimsical form of a W and M, giving it quite another face.

All these buildings are of brick, covered with shingle, except the debtors prison, which is flat-roofed: Their private buildings also were much improved in the time of Governor SPOTSWOOD, several gentlemen building themselves large brick houses, many rooms on a floor; for they do not affect to have them high as they have room enough to build upon, and are in this way of building less exposed to the high winds which rage on this coast at some seasons of the year: But though they have not many stories in their houses they delight in spacious rooms, and of late have made them much loftier than formerly; their windows are large and sashed with crown glass, and their apartments adorned with rich furniture; their dairies, kitchens, and other offices stand at a distance from the dwelling-house.

Their tobacco-houses are built all of wood as open and airy as possible; which sort of building is the most convenient for curing their tobacco. These houses are covered with clap-board, as the others are with shingle; that is, oblong squares of cypress or pine-wood; tho' they have slate enough in some parts of the country, and good clay for making tiles; they have very few slate or tiled houses.

The militia are the only forces in Virginia. They are happy (according to Colonel BEVERLEY) in the enjoyment of an everlasting peace; which their poverty and want of towns secure to them. They have the Indians round about in subjection, and have no sort of apprehension from them: And for a foreign enemy it can never be worth their while to carry troops sufficient to conquer the country; and the scattering method of their settlements will not answer the charge of an expedition to plunder them; so that they feel none but the distant effects of war, which, however, keep them so poor that they can boast of nothing but the security of their persons and habitations.

The Eng-
lish forces
in Virgi-
nia.

The Governor is Lieutenant-General by his commission, and in each county does appoint the Colonel, Lieutenant-Colonel, and Major, who have under them Captains, and other commissioned subaltern officers.

Every freeman (by which denomination they call all but indented or bought servants) from sixteen to sixty years of age is listed in the militia, which by a law is to be mustered in a general muster for each county once a year, and in single troops

CHAP. X. troops and companies four times more at least. Most people there are skilful in the use of fire-arms, bringing all their lives accustomed to shoot in the woods. This, together with a little exercising, would soon make the militia useful.

The exact number of the militia is not now known, there not being any account of the number taken of late years; but I guess them at this time (1722,) to be about 18,000 effective men in all.

And whereas by the practice of former times upon the militia law, several people were obliged to travel sometimes thirty or forty miles to a private muster of a troop or company, which was very burdensome to some more than others to answer only the same duty; this Governor (SPOTSWOOD) just and regular in all his conduct, and sufficiently experienced to put his designs in execution, so contrived it, that by dividing the counties into several cantons or military districts, forming the troops and companies belonging to each canton, and by appointing the muster-fields in the centre of each, none are now obliged to travel above ten miles to a private muster, and yet the law is duly executed.

Instead of the soldiers they formerly kept constantly in forts, and of the others after them by the name of Rangers, to scour the frontiers clear of the Indian enemy, they have by law appointed the militia to march out upon such occasions under the command of the chief officer of the county, on receiving advice of any incursion or invasion: And if they upon such expedition remain in arms three days and upwards, they are then entitled to the pay for the whole time; but if it prove a false alarm, and they have no occasion to continue out so long, they can demand nothing.

The number of soldiers in each troop of light-horse are from thirty to sixty, as the convenience of the canton will admit, and in a company of foot about fifty or sixty. A troop or company may be got together at a day's warning.

As to their forces by sea, they are not suffered in any of our plantations to build men of war. But small guard-ships are sent from England from time to time, which just serve to defend them against pyrates, and hardly that; for ships have been carried away by pyrates within the capes of Virginia: Nor do the Virginians apply themselves to build merchant-ships themselves, though several are built by others in their country. Their only foreign trade worth mentioning is that to England; and that indeed is very great and very profitable to England, but not so to themselves; the merchants beating down the price of their tobacco to little or nothing.

They had also a trade to the Leeward-islands, whither they sent lumber, corn, and flesh; for which they took rum, sugar, and molasses in return; but New-England, New-York, and Carolina have in a manner beaten them out of that branch of business.

All sorts of naval stores are produced here; but these and a thousand other advantages which this country naturally affords, says the Colonel, the inhabitants make no use of; they see their naval stores daily enrich the English, who send hither to build ships, while they, instead of promoting such undertakings among themselves, discourage them: They see also what advantages the neighbouring plantations make of their grain and provisions, while they, who can produce them infinitely better, not only neglect the making a trade

thereof, but even a necessary provision against an accidental scarcity, contenting themselves with a supply of food from hand to mouth; so that if it should please God to send them an unreasonable year, there would not be found in the country provision sufficient to support the people for three months extraordinary.

By reason of the unfortunate method of the settlement and want of cohabitation, they cannot make a beneficial use of their flax, hemp, silk, silk-grass and wool; which might otherwise supply their necessities, and leave the produce of tobacco to enrich them when a gainful market can be found for it.

Thus they depend altogether upon the liberality of nature without endeavouring to improve its gifts by art or industry; they sponge upon the blessings of a warm sun and a fruitful soil, and almost grudge the pains of gathering in the bounties of the earth. I should be ashamed to publish this slothful indolence of my countrymen (says Colonel BEVERLEY) but that I hope it will some time or other rouse them out of their lethargy, and excite them to make the most of all those happy advantages which nature has given them; and if it does this, I am sure they will have the goodness to forgive me.

Instead of silver and gold coin the Indians made use of shells before the English arrived; of which they had two sorts (viz.) peak and roenoke, and these served them for ornaments as well as money.

Their peak is of two sorts, or rather two colours, for both are made of one shell, though of different colours; one is a dark purple cylinder and the other white. They are both made in size and figure alike, and commonly resemble the English bugles, but are not so transparent nor so brittle. They are wrought as smooth as glass, being one third of an inch long, and about a quarter diameter, strung by a hole drilled through the centre. The dark colour is the dearest, and distinguished by the name of wampom-peak. The Englishmen that are called Indian traders value the wampom-peak at eighteen pence per yard, and the white-peak at nine pence. The Indians also make pipes of this two or three inches long, and thicker than ordinary, which are much more valuable. They also make runtees of the small shells, and grind them as smooth as peak. These are either large like an oval bead, and drilled the length of the oval, or else they are circular, and flat almost an inch over, and one third of an inch thick, and drilled edge-ways. Of this shell they also make round tablets of about four inches diameter, which they polish as smooth as the other, and sometimes they etch or grave thereon circles, stars, a half-moon, or any other figure suitable to their fancy. These they wear instead of medals before or behind their neck, and use the peak, runtees, and pipes for coronets, bracelets, belts, or long strings hanging down before the breast; or else they lace their garments with them and adorn their tomahawks and every thing else they value with them.

The roenoke also is current among them as money, but of far less value than the former. This is made of the cockle-shell broken into small bits with rough edges, drilled through in the same manner as beads, and this they use also as peak for ornament.

As to the money that passes among the English, Mr. BEVERLEY informs us, it is either gold of the stamp of Arabia, or silver and gold of the stamp of

Foreign
trade and
shipping.

Manufactures.

Coin.

Peak and
roenoke
described.

English
money.

CHAP. X. of France, Portugal, or the Spanish America. Spanish, French, and Portuguese-coined silver is settled by law at three pence three farthings the penny-weight. Gold of the same coin, and of Arabia, at five shillings the penny-weight. English guineas at twenty-six shillings each; and the silver, two pence in every shilling advance. English old coin goes by weight as the other gold and silver.

Weights and measures. Their weights and measures are enacted to be of the same standard as in England by their general assembly.

Earths, stones, and minerals. And here I shall take an opportunity of giving a further description of their earths, stones, and minerals, from Mr. BEVERLEY. This gentleman informs us, that there are found in this country a great variety of earths for physick, cleansing, scouring, and making all sorts of potter's ware; such as antimony, talk, yellow and red oker, Fuller's-earth, pipe-clay, and other fat and fine clays, marle, &c.

Coal and slate. They have besides in these upper parts coal for firing, slate for covering, and stones for building and flat paving in vast quantities, as likewise pebble-stones; nevertheless it has been confidently affirmed, by many who have been in Virginia, that there is not a stone in all the country. If such travellers (says Colonel BEVERLEY) knew no better than they said, my judgment of them is, that either they were people of extreme short memories, or else of very narrow observation: For though generally the lower parts are flat, and so free from stones that people seldom shoe their horses; yet in many places, and particularly near the falls of the rivers, are found vast quantities of stones fit for all kinds of uses. However, as yet there is seldom any use made of them, because commonly wood is to be had at much less trouble. And as for coals, it is not likely they should ever be used there in any thing but forges and great towns, if ever they happen to have any; for in their country plantations the wood grows at every man's door so fast that after it has been cut down it will in seven years time grow up again from seed to substantial firewood; and in eighteen or twenty years it will come to be very good board-timber.

Iron and other minerals. For mineral earths it is believed they have great plenty and variety, that country being in a good latitude, and having great appearances of them. It has been proved too that they have both iron and lead, as appears by what was said before concerning the iron work set up at Falling-creek in James-river, where the iron proved reasonably good: But before they got into the body of the mine the people were cut off in that fatal massacre, and the project has never been set on foot since until of late; but it has not had its full trial.

Bristol stones. The gold mine, of which there was once so much noise, may perhaps, be found hereafter to be some good metal when it comes to be fully examined. But be that as it will, the stones that are found near it in great plenty are valuable, their lustre approaching nearer to that of the diamond than those of Bristol or Kerry. There is no other fault in them but their softness, which the weather hardens when they have been some time exposed to it, they being found under the surface of the earth. This place has now plantations on it.

Pearl. The Indians have some pearl amongst them, and formerly had many more; but how they came by them is uncertain: BEVERLEY is of opinion they found them in the oyster-banks which abound in this country.

CHAP. X. The Indians perform all their journeys on foot, the fatigue of which they endure to admiration. They make no other provision for their journey but their gun or bow, to supply them with food of travel-ling. many hundred miles together. If they carry any flesh in their marches they barbacue it, or rather dry it by degrees at some distance over the clear coals of a wood-fire, just as the Charibees are said to preserve the bodies of their great men from corruption. Their sauce to this dry meat (if they have any besides a good stomach) is only a little bears oil, or oil of acorns, which last they force out by boiling the acorns in a strong lye. Sometimes also in their travels each man takes a pint or quart of rockahomony, that is, the finest Indian corn parched and beaten to powder. When they find their stomach empty (and cannot stay for the tedious cookery of other things) they put about a spoonful of this into their mouths and drink a draught of water upon it, which stays their stomachs, and enables them to pursue their journey without delay. But their main dependance is upon the game they kill by the way, and the natural fruits of the earth. They take no care about lodging in these journeys, but content themselves with the shade of a tree, or a little high grass.

When they fear being discovered or followed by an enemy in their marches, they every morning, having first agreed where they shall rendezvous at night, disperse themselves into the woods, and each takes a different way, that so the grass or leaves being but singly pressed may rise again and not betray them: For the Indians are very artful in following a track, even where the impressions are not visible to other people, especially if they have any advantage from the looseness of the earth, from the stiffness of the grass, or the stirring of the leaves, which in the winter season lie very thick upon the ground, and likewise afterwards if they do not happen to be burned.

When in their travels they meet with any waters which are not fordable, they make canoes of birch-bark, by slipping it whole off the tree in this manner: 1. They gash the bark quite round the tree at the length they would have the canoe of, then slit down the length from end to end; when that is done, they with their tomahawks easily open the bark, and strip it whole off. Then they force it open with sticks in the middle, slope the under side of the ends, and sew them up, which helps to keep the belly open; or if the birch-trees happen to be small, they sew the bark of two together. The seams they daub with clay or mud, and then pass over in these canoes by two or three or more at a time, according as they are in bigness. By reason of the lightness of these boats they can easily carry them over land if they foresee they are like to meet with any more waters that may impede their march; or else they leave them at the water-side, making no farther account of them, except it be to repair the same waters in their return.

The Indians, when they travel ever so small a way, being much embroiled in war one with another, use several marks painted upon their shoulders to distinguish themselves by, and shew what nation they are of. The usual mark is one, two, or three arrows. One nation paints these arrows upwards, another downwards, a third side-ways; and others again use other distinctions, from whence it came to pass that the Virginia assembly took up the humour of making badges of silver,

CHAP. X. silver, copper or brass, of which they gave a sufficient number to each nation in amity with the English, and then made a law that the Indians should not travel among the English plantations without one of these badges in their company, to shew that they are friends.

Hospitality of the natives supplies the place of inns.

The English inhabitants are very courteous to travellers, who need no other recommendation but the being human creatures. A stranger has no more to do but to enquire upon the road where any gentleman or good house-keeper lives, and there he may depend upon his being received with hospitality. This good-nature is so general among their people, that the gentry, when they go abroad, order their principal servant to entertain all visitors with every thing the plantation affords. And the poor planters, who have but one bed, will very often sit up or lie upon a form or couch all night to make room for a weary traveller to repose himself after his journey.

CHAP. X. If there happen to be a churl that either out of covetousness or ill-nature won't comply with this general custom, he has a mark of infamy set upon him, and is abhorred by all.

As to the roads, there are no where better, Roads. the country being for the most part level, and scarce any rugged or deep ways; insomuch that it is a common thing to ride forty or fifty miles in an afternoon, and sometimes an hundred in a summer's day.

As the Indians travel on foot, so the English Land and generally ride on horseback, or go by water from one part of the country to the other, their numerous rivers and creeks affording them water carriage to every plantation almost; which renders stage-coaches and waggons perfectly useless in most places: And I don't find they have any other way of carrying their merchandize or baggage by land than on the backs of porters or Pack-horses.

THE PRESENT STATE OF MARYLAND.

CHAP. I.

Of the name, situation, and extent of Maryland; and of the face of the country, its mountains, forests, seas, bays, rivers and springs.

CHAP. I. **K**ING CHARLES I. was pleased to give this province the name of Maryland, in honour to his Queen HENRIETTA-MARIA, daughter of HENRY IV. of France, when he granted it by patent to GEORGE CALVERT, Lord Baltimore, anno 1631.

Name. Maryland is situated between the 38th and 40th degrees of northern latitude, and between the 74th and 78th degrees of western longitude, as is generally computed; but it must be confessed the western boundaries are very uncertain, some extending them beyond the Apalathean Mountains. Our first adventurers particularly were of opinion that Virginia, under which name they comprehended all the British Plantations, extended westward as far as the Pacifick Ocean, tho' later discoveries have convinced us that the continent to the westward of our plantations is more than two thousand miles broad; and should we continue to enlarge our western frontier for a thousand years to come, without any opposition from the natives, the French, or Spaniards, I doubt we should not be able to people or plant one half of it.

Situation. The north end of the bay of Chesapeake divides Maryland into two parts, called the Eastern and Western Shores. It is bounded at present by part of Pennsylvania on the north, by another part of Pennsylvania and the Atlantick Ocean on the east; by Virginia Proper on the south, by the Apalathean Mountains on the west. It is separated from Virginia on the south, by the river Patowmack on the western shore, and the river Pocomoac on the eastern shore. The length from north to south being about an hundred and forty miles, and the breadth from east to west, if we extend it no farther than the country already planted, will not be so much, tho' its future limits possibly may extend much farther.

Extent. As to the face of the country, this, as well as Virginia, may be divided into: 1. The low lands next the sea: 2. The hilly country towards the heads of the rivers: And 3. The Apalathean Mountains beyond, which are exceeding high, and run parallel to the Atlantick Ocean, viz. from the north-east to the south-west.

The low lands heretofore consisted of swamps or woods, being one continued forest almost till the English cleared a good part of it, either to make room for their plantations, or for the building of ships and houses, and the

CHAP. I.

CHAP. I. the making Tobacco-casks and Pipe-staves for exportation; which has made such havoc among their woods, that some of them begin to apprehend the want of timber, especially near their ports and rivers; for as to that which lies remote from the water, it is of little use to them, the price of the carriage exceeding the value of the wood.

Towards the heads of the rivers there are a mixture of hills and vallies as in Virginia, well planted with a variety of timber and fruit-trees; and where these are wanting there are large meadows or savannahs, where the grass grows to a surprising length.

This country, like Virginia, also is watered with innumerable springs, which form a great many fine rivers, of which the chief are,

1. Patowmack, which rising in the mountains on the north-west runs to the south-east, and separates Maryland from Virginia on the south-west, falling into the middle of the bay of Chesepeak.

2. The river Pocomoac, which rising near the ocean runs almost directly south, and then turning to the west falls into the bay of Chesepeak, near Watkins's Point; a line drawn from the mouth of the river directly east to the Atlantick Ocean is the true boundary between Maryland and Virginia on the eastern shore.

3. The river Patuxent, which rising in Anne Arundel Country runs to the south-east, and falls into the bay of Chesepeak, about twenty miles to the northward of the mouth of Patowmack River.

4. Severn River, which rises on the north-west part of Maryland, and running south-east falls into the upper-part of the said bay.

5. Cheptonk, which rising on the eastern shore runs to the south-west and falls into the same bay.

6. Sassafras River, which rises in the north-east of Maryland, and running almost due west falls into the north end of the said bay.

7. Wicomo River, which rising on the eastern shore runs to the south-west, and falls into the bay almost against the mouth of Patowmack River.

The 8th and last river I shall mention is St. George's, on the west side of the bay, which running from north to south falls into the mouth of the river Patowmack: Here the English first settled and built the town of St. Mary's. There are a great many more rivers capable of receiving large ships, which with the numerous bays and creeks that indent the land on every side, give the seamen an opportunity of bringing their vessels up to the very planters doors to receive their freight, as in Virginia. As to that part of the coast of Maryland which lies upon the Atlantick Ocean, the same may be said of it which Colonel BEVERLEY says of Virginia, that it is a bold even coast with regular soundings, and open all the year round; so that having the latitude, which can hardly be wanted where there is so much clear weather, any ship may go in by soundings alone by day or

night, in summer or winter, and need fear no disaster if the Mariners understand any thing. Let the wind blow how it will, and chop about never so suddenly, they will find an opportunity by the evenness of the coast either of standing off and clearing the shore, or of running into a safe harbour within the capes of Virginia; to which conveniences there is the addition of good anchorage without the capes.

CHAP. II.

Of the air, seasons, winds and tides.

CHAP. II. THE air of this country, I perceive, is excessive hot some part of the summer, and equally cold in winter when the north-west wind blows: But the natives, who would have us believe their country a perfect paradise, tell us they are happily situated between the heat and cold; that their heats are very seldom troublesome, and then only by accident in a perfect calm, but that this does not happen above two or three days in a year, and then lasts but a few hours at a time; and even that inconvenience is made very tolerable by their cool shades, their open and airy rooms, arbours and grotto's; and in spring and fall the weather is as pleasant as can be wished.

That their winters are not of more than three or four months duration, and in these they seldom have one month of bad weather; all the rest they have are happy in a clear air and a bright sun, and are scarce ever troubled with fogs. It is acknowledged they have hard frosts sometimes, but they last no longer than while the wind blows from the north and north-west points, which is seldom more than three or four days. At other times they have no frost at all; and their frosts are attended with bright serene weather: And in the spring, summer and winter, these winds are only cool pleasant breezes.

Their rains, except in the depth of winter, are very agreeable and refreshing. In summer they last but a few hours, and then bright weather succeeds. However, it is acknowledged that the showers which fall in summer are very heavy for the time the last, and that part of the country which lies on the bays of the sea and the mouths of the rivers, which is much the best peopled, is certainly hot and moist, and consequently unhealthy: Indeed higher up the country, whither their plantations are now extended, the air is much more healthful; especially since their lands are cleared of wood. They have here however dreadful thunder in the heat of summer, but as it cools and refreshes the air, they rather wish for it than fear it, they tell us; tho' it sometimes does much mischief.

CHAP. II. Their tides are very small as well on the coast bordering on the ocean as in the bay of Chesepeak, as was observed in treating of Virginia, to which I must refer the reader for further satisfaction on these heads; these counties being situated almost in the same latitude and on the same bay of Chesepeak.

Tides.

CHAP III.

Of the provinces and chief towns of Maryland; and of the buildings of the Indians.

CHAP. III. WHEN the English planted this country they found a King or Chief called a Weroance, upon almost every river, as in Virginia; but the limits of their respective countries are not exactly known: Since the Indians transferred or yielded this province to the English, it has been divided into ten counties, six on the west side of the bay and four on the east side of it: Those on the west side taking them from south to north are, 1. St. Mary's County. 2. Charles County. 3. Prince George County. 4. Calvert County. 5. Anne Arundel County; and, 6. Baltimore County.

Provinces.

The counties on the east side of the bay, beginning also from the south, are, 1. Somerset County. 2. Dorchester County. 3. Talbot County. 4. Cecil County. As for the county of Kent, that or the greatest part of it is now held to be in Pennsylvania.

St. Mary's Town and County.

1. St. Mary's, the capitol of the county of the same name, and for some time of the whole province, is situated on the east side of the river St. George, in 38 degrees odd minutes north latitude. This, as has been intimated, was the first town in Maryland, built by the English, who raised a fort for its defence; but I don't perceive in its most flourishing state it had more than three or fourscore houses in it, and since the seat of the government has been removed to Annapolis, seems to be upon the decline; for the same humour prevails here as in Virginia of living on their respective plantations and not in towns. In this county also are the parishes of Hervington, St. Clement's, and St. John's; and here is a noble seat of the Lord Baltimore, the proprietor, called Mettapan, situate near the mouth of the river Patuxent.

Prince Charles County. Prince George County. Calvert County.

2 and 3. In Prince Charles County, which lies north of St. Mary's, are the parishes of Bristol and Piscataway; and in that of Prince George the parish of Masterkout.

Anne Arundel County. Annapolis, the capital of province.

4. In Calvert County, which is divided from Charles County by the river Patuxent, are the parishes of Abington, Warrington, and Calverton.

5. In the County of Anne Arundel, which lies north of Charles County, the chief Town is Annapolis, now the capital of the province, and formerly called Severn; being situate on the river of that name, in 39 degrees odd minutes north latitude: Here the courts of justice and the general assemblies were ordered to be

held in the year 1690, and this has ever since been the residence of the Governor; notwithstanding which, 'tis said there are not yet an hundred houses built in the town.

CHAP. III.

6. In Baltimore County, which lies between Anne Arundel County and the province of Pennsylvania, is the parish of Baltimore, situate on the north-west part of the Bay of Chesepeak.

Baltimore County.

1. In Somerset County, which is the most southerly county on the east side of the bay, are the town and parish of Somerset.

Somerset Town and County.

2. In Dorchester County, which lies north of Somerset, are the town and parish of Dorchester, besides a great many Indian towns.

Dorchester County.

3. In Talbot County, which lies north of Dorchester, are the parishes of Oxford, St. Michael's, and Bolingbroke; and

Talbot County.

4. Cecil, the most northerly county on the east side of the bay, is bounded both on the north and east by the province of Pennsylvania; but the limits hereof will be more particularly described when I come to treat of Pennsylvania.

Cecil County.

In this province are more Indian towns and better peopled than in Virginia, especially on the east side of the bay; there never having been any wars, and scarce any misunderstanding between the English and the natives. The houses of the Indians, which they call Wigwams, or Wigwangs, are of two sorts, the smaller resembling a bee-hive, and the larger being of an oblong form, are roofed like a barn; and both built with green poles, and covered with bark, which they tie together with the fibres of roots, or the rind of trees. Their windows are only holes in the sides of the house, which they close with shutters of bark in bad weather, leaving only the windows open to the leeward. Their fire-hearth is in the middle of the house, and a little hole at the top of it to let out the smoke; but it not being confin'd as in a chimney, the smoke often spreads all over the house, and can only be borne by those who have been bred up in such places from their infancy. Their door is no more than a piece of matting hung upon a string; and when they go far from home they barricade the door with great pieces of timber, to keep out wild beasts. The house seldom has more than one room; unless it be a great man's palace, which has usually some partitions in it made with poles and mats.

Buildings.

As to their furniture, the better sort have mats or carpets to sit on, and usually sit with their legs stretched out, and not cross-legged, like the eastern nations: Their lodging is upon a couch of boards or reeds, fixed to the side of the house, and covered with mats or skins. In winter they will lie upon the skin of a bear or some other animal about the fire, covering themselves with their watchcoats; but in warm weather they lie only on a matt, rolling up another matt for their pillow. When they are at war, or apprehensive of the approach of an enemy, they surround their town with palisades, or at least the houses of their Weroances or Chiefs; within which they all retire with their families and effects, as in Virginia, upon receiving any alarm.

Furniture.

CHAP.

CHAP. IV.

Of the persons and habits of the Indians; their genius and temper, manufactures, food, exercises and diversions; the diseases they are subject to, and their remedies.

CHAP.
IV.
Persons of
the Mary-
land In-
dians.

THE stature of the Indians, as has been observed in treating of Virginia, is not different from that of the English. Their bodies are straight, and well proportioned; their features tolerable; their complexion would be the same as that of the people in the same latitude in Europe, if they did not take a great deal of pains to make them darker by greasing, and then exposing themselves to the sun from their infancy: The features of their women are not very engaging, and following the same custom of anointing themselves, and lying in the sun as the men do, their complexions are very dark, and some have observed they have an odd cast with their eyes, which are generally black.

The hair of both sexes is black; the men cut theirs short in various forms, and either grease or paint it; and persons of distinction leave a long lock behind. The men pull off the hair of their beards by the roots with tweezers made of shells, and neither men or women suffer any hair to grow on their bodies: The women wear the hair of their heads very long; sometimes flowing down their backs, and at others tied up with a fillet, or coronet of shells and beads; and men of distinction, as well as the women, wear coronets of shells and beads of various colours: The women also have chains of the same about their necks, and bracelets on their arms.

Habits.

The common people go bare-headed, only sticking some beautiful feathers on their crowns; and when they are at work, or employed in hunting, shooting, and other exercises, they wear only a piece of skin, wrapped about their loins, being naked from their waist upwards, and from the middle of the thigh downwards, but when they are dressed, especially in cold weather, they have a mantle about their shoulders, made of the skin of a deer, or some other animal, which they sometimes wear loose, and at others tied close about them; and they seldom go abroad without their bow, their quiver of arrows, and their tomahawk, or hatchet: They have a kind of shoes, made of a piece of deer-skin, which they lace, or fasten with a thong on the top of the foot. The dress of the women does not differ from that of the men, except it be in their ornaments, viz. their necklaces, bracelets, &c. and in the wearing of their hair.

Their Priests have a garment different from other men, resembling a short cloak, hung upon one shoulder, which being fastened about the neck reaches down to the middle of the thigh; but this garment having been described in Virginia, I shall not trouble the reader with it again.

VOL. III.

The Indians of Maryland are allowed to be men of quick and sprightly parts, like their neighbours of Virginia; but want, like them, the advantage of letters and education. They are nimble, active, and indefatigable in their warlike expeditions, hunting, and journeys. There are also men of courage amongst them; but they are generally timorous, revengeful, and implacable; and when they gain a victory, or get advantage of an enemy, destroy man, woman, and child. Their little kingdoms and tribes are perpetually in a state of war, which very much lessens their numbers; and if one man kills another of the same clan, the quarrel is never forgotten or forgiven, but they endeavour to retaliate injury for injury, from generation to generation. I do not find their Princes interpose in these cases, but leave every man to take his own revenge. Mr. HUGH JONES, in his account of the Indians of Maryland, says, though they are timorous and cowardly in fight, yet when they are taken prisoners, and condemned to death, they die like heroes, braving the most exquisite torments, and singing even upon the rack.

As to their manufactures and mechanic arts, if we consider the badness of their tools, they might be esteemed excellent workmen, especially as they had no particular trades amongst them; but every man was his own artificer, and did the work of a carpenter, tailor, shoe-maker, &c. for himself.

When the English arrived there, they had no sort of iron tools or instruments; their axes were sharp stones set in wood: With these they made their bows of the locust-tree, an excessive hard wood when it is dry, but they fashioned them therefore while it was green and pliant: Their arrows they made of reeds or sticks, that wanted but little fashioning; and sledged their arrows with turkeys feathers, which they glued to the small end of the shaft, and armed the head with a white transparent stone, a bone, or the spur of a wild turkey.

They procured fire, by rubbing a stick of hard wood upon a piece that was soft and dry: They felled trees of a prodigious size by making a little fire about the root, and keeping the flame from ascending, until they burnt away so much of the basis, that the least blast of wind brought it down; and as it lay on the ground, they burnt it of what length they pleased: Then they raised it to a convenient height to work upon, and burnt it hollow, when they intended to make a boat of it, removing the fire from place to place, until they had made it as deep as they designed; after which they scraped it smooth, and the canoe, or boat, was finished, being all of a piece: These canoes are from ten to forty foot in length.

In order to clear the ground for a plantation, they used to chop the trees round with their stone-hatchets, or tomahawks, which killed them in two or three years, and the trees fell of themselves; but they were glad to change their tomahawks for European axes, which make much quicker dispatch.

24 E

Their

CHAP.

IV.

Utenfils.

Their household utenfils were earthen pots, in which they boiled their meat. Baskets made of filk-grafs, with gourds or calabashes, served them for difhes and bowls; a fhell was their fpoon, and their knife an edged reed or flint. Their mats were made of rufhes; their mantles of the fkins of beafis, which served them alfo for bed-cloaths; and as they never trouble themfelves to fhape their cloaths to their bodies, it did not require much fkill or pains to finifh them. The fibres of the bark of trees, as well as filk-grafs, served them for thread and cordage; and their needle was a thorn, or the bone of a fifh.

Their
diet.

The Indians here have no fet meals, but eat all day long when they have plenty of provifions, efpecially when they have fuch food as they like: However, no men endure hunger with more patience in a time of fcarcity; and this they make more tolerable, it is faid, by girding up their bellies, which makes them not fo fenfible of the want of food as they would otherwife be.

They eat fifh, fefh and fowl of almoft all forts, and even fome fpecies of fnakes and infefts, fuch as grubs, the nymphe of wasps; fome fort of fcarabæi, cicade, &c. They eat alfo peas, beans, and all manner of pulfe parched and boiled. Their bread is made of Indian corn, wild oats, or the feed of the fun-flower; but they never eat bread with their meat. They had no falt, but ufed the afhes of hiccory, ftick-weed, or fome other plants that afforded a falt-afh, to feafon their meat: And there is no food they feem fonder of than the green ears of Indian corn roasted; for which reafon they plant it at different times in the fpring that the feafon may laft the longer.

Various
ways of
dreffing
their food.

They flew their meat moft commonly: They alfo broil and toaft it againft the fire, and frequently put fifh and fefh into their homony (which is Indian corp flewed over a gentle fire for ten or twelve hours, until it is as thick as fummery or buttered wheat.) They either broil their meat upon the coals, or on a hot hearth, and frequently dry it upon a wooden grate, which ftands very high above the fire, which they call barbacuing it; and this dried fefh they ufually take with them on a march, or in their hunting expeditions, and flew it as they want it. They flea and embowel their venifon and other meat as the Europeans do, and pull and draw their fowls; but they drefs their fifh without gutting or fealing; however, they do not eat the guts, as the Europeans do thofe of woodcocks and larks.

The flewed umbles of a deer is a great difh with them, and the foup made thereof much admired. Their defert confifts of dried peaches and other fruits. They eat no kind of fallads or fauce with their meats, but boil roots with it, and make it pretty favoury with pepper, &c. in the dreffing. They eat alfo trubs, earth-nuts, wild onions, and a tuberous root called tuckaboe, which grows in boggy grounds and is about the bignefs of a potatoe, which it refembles in tafte.

Liquor.

As for liquor, I do not find they drank

any thing but water, until the Englifh taught them better (or rather worfe;) and it is remarkable that though they had a great variety of fine fountains, they always chofe pond-water, or any other that had been expofed to the air and fun, to drink, rather than fountain or well-water. They are now very fond of every kind of ftrong liquor the Englifh have, and will be drunk with it as often as they can get it. They fit drinking, and at their meals, on a mat on the ground, with their legs ftretched out at length before them, and the cup or difh between their legs; and for this reafon feldom more than two eat together.

As to their exercifes and diverfions, there are no people more constantly employed in hunting, fifhing, and fowling than the Indians of this country, during the refpective feafons; but thefe may be looked upon rather as their bufinefs than diverfions, as they fupply their families with food by thefe means the greateft part of the year: Their domeftick diverfions are finging, inftrumental mufick, and dancing; which not differing from the mufick and dancing of the Virginian Indians already defcribed, I fhall not weary the reader with the repetition of what has been already faid upon that head. The diverfions of the Englifh both here and in Virginia are chiefly hunting, fifhing and fowling; fome ufe ftalking-horfes, whereby they cover themfelves from the fight of the deer, until they come within reach of them; others cut down trees for the deer to browse upon, and lie in wait behind them: Others again fet ftakes in pits near their fences, where the deer have been ufed to leap over into a field of peas, which they love extremely. Thefe ftakes they fo place as to run into the body of the deer when he pitches, by which means they impale him; and for a temptation to the leap, take down the top-part of the fence.

They hunt their hares (which are very numerous) on foot with mungrels or fwift dogs, which either catch them quickly, or force them to hole in a hollow tree, whither all their hares generally tend when they are clofely purfued. As foon as they are thus holed and have crawled up into the body of the tree, they kindle a fire, and fmother them with fmoak, until they let go their hold, and fall to the bottom ftiffed, from whence they take them: If they have a mind to fpare their lives, upon turning them loofe, they will be as fit as ever to hunt at another time, for the mifchief done them by the fmoak immediately wears off again.

They have another fort of hunting which is very diverting, and that they call vermine-hunting. It is performed on foot with fmall dogs in the night, by the light of the moon or ftars. Thus in fummer-time they find abundance of raccoons, opoffums, and foxes, in the corn-fields, and about their plantations; but at other times they muft go into the woods for them. The method is to go out with three or four dogs, and as foon as they come to the place, they bid the dogs feek out, and all the company follow immediately. Wherever a dog barks you may

CHAP.

IV.

Exercifes.

Hunting.

CHAP. IV. may depend upon finding the game, and this alarm draws both men and dogs that way. If this sport be in the woods, the game by that time you come near it, is perhaps mounted on the top of an high tree, and then they detach a nimble fellow up after it, who must have a scuffle with the beast before he can throw it down to the dogs; and then the sport increases to see the vermine encounter those little curs. In this sort of hunting they carry their great dogs out with them, because wolves, bears, panthers, wild cats, and all other beasts of prey are abroad in the night.

For wolves they make traps, and set guns baited in the woods, so that when he offers to seize the bait, he pulls the trigger, and the gun discharges upon him. They have many pretty devices besides the gun to take wild turkeys.

Fishing. The Indian invention of weirs in fishing is mightily improved by the English, besides which they make use of seins, trolls, casting-nets, setting-nets, hand-fishing, and angling; and in each find abundance of diversion. Like those of the Euxine sea, they also fish with spilyards, which is a long line staked out in the river, and hung with a great many hooks on short strings, fastened to the main line about three or four foot asunder, supported by stakes, or buoyed with gourds. They use likewise the Indian way of striking by the light of a fire in the night.

Fowling. Their fowling is answerable to their fishing, for plenty of game in its proper season. Some plantations have a vast variety of it.

Beavers. The admirable oeconomy of the Beavers deserves to be particularly remembered. They cohabit in one house; are incorporated in a regular form of government, something like monarchy; and have over them a superintendent, which the Indians call Pericu: He leads them out to their several employments, which consists in felling of trees, biting off the branches, and cutting them into certain lengths suitable to the business they design them for; all which they perform with their teeth. When this is done, the Pericu orders several of his subjects to join together and take up one of those logs; which they must carry to their house or dam, as occasion requires. He walks in state by them all the while, and sees that every one bears his equal share of the burden while he bites with his teeth and lashes with his tail those that lag behind, and do not lend all their strength. Their way of carriage is upon their tail. They commonly build their houses in swamps; and then to raise the water to a convenient height, they make a dam with logs, and a binding sort of clay, so firm, that though the water runs continually over, it cannot wash it away. Within these dams they will enclose water enough to make a pool like a mill-pond; and if a mill happen to be built on the same stream below their dam, the miller in a dry season, finds it worth his while to cut it to supply his mill with water; upon which disaster the beavers are so expert at their work, that in

one or two nights time they will repair the breach and make it perfectly whole again. Sometimes they build their houses in a broad marsh, where the tide ebbs and flows, and then they make no dam at all. The doors into their houses are under water. I have been at the demolishing one of these houses, that was found in a marsh, and was surprised to find it fortified with logs that were six foot long and ten inches through; and had been carried at least one hundred and fifty yards: This house was three stories high, and contained five rooms, that is to say, two in the lower, two in the middle story, and but one at the top. These creatures have a great deal of policy, and know how to defeat all the subtilty and stratagems of the hunter, who seldom can meet with them, though they are in great numbers all over the country.

They have many horses foaled in the woods of the up-lands that never were in hand, and are as shy as any savage creature: These having no mark upon them belong to him that first takes them. However the captor commonly purchases these horses very dear by spoiling better in their pursuit, in which case he has little to make himself amends, besides the pleasure of the chase: And very often this is all he has for it, for the wild horses are so swift that it is difficult to catch them, and when they are taken, it is odds but their grease is melted, or else being old they are so fullen that they cannot be tamed.

The diseases of the Indians proceed from heats and colds, and are usually removed by sweating; but if the humour fixes, and occasions a pain in any of their limbs, they endeavour to cure it by burning the part with a live coal; with which having made a sore, they keep it running until the humour is drawn off.

They also scarify the part and suck the sore, and sometimes make use of reeds for cauterising, which they heat over the fire until they are ready to flame, and then apply them upon a piece of wet leather to the grieved part, which makes the heat more intense. As for the rest of their remedies, I must refer the reader to Virginia, and consider, in the next place, the diseases the English are subject to in this part of the world.

Distempers come not here (says my author) by choking up the spirits with a foggy and thick air, as in some northern climes, nor by a stifling heat, which exhales the vigour of those that dwell in a more southerly latitude, but by a wilful and foolish indulging themselves in those pleasures which in a warm and fruitful country nature lavishes upon mankind for their happiness, and not for their destruction.

Thus I have seen persons impatient of heat lie almost naked upon the cold grass in the shades, and there often forgetting themselves fall asleep; nay, many are so imprudent as to do this in an evening, and perhaps lie so all night; when between the dew from heaven,

CHAP.

IV.

ven, and the damps from the earth, such impressions are made upon the humours of their body as occasion fatal distempers.

Thus also have I seen persons put into a great heat by excessive action, and in the midst of that heat strip off their cloaths and expose their open pores to the air: Nay, I have known some mad enough in this hot condition to take huge draughts of cold water, or perhaps of milk and water; which they esteem much more cold in operation than water alone.

And thus likewise have I seen several people (especially new comers) so intemperate in devouring the pleasant fruits, that they have fallen into dangerous fluxes and surfeits. These and such like disorders are the chief occasion of their diseases.

The first sickness that any new comer happens to have there, he unfairly calls a seasoning, be it fever, ague, or any thing else that his own folly or excesses bring upon him.

Their intermitting-fevers, as well as their agues, are very troublesome if a fit remedy be not applied; but of late the Doctors there have made use of the cortex peruvian with success, and find that it seldom or never fails to remove the fits. The planters too have several roots natural to the country, which in this case they cry up as infallible; and I have found, by several examples, a total immersion in cold spring water, just at the accession of the fit, an infallible cure.

When these damps, colds, and disorders affect the body more gently, and do not seize people violently at first, then for want of some timely application (the planters abhorring all physick, except in desperate cases,) these small disorders are suffered to go on until they grow into a cachexy, by which the body is over-run with obstinate scorbutick humours: and this in a more fierce and virulent degree I take to be the yaws.

The gripes is a distemper of the Caribbee-Islands, and not of Virginia or Maryland, and seldom gets footing there, and then only upon great provocations, namely, by the intemperances before-mentioned, together with an unreasonable use of filthy and unclean drinks. Perhaps too it may come by new unfine cyder, perry or peach-drink, which the people are impatient to drink before it is ready; or by the excessive use of lime-juice and foul sugar in punch and flip; or else by the constant drinking of uncorrected beer made of some windy unwholesome things, as some people make use of in brewing.

CHAP. V.

CHAP.

V.

Maryland first discovered. Its name.

Of their history, government, and religion.

VIRGINIA and Maryland were discovered anno 1606, by the same adventurers, and retained the same name until the eighth year of King CHARLES the first,

anno 1632, when that Prince granted that part of Virginia which lay north of Patowmack river, and was not then planted, unto CECILIUS CALVERT, Lord Baltimore, of the kingdom of Ireland, and his heirs: And this part of the country was afterwards called Maryland, in honour of the then Queen consort, HENRIETTA-MARIA, youngest daughter of the French King, HENRY IV.

The Lord Baltimore having obtained this grant, sent over his brother, the honourable LEONARD CALVERT, Esq; with several Roman Catholick gentlemen and other adventurers, to the number of two hundred, to take possession of the country; who setting sail from England on the twenty-second of November, 1633, arrived at Point-Comfort, in the bay of Chesapeake, on the twenty-fourth of February following; where being kindly received and supplied with provisions by the English of Virginia, they continued the voyage northward to the river Patowmack, appointed to be the boundary between Virginia and Maryland, on the west side of the bay.

The adventurers sailed up this river, and landing in several places on the northern shore, acquainted the natives they were come to settle among them and trade with them; but the natives seemed rather to desire their absence than their company. However, there were no acts of hostility committed on either side, and the English returning down the river patowmack again, made choice of a place near the mouth of a river (which falls into it, and by them called St. George's River) to plant the first colony. They advanced afterwards to an Indian town, called Yoamaco, then the capital of the country, and at a conference with the Weroance or sovereign of the place, to whom they made considerable presents, the Weroance consented that the English should dwell in one part of the town, reserving the other for his own people till the harvest was over; and then agreed to quit the whole entirely to the English, and retire further into the country, which they did accordingly; and the following March Mr. CALVERT and the planters were left in the quiet possession of the whole town, to which they gave the name of St. Mary's; and it was agreed on both sides, that if any wrong was done by either party, the nation offending should make full satisfaction for the injury. The reason the Yoamaco Indians were so ready to enter into a treaty with the English, and yield them part of their country, was in hopes of obtaining their protection and assistance against the Sasquahannah Indians, their northern neighbours, with whom they were then at war, and indeed the Yoamaco Indians were upon the point of abandoning their country to avoid the fury of the Sasquahannah nation before the English arrived; from whence it appears, that the adventurers sent over by the Lord Baltimore cannot be charged with any injustice in settling themselves in this part,

CHAP.

IV.

Granted to Lord Baltimore.

Planted anno 1603.

St. Mary's the first town possessed by the English.

CHAP. V. part of America, being invited to it by the original inhabitants.

The English being thus settled at St. Mary's, applied themselves with great diligence to cultivating the ground, and raised large quantities of Indian Corn, while the natives went every day into the woods to hunt for game, bringing home Venison and Turkies to the English colony in abundance, for which they received knives, tools and toys in return. And thus both nations lived in the greatest friendship, doing good offices to each other, till some of the English in Virginia, envious of the happiness of this thriving colony, suggested to the Indians that these strangers were not really English, as they pretended, but Spaniards; and would infallibly enslave them, as they had done many of their countrymen: And the Indians were so credulous as to believe it, and appeared jealous of Mr. CALVERT, making preparations as if they intended to fall upon the strangers; which the English perceiving, stood upon their guard, and erected a fort for their security, on which they planted several pieces of ordinance, at the firing whereof the Yoamaco's were so terrified that they abandoned their country without any other compulsion, and left the English in possession of it; who receiving supplies and reinforcements continually from England, and having no other enemy to contend with than agues and fevers (which swept off some of them before they found out a proper regimen for the climate) they soon became a flourishing people, many Roman Catholick families of quality and fortune transporting themselves hither to avoid the penal laws made against them in England; and Maryland has been a place of refuge for those of that persuasion from that day to this.

During the grand rebellion in England, the Lord Baltimore's family were deprived of the government of this province, but were restored to their right by King CHARLES II. soon after his own restoration. Whereupon the Lord Baltimore sent over his son, CHARLES CALVERT, afterwards Lord Baltimore, to be Governor of Maryland, who continued in that post upwards of twenty years (long after his father's death,) by whose prudence the colony became almost as considerable as Virginia for its Tobacco and other products of the soil: And all the Indian nations on that side put themselves under their protection. The Indian Chiefs were appointed, or at least approved and confirmed in their commands by the Lord Baltimore, the proprietor, whose success is to be ascribed in great measure to the endeavours he used to cultivate a good correspondence with the Indian nations, and to give them as little offence as possible. I can't learn that this colony was ever in a state of war with the natives, or ever received any injury from them, unless in the year 1677; when the Indians being at war with the English of Virginia, plundered the frontiers of Maryland, and half a dozen people lost their lives: But this proceeded from a mistake; peace was soon restored upon the Indians making satisfaction for the outrage.

At the revolution the Lord Baltimore was deprived of the power of appointing a Governor and other Officers, and the government of that province fell under the same regulation as other plantations which are immediately subject to the crown. The Baltimore family also were in danger of losing their propriety on account of their religion,

by the act which requires all Roman Catholick heirs to profess the protestant religion, on pain of being deprived of their estates: But that prudent family thought fit to profess the protestant religion rather than lose their inheritance; and the present Lord Baltimore is now both proprietor and Governor of Maryland, being one of the noblest estates enjoyed by a subject of Britain; for he is still entitled to a duty on every hoghead of Tobacco exported, enjoys several fair manours, which may be stiled his demesne lands, and has a rent paid him by every planter, besides other perquisites.

The Governor, however, as has been already observed, is now appointed by the crown, as are also the members of the council. The assembly is chosen by the freeholders of the respective counties, as in Virginia; and in the Governor, council and assembly, the legislative power is lodged. The Governor has a negative as the King has in England, and their acts must be confirmed by the King: However, they are in force till the King disapproves of them.

Their Provincial-courts are held once every quarter in the capital town of Annapolis, which determine common-law causes of consequence in the first instance, and on writs of error other causes brought from the inferior County-courts; and there is a court of chancery, which gives relief in equity, as in England.

Among the Laws of Maryland, we meet with these that follow.

The parties bringing appeals or writs of error in the provincial court from the County-courts are required to give security to pay the costs and damages in case the cause goes against them.

No Person shall bring a writ of error or appeal from the County-court, where the debt or damage does not amount to six Pounds sterling; nor from the Provincial-court to the Governor and council, where it does not exceed fifty Pounds; but the judgments of those courts in such cases shall be final.

None shall appeal from the Governor and council to the King and council in England, unless the thing in dispute be of the value of three hundred Pounds sterling.

Every Elector of Burgesses for the general assembly shall have fifty acres of freehold land in the county, or a visible estate of the value of forty Pounds sterling. Four members shall be chosen to represent each county: Two citizens shall serve for the city of St. Mary's, and two for Annapolis, and every other town and borough privileged to send members to the general assembly.

No Person keeping a publick house is qualified to be a representative.

Members shall be allowed one hundred and forty pounds of Tobacco per diem for their wages, besides travelling charges.

The same allowance shall be made to every Commissioner or Judge of the provincial court during his attendance on that court, and eighty pounds of Tobacco per diem to the Judge of every County-court. But the latter part of this statute for allowing salaries to the Judges of the Provincial and County-courts was afterwards repealed.

Any person that shall blaspheme, or curse God, blasphemy our Saviour to be the Son of God, deny my the

- CHAP. V.** the Trinity of the Godhead of any of the three Persons, or the unity of the Godhead, or shall utter any reproachful words against any of the three Persons, shall be bored through the Tongue, and fined twenty Pounds sterling for the first offence, forty Pounds for the second offence, and suffer death and confiscation of goods for the third offence.
- Fornication.** The penalty for fornication is twenty Shillings sterling, or corporal punishment, not exceeding thirty-nine lashes; at the discretion of the court.
- Adultery.** And the punishment for adultery forty Shillings, or corporal punishment as aforesaid.
- Persons who harbour such lewd people are liable to the same penalties.
- Cursing and swearing.** The penalty of cursing and swearing is five Shillings sterling; and if the offence be committed in a court of justice ten Shillings.
- Schools.** Free-Schools were erected and endowed in several towns in Maryland for teaching latin and greek, by an act of assembly, anno 1696.
- English statute-book.** The English statutes or acts of parliament, with DALTON's Justice of peace, were ordered to be provided by the Justices of peace of every county in Maryland, by an act of assembly, anno 1699.
- Evidence.** Proof of bills, bonds, or other specialties, book-debts or accounts, may be made before two Justices of peace of any county, or one of the Justices of the provincial court; and the balance due upon such account, being certified under the hands and seals of such Justices, shall be deemed sufficient evidence in any court within the province.
- Annapolis the capital.** The port of Annapolis in Anne Arundel County, was made the chief seat of justice within the province, for holding assemblies and provincial courts, by an act of assembly passed 11. W. III. anno 1699.
- Conveyances.** It was enacted by their assembly 11 W. III. 1699, That no lands or tenements should be alienated or transferred from one to another, but by deed, indented and enrolled in the Provincial-court, or County-court where such lands, &c. lie.
- Executions.** Necessary Corn for the defendant's maintenance, his gun, bedding, tools, and such like, shall be protected from executions.
- Limitations of actions. Debts.** No bonds or obligations under hand and seal shall be suable, unless renewed within five years.
- No person shall depart the province, unless he set up his name three months at the Secretary's office before his departure, or give security to the government to pay his debts.
- Every master of a ship, or other person, transporting or conveying away any person out of the province without a certificate of his having complied with this law, is made liable to pay his debts: And if he convey away any servant, he shall be liable to satisfy the owner for his damages.
- Theft.** The Justices of the several County-courts are made Judges of all thefts under the value of one thousand pounds of Tobacco (robbery, burglary, and house-breaking excepted.)
- Every person convicted of such theft shall pay fourfold the value of the goods stolen, to the owner, and be put in the pillory, and whipped, as the court shall adjudge, not exceeding forty stripes. If the offender be not able to satisfy the owner otherwise, he shall receive the said corporal punishment, and pay the said penalty of four-fold retribution by servitude, the time thereof being determined by the court; and the receiver of such stolen goods is made liable to the like penalties as the thief.
- No Person shall range in the woods after wild neat cattle, or Horses, without the Governor's licence, on pain of forfeiting five thousand pounds of Tobacco for every such wild animal killed or taken. Nor shall any person cut off the ear of a Hog, taken in the woods, on pain of being adjudged a Hog-stealer.
- All fences for inclosing corn-ground shall be five foot high at least, and strongly made; and if any cattle break into such fence, the owner of the cattle shall forfeit five hundred pounds of Tobacco, or such further damages as a Justice of peace shall award.
- No master of a ship, or merchant, shall import a convicted felon into Maryland, on pain of forfeiting the value of two thousand lb. of Tobacco.
- Whoever shall take, entice away, or sell any friend Indian without licence, shall be fined and imprisoned at discretion.
- In the year 1698, part of Dorchester County was assigned to the natives; to hold the same of the Lord Proprietor, under the rent of one Beaver skin.
- By an act, 11 W. III. 1699, The carrying strong liquors to the Indian Towns was prohibited.
- By 12 W. III. anno 1700, Certain persons were authorised by the government to determine all differences between the English and Indians.
- Enacted 11 W. III. 1699, That the libraries in every parish should be in possession of the Minister; who should preserve them, and be accountable for the books.
- Enacted 4 W. & M. 1692, That the persons intending to marry shall apply themselves to the Minister or Magistrate, and banns shall be published in the Church, County-court, or meeting-house next to which the parties dwell; and upon a certificate thereof the Minister or Magistrate may, three weeks after such banns published, join the parties in marriage, according to the liturgy of the Church of England: And no person shall contract marriage without such publication on pain of forfeiting one thousand lb. of Tobacco, and the Minister or Magistrate joining them in marriage five thousand lb. of Tobacco: And all marriages not made by some Minister or Magistrate, before five sufficient witnesses at least, shall be void: The fees for marriage being restrained to one hundred lb. of Tobacco.
- The Colonels and other Officers of the militia in every county are impower'd to enlist all persons to serve in the horse or foot from sixteen to sixty (except Negroes and slaves;) who are obliged to muster in their respective counties from time to time, at such places as the Governor shall appoint, and to bring their own arms and Horses, and maintain themselves during such muster. But if they are sent on actual service, their arms, &c. are to be provided them out of the publick magazines, and they are to be regularly paid by the respective counties they belong to: And Press-masters are appointed in every county to press provisions for the troops.
- The prisoners and plunder to be equally divided among the soldiery; and Troopers losing their Horses to have others bought them at the publick charge.

CHAP. V. Any Soldier being wounded to be provided for by the publick, as also the wives and children of such as are killed in the service.

Negroes. The baptized Negroes shall not alter their condition as to servitude.

Constables. Justices of peace in each county are empowered to appoint Constables in every parish.

Publick houses. Inns and publick houses are to be licensed by the Commissioners of each county; who may ascertain the price they shall take for their liquor, beds, provisions, and provender; and may suppress them if disorderly.

The landlord obliged to credit every freeholder as far as the value of four hundred lb. of Tobacco.

Perjury. The penalty of perjury twenty Pounds sterling, and six months imprisonment; and in default of paying the penalty, the offender to be set in the pillory, and his ears nailed to it.

Enemies. By 11 W. III. 1699, It was made felony to serve any foreign Prince or state against any other Prince or state in amity with Great-Britain.

Trials. And that treasons, felonies, pyracies, or robberies committed at sea, should be tried in the same manner as such offences committed on shore; the Commissioners or Judges to proceed according to the English statute of 28 H. VIII. c. 15.

Small debts. No County-court shall take cognizance of any action where the debt or damage does not exceed the value of two hundred lb. of Tobacco, or sixteen Shillings and eight Pence sterling; but such causes shall be determined by any one Justice of peace of the county where the debtor shall reside without fee.

Chancery. The Court of Chancery shall not hear any cause where the original debt or damage does not amount to the value of twelve hundred lb. of Tobacco, or five Pounds sterling and upwards; but the judgments of the County-courts in such cases shall be final.

Acts of assembly. All acts of assembly are required to be published by the Sheriffs in the respective counties.

Common-prayer. By 12 W. III. 1700, the book of common-prayer was required to be read in all the churches of Maryland.

Clergy. For the encouragement of the clergy a tax of forty lb. of Tobacco per head was enacted to be levied and paid to the Ministers of the respective parishes.

Marriage. Enacted, that none should marry within the degrees prohibited.

No Justice of peace or Magistrate shall marry people in any parish where there is a clergyman resident.

Vestries. The vestry-men of each parish are incorporated and empower'd to receive for pious uses, and the benefit of each church and parish, all lands, tenements, goods and chattels granted or bequeathed to them. The Minister of the parish to preside in the vestry.

Pluralities. No Minister shall hold more than two parishes, and shall have the licence of the Governor and the two vestries for this.

Readers. Where there is no Minister in any parish the vestry may provide a Reader, allowing him a salary out of the forty Pounds per poll, not exceeding half the revenue of a Minister: And such Readers are allowed to read divine service out of the common-prayer-book, and read the homilies.

Servants and slaves. No servant or slave shall travel more than ten miles from his master's house without a note from his master or his overseer, on pain of being deemed a runaway; and such servant absenting him-

self shall serve ten days for every day he is absent.

Any person travelling out of his county without a pass under the county-seal, and not being known or able to give a good account of himself, shall be deemed a runaway and carried before the next Magistrate; who shall commit him to safe custody, and give notice to his master or mistress, if it appear he have any; or else cause the name and description of such a runaway to be set up in the next County-courts, that it may be discovered to whom he belongs.

Every servant, at the expiration of his time, shall have a new suit of cloaths, two hoes, an ax, a gun, and three barrels of Indian Corn given him by his master.

No person shall barter goods, or traffick with any servant or slave without the master's leave.

If any servant shall be denied sufficient meat, drink, lodging, or cloathing, or shall be overworked or debarred of his natural rest, the County-court may fine such master; and for the third offence set the wronged person at liberty.

If any white woman suffer herself to be got with child by a Negroe, she shall become a servant for seven years; and if she be then a servant, she shall serve seven years beyond her time. If the Negroe who got the child be free, he shall serve seven years; and their issue shall be servants until they arrive at thirty one years of age.

And if a white man get a Negroe woman with child he shall undergo the same punishment as a white woman got with child by a Negroe.

If a white woman servant have a bastard, and cannot prove who is the father, she shall satisfy the damage to her master by further servitude; and if she do produce the father he shall satisfy the damage, if free; and if a servant half the damage: And if the father be a single person and promised the maid marriage before he lay with her, he shall be at liberty to perform his promise, or make satisfaction otherwise.

No person shall work or use any sports on Sundays, or suffer his servants to work, &c. on that day (works of necessity excepted) on pain of forfeiting two thousand lb. of Tobacco for every offence.

No publick house shall sell strong liquor on Sundays, or suffer tipling, gaming, or other pastime, on pain of forfeiting one hundred lb. of Tobacco.

For Irish servants or Negroes imported, a duty of twenty Shillings sterling per head was given by an act of 11 W. III. 1699, and a duty of three Pence per gallon on rum and wine imported.

Every Constable shall annually on the 20th of June require of every master and mistress a list of all taxable persons in their respective families, and send one copy thereof to the Sheriff and another to the County-court.

All male children born and resident in this province, (being above sixteen years of age) all male servants of sixteen imported, all slaves male and female, imported of sixteen years of age, and all freemen (except clergymen and poor people that receive alms) shall be deemed taxable.

Weights and measures are enacted to be the same as in England.

Upon a man's dying intestate, one third of his personal estate goes to his widow, and the other two to his children; and if he has no children, to the nearest relations of the intestate.

And

CHAP. V. And the Justices of the respective counties are empowered to take care of all orphans, with their estates and effects until of age, every male orphan being deemed of age at one and twenty, and every female at sixteen, or day of marriage, which shall first happen; and it was provided that no orphan should be put into the hands of a person of a different religion from that of his parents.

Orphans.

The Justices of the County-courts shall annually enquire by a jury, how orphans are maintained and educated; and if they are apprentices, how they are used and instructed; and if they find any abuse or neglect, to redress the same.

N. B. The Governors of Maryland have endeavoured from time to time to make their laws resemble those of England as near as possible; and they have also unhappily introduced most of the niceties in pleading and dilatory proceedings of our courts of law and equity; which their neighbours of Virginia have wisely provided against, and retrenched all exorbitant fees; so that justice is administered in that province with much more speed and less charge than it is in this.

Mr. JONES, who resided a considerable time in Maryland, treating of their religion and government, expresses himself in the following manner:

JONES'S observations.

We are governed (says that gentleman) by the same laws as in England, only some acts of assembly we have relating to some particular cases, not under the verge of the English laws, or where the laws of England do not aptly provide for some circumstances, under which our way of living hath put us. The Church of England (God be praised) is pretty firmly established amongst us. Churches are built, and there is an annual stipend allowed for every Minister by a perpetual law, which is more or less, according to the number of taxables in each parish; every Christian male sixteen years old, and Negroes male and female above that age, pay forty lb. of Tobacco to the Minister, which is levied by the Sheriff among other publick levies; which makes the revenues of the Ministers, one with another, about twenty thousand lb. of Tobacco, or one hundred Pounds sterling per annum. It hath been the unhappiness of this country, that they had no protestant Ministers hardly among them, till Governor NICHOLSON'S time, but now and then an itinerant preacher, of very loose morals, and scandalous behaviour; so that what with such mens ill examples, the Romish Priests cunning, and the Quakers bigotry, religion was in a manner turned out of doors: But (God be praised) things now stand better, and our churches are crowded as full as they can hold, and the people are pretty sensible of the Romish superstition, and the Quakers madness; so that their parties both joined together are very inconsiderable to what ours is. Indeed the Quakers struggle hard to maintain their footing, and their teachers (especially the female sex, who are the most zealous) are very free of their taunts and contumelies against us; but it is to little purpose, unless to make their own way more ridiculous.

We have not yet found the way of associating ourselves in towns and corporations. There are indeed several places allotted for towns, but hither-

to they are only titular ones, except Annapolis, where the Governor resides. Governor NICHOLSON did his endeavour to make a town of that, and there are in it above forty dwelling houses, seven or eight whereof afford good lodging and accommodation for strangers. There is also a State-house, a church, and a free-school built with brick, which make a great show among a parcel of wooden houses; but their buildings are much improved since Mr. JONES wrote.

As for our predecessors, the Indian inhabitants, I cannot give you any further account of them than this, viz. That whereas at the first seating of Maryland there were several nations of Indians in the country governed by several petty Kings, I do not think that there are now five hundred fighting men of them in the province, and those are more on the eastern shore than on the west. Here they have two or three little towns, and some of them come over to the west in winter time to hunt for Deer; being generally employed by the English. These Indians take delight in nothing else, and it is rare that any of them will embrace our way of living and worship. The cause of their diminishing proceeded not from any wars with the English, for we have had none with them, but from their own perpetual discords and wars among themselves: And their drinking and other vices which the English taught them probably may have destroyed many more.

I shall conclude the state of Maryland with a late account Mr. JONES has given us of the college erected at Williamstadt in Virginia, which was built for the education of the youth of Maryland as well as those of Virginia.

The royal foundation of William and Mary college, erected with a prospect of doing the greatest good to the colonies of Virginia and Maryland, and seconded with the ample benefactions of the honourable Mr. BOYLE, and the contributions of the country, had many difficulties to struggle with in its infancy: And two sides of the quadrangle were no sooner finished but it was laid in ashes by a terrible fire, that could not be extinguished until the whole fabrick was consumed. And tho' it was afterwards rebuilt and much improved, it has not answered the expectations that were conceived of it; for it was still (when Mr. JONES wrote, being about twelve years since) without a scholarship, without a statute, and without a chapel, and very few books in the library.

The Indians upon Mr. BOYLE'S foundation have indeed a handsome apartment for themselves and their master, built near the college; which useful contrivance ought to be carried on to the utmost advantage in the real education and conversion of the Infidels; for hitherto but little good has been done therein, though abundance of money has been laid out, and a great many endeavours have been used, and much pains taken for that purpose.

The young Indians procured from the tributary or foreign nations with much difficulty, were formerly boarded and lodged in the town, where abundance of them used to die, either through sickness, change of provision and way of life; or, as some will have it, often for want of proper necessaries, and due care taken of them: Those of them that have escaped well, and been taught to read and write, have, for the most part, returned to their homes, some with, and some with-

out

CHAP. V. out baptism; where they followed their own savage customs and heathenish rites.

A few of them have lived as servants among the English, or loitered and idled away their time in laziness and mischief.

But it is great pity that more care is not taken about them after they are dismissed from school.

They have admirable capacities when their humours and tempers are perfectly understood; and if well taught, they might advance themselves, and do great good in the service of religion; whereas now they are rather taught to become worse than better, by falling into the worst

practices of vile nominal Christians, which they add to their own Indian manners and absurd customs.

It is unnecessary to dwell longer on the state of Maryland, having so largely described that of Virginia, where the climate and soil are the same; the government, manners, religion and customs of the Indians the same; and the European Inhabitants differing but little from those of Virginia in their laws and customs; as the reader will observe on comparing the abovesaid abstracts that have been given of the laws of the respective countries. I proceed therefore now to the description of New-England.

CHAP. V.

THE PRESENT STATE OF NEW-ENGLAND.

C H A P. I.

Of the name, situation, extent and face of the country. Of its seas, bays, capes, lakes, springs and rivers; and of the tides, winds, air and seasons.

- CHAP. I.** **U**NDER the general title of New-England are comprehended the several colonies or governments of 1. The Massachusetts. 2. New Hampshire. 3. Connecticut. and, 4. Rhode Island, and Providence Plantation.
- Name.** This country received the name of New-England from prince CHARLES, afterwards King CHARLES I. and is situated between 41 and 45 degrees of north latitude; and between 67 and 73 degrees of western longitude; being bounded by Canada on the north-west, by Nova Scotia on the north-east, by the Atlantick Ocean on the east and south, and by the province of New-York on the west; and as it stretches along the said ocean from the south-west to the north-west, is upwards of three hundred miles in length, and from one hundred to two hundred miles in breadth.
- Face of the country.** This like other uncultivated countries was one great forest, covered with excellent timber when the English first visited these shores: The land next the Sea being generally low, and intermixed with a great many swamps or morasses, on which there grew under-wood and bushes; but farther up in the country the land rises into hills, and on the north-east is rocky and mountainous.
- Sea.** The Atlantick Ocean washes the shores on the east and south, and there are several good bays and harbours on the coast, particularly those formed by Plymouth, Rhode Island and Providence Plantation on the south; Monument Bay to the eastward of these in Barnstable-County; West-Harbour, formed by the bending of the coast at Cape Cod; the harbour of Boston, which will be particularly described in treating of that capital; Casco Bay farther northward, with several others of less note, which will be found in the map of the British Plantations; several of these are capable of receiving the largest fleets.
- Capes.** The most remarkable capes going from south to north are, 1. that of Cape Cod. 2. Marble Head. 3. Cape Anne. 4. Cape Netick. 5. Cape Porpus. 6. Cape Elizabeth; and 7. Cape Small-point.
- Springs.** The country is generally well watered with springs and rivulets, and there are some lakes, but not of that magnitude as those which lie north and west of this country. The principal rivers are, 1. that of Connecticut, which rising north of New-England runs almost directly south, and having divided the province of Connecticut in two parts, falls into the sea between the towns of Saybroke and Lime, almost over-against the east-end of Long Island; this river is navigable with large vessels a great way. 2. The Thames, which rising in some lake north of the Massachusetts, runs also directly south, falling into the sea below New London, and to the eastward of the river Connecticut. 3. The river Patuxet, which rising in the north-west of the Massachusetts country, runs to the south-east thro' Providence Plantation, falling into a bay of the sea near the town of Swansey. 4. The great river Merimack, which rising north of New-England also runs to the southward, forming a lake on the west of New Hampshire, from whence continuing its course south to 43 degrees of latitude, then turns about to the east, falling into the sea between Salisbury and Newbury in the county of Essex. 5. The river Piscataway, which runs from west to east, and falls into the sea near the town of Portsmouth in Hampshire; the mouth of which is more like an arm of the sea than a river, and is capable of receiving the largest ships. 6. The river Saco, which rising north of New-England takes its course to the south, falling into the sea between Cape Porpus and Cape Elizabeth in the province of Maine. 7. The river Casco, which runs parallel to the river Saco, and falls into Casco Bay. To the eastward of these are the rivers Saghedock, Kenebeck, Penobscot, and many more considerable streams, which rising far to the north run almost due south, falling into the ocean to the eastward of Casco Bay; but this part of the country being but slenderly inhabited and little resorted to, I meet with no further description of them. The tides on these shores ebb and flow regularly, rising usually nine or ten foot in the bays and mouths of rivers. Their winds are variable as with us, and very boisterous in the winter season: The north and north-west winds are exceeding cold, blowing over a long tract of frozen countries,

NEW ENGLAND.
NEW YORK,
NEW JERSEY and
PENSILVANIA.
By H. Koll Geographer

English Miles

An Account of the Port of the Continent of Nth America
as they now Regulated by the Dominions of the Port of New
York.

The Western Port sent out from Philadelphia every Friday
leaving Letters at Burlington and Port Amoy and arrives at New York
on Sunday night; the distance between Philadelphia and New York be-
ing 100 Miles. The Port goes out Eastward every Monday morning from
New York, and arrives at New York Thursday noon; being 150 Miles
when the Port from Boston sets out at the same time; the New York
Port returning with the Eastern Letters, and the Boston Port with
the Western. Bags are kept at New London, Stonington, Rhode
Island, and Bristol. The Port from Boston to Philadelphia being
70 Miles leaves Letters at Ipswich, Salem, Marblehead and New-
berry. There are offices kept at Burlington, Port Amoy in New-
Jersey, New London and Stonington in Connecticut, at Rhode
Island, Bristol, Ipswich, Salem, Marblehead and Newberry, and
the 3 Great Offices are at Boston, New York & Philadelphia.

CHAP.

I.
Seasons.

tries. Their winters are much severer, and some months longer than ours, tho' they lie nine or ten degrees nearer the sun than we do; however, their heaven is usually brighter, and the weather more settled than in England both in winter and summer; and the summer, though shorter than in England, is a great deal hotter whilst it lasts; however, the climate is esteemed as healthful and agreeable to English constitutions as any of our plantations on the continent.

CHAP. II.

Of the provinces and sub-divisions of this country, generally known by the name of New-England; and of its chief towns, and publick and private buildings.

English colonies first erected.

The present divisions of the country.

WHEN the English arrived here, they found this country inhabited by upwards of twenty different nations or tribes, commanded by their respective Chiefs, the territories of several of them not exceeding five and twenty or thirty miles in circumference. Of these the most powerful were, 1. The Massachusetts, whose country comprehended the counties of Suffolk and Middlesex, and still a part of the Massachusetts colony. 2. The Neumkeaks, who inhabited that part of the Massachusetts Country which now goes by the name of the county of Essex. 3. The Narragansets, whose habitations were in the county of New London, east of the river Connecticut. 4. The Pocassetts; this people dwelt to the southward of the Massachusetts in the county now called New Plymouth. 5. The Pequots, who inhabited another part of Connecticut. 6. The Wompanoags, who inhabited the country now called New Bristol. 7. The Moratigons, seated to the westward of the Wompanoags. 8. The Patuxets, seated upon the river which still bears that name. 9. The Maquas, who lived to the westward of Connecticut River. 10. The Manimoyas, who inhabited Barnstable County. 11. The Nicaniticks, Mattachiefts and Namaskets, situated south-west of Merimack River: And, 12. The Marchicans and Sequems, who were seated in New Hampshire.

The first four colonies established by the English in this country were, 1. The Massachusetts. 2. New Plymouth. 3. Connecticut; and, 4. New Haven: Afterwards three more were added, viz. 5. The province of Maine. 6. New Hampshire; and, 7. Rhode Island and Providence Plantation.

These seven colonies have since been reduced to four, 1. The provinces of the Massachusetts, New Plymouth and Maine, are now included in one charter and subject to the same government. 2. New Hampshire is at this day a separate government. 3. Connecticut and New Haven are now included in one charter; and, 4. Rhode Island and Providence Plantation have a distinct charter, and are a colony independent of any of the former; the occasion of which alterations will appear in the chapter assigned to treat of the history of this country.

I proceed in the next place to describe the situation and boundaries of the present larger subdivisions, and to enumerate the counties and chief towns comprehended in each of these divisions.

1. The Massachusetts colony, which at this day includes the following grand subdivisions; viz. 1. That of Massachusetts Proper. 2. New-Plymouth. and, 3. That of Maine.

1. Massachusetts Proper is bounded by New-Hampshire towards the north, by the Massachusetts Bay on the east, by Plymouth and Connecticut on the south, and by the province of New-York on the west, containing the counties of Suffolk, Middlesex, and Essex, all of them situated on the Massachusetts Bay, of which Suffolk is the most southerly, comprehending the towns of, 1. Boston the capital of the province. 2. Braintree. 3. Dedham. 4. Dorchester. 5. Hingham. 6. Hull. 7. Medfield. 8. Mendon. 9. Milton. 10. Roxborough. 11. Weymouth. 12. Woodstock. 13. Wrentham. 14. Brooklin; and 15. Needham.

Boston, the capital of New-England, according to Mr. NEALE, is situated in 42 degrees 24 minutes north latitude, and 71 degrees of western longitude, making London the first meridian. It stands in a peninsula about four miles in circumference, at the bottom of a fine bay of the sea, at the entrance whereof are several rocks, which appear above water, and above a dozen small islands, some of which are inhabited. There is but one safe chanel to approach the harbour, and that so narrow that three ships can scarce sail through a-breast; but within the harbour there is room enough for five hundred sail to lie at anchor. The entrance is defended by the castle of Fort William, on which are one hundred guns mounted, twenty of which lie on a platform level with the water; so that it is scarce possible for an enemy to pass the castle: And to prevent surprize, they have a guard placed on one of the rocks, about two leagues distant, on which also there stands a light-house, from whence they make signals to the castle when any ships come in sight. There is also a battery of great guns at each end of the town, which command the harbour, to the fire whereof an enemy would be exposed if he should be so fortunate to pass the castle.

At the bottom of the bay there is a pier near two thousand feet in length, with warehouses for the Merchants on the north side of it; and ships of the greatest burden may come up close to the pier and unload without the help of boats.

The same writer adds, that the town of Boston lies in the form of a crescent about the harbour; the country beyond rising gradually, and affording a most delightful prospect from the sea: That there are several streets not much inferior to the best in London, the chief of which runs from the pier up to their town-house or guild-hall; a handsome building, where are walks for the Merchants; as on the exchange; and here also are the council-chamber, the house of representatives, and their courts of justice; the exchange being surrounded with booksellers shops, who have trade enough to employ five printing presses here. There are ten churches of all denominations, of which six are Independents, the most prevailing party in New-England: And the number of souls in the towns may be about fourteen or fifteen thousand. The episcopal church is handsomely built and adorned, and the congregation said to be about a thousand.

CHAP. II. thousand in number: Their church-plate and some pieces of painting were given them by King WILLIAM and Queen MARY, and their organ by THOMAS BRATTEL, Esq; there is also in this Church a magnificent seat for the Governor, who comes hither, I presume, when he happens to be of the Church of England.

Mr. NEAL observes further, that Boston is the most flourishing town of trade in English-America; and that three or four hundred sail of ships, brigantines, and other vessels, are annually loaded here with lumber, beef, pork, fish, and other provisions for Europe or the American Islands: That their Merchants and tradesmen are a polite people, many of them having travelled into Europe, or conversed with foreigners of several nations at home: That their houses are as elegantly furnished, and their tables as well served as those of the Merchants and tradesmen in London; all manner of provisions being as plentiful as in any town in Old-England.

Mr. DUMMER's description of Boston agrees with Mr. NEAL's as to the fortifications, but is something more particular; for he says there is a battery of great guns at each end of the town, and about a league from it there is a beautiful strong castle, by far the finest piece of military architecture in British-America: That it is a quarry surrounded by a covered way, and joined with two lines of communication to the main battery, as also a line of communication from the main gate to a redoubt, to prevent an enemy's landing; and the battery is situated so near the chanel as to hinder ships coming up to the town, which must all sail within pistol-shot of it: That in time of peace there is but one company on duty in the castle, but in time of war there are five hundred able-bodied men, exempted from all other military duty, to attend the service of the castle at an hour's warning, when the signal is given from the light house of the approach of an enemy: That the castle thereupon makes a signal to the town, and if five ships or more appear in time of war, the neighbouring country is alarmed by firing a beacon.

Middlesex. Chief Towns. The county of Middlesex lies contiguous to that of Suffolk on the north, and contains the following towns. 1. Cambridge. 2. Billerica. 3. Charles-town. 4. Chelmsford. 5. Concord. 6. Lexington. 7. Groton. 8. Lancaster. 9. Marlborough. 10. Malden. 11. Framingham. 12. Medford. 13. Newton. 14. Oxford. 15. Reading. 16. Sherburn. 17. Stow. 18. Sudbury. 19. East-Waterton. 20. Weston. 21. Woburn; and, 22. Worcester.

Cambridge. The chief town whereof is Cambridge, commonly called Newton, situated on the northern branch of Charles River, about seven miles from Boston, in which are several well-built streets; but it is most considerable for its university, consisting of three colleges, viz. Harvard-College, Stoughton-Hall, and — Hall. There was also a college built for the education of Indians, but this is now converted into a printing-house, the education of the Indians in the learned languages being found impracticable; there never were above four or five educated there, and but one that ever took a degree. They have also a library here, but very defective in modern books; which my author is of opinion is the reason that the stile of the New-England divines is no better: They also still want endowments for the reading publick lectures in the college by professors of the

several sciences. The university is governed by a President, five Fellows, and the Treasurer, who have each of them a competent revenue settled on them; and there may be an hundred and fifty students resident in all the colleges: Their visitors or overseers are the Governor, and Deputy-Governor with the magistrates of the province, and the Ministers (for the time being) of six adjacent towns.

Essex is the most northerly county of Massachusetts Proper, and contains the towns of, 1. Salem. 2. Amesbury. 3. Salisbury. 4. Haverhill. 5. Newbury. 6. Boxford. 7. Rowley. 8. Ipswich. 9. Topsfield. 10. Bradford. 11. Gloucester. 12. Manchester. 13. Beverly. 14. Marble-head. 15. Lyn. 16. Wenham; and, 17. Andover; of which Salem is the chief, or county-town, being situate in a plain between two rivers mouths, and has two harbours, the one called the Summer and the other Winter Harbour. They boast mightily of their church, which they assure us is one of the finest in New-England: They value themselves also on their antiquity; for here it was, they relate, that the Massachusetts adventurers fixed their first colony. A little to the northward of Salem lies the promontory called Cape Anne, esteemed a good station for fishing; and a little further northward lies Newbury, pleasantly situated at the mouth of Merimack River, where they take abundance of Sturgeon, and pickle them after the same manner as they do in the Baltick. On the opposite side of Merimack River lies the town of Salisbury; and between Salisbury and Newbury these towns there is a constant ferry half a mile over.

The second grand division of the Massachusetts government is the province of Maine, which is bounded on the north-east by Nova-Scotia; by the bay of Massachusetts on the south-east, and by the province of New-Hampshire on the south-west and north-west, in which are the two counties of York and Cornwall; though according to some, the whole province of Maine is but one county: The chief towns are, 1. Falmouth. 2. Saco, or Scarborough. 3. Wells. 4. Hedeck, or New-castle. 5. Edger Town. 6. York. 7. Kitterg. 8. Berwick; and, 9. Biddeford. Several fortifications were erected on the north-east part of this province in the late wars, to defend the country against the French and Indians of Nova-Scotia; particularly at Saco, Kennebeck, Saghadock and Pemaquid; the last of which was taken by the French and demolished: And since Nova-Scotia has been yielded to Great Britain by France, it is to be presumed the rest are of no great use, our frontiers on that side being extended much farther by that cession.

The third and last grand division of the Massachusetts government is that of Plymouth, which lies south of Massachusetts Proper, and contains the three counties of Plymouth, Barnstable, and Bristol.

Of these three counties, that of Plymouth lies most northerly; in which are the towns of, 1. New-Plymouth. 2. Bridgewater. 3. Duxbury. 4. Marshfield. 5. Scituate. 6. Middleburgh. 7. Pembroke; and 8. Plympton. And of these, New-Plymouth the chief, is situated on the south-side of a large bay, called Plymouth Bay, and is the oldest town in New-England.

The county of Barnstable lies contiguous to Plymouth on the south-east, in which is the celebrated promontory of Cape Cod, forming a large commodious

CHAP. II. commodious bay, capable of containing a thousand fail of ships. In this country the chief towns are, 1. Barnstable, situate at the bottom of the first bay. 2. Eastham. 3. Marmoy. 4. Truro. 5. Rochester. 6. Sandwich. 7. Yarmouth. 8. Harwich; and, 9. Nantucket, situate in an island of the same name, that lies south-east of the main land, near which is one of the most considerable fisheries in New-England; and the town flourishes in proportion, there being three or four score fail of ships and vessels belonging to that port, as I am informed.

Bristol County. Chief towns. The county of Bristol lies south-west of Plymouth, and contains the towns of, 1. Bristol. 2. Swansey. 3. Rohoboth. 4. Norton. 5. Dartmouth. 6. Taunton. 7. Dighton. 8. Little Compton. 9. Artleborough. 10. Freetown; of which, Bristol the chief is situated on a commodious harbour, at the entrance whereof lies Rhode-Island.

The province of New-Hampshire. Chief towns. The province of New-Hampshire, now a distinct government, is bounded by Nova-Scotia on the north-east; by the province of Maine on the south-west; by the Massachusetts Colony on the south-east; and by Canada on the north-west; the chief towns whereof are Dover, Portsmouth, Exeter, and Hampton, all which lie near the mouth of the river Piscataway; and indeed I meet with scarce any towns in the in-land country, which still remains a great forest, covered with excellent timber, large portions whereof are set apart and appropriated by act of parliament to the furnishing masts, &c. for the royal-navy of England; but the soil does not seem proper either for Corn or Grains.

The province bordering upon Canada, or New-France, suffered much by the ravages of the French and Indians in the two last wars; which occasioned the building several forts and redoubts on the frontiers for their security.

Connecticut Colony. Counties. The third colony or government, esteemed also a part of New-England, is that of Connecticut, which comprehends New-Haven, and is bounded by the Massachusetts Colony on the north; by another part of the Massachusetts and Rhode-Island on the east; by an arm of the sea, which divides Connecticut from Long-Island on the south; and by New-York on the west, being about one hundred miles in length, and eighty in breadth, and contains the following counties, viz. 1. New-London. 2. Hartford. 3. New-Haven County; and 4. Fairfield County.

New-London County. Chief towns. New-London County is situated on both sides of the river Connecticut, and contains the following towns, viz. 1. New-London, situate on the west bank of the Thames not far from its mouth. 2. Saybrook, the oldest town in the county, situate at the mouth of the river Connecticut, on the west-side, as 3. Lyme is on the east-side. 4. Stoniton. 5. Preston. 6. Dantick. 7. Norwich. 8. Lebanon; and 9. Killingworth.

Hartford County. Chief towns. Hartford County, contiguous to that of London County on the north, lies also on both sides the river Connecticut, containing the following towns, viz. 1. Hartford. 2. Farmington. 3. Glassenbury. 4. Hadham. 5. Middletown. 6. Simsbury. 7. Waterbury. 8. Weathersfield. 9. Windsor. 10. Farm; and 11. Windham; of which Hartford is the chief or County-town, and capital of the whole province, having a little university or college in it, as I am informed, where young gentlemen receive academical education.

CHAP. II. New-Haven County is bounded by that of Hertford on the north; by London County on the east; the sea on the south; and Fairfield County on the west; in which are the towns of 1. New-Haven, the chief, said to be a very flourishing place, and to have a college in it called Yale-College, where young gentlemen have university education. To which is added a library well furnished with books, procured chiefly by the application and interest of JEREMY DUMMER, Esq. once Agent for this colony. 2. Brainford. 3. Derby. 4. Guildford. 5. Milford; and, 6. Wallingford.

Fairfield County also lies upon the sea, between Fairfield the county of New-Haven on the east, and the province of New-York on the west; in which are the chief towns of, 1. Fairfield. 2. Danbury. 3. Greenwich. 4. Norwalk. 5. Rye. 6. Stamford. 7. Stratford; and, 8. Woodbury.

4. The last colony comprehended in New-England is that of Rhode-Island and Providence Plantation established by another charter. Rhode-Island called by the natives Aquetnet, lies in the Narraganset Bay, between Plymouth Colony and Providence Plantation, being about fifteen miles in length, and six in breadth; to which belong several smaller islands: And Providence Plantation, which is included in the same charter, being a district about twenty miles square, on the neighbouring continent, and separated from Connecticut on the west by an imaginary line drawn from north to south, and from the Massachusetts by another line drawn from east to west.

The chief towns are, 1. Newport, situated on the south-west part of Rhode-Island, in 41 degrees odd minutes north latitude, having a very secure and commodious harbour, defended by a regular fort at the entrance, on which are planted three hundred pieces of large cannon. It appears to have a brisk trade, for there are no less than sixty ships and vessels belonging to this town.

There are two other large port towns situated on the continent, near the mouth of the river Patuxet in Providence Plantation, one of them called Providence, and the other Warwick; but of these I meet with no particular description.

Several other islands lie near the south-east coast of New-England; of which Block-Island belongs to Connecticut Colony; and Elizabeth-Island, Martha's Vineyard, and Nantucket already mentioned belong to the Massachusetts government; and are very considerable on account of the fishery carried on in those seas.

As to the buildings of the Indians of New-England, they are not different from those of Virginia and Maryland already described; and the English follow the models of their mother country, as near as they can, except in their churches; which come nearer the form of the London meeting-houses than of our churches. The few churches indeed that have been erected by the members of the Church of England, resemble those in Old England, and are generally built of wood, but some few of brick. The only publick buildings they have besides, are the town-house and guild-hall in every province and county-town, where the respective general assemblies and courts of justice are held; and some colleges and schools that have been erected in their great towns for the education of youth, which, I presume, have nothing extraordinary in

* N. B. I call all that country Nova-Scotia, which lies north-east of New-England.

CHAP. II. the fabrick, by the silence of their historians in the description of them.

CHAP. III.

Of the persons and habits of the New-England Indians; their genius and temper, arts, manufactures, food, exercises and diversions.

CHAP. III.

Persons of the Indians.

THE New-England Indians are of a good stature, and might have good complexions, if they did not affect an olive-colour, and take a great deal of pains with certain oils and juices to make their skins darker than they naturally are. Their features are well enough, except their noses, which their parents press flat in their infancy, if they are not born so: Their hair is black, and usually cut short before, but suffered to grow long behind, sometimes braided and dressed up fantastically with feathers. The hair of their beards and bodies they pull up by the roots as soon as they appear, and some of them, 'tis said, never have any beards: They frequently paint their faces and shoulders with a deep red, and on other parts of their bodies make a variety of frightful figures, endeavouring to render themselves as terrible as possible.

Habits.

They generally go naked in the summer, covering their loins only with a piece of skin; but in the winter, the days of ceremony, they have a mantle or short cloak, made of the skin of a deer, or of some other animal: And of the like materials they make breeches, stockings, and shoes, all of a piece frequently. In hard weather they also put on their snow-shoes, which are very long and broad, and tied on their feet with thongs of green leather.

Ornaments.

The women paint as well as the men; and their mantles are much of the same form. Their ornaments are earrings of copper, necklaces, and bracelets, made of beads and shells, or other glittering toys.

Arts and sciences.

The natives are generally reckoned to have quick parts, though they had made but little improvement in arts and sciences when the English came amongst them. Their buildings and cloathing are very mean, nor was there any thing that could be called a manufacture in the country, much less were they skilled in the liberal arts, having no notion of letters, and seem but little disposed to literature at this day; for the English here, and in the rest of our colonies, tell us, they despair of making scholars of them, though no means have been left unattempted to give them a learned education.

Genius and temper.

Courage or a contempt of death is what they most admire in others, and affect to be thought possessed of themselves. And there appears to have been some brave men amongst them; but they are generally timorous, revengeful, and thievish. They seldom have the courage to face an enemy in the open field; most of the great actions they boast of being done in the dark, or by surprise; and a wood-fight, where they can skulk behind the trees and bushes, is their master-piece. As they are very nimble and excellent marksmen, they have sometimes been too hard for the Europeans in such encounters.

In war, in hunting, fishing, and other rural sports, they are acknowledged to be indefatigable. They will make prodigious long and swift marches, lie in the woods night after night, endure cold and heat, hunger and thirst to admiration; and yet, when they are not engaged

in such expeditions, they are observed to be the most idle, slothful wretches upon the face of the earth; putting their women upon all manner of drudgery both without doors and within: For the women plant their corn, ruits, and fruits; and afterwards reap and gather them. They also prepare and dress their food, lug about their children, and do all manner of household business, and even carry the provision and baggage upon every march and removal, the men carrying nothing but their arms: And 'tis observed they seldom go out a hunting or fishing, till necessity forces them, and then they usually set out fifty or an hundred in a company, dividing the country amongst them, so as the game may not escape, which ever way it takes, and continue their sport several weeks: Sometimes they beat the woods and thickets, at others they take their canoes or boats, and go down their rivers; and are so dextrous at shooting and striking their game in the water, as well as land, that they seldom fail of doing execution.

Their food, and the manner of dressing it, differs so little from that of the Indians already described, that it is unnecessary to enlarge on those articles any more than on their domestick diversions and exercises; which consist chiefly in singing, dancing, and hollowing; in distorting their limbs, and the most extravagant gestures they can invent.

The Europeans have taught them another mischievous recreation, viz. The drinking strong liquors, of which they are so fond, that they would sell their lands, and every thing they had, to procure them some; till the government, in compassion to the natives, prohibited their drinking strong liquors, and forbid the English to purchase their lands, without the leave of their superiors: However, these regulations are little observed; and those Indians, that live among the English, are still a wretched, sottish, and beggarly people, that will apply themselves to no manner of business; dreading labour more than poverty itself.

CHAP. IV.

Of their animals and vegetables.

THEIR Quadrupedes are almost the same here as in Virginia, viz. Deer, Elks, Raccoons, Bears, Wolves, Foxes, Hares, Rabbits, Squirrels, Beavers, Martins, Opossums, and little Cur-Dogs. They have now also all manner of European cattle, viz. Horses, Oxen, Sheep, and Hogs; none of which they ever saw, till the English carried them over: And though the Horses are not so large as those we have here, yet they are very serviceable both for the saddle and draught, and make the best troopers horses in America. But the most celebrated animal, which is almost peculiar to New-England, is the Moose-Deer, of which Mr. DUPLEY, now of the council in New-England, and a member of the Royal Society, has given us the following account.

The Moose is thought peculiar to North-America, and is one of the noblest creatures of the forest: The Aborigines have given him the name of Moose, Moosuck in the plural.

There are two sorts; the common light and grey Moose, by the Indians called Wampoose; these are more like the ordinary Deer, spring like

CHAP. like them, and herd sometimes to thirty in a company: And then there are the large and black Moose, of which I shall now give you the following account.

IV.

He is the head of the Deer-kind, has many things in common with other Deer, in many things differs; but in all very superior. The Moose is made much like a Deer, parts the hoof, chews the cud, has no gall, his ears large and erect. The hair of the black Moose is a dark grey; upon the ridge of his back the hair is ten and twelve inches long, of which the Indians make good belts. He has a very short bob tail. Mr. NEAL, in his late history of this country, speaking of the Moose, says, they have a long tail; but that gentleman was imposed on as to other things, besides the Moose.

Our hunters have found a Buck or Stag-Moose of fourteen spans in height from the Withers, reckoning nine inches to a span; a quarter of his venison weighed more than two hundred pounds. A few years since, a gentleman surprised one of these black Moose in his grounds, within two miles of Boston; it proved a Doe or Hind of the fourth year. After she was dead, they measured her upon the ground from the nose to the tail between ten and eleven feet. She wanted an inch of seven foot in height.

The horns of the Moose, when full grown, are about four and five feet from the head to the tip; and have shoots and branches to each horn, and generally spread about six feet. When the horns come out of the head, they are round, like the horns of an Ox. About a foot from the head they begin to grow a palm broad, and further up still wider; of which the Indians make good ladles that will hold a pint. When a Moose goes through a thicket, or under the boughs of trees, he lays his horns back on his neck, not only that he may make his way the easier, but to cover his body from the browse or scratch of the Wood. These mighty horns are shed every year. The Doe-Moose has none of these horns.

A Moose does not spring or rise in going, as an ordinary Deer, but shoves along side-ways, throwing out the feet much like a Horse in a racking pace. One of these large black Moose, in his common walk, has been seen to step over a gate or fence five feet high. After you unharness a Moose, he will run a course of twenty or thirty miles before he turns about or come to a bay. When they are chased, they generally take to the water, the common Deer for a short space are swifter than a Moose; but then a Moose soon outwinds a Deer.

The meat of a Moose is excellent food; and tho' it be not so delicate as the common venison, yet it is more substantial, and will bear salting. The nose is looked upon as a great dainty. I have eat several of them myself; they are perfect marrow. The Indians have told me, that they can travel as far after a meal of Moose, as after any other flesh in the forest.

The black Moose is not very gregarious, being rarely found above four or five together; the young ones keep with the dam a full year.

A Moose calves every year, and generally brings two. The Moose bring forth their young ones standing, and the young fall from the dam upon their feet. The time of their bringing forth is generally in the month of April.

The Moose being very tall, and having short necks, do not graze on the ground as the common Deer, neat cattle, &c. do; and if at any time they eat Grass, it is the top of that which grows very high, or on steep rising ground. In the summer they feed upon plants, herbs, and young shrubs, that grow upon the land; but mostly, and with greatest delight, on water-plants, especially a sort of wild Colts-foot and Lilly that abound in our ponds, and by the sides of the rivers, and for which the Moose will wade far and deep; and by the noise they make in the water our hunters often discover them. In the winter they live upon Browse, or the tops of bushes and young trees; and being very tall and strong they will bend down a tree as big as a man's leg; and where the Browse fails them, they will eat off the bark of some sort of trees as high as they can reach. They generally feed in the night, and lie still in the day.

The skin of the Moose, when well dressed, makes excellent buff; the Indians make their snow-shoes of them. Their way of dressing it, which is reckoned very good, is thus: After they have haired and grained the hide, they make a lather of the Moose's brains in warm water, and after they have soaked the hide for some time, they stretch and supple it.

Their fowls, birds, snakes, and insects, are much the same here as in Virginia, whither therefore I refer the reader: And they have the same fish in their seas and rivers, only I must observe, that the Cod-fishery and Whale-fishery of New-England are far superior to any fisheries on the coast of North-America, and yield a vast profit to this country. I am informed also, that the year before last, the New-England men sent twenty sail of ships to fish for Whales in Greenland and Davis's Straights, where they met with great success, but were not so fortunate the last year. And here it may be acceptable to the reader to introduce Mr. DUDLEY's description of their Whales, and the whale-fishery on the coast of New-England.

This gentleman observes, that the most learned part of mankind were at a loss about many things even in medical use, and particularly in what is called Ambergreese, until the whale fishermen of Nantucket in New-England, some three or four years ago, made the discovery.

Cutting up a Sperma Ceti Bull Whale, they found accidentally in him about twenty pound weight, more or less, of that drug: After which they and some other fishermen became very curious in searching all such Whales as they killed; and it has since been found in lesser quantities in several male Whales of that kind and in no other; and scarcely in one of an hundred of them. They add further, that it is contained in a cyst or bag, without any in-let or out-let to it, and that they have sometimes found the bag empty and yet entire.

The bag is no where to be found but near the genital part of the fish. The ambergreese is, when first taken out, moist and of an exceeding strong and offensive smell.

The following account respects only such Whales as are found on the coast of New-England, and of these there are divers sorts.

The right or Whalebone Whale is a large fish measuring sixty or seventy feet in length, and very bulky, having no scales, but a soft fine smooth skin;

CHAP. IV.

Fowls, insects, &c.

The Sperma Ceti Whale.

The Whalebone Whale.

CHAP.
IV.

skin; no fins but only one on each side, from five to eight foot long, which they are not observed to use but only in turning themselves, unless while young and carried by the dam on the flukes of their tails, when with those fins they clasp about her small, and so hold themselves on. This fish, when first brought forth, is about twenty foot long, and of little worth, but then the dam is very fat. At a year old, when they are called short-heads, they are very fat, and yield to fifty barrels of oil; but by that time the dam is very poor and termed a dry skin, and will not yield more than thirty barrels of oil, tho' of large bulk. At two years old they are called Stunts, being stunted after weaning, and will then yield generally from twenty-four to twenty-eight barrels. After this they are termed Scull-fish, their age not being known, but only guessed at by the length of their bones in their mouths. The Whalebone so called grows in the upper jaw on each side, and is sometimes six or seven feet in length. A good large Whale has yielded a thousand weight in bone. 'Tis thought by some that the hairy part of the Whalebone, and which is next to the tongue, serves in the nature of a strainer of their food.

The eye of a Whale is about the bigness of an Ox's eye, and situated in the after-part of the head on each side, and where the Whale is broadest; for his head tapers away forward from his eyes, and his body tapers away backwards: His eyes are more than half way his depth, or nearest his under-part. Just under his eyes are his two fins abovementioned; he carries his tail horizontally, and with that he sculls himself along.

The intrails of this Whale are made and situated much like those of an Ox, and their scalps are sometimes found covered with thousands of Sea Lice. One of these Whales has yielded one hundred and thirty barrels of oil, and near twenty out of the tongue. The Whalebone Whale is the most valuable, except the Sperma Ceti Whale.

The Scrag
Whale.

The Scrag Whale is near a kin to the fin-back; but instead of a fin upon his back, the ridge of the after-part of his back is straggled, with half a dozen knobs: He is nearest the right Whale in figure and for quantity of oil: His bone is white, but will not split.

The Fin-
back.

The Fin-back Whale is distinguished from the right Whale by having a great fin on his back from two foot and a half to four foot long, which gives him the name. He has also two side fins, as the Whalebone Whale, but much longer; measuring six or seven feet. This fish is somewhat longer than the other, but not so bulky, much swifter, and very furious when struck, and very difficultly held; their oil is not near so much as that of the right Whale, and the bone of little profit, being short and knobby. The belly of this Whale is white.

The Bunch
Whale.

The Bunch, or Hump-back Whale, is distinguished from the right Whale by having a bunch standing in the place where the fin does in the fin-back. This bunch is as big as a man's head, and a foot high, shaped like a plug pointing backwards. The bone of this Whale is not worth much, tho' somewhat better than the fin-back's. His fins are sometimes eighteen foot long, and very white; his oil as much as that of the fin-back. Both the fin-backs and hump-backs are shaped in reeves longitudinal, from head to tail, on their bellies and their sides, as far as their fins, which are about half way up their sides.

The Sperma Ceti Whale is much of the same dimension with the other, but is of a greyish colour, whereas the others are black. He has a bunch on his back like the hump-back, but then he is distinguished by not having any Whalebone in the mouth; instead of which there are rows of fine ivory teeth in each jaw, about five or six inches long. One of these teeth I have sent the society; the man who gave it me, says the Whale was forty-nine foot long, and his head made twelve barrels of Sperma Ceti oil. They are a more gentle fish than the other Whales, and seldom fight with their tails, but when struck usually turn upon their backs and fight with their mouths. The oil which is made of the body of this fish is much clearer and sweeter than that of the other Whales.

The Sperma Ceti oil so called lies in a great trunk, about four or five foot deep, and ten or twelve foot long, near the whole depth, breadth, and length of the head, in the place of the brains, and seems to be the same, and disposed in several membranous cells, and covered not with a bone but a thick gristly substance below the skin, thro' which they dig a hole and lade out the clear oil. Not but that the head and other glandulous parts of this fish will make the Sperma Ceti oil; yet the best, and that which is prepared by nature, is in the trunk aforesaid: And an ingenious man, who has himself killed many of these Whales, assures me, that only the trunk will afford from ten to twenty barrels. Besides the Sperma Ceti oil, this fish will yield from twenty to fifty barrels of common oil.

They generate much like our neat cattle, and therefore they are termed Bull, Cow, and Calf: They bring forth but one at a time, and but every other year. When the Cow takes Bull, she throws herself upon her back, sinking her tail, and so the Bull slides up, and when he is slid up she clasps him with her fins. A Whale's pizzel is six foot long, and at the root is seven or eight inches diameter, and tapers away till it comes to about an inch diameter; his stones would fill half a barrel, but his genitals are not open or visible, like those of the true Bull. The Calf, or young Whale, has been found perfectly formed in the Cow when not above seventeen inches long, and white; and yet when brought forth is usually twenty foot, but of a black colour. It is supposed they go with their young about nine or ten months, and are very fat in that time, especially when they bring forth. When the female suckles her young she turns herself almost upon her back upon the rim of the water. She has two teats of six or eight inches long, and ten or twelve inches round. The milk is white, like that of a Cow; and upon opening a young sucking Whale the milk was found curdled in his bag, just like that of a Calf.

Their care of their young is very remarkable, they not only carrying them on their tails and suckling them, but often rising with them for the benefit of the air; and however they are chased and wounded, yet as long as they have sense, and perceive life in their young, they will never leave them, nor will they then strike with their tail; and if in their running the young one loses his hold and drops off, the dam turns about, and passing underneath takes it on again; and therefore care is taken by those who kill these fish, only to fasten the Calf but not to kill her, till they have first secured the Cow; for as soon as ever the Calf is dead

CHAP.

The Sper-
ma Ceti
Whale
further de-
scribed.

How they
engender.

CHAP. IV. dead the Cow perceives it, and grows so violent that there is no managing her.

The Whales are very gregarious, being sometimes found an hundred in a scull, and are great travellers: In the fall of the year the Whalebone Whales go westward, and in the spring they are headed eastward: And here it must be noted, that the several kinds of Whales do not mix with one another, but keep by themselves.

Their way of breathing is by two spout-holes in the top of the head: The Sperma Ceti Whale has but one, and that on the left side of the head. Once in a quarter of an hour, when not disturbed, they are observed to rise and blow, spouting out water and wind, and to draw in fresh air; but when pursued they will sometimes keep under half an hour or more: Tho' it is observed, when any Cow has her Calf on her tail, she rises much oftner for the young one to breathe, without breathing herself. Out of their breathing-holes they spout great quantities of blood when they have received their death's wound.

For the first year they all suck the dam: After they are weaned the right Whales (as is generally supposed) live upon ouzy matter, which they suck up from the bottom of the sea. The triers that open them when dead, acquaint me, that they never observed any grass, fish, or any other sort of food in the right or Whalebone Whale, but only a greyish soft clay, which the people call Bole Armoniac; and yet an experienced whaleman tel's me, that he has seen this Whale in still weather skimming on the surface of the water, to take in a sort of reddish spawn or brett, as some call it, that at sometimes will lie upon the top of the water for a mile together. Here also it may be observed, that tho' the body of this Whale is so very bulky, and so exceeding fat, yet when cut open is seldom found to have much more draught than that of an Ox; and they dung much as neat cattle. Their swallow is not much bigger than an Ox's, but the Fin-back Whale has a larger swallow, for he lives upon the smaller fish, as Mackarel, Herrings, &c. great sculls of which they run through, and with a short turn cause an eddy or whirlpool, by the force of which the small fish are brought into a cluster, so that this fish with open mouth will take in some hundreds of them at a time. The Sperma Ceti Whale, besides other fish, feeds much upon a small fish that has a bill, our fishermen call them Squid-fish: The small pieces of these squid-bills are plainly to be discerned in the ambergreese, and may be picked out of it; they appear glazy, and like little pieces of broken shells.

Mr. HARRIS, in his *Bibliotheca Navigantium*, &c. has given us a very particular account of the method of taking Whales at Greenland; and tho' our way in New-England differs very much from that, yet I shall wave it as not so strictly appertaining to philosophy; only I would take notice of the boats our whale-men use in going from the shore after the Whale: They are made of Cedar Clapboards, and so very light that two men can conveniently carry them, and yet they are twenty foot long, and carry six men, viz. the harpooner in the fore-part of the boat, four oar-men and the steeraman. These boats run very swift, and by reason of their lightness can be brought on and off, and so kept out of danger. The Whale is sometimes kill'd with a single stroke, and yet at other times she will hold the whale-men in play near half a day together with their launces, and

VOL. III.

will sometimes get away after they have been launched and spouted blood, with irons in them, and drags fastened to them, which are thick boards about fourteen inches square. Our people formerly used to kill the Whale near the shore, but now they go off to sea in sloops and whale-boats, in the months of May, June, and July, between Cape Cod and Bermudas; where they lie by in the night, and sail to and again in the day, and seldom miss of them, bringing home the blubber in their sloops. The true season for taking the right or Whalebone Whale is from the beginning of February to the end of May; of the Sperma Ceti Whale from the beginning of June to the end of August: And it has been observed by our fishermen, that when a Sperma Ceti Whale is struck, he usually if not always throws the excrements out of the anus.

The wonderful and even prodigious strength of this creature lies principally in their tail, that being both their offensive and defensive weapon. Many instances of this kind I have had from credible persons, who were eye-witnesses. I will mention but a few. A boat has been cut down from top to bottom with the tail of a Whale, as if cut with a saw, the clap-boards scarce splintered, tho' the gunnel upon the top is of a tough wood. Another has had the stem or stern-post, of about three inches through, and of the toughest wood that can be found, into which the ends of the Cedar Clap-boards are nailed, cut off smooth above the cuddee, without so much as shattering the boat, or drawing the nails of the Clapboards. An oar has been cut off with a stroke upwards, and yet not so much as lifted up out of the thole-pin. One person had an oar cut off while in his hand, and yet never felt any jarring.

A few years since, one of the Fin-back Whales came into a harbour near Cape Cod, and towed away a sloop of near forty ton out of the harbour into the sea. This accident happened thus: It was thought the Whale was rubbing herself upon the fluke of the anchor, and going near the bottom got the fluke into her nicket, or the orifice of the uterus; and finding herself caught, tore away with such violence that she towed the ship out of the harbour as fast as if she had been under sail with a good gale of wind, to the astonishment of the people on shore; for there was no body on board. When the Whale came into deep water she went under, and had like to have carried the sloop with her, but the cable gave way and so the boats that were out after her recovered it. This Whale was found dead some days after on that shore with the anchor sticking in her belly.

After a Whale is dead it has been observed that the same way the head lies, so the head will lie, if not forcibly turned; and let the wind blow which way it will, that way they will scull a head tho' right in the eye of the wind, and they are much easier towed to the shore, if they die that way with their head than any other.

The enemies of the Whale, or the fish that prey upon the Whales, and often kill the young ones (for they will not venture upon a young one, unless much wounded) our whale-men have given the name of Killers. The Killers are from twenty to thirty foot long, and have teeth in both jaws that lock one within another: They have a fin near the middle of their backs four or five foot long: They go in company by dozens and set upon a young Whale, and will bait him like so many Bull-Dogs; some will lay hold of his tail

The way of taking Whales in New-England.

The Killers which prey upon Whales.

CHAP.
IV.

tail to keep him from threshing, while others lay hold of his head, and bite and thresh him until the poor creature being thus heated lools out his tongue, and then some of the Killers catch hold of his lips, and if possible of his tongue; and after they have killed him they chiefly feed upon the tongue and head; but when he begins to putrify they leave him. This Killer is without doubt the Orca that Dr. FRANGIUS describes in his treatise of animals. His words are these: Quando Orca insequitur Balænam, ipsa Balæna horribilem edit mugitum, non aliter quàm cum Taurus mordetur à Cane. These Killers are of such invincible strength, that when several boats together have been towing a dead Whale, one of them has come and fastened his teeth in her and carried her away down to the bottom in an instant: And sometimes they have bit out a piece of blubber of about two foot square, which is of that toughness that an iron with little beads being struck into it will hold it until it draws the boat under water. The Killers are sometimes taken and make good oyl, but have no whalebone. The carcases of Whales in the sea serve for food for Gulls and other sea fowl as well as Sharks, for they are not very nice.

Amber-
greese,
what.

Many and various have been the opinions (even of the learned world) as to the origin and nature of ambergreese. Some have reckoned it a bitumen, and to issue from the entrails of the earth; others, that it was produced from some insect, as honey, silk, &c. The famous Mr. BOYLE, as I find it in the second volume of LOWTHORP'S abridgment of the philosophical transactions, communicates an account of ambergreese from a Dutch Merchant, who first denies it to be the scum or excrement of a Whale; and then gives it as his opinion, that it is a fat gum that issues from the root of a tree, and that you may raise it in quantities by planting those trees by the shore, and so the stream will cast it up to great advantage. But it is now found out, that this occultum naturæ is an animal production, and bred in the body of the Sperma Ceti Whale, analogous to what is found in some animals of the land, as the Musk-Hog, or Taiacu, the Musk-Deer, the Bezoar Sheep, and some amphibious animals, as the Musquash, &c. who have their valuable scent in a particular cystis or bag. I am apt to think that which first gave occasion to the notice of ambergreese being the production of the Whale, was because it was found in considerable quantities on the shores of the Summer Islands, and among the Bahama's, where the dead Whales are frequently wrecked, and broke up with the sea, and the ambergreese found floating on the shore; but here again the ingenious, until very lately, were at a loss, and divided in opinion; for tho' they agreed it to come from the Whale, yet some took it to be the true and proper semen, being found only in the Bull at the root of the penis near the testicles; others again thought that it was the ordure or excrements of the Whale.

The best and most exact account of ambergreese, that I have been able to procure, I very lately received from one Mr. ATKINS, now an inhabitant at Boston in New-England, who used the whale-fishery for ten or twelve years together, and was one of the first that went out a fishing for the Sperma Ceti Whales, about the year 1670, and then began to discover the ambergreese; and being a sober ingenious man, what he says may safely

be depended on, tho' for substance I have had it from several of the whale-men. CHAP.
IV.

His relation which was taken a few days since from his own mouth is as follows:

"The ambergreese is found only in the Sperma Ceti Whales, and consists of balls or globular bodies of various sizes from about three inches to twelve inches diameter, and will weigh from a lb. and an half to twenty-two lb. lying loose in a large oval bag or bladder, of three or four foot long, and two or three foot deep, and wide almost in the form of an Ox's bladder, only the ends more acute or like a Blacksmith's long bellows, with a snout running tapering in to and through the length of the penis, and a duct or canal opening into the other end of the bag, and coming from towards the kidneys; this bag lies just over the testicles which are above a foot long, and is placed lengthways at the root of the penis, about four or five foot below the navel, and three or four foot above the anus. This bag or bladder is almost of a deep orange-coloured liquor, not quite so thick as oyl, and smelling as strong or rather stronger; of the same scent with the balls of ambergreese which float and swim loose in it. The inside of the bag is very deeply tinged with the same colour as the liquor, which may also be found in the canal of the penis. The balls seem to be pretty hard while the Whale is alive, inasmuch as there are many times found upon opening the bag large concave shells of the same substance and consistence, that have scaled off from them; and the balls themselves seem to be composed of several distinct coats inclosing one another, something like the coats of an Onion."

As to the number of balls, Mr. ATKINS never found above four in a bag, and in the bag where he found one that weighed twenty one lb. which was the largest he ever saw, there was no other.

He further says, "That to one Sperma Ceti Whale that has any of these balls, there are two that have nothing but the deep orange-coloured liquor aforesaid in their bags." This remark confirms what another whale man told me; "That the ambergreese was found only in such Sperma Ceti Whales as are old and well grown." It is the general opinion of the whalemen that the ambergreese produced only by the male, or the Bull Sperma Ceti Whale. As to this particular, Mr. ATKINS says, "He never saw or certainly heard of a female Sperma Ceti Whale taken in his life, the Cows of that species of Whales being much more timorous than the males, and almost impossible to be come at, unless when happily found asleep on the water and detained by their Calves." This is certain, the boats can never come near them when they are awake, they are so very shy and fearful.

Mr. ATKINS's method of getting the ambergreese out of the Whale was thus: After the fish is killed, he turns the belly upwards and fixes a tackle to the penis; then cuts a hole round the root of the penis, through the rim of the belly, until he comes to the intrails, and then searching for the duct or canal at the further end of the bag, cuts the duct off beyond it, upon which he draws forth the penis by the tackle, and the ambergreese bag entirely follows it, and comes clean and whole out of the belly.

The

CHAP. IV. The reverend Mr. PRINCE of Boston, who took the preceding relation from Mr. ATKINS, apprehends the bag aforesaid to be the urinary bladder, and the ambergreece ball to be a certain concretion formed out of the greasy odoriferous substance of the liquor aforesaid contained within it. As for my own part, I dare not pretend to give any opinion upon the point, but content myself with relating matter of fact.

It may be added here, that the bone taken out of the New-England Whales is not near so good as that taken out of the Greenland Whales, being too brittle for the uses whalebone is put to, otherwise we should not be obliged to import so much of the Hollanders whalebone: But as the New-England men are now got into the way of fishing for Whales in Greenland, it is probable they will be able to furnish their mother country with the best whalebone in a few years; and we shall not be obliged to part with so much treasure to the Dutch for this kind of merchandise.

New Eng-land plants by DUB-ROU.
The plants of England, as well those of the fields and orchards as of the garden that have been brought over hither, suit mighty well with our soil, and grow here to great perfection.

Our Apples are without doubt as good as those of England, and much fairer to look to, and so are the Pears; but we have not got of all the sorts.

Our Peaches do rather excel those of England, and then we have not the trouble or expence of walls for them; for our Peach Trees are all standards, and I have had in my own garden seven or eight hundred fine Peaches of the Rare-ripes growing at a time on one tree.

Our people of late years have run so much upon orchards, that in a village near Boston, consisting of about forty families, they made near three thousand barrels of Cyder: This was in the year 1721. And in another town of two hundred families, in the same year, I am credibly informed they made near ten thousand barrels. Some of our Apple-Trees will make six, some have made seven barrels of Cyder, but this is not common; and the Apples will yield from seven to nine bushels for a barrel of Cyder. A good Apple-Tree with us will measure from six to ten foot in girt. I have seen a fine Pearmain at a foot from the ground measure ten foot and four inches round: This tree in one year has bore thirty-eight bushels (by measure) of as fine Pearmains as ever I saw in England. A Kentish Pippin at three foot from the ground seven foot in girt: A Golden-Rossetin six foot round. The largest Apple-Tree that I could find was ten foot and six inches round; but this was no graft.

An Orange Pear-Tree grows the largest and yields the fairest fruit. I know one of them near forty foot high that measures six foot and six inches in girt a yard from the ground, and has born thirty bushels at a time; and this year I measured an Orange-Pear, that grew in my own orchard, of eleven inches round the bulge. I have a Warden Pear-Tree that measures five foot six inches round. One of my neighbours has a Bergamot Pear-Tree, that was brought from England in a box about the year 1643, that now measures six foot about, and has bore twenty-two bushels of fine Pears in one year. About twenty years since, the owner took a Cyon, and grafted it upon a common Hedge-Pair, but the fruit does not prove altogether

so good, and the rind or skin is thicker than that of the original.

Our Peach-Trees are large and fruitful, and bear commonly in three years from the stone. I have one in my garden of twelve years growth that measures two foot and an inch in girt, a yard from the ground, which two years ago bore me near a bushel of fine Peaches. Our common Cherries are not so good as the Kentish Cherries of England; and we have no Dukes, or Heart-Cherries, unless in two or three gardens.

Some years since, I measured a Platanus Occidentalis, or Button-wood-tree (as they are called here) of nine yards in girt, and it held its bigness a great way up. This tree, when it was cut down, I am informed, made twenty-two cord of wood. A gentleman tells me, that in the forest he met with a strait ash that grew like a pillar of a great height, and free from limbs, that measured fourteen foot eight inches round, near a yard from the ground; and the other day I met with a Sassafras-Tree that measured five foot three inches in girt. I meddle not here with our noble Pines and Cedars, because I design to treat of them in a chapter of the Ever-greens of this country. Among our trees of quick and easy growth, the Button-wood, before mentioned, and the Locust-Tree are the most remarkable; as to the latter, by the description Mr. MOORE, while in New-England, gave me of the Manna-Tree, our Locust-Tree may be called the American Manna. I have known a seed of it blown off from the tree into my garden that took root of itself, and in less than two years was got above six foot high, and as big about as a common walking-cane. The Platanus I have frequently propagated by cutting off sticks of five or six foot long, and setting them a foot deep in the ground, in the spring of the year when the season was wet; they thrive best in a moist soil.

An Onion set out for seed will rise to four foot nine inches in height. A Parsnip will reach to eight foot: Red Orrice will mount nine foot, White Orrice eight. In the pastures I measured Seed-Mullen nine foot two inches in height, and one of the common thistles above eight foot.

Among the remarkable instances of the power of vegetation, I shall begin with an account of a Pompion seed, which I have well attested from a worthy divine. The relation is as follows: That in the year 1699, a single Pompion seed was accidentally dropp'd in a small pasture where cattle had been foddered for some time. This single seed took root of itself, and without any manner of care the vine run along over several fences, and spread over a large piece of ground far and wide, and continued its progress till the frost came and killed it. This seed had no more than one stalk but a very large one, for it measured eight inches round. From this single vine they gathered two hundred and sixty Pompions, and one with another as big as a half-peck, enough in the whole to fill a large tumbrel; besides a considerable number of small and unripe Pompions that they made no account of. The philosophical transactions give an account of a single plant of Barley, that by steeping and watering with salt-petre dissolved in water, produced two hundred and forty-nine stalks, and eighteen thousand grains; but then there was art, and even force in that case, whereas in ours there was nothing but pure nature and accident.

Our

CHAP.
IV.

Our Indian Corn is the most prolifick grain that we have, and commonly produces twelve hundred, and often two thousand grains from one; but the fairest computation is thus: Six quarts of this grain will plant an acre of ground, and it is not unusual for an acre of good ground to produce fifty bushels of Corn. Indian Corn is of several colours, as blue, white, red and yellow; and if they are planted separately, so that no other sort be near them, they will keep to their own colour: But if in the same field you plant the blue Corn in one row of hills (as we term them) and the white or yellow in the next row, they will mix and interchange their colours; that is, some of the ears of Corn in the blue Corn rows shall be white or yellow, and some again in the white or yellow rows shall be blue. Our hills of Indian Corn are generally about four foot asunder, and so continued in a strait line as far as the field will allow; and then a second line or row of hills and so on; and yet this mixing and interchanging of colours has been observed when the distance between the row of hills has been several yards: And a worthy clergyman of an island in this province assures me, that the blue Corn has thus communicated or exchanged even at the distance of four or five rods; and particularly in one place where there was a broad ditch of water betwixt them. Some of our people, but especially the Aborigines, have been of opinion that this commixtion and interchange was owing to the roots and small fibres reaching to, and communicating with one another: But this must certainly be a mistake, considering the great distance of the communication, especially at some times, and cross a canal of water; for the small fibres of the roots of our Indian Corn cannot extend above four or five foot. I am therefore humbly of opinion, that the stamina, or principles of this wonderful copulation, or mixing of colours, are carried by the wind, and that the season of it is when the Corn is in the earing, and while the milk is in the grain; for at that time the Corn is in a sort of effusion, and emits a strong scent. One thing which confirms the air's being the medium of this communication of colours in the Corn, is an observation of one of my neighbour's, that a close high board fence between two fields of Corn, that were of a different colour, entirely prevented any mixture or alteration of colour from that they were planted with.

Forrest-trees.

Forrest-trees and others of the growth of New-England are Cedar, Oak, Ash, Elm, Cypress, Pine, Firr, Alpin, Beech, Walnut, Chesnut, Hazel, Sassafras, Sumack, and other woods used in dying, and tanning leather. Their Firr Trees are of an uncommon growth, and furnish the royal navy of England with masts and yards; they draw also from these and other trees Pitch, Tar, Rosin, Turpentine, Gums and Balms used in physick and surgery: And the soil is extremely proper for Hemp and Flax.

Fruits.

They had a variety of fruits of their own growth before the English arrived; particularly Grapes, Strawberries, Raspberries, Hurtleberries, Filberts, and many more mentioned among the plants of Virginia: As also roots and salad-herbs, several sorts of Beans and Pulse, but they had the greatest plenty of Kidney-Beans of any of them. I proceed in the next place to speak of their trade and manufactures, the best account whereof we meet with in the representation of the board of trade to the House of Commons, in the year 1732.

Trade and manufactures of the British Colonies.

In this representation they inform the house that an act passed in the general assembly of the Massachusetts Colony in the year 1728, entitled, An act for the encouragement of the making paper; but that manufacture, however, has hitherto made but a very small progress, and can hardly be said to interfere with the paper manufacture in Old-England; because almost all the paper sent to New-England from hence is foreign manufacture; but it certainly interferes with the profit made by the British Merchant upon foreign paper sent to this province: However, no complaints have ever been made to us against this law.

By the return to our circular letter from the Governor of New-Hampshire, we are informed, that an act passed many years since in that province for encouraging of Iron-works, by which the exportation of Iron Ore is prohibited; but, upon the most diligent enquiry, no such act is to be found in our office, and we believe none such was ever transmitted to this board: However, not knowing whether this act might not have passed since the late King's accession, we have inserted it in this list.

A law passed in the year 1728, in New-York, entitled, an act to repeal some parts, and to continue and enforce other parts of the act therein mentioned, and for granting several duties to his Majesty for supporting his government in the colony of New-York, from the 1st of September, which will be in the year 1733; wherein (among other duties) one was laid of five ounces of plate, or forty Shillings in bills of credit, on every Negroe imported from Africa, and a duty of four Pounds on every Negroe imported from any other place.

The plantations in all times past have laid duties upon the importation of Negroes, and as the Merchants have naturally increased their price in proportion to those duties, so it is but lately that complaints have been made against these duties, unless they went to excess: But the board are of opinion, that it would be more for the convenience of the trade that these duties should for the future be paid by the purchaser, than by the importer; and his Majesty has (upon our representation) been pleased to send an instruction to that effect to all the Governors in America.

By the charter of Pennsylvania it has already been observed, that the proprietor is obliged to offer the laws of the province to the crown, for approbation or disallowance, within five years after they are passed; and if his Majesty does not think fit to repeal them in six months from the time they are so offered, it is not in the power of the crown to repeal them afterwards; but since the year 1715 this article of the charter has been evaded, and the laws of this province have not been transmitted to this board (except occasionally an act or two;) so that we are not enabled to lay a state of the laws of this province before the house.

That upon a late petition to his Majesty from the Merchants of London, in the behalf of themselves and others, complaining that, as the law now stands in some of the colonies, his subjects residing in Great-Britain are left without any remedy for the recovery of their just debts, or have such only as is very partial and precarious; as also that in several of the said colonies and plantations greater and higher duties and impositions are laid on the ships and goods belonging to subjects

in

CHAP.
IV.

Paper.

Iron-works in Hampshire.

Duties on Negroes imported.

Now paid by the purchaser.

CHAP. IV. in Great-Britain, than on the goods and ships of persons inhabiting the said colonies and plantations.

The said Merchants being desired to acquaint the board whether they knew of any particular laws in the colonies, against which they had reason to object, they did deliver to us a list of laws wherein the said colonies appear to have been very partial in their own favour; in some of them exempting their persons from arrests, in others giving a preference to the inhabitants before the British Merchants in the recovery of debts, and enacting duties where a less burthen is laid upon their own effects than upon those of the British Merchants.

We beg leave to acquaint this house, that pursuant to an order of the committee of council, this board did, on the 5th of December, 1728, make a very particular enquiry into the state of the plantations at that time, with respect to Silk, Linnen and Woollen Manufactures established there; and having then discoursed with many persons who had either been Governors of some of the colonies, or were by other means well acquainted with their circumstances, it appeared to this board, and we did accordingly represent,

That in the colonies of New-England, New-York, Connecticut, Rhode-Island, Pennsylvania, and in the county of Somerset in Maryland, the people had fallen into the manufacture of Woollen and Linnen Cloth for the use of their own families; but we could not learn they had ever manufactured any for sale in those colonies, except in a small Indian town in Pennsylvania, where some Palatines had then lately settled.

The reasons why these people had begun this manufacture were:

1. That the product of those colonies being chiefly stock and grain, the estates of the inhabitants depended wholly upon farming; and as this could not be carried on without a certain quantity of Sheep, their Wool would be entirely lost, were not their servants employed at leisure times of the year, but chiefly during the winter, in manufacturing it for the use of their families.

2. That Flax and Hemp being likewise easily raised, the inhabitants manufactured them into a coarse sort of Cloth-bags, traces and halters for their Horses; which they found did more service than those they had from any part of Europe.

3. That these settlements, which were distant from water-carriage, and remotely situated in the woods, had no opportunities of a market for grain; and therefore as they did not raise more Corn than was sufficient for their own use, they had the more time to manufacture both Wool and Flax for the service of their families, and seemed to be under a great necessity of doing it.

Upon a farther enquiry into this matter, we do not find that those people had the same temptation to go on with those manufactures during the time that the bounty upon naval stores subsisted, having then encouragement to employ their leisure hours in another way, and more profitably both to themselves and this kingdom; for the height of wages, and great price of labour in general in America, made it impracticable for the people there to manufacture their Linnen Cloth at less than 20 per cent. more than the rate in England, or Woollen Cloth at less than 50 per cent. dearer than that which is exported from hence for sale. We conceive it was to be wished,

VOL. III. NUMB. CXXXV.

that some expedient might be fallen upon to divert their thoughts from undertakings of this nature; so much the rather, because those manufactures, in process of time, might be carried on in a greater degree, unless an early stop were put to their progress; and the most natural inducement that we could think of to engage the people in America to desist from these pursuits, was to employ them in naval stores: Wherefore we take leave to renew our repeated proposals, that a reasonable encouragement should be given for the making, raising and manufacturing naval stores of all kinds in the plantations; from whence we might be furnished in return for our own manufactures.

But several alterations have happened since that time; and by such lights as we have been able to acquire we find trades carried on, and manufactures set up there detrimental to the trade, navigation and manufacture of Great-Britain.

The state of the plantations varying almost every year more or less in their trade and manufactures, as well as in other particulars, we thought it necessary for his Majesty's service, and for the discharge of our trust, from time to time to send certain general queries to the several Governors in America, that we might be the more exactly informed of the condition of the said plantations; among which there were several that related to their trade and manufactures: To which we received the following returns.

New-Hampshire.

Colonel SHUTE, Governor of New-Hampshire, in his answer to the same queries in 1719, said, that there were no settled manufactures in that province, and that their trade principally consisted in lumber and fish.

Massachusetts Bay in New-England.

Colonel SHUTE, at the same time Governor of the Massachusetts Bay, informed us, that in some parts of this province the inhabitants worked up their Wool and Flax, and made an ordinary coarse cloth for their own use; but did not export any: That the greatest part both of the linnen and woollen cloathing, that was then worn in this province, was imported from Great Britain, and sometimes linen from Ireland; but, considering the excessive price of labour in New-England, the Merchants could afford what was imported cheaper than what was made in that country.

That there were also a few Hatters set up in the maritime towns, and that the greatest part of the Leather used in that country was manufactured amongst themselves.

That there had been for many years some iron-works in that province, which had afforded the people Iron for some of their necessary occasions; but that the Iron imported from Great Britain was esteemed much the best, and wholly used by the shipping.

That the iron-works of that province were not able to supply the twentieth part of what was necessary for the use of the country.

New-York.

General HUNTER, formerly Governor of New-York, in his answer to the queries in the year 1720, informed us, that they had no manufactures in that province that deserved mentioning; and that the trade consisted chiefly in Furs, Whalebone, Oil, Pitch, Tar, and provisions.

CHAP. IV.

The raising naval stores ought to be encouraged in the plantations.

New-Jersey.

General HUNTER, formerly Governor of this province, also informs us, in his answer to the same queries in the year 1720, that there were in that province no manufactures that deserve mentioning; and that their trade was chiefly in provisions exported to New-York and Pennsylvania.

Pennsylvania.

Colonel HART, formerly Governor of Maryland, who lived many years in the neighbourhood of this government, in answer to the like queries in 1720, relating to this province, said, that their chief trade lay in the exportation of provisions and lumber; and that they had no manufactures established, their cloathing and utensils for their houses being all imported from Great-Britain.

New-Hampshire.

Linen
made in
New-
Hamp-
shire.

Mr. BELCHER, Governor of New-Hampshire, in his letter, dated the 4th of December last, informs us, that the Woollen manufacture of that province was much less than formerly, the common lands on which the Sheep used to feed being now divided into particular properties, and the people almost wholly cloathed with Woollen from Great-Britain: That the manufacturing of Flax into Linnen (some coarser, some finer) daily increased, by the great resort of people from Ireland into this province, who are well skilled in that business.

And the chief trade of this province continued, as for many years past, in the exportation of naval stores, lumber and fish.

Massachusetts Bay in New-England.

Naval
stores, &c.

Mr. BELCHER, the present Governor of this province, in answer to the same queries, which we sent him in June last, informs us:

Massachu-
set's.

That there is a resolve of the assembly of that province subsisting, for allowing a bounty of twenty Shillings to all persons, and ten Shillings more to JOHN POWELL, the first undertaker, for every piece of Duck or Canvas by them made; but he does not give us any account of the quantity that has been made.

Brown-
Hollands
made
there.

He farther says, that there are some other manufactures carried on there, as the making of brown Hollands for womens wear, which lessens the importation of Calicoes and some other sorts of Indian goods in that province.

Cotton
and Linen.

That there are likewise some small quantities of cloth made of Linen and Cotton, for ordinary shirting and sheeting.

Paper.

That about three years ago a paper-mill was set up, which makes to the value of about 200 l. sterling per ann.

Iron-
works.

That there are several forges for making Bar-iron, and some furnaces for Cast-iron (or hollow-ware) and one sifting-mill, the undertaker whereof carries on the manufacture of nails.

Woollen
Cloth.

As to the woollen manufacture, Mr. BELCHER says, the country people, who used formerly to make most of their cloathing out of their own Wool, do not now make a third part of what they wear, but are mostly cloathed with British manufactures.

Copper-
mines in
the Massa-
chuset Col-
ony.

We are likewise informed, by some letters of older date from Mr. BELCHER, in answer to our annual queries, that there are some few Copper-mines in this province; but so far distant from water-carriage, and the ore so poor, that it is not worth the digging.

Colonel DUNBAR, Surveyor-General of his Majesty's woods, in his letter of September the 15th, 1730, takes notice, that the people of New-England have an advantage over those of Great-Britain, in the draw-back for all India and other goods exported, which pay a duty in Great Britain, and no duty is paid upon importing them into the plantations. He has likewise sent this board several samples of edge-tools made in New-England; and in his letter to our Secretary of the 4th of June 1731, he says they have six furnaces and nineteen forges for making Iron in New-England.

He also informs us, in his letter of the 19th of August, 1730, that in this province many ships are built for the French and Spaniards, in return for Rum, Molosses, Wines, and Silks, which they truck there by connivance.

These informations have been in a great measure confirmed by Mr. JEREMIAH DUMMER, deputy Surveyor of the woods, and also by Mr. THOMAS CORAM, a person of reputation, who resided many years in New-England: To which they have added, that great quantities of Hats they made in New-England, of which the company of Hatters of London have likewise lately complained to us: And Mr. JEREMIAH DUMMER further says, that great quantities of Hats made in that province are exported to Spain, Portugal, and our West-India Islands; and that they make all sorts of iron-work for shipping; and that there are several still-houses and sugar-bakers established in New-England.

Hats ex-
ported.
Wrought
Iron.
Distillers
and Sugar
Bakers.

New-York.

Mr. RIP VAN DAM, President of the council of this province, in his letter of the 29th of October last, informs us, that there are no manufactures established there that can affect the manufactures of Great Britain.

And as to the trade and navigation of the province, he acquaints us there is yearly imported into New-York a very large quantity of the Woollen Manufacture of this kingdom for their cloathing; which they should be rendered incapable to pay for, and reduced to the necessity of making for themselves, if they were prohibited from receiving from the foreign Sugar Colonies the money, Rum, Sugar, Molosses, Cocoa, Indico, Cotton, Wool, &c. which they at present take in return for provisions, Horses and lumber; the produce of that province and New-Jersey, of which he affirms the British Colonies do not take off above one half.

But the company of Hatters in London have since informed us that Hats are manufactured in great quantities in this province.

New-Jersey.

Mr. MORRIS, who is at present Commander in chief to this province, has made no particular return for the same.

Pennsylvania.

Major GORDON, Deputy-Governor of Pennsylvania, in his answer received the 24th of the last month, informs us, that he does not know of any trade carried on in that province that can be injurious to this kingdom; and that they do not export any Woollen or Linen manufactures, all they make (which are of a coarser sort) being for the use of themselves and families.

We are further informed, that in this province are built brigantines and small sloops, which they sell to the West-Indies.

Rhode-

C H A P.

IV.

Iron-works in Rhode-Island.

Rhode-Island.

The Governor of Rhode-Island, in his answer to queries dated the ninth of November last, informs us, that there are Iron-mines there, tho' not a fourth part of Iron enough to serve their own use; but he takes no notice of any sort of manufacture set up there.

Connecticut.

Produce and handicrafts in Connecticut.

We have no return from the Governor of this province; but we find by some accounts that the produce of this colony is Timber-board, all sorts of English grain, Hemp, Flax, Sheep, cattle; Swine, Horses, Goats, and Tobacco, of which they export Horses and lumber to the West-Indies, and receive in return Sugar, Salt, Molasses, and Rum. We likewise find that their manufactures are very inconsiderable, the people there being generally employed in tillage; some few in tanning, shoe-making, and other handicrafts; others in building, Joyners, Taylors, and Smiths work, without which they could not subsist.

The Sugar Colonies, viz. Jamaica, Leeward-Islands, and Barbadoes.

No manufactures in the Sugar Islands, which interfere with those of Britain. Their Produce.

By the last returns which we have had from those islands to our circular queries, we do not find that they have any other manufactures established besides those of Sugar, Molasses, Rum, and Indigo of their own produce; these, with Cotton, Aloes, Piemento, and some other productions of less note, are their whole dependance, which are commodities no ways interfering with the manufactures of this kingdom.

In the year 1724, Mr. WORSELEY, then Governor of Barbadoes, informed us, that of Cotton they made hammocks, a few stockings, and nets for Horses.

From the foregoing state it is observable, that there are more trades carried on, and manufactures set up in the provinces on the continent of America to the northward of Virginia prejudicial to the trade and manufactures of Great-Britain, particularly in New-England, than in any other of the British Colonies, which is not to be wondered at; for their soil, climate, and produce being pretty near the same with ours, they have no staple commodities of their own growth to exchange for our manufactures, which puts them under great necessity, as well as under greater temptation of providing for themselves at home. To which may be added, in the charter governments the little dependance they have upon their mother country, and consequently the small restraints they are under in any matters detrimental to her interest.

Reflections on the charter governments.

And therefore we would humbly beg leave to report and submit to the wisdom of this honourable house the substance of what we formerly proposed in our report on the Silk, Linen and Woollen manufactures herein before recited; namely, whether it might not be expedient to give these colonies proper encouragements for turning their industry to such manufactures and products as might be of service to Great-Britain, and more particularly to the production of all kinds of naval stores.

Trade and produce of Rhode-Island and Providence plantation.

From a considerable Merchant of New-England I received the following account of the trade and produce of Rhode-Island and Providence Plantation, viz. That they have a great-trade by sea to the British West-Indies, to the Dutch Colonies at Surinam, on the continent of South-America, and to the Dutch Island of Curacao, or Curassow, near the coast of Terra-Firma, whither they send

Horses, Salt, provisions and lumber; that is Deal-boards, Pipe-slaves, Hoops, and Shingles. They also send their ships sometimes by the way of the West-Indies to London: And several vessels sail annually to the bay of Honduras for Logwood, which they transport to Europe; but this colony has very little concern in the fishery.

Trade with the Dutch and the Spaniards.

They are supplied with most of their British manufactures from Boston; but sometimes they import these themselves directly from Great Britain. It is a pleasant, healthful, and fruitful country. They breed and feed great numbers of Horses and black cattle, their land being proper for grazing. They have some Indian Corn, indeed, but very little other grain, importing most of their Wheat from New-York, and some from Virginia. Here are some iron-mines also wrought, and turn to a good account; for they make many of their own edged-tools, and implements of husbandry.

A grazing country.

Iron-mines.

C H A P. V.

Of the history of New-England.

KING JAMES I. by letters patents dated the 10th of April, 1606, erected two companies of adventurers, empowering them to send colonies to Virginia (as the north-east coast of America was then called;) the first of which companies obtained the name of the London-Company, and were authorized to plant colonies between 34 and 41 degrees of north latitude; and the other obtained the name of the Plymouth-Company, and were empowered to plant their people between 38 and 45 degrees of north latitude; but it was provided that the said companies should not interfere or fix themselves within an hundred miles of each other: The London-Company hereupon sent out ships the very same year, and planted that country to which the name of Virginia is now appropriated, as has been already related; but the Plymouth-Company contented themselves for some years with trafficking with the natives of North-Virginia (as New-England was then called) for Furs, and fishing upon that coast. Two ships being employed in this fishery in the year 1614, commanded by Captain JOHN SMITH (formerly President of South-Virginia) and Captain THOMAS HUNT; Captain SMITH went on shore, and took a particular view of the country of the Massachusetts, and had some skirmishes with the natives: After which he returned to England, ordering HUNT to sail with the other ship to Spain, and dispose of the fish he had taken there; but HUNT, proposing to make a market of the natives themselves, as well as of their fish, after Captain SMITH was gone, enticed twenty-seven of the Indians on board his Ship; and then setting sail with them to Malaga, sold them there to the Spaniards for slaves, at the rate of twenty Pounds a man; among whom was an Indian called SQUANTO, afterwards very serviceable to the English. This outrage was so resented by the Indians for the present, that all commerce with them became impracticable; nor was this the first time the natives had been thus violently carried away by the English; for Captain HARLOW, in the year 1611, surprised one EPEHOW, and two more of his countrymen, and brought them to England; where EPEHOW having learned English enough to impose upon his masters, and understanding that the hopes of acquiring mountains of gold was

A stratagem of an Indian to get home again.

the

CHAP. V. the principal inducement the English had to visit his country, the cunning Indian, in order to get thither again, pretended there was a rich gold mine not far from the country where he was born, which he would guide them to if they thought it worth their while to fit out a ship on such an Expedition. This overture had the success Epenow expected, and Captain Hobson was dispatched the next year, with provisions, tools and materials proper to make a settlement, and open the mines Epenow had given them intelligence of. The ship arriving on the coast of the Massachusetts, several Indians came on board, promising to return the next day with Furs and other merchandize; and they did indeed return, but in an hostile manner, with twenty canoes full of armed men; and Epenow beckoning to them to approach nearer the ship, jumped into the sea, and made his escape to them: Whereupon the English fired upon the canoes, and were answered with a flight of arrows, and several were wounded on both sides, among whom was Captain Hobson himself: After which, the Captain, without attempting any thing farther, thought fit to return to England.

In the year 1619, Captain DORMER was sent to New-England, and with him SQUANTO the Indian, as an interpreter, to endeavour to make peace with the natives, and settle a colony in the Massachusetts Bay; but to no purpose, the Indians would not be reconciled, and in a skirmish with them, DORMER received fourteen wounds; whereupon he proceeded to Virginia, leaving SQUANTO on shore in New-England.

The original of the New-England Colonies.

In the mean time some Brownists, the very worst of our English sectaries, who had rendered themselves obnoxious to the government by the rebellious principles they taught, thought fit to transport themselves to Amsterdam; where not being able to agree among themselves, part of them removed with their preacher Mr. JOHN ROBINSON, to Leyden, about the year 1610; where having remained seven years more, either the Dutch grew weary of them, or they grew weary of the Dutch; for the Brownists complained of very great hardships, declaring that imprisonment in England was preferable to the condition of refugees in Holland; and many of them actually returned to England. Whereupon ROBINSON and his elders, apprehending a general desertion of their flock, hit upon this expedient to keep them together, and increase their number: They represented that New-England was not only a place which abounded with all things desirable in life, but that there were great expectations of discovering treasures there equal to those of Mexico or Peru: However, as it was known to be a fruitful soil, and the climate not unlike that of Old-England, here the sectaries might live in peace and plenty, and enjoy the freedom of their consciences, and probably become the founders of some mighty state; they proposed therefore to the dissenters in England to join them, and make a common purse, with which they might purchase a territory in New-England of the Plymouth-Company, and obtain a patent from his Majesty King JAMES I. for the free exercise of their religion; and furnish themselves with ships, men, provisions, and utensils to plant the country.

This project many dissenters came into, and some others, on a prospect of making their fortunes, and immediately applied themselves to the then Ministry for a patent; which they at length

obtained by the mediation of Sir ROBERT NA-CHAP. TON, Secretary of state, and Sir EDWARD SANDYS: But it seems the patent was not so full as they expected; for there was not an express toleration of their religion contained in it; only an assurance that their worships should be connived at.

The motives made use of at court to obtain this grant were, the glorious pretence of propagating the christian religion among infidels, the extending his Majesty's dominions, and the enriching their mother country; and possibly it might be suggested, that they should thereby prevent both the French and Dutch possessing themselves of this desirable country, which they were attempting to do at this time. All things being at length agreed upon, the Leyden adventurers embarked at Delf in Holland in July 1620, and arrived at Southampton the latter end of that month, where they found their friends on board a ship of near two hundred tons. It seems Mr. ROBINSON and great part of his congregation remained in Holland, not designing to embark till they received advice of the success of this first attempt.

The two ships having provided themselves with all manner of necessaries at Southampton for establishing a colony, and taken to the value of between two and three thousand Pounds in merchandize on board, to traffick with the Indians, they set sail on the 5th of August: But the smaller ship springing a leak, they were forced to return into harbour again; and the leaky vessel being at length found unfit for the sea, they removed part of their men and provisions into the large ship, which set sail from Plymouth on the 6th of September with an hundred and fifty people on board, including the seamen; and after a stormy passage they arrived at Cape Cod in New-England on the 9th of November following.

The first colony set sail for New-England and arrive at Cape Cod.

Our adventurers were bound for HUDSON'S River, at the mouth whereof New-York now stands; but their pilot, it is said, was bribed by the Dutch to carry them further north, the Hollanders proposing to plant that country with their own people, as they actually did soon after. Certain it is, our adventurers finding the winter exceeding sharp, and sailing become dangerous on that coast, resolved to fix themselves at the first good harbour they should meet with. They went on shore therefore in their boats; and having taken a view of the country over against Cape Cod, after a month's laborious search, many hazards at sea, and some skirmishes with the natives on shore, they arrived at a very commodious bay, on which they built a town, and gave it the name of Plymouth, being situate in 42 degrees north latitude, a great way to the north-east of the country they had purchased and obtained a patent to plant. They determined therefore to have no regard to the letters patents they had obtained from the crown, but to elect a Governor, and strike out such a form of government as they could agree on among themselves.

The planters, designed to stay in the country, including women and children, were about an hundred, of whom only one boy died in the passage. Their historians mention no more than nineteen families that settled at Plymouth, and give us the names but of forty one effective men, among whom the chief were JOHN CARVER, The chief WILLIAM BRADFORD, EDWARD WINSLOW, planters. (JOHN BREWSTER, assistant to Mr. ROBINSON above-

CHAP. V. abovementioned, and ruling elder of his church, to whose care he committed that part of his flock who engaged in this enterprize,) ISAAC ALLERTON, MILES STANDISH, JOHN HOWLAND, RICHARD WARREN, STEPHEN HOPKINS, EDWARD TILLY, CHRISTOPHER MARTIN, WILLIAM WHITE, RICHARD CLARK, and THOMAS ENGLISH.

The first thing they considered after their landing, was the choice of a Governor, and were unanimous in conferring that post upon Mr. JOHN CARVER. They also agreed to submit to such laws as should be approved of by the majority, and signed an instrument to that effect; but such were the fatigues and hardships this young colony underwent the first winter, that out of an hundred planters fifty of them died within the space of two months; and had the Indians attacked them, they had probably all perished before the winter was over; but they met with no disturbance from the natives after they fixed themselves at Plymouth Bay, and only saw some few of them now and then at a distance till the middle of March, when SAMOSET, one of their Sagamores or Captains, came to them in a friendly manner, and gave them to understand they were welcome into the country, and that his people would be glad to traffick with them. And coming again the next day with several other Indians, they informed the English that their great Sachem or King, whom they called MASSASSOJET, had his residence but two or three days march to the northward, and intended them a visit; and accordingly MASSASSOJET arrived on the 22d of March, with a retinue of about sixty people, and being received by Captain STANDISH at the head of a file of musketeers, was conducted to a kind of throne they had prepared for his Indian Majesty in one of their houses.

MASSASSOJET an Indian King visits them.

They relate, that this Monarch was of a large stature, middle aged, of a grave countenance, and sparing in his speech; that his face was painted red, and both head and face smeared over with oil; that he had a mantle of Deer-skin, and his breeches and stockings, which were all of a piece, were of the same materials; that his knife or tomahawk hung upon his breast on a string, his Tobacco-pouch behind him, and his arms were clothed with wild Cat-skins; and in the same garb were his principal attendants. They did not observe any marks of distinction between this Prince and his subjects, unless it were a chain of fish bones which MASSASSOJET wore about his neck.

Soon after the Prince was seated, CARVER the Governor came in with a guard of musketeers, a drum and trumpet marching before him: Whereupon MASSASSOJET rose up and kissed him; after which they both sat down, and an entertainment was provided for the Indians, of which no part appeared more acceptable to them than the brandy, the Sachem himself drinking very plentifully of it. In MASSASSOJET's retinue was the abovementioned SQUANTO, who had been carried to Europe by HUNT and brought to New-England again, as related above. This Indian it seems had a very great affection for the English, among whom he lived several years; and it was to his favourable representation of the colony that the Sachem was induced to make them this friendly visit; and at this first meeting to enter into an alliance offensive and defensive with the English, and even to acknowledge King JAMES

VOL. III.

for his Sovereign, and promise to hold his dominions of him; and as an evidence of his sincerity, MASSASSOJET granted and transferred part of his country to the planters and their heirs forever. This alliance being founded upon the mutual interests of the contracting parties was maintained inviolably many years. The Sachem, who had been informed by SQUANTO how powerful a people the English were both by sea and land, promised himself their assistance against the Narraganset Indians his enemies; and the English stood in no less need of his friendship and assistance to establish themselves in that country.

The treaty being concluded, MASSASSOJET returned to his capital, leaving SQUANTO with the colony, who was extremely serviceable to them, not only as an interpreter, but by instructing them how to plant and manage their Indian Corn, in piloting them along the coast, and supplying them with fish, fowl and venison. Still the English remained very unhealthful, and many of them died, among whom was Mr. CARVER their Governor, who did not survive the month of April, 1621. The seamen also had their share of illness, inasmuch that they were not in a condition to sail till May, when the ship returned to England to give their friends an account of the circumstances of the colony.

In the mean time the colony elected Mr. BRADFORD their Governor, who sent an embassy to the Sachem MASSASSOJET, and renewed and confirmed the treaty of alliance his predecessor had made with that Monarch. The Ambassadors, in their journey to Pokanoket, the usual residence of MASSASSOJET, received great civilities from the Indians upon the road, who supplied them with provisions, carried their baggage, and assisted them in crossing the rivers they met with in their way; and the English understood from them that the country had been in a manner depopulated by a great plague which raged there the beginning of this year, inasmuch that several towns were left without inhabitants, and the Corn standing in their fields without an owner; and to this calamity our adventurers in a great measure ascribed their security that they were not molested by the natives. They tell us however, that they were threatened by the Narragansets, enemies to MASSASSOJET, a powerful nation on the south-west of Plymouth; but having strengthened their fort, and planted cannon on their works, they rendered themselves so formidable, that the Narragansets did not think fit to attack them: On the other hand, several Sachems, or petty Princes, came in and put themselves under their protection, acknowledging the King of Great-Britain their Sovereign.

In the year 1622 several ships arrived from England with planters, but bringing no provisions with them, and there happening a great drought in New-England this summer, they were in great danger of being distressed for provisions; but the rain falling plentifully in July, they had a better crop of Indian Corn than they expected; and some ships arriving from England with cutlery ware and other merchandize about the same time, they purchased a farther supply of Corn of the natives. This year died that friendly Indian SQUANTO, who had been so serviceable to the colony: It seems he endeavoured to render the English as formidable to his countrymen as

CHAP. V. MASSASSOJET enters into an alliance with the English, and acknowledges the King of Great-Britain his sovereign.

The colony sickly. CARVER the Governor dies.

CHAP. V. possible; and among other things assured them, that the English could inflict what plagues they pleased upon their enemies; insinuating, that they had been the authors of the last pestilence, which fell upon some districts that were for driving the English out of their country; and this, it is said, kept the rest of the Indian Princes in great awe.

Divisions in the colony on account of religion.

And now the numbers of the planters being increased by the continual arrival of ships from Old-England, and there being some differences among them on account of religion, Mr. WESTON, with part of their adventurers (who seem to have been members of the Church of England, by the character the sectaries of Plymouth give of them) removed to a place called Wefagusquasset, afterwards Weymouth, situate on the south-side of the Massachusetts Bay, where they built some huts, and surrounded them with palisadoes; but having no great guns, or any reinforcements of men from England, or supplies of ammunition or provision, as the people of Plymouth had; and being forced to range about the fields and woods in search of provisions, they became contemptible among the Indians, were daily insulted, and had been all massacred (as the Plymouth men relate) if they had not sent a detachment to their relief, who attacked the Indians, killed some of their Chiefs, and compelled the rest to sue for peace. However, WESTON and his men, being in no condition to maintain themselves at Weymouth, quitted that settlement, which Captain GORGES afterwards came from England with a design to restore, being made Governor of that part of the country by the company; but not finding things answer his expectations, this gentleman also abandoned Weymouth, and returned to England, being soon followed by his Bishop and the rest of the planters, as the Plymouth men relate. What they mean by his Bishop, I presume, was the chaplain of the colony, which Captain GORGES carried over with him; and as this Weymouth Colony were generally episcopal Men, the New-England historians (who were of another persuasion) represent the Weymouth planters as a most licentious and debauched generation, and impute their want of success to the wickedness of their lives; but as they dress up all their church-men in the like odious colours, it is presumed little weight will be given to this charge, especially as we find their dancing round a maypole enumerated amongst their greatest crimes.

The true reason why the sectaries succeeded better in this country than other adventurers was, that their whole party almost engaged in the enterprise, proposing to make this their retreat, if they miscarried in the design they had in view, of subverting the ecclesiastical and civil government at home: If this could not be effected, they promised themselves however that they should be able here to put in practice their darling schemes of independency in the church, and democracy in the state, and become the founders of a new religion, as well as of a new republick.

As their hearts were set upon this project, they took care to supply their friends they sent before them from time to time with all manner of provisions and necessaries, while they supplanted and discouraged all others from settling there, and actually sent several considerable adventurers back again to England for presuming to worship God after the manner of the establish'd church; as will

appear from their own relations in the course of CHAP. V. this history.

As for themselves, they had not for many years any clergyman amongst them, either conformist or non-conformist, but were preached to and directed in their devotions by BREWSTER the lay-elder, whom father ROBINSON sent over to explore the country, and prepare a place for his reception; but ROBINSON died in Holland, and was not suffered to pass over Jordan to that land of reformation, that paradise of the saints.

The colony of Plymouth still remaining without a patent, or any title to the lands they possessed from the North-Virginia (or New-England) Company, sent over Mr. WINSLOW, one of their number, to solicit for both in the year 1624; and this gentleman succeeded beyond their expectations, for the charter he procured enabled the planters to elect a Governor, a Council and Magistrates, and to make laws, provided they were not opposite to the laws of England, nor encroached on the prerogatives of the crown.

Three Heifers and a Bull were carried over to Plymouth Colony this year (1624) being the first horned cattle that ever were seen in New-England: Some Hogs, Goats and poultry also were imported about the same time, which soon increased to a very great number.

The company also sent over one LYFORD an Irishman, as Chaplain to the Plymouth Colony, who would have performed divine service and administered the sacraments after the manner of the Church of England; but the planters compelled him to conform himself to their way of worship, and sufficiently humbled him upon intercepting some letters he had sent to England, complaining of their extravagancies, and representing them as monsters in religion; insomuch that he was forced to remove from Plymouth to a new colony of planters, who had fixed themselves near cape Anne.

In the year 1625 (as the New-England historians relate) Mr. WHITE, Minister of Dorchester, observing the success of the Plymouth Colony, projected a new settlement in the Massachusetts Bay in New-England, as an asylum also for the sectaries; and prevailing with Mr. CONANT and some others, to go over and make choice of a proper settlement, he and his friends purchased or procured a grant from the North-Virginia or New-England Company in the year 1627, to Sir HENRY ROSWELL, Sir JOHN YOUNG, Knights, THOMAS SOUTHCOT, JOHN HUMPHRIES, and SIMON NEWCOMBE, Esqrs. their heirs, assigns, and associates, of all that part of New-England which lies between the great river Merimack and Charles River, at the bottom of the Massachusetts Bay, and all lands, &c. three miles north of Merimack River, and three miles south of Charles River, and in length or in longitude between those rivers from the Atlantick to the South Sea; and obtained a patent from King CHARLES I. to hold the same as of his manour of East-Greenwich, in common socage, yielding and paying to his Majesty a fifth part of such gold and silver Ore as should from time to time be found within those limits.

These gentlemen having taken in Sir RICHARD SALTOUSTAL, Mr. ISAAC JOHNSON, SAMUEL ADDERLEY, JOHN VAN MATTHEW CRADOCK, THOMAS GOFF, GEORGE HARWOOD, SAMUEL BROWN, and several more partners, the following year 1628, procured a new patent with the names of the last mentioned gentlemen inserted

The Plymouth planters obtain a charter.

Cattle sent to New-England.

The original of the Massachusetts Colony.

CHAP. V. settled as proprietors; by which patent they and all others who should join with them were incorporated by the name of the Governor and Company of the Massachusetts Bay in New-England, and were empowered to elect a Governor, Deputy Governor, and Magistrates, and to make laws for the good of the plantation, tho' not repugnant to the laws of England; and liberty of conscience was thereby granted to all that should settle there.

CRA-DOCK the first Governor of the Massachusetts Colony. The adventurers, by virtue of this patent, elected Mr. CRADOCK their Governor, and Mr. EUPHICOR their Deputy-Governor, and sent over the latter immediately to reinforce Mr. CONANT, who was settled at Mumkeak, now Salem, situate on the coast of New-England, between the promontories of Marblehead and Cape Anne.

A fleet of planters arrive at Salem. The following year the Massachusetts adventurers fitted out six ships, on board whereof were three hundred and fifty planters, men; women and children; and two non-conformist Ministers, viz. Mr. SHELTON and Mr. HIGGINSON: They also sent over cattle of all kinds, viz. Horses, Mares, Cows, Hogs and Goats, with Rabbits and Barri-door-fowls; as also cannon, ammunition and provision of all kinds, necessary to establish a colony; which fleet sailed from the Isle of Wight on the first of May, 1620, and arrived at Salem in New-England on the twenty-fourth of June following. The first thing they did after their arrival was to send for some of their brethren from Plymouth, and having learned what species of independents they were, resolved to copy after them (in religion at least) and entered into a solemn covenant among themselves for that purpose; declaring (as I understand the instrument) that they would submit to no government, ecclesiastical or civil, but of their own framing. One of their own writers observes, that they were attached to the principles of the Brownists, which they carried to such a length as not only to discourage but to drive away a regular and learned ministry, which after some years they were blessed with. (I presume he means the presbyterian fathers who resorted thither afterwards.)

They refuse to tolerate the service of the church of England. The same writer informs us, that some of the planters, finding their Ministers did not use the common-prayer, or administer the sacraments with the usual ceremonies, set up a separate assembly, wherein they used the liturgy of the Church of England; and of these Mr. SAMUEL BROWN a lawyer, and his brother JOHN BROWN a merchant, men of estates and figure, were the chief, being of the number of the first patentees.

The Deputy-Governor sending to these gentlemen to demand the reason of their separation, they represented, that the Ministers were separatists from the Church of England, and the principles they professed would shortly lead them to become anabaptists. To which the Ministers answered, they were neither separatists nor anabaptists; they did not separate from the Church of England, or from the ordinances of God, but only from the corruptions and disorders of that church; that they came away from the common-prayer and ceremonies, and had suffered for their non-conformity in their native land; and being now in a place where they had their liberties, they neither could nor would use them, judging the imposition of these things sinful corruptions of the word of God.

Mr. BROWN and his friends replied, that as they were of the church established by law in

CHAP. V. their native country, it was highly reasonable they should worship God in the manner that government required, from which they received their charter; at least they ought to allow the members of the church that liberty of conscience they themselves thought so reasonable when they were on the other side of the water; and as one article in their charter provided that all persuasions of Christians should have liberty of conscience, they did not know whether their denying it to them was not a forfeiture of their charter. But these arguments were called seditious and mutinous; and the brethren, determining to suffer none to reside there that were not of the same levelling principles in church and state as they professed, forced the two Mr. BROWNS to return back to Old-England in the same ship that brought them over, whereby they escaped that mortality which happened among the planters the next winter, when an hundred of them died, and among the rest Mr. FRANCIS HIGGINSON their preacher, and Houghton the ruling elder of their church.

WIN-THROP made Governor. DUDLEY Deputy-Governor. The year following (1630) Mr. CRADOCK declining to go over to his government, the Massachusetts adventurers in Old-England made choice of JOHN WINTHROP, Esq. for Governor, and Mr. THOMAS DUDLEY Deputy-Governor; and having fitted out ten sail of ships, the Governor and his Deputy embarked in that fleet for New-England, together with Sir RICHARD SALTOUSTAL, ISAAC JOHNSON, Esq. and his lady, THEOPHILUS EATON and JOHN VENN, Esqrs. with several other gentlemen and non-conformist Ministers, and upwards of two hundred planters more, who arrived at Salem in July 1630: Soon after which the people of Salem made two new settlements, the first at Charles Town, on the north side of Charles River, opposite to the place where Boston now stands, and the other at Dorchester, situate at the bottom of the Massachusetts Bay; but the new planters bringing the scurvy and other distempers along with them, and lying in tents and booths pretty much exposed to the weather, above an hundred of them dyed within three months after their arrival. The small-pox at the same time made such havock among the Indians that nine parts in ten of them (as the New-England historians relate) died of that distemper, and the rest flying from the distemper the country was in a manner depopulated: But this it not very consistent with what the New-England writers add: That they purchased the several tracts of land they afterwards possessed of the natives; for if the former inhabitants were all dead or gone, the English, who succeeded them in the possession, seem to have had the best title to the country, and had no occasion or even opportunity to purchase their lands. If they did purchase some small parcels on their arrival, there is no doubt to be made but they possessed themselves of much more on this general desertion without paying any thing for it.

The latter end of the same year 1630, the inhabitants of Charles Town observing that the opposite side of the river was a much more desirable situation than that their town stood upon, took the liberty to dispossess Mr. BLACKSTON an episcopal Minister, of it, who had built a little house there, by virtue whereof he laid claim to the whole peninsula; and they seem to justify the outrage by suggesting that Mr. BLACKSTON was an odd sort of a man, who would not join himself with any of their New-England Churches, declaring that

DUDLEY Deputy-Governor.

Charles Town founded: And Dorchester.

CHAP. V. as he came from Old-England because he did not like Lords Bishops, so he would not join with them because he would not be subject to the Lords Brethren, whose tyranny he held much more insupportable than the other: But however that be, certain it is, when the brethren had driven away this unhappy Parson that could agree with no body, they laid the foundation of their capital city upon this very spot of ground, to which they gave the name of Boston: Cambridge and several towns more were founded soon after not far from Boston; for now the non-conformists resorted hither in great numbers; fleets of ships came over crowded with them every year. In 1634 the small-pox was as fatal to the Indians as it had been in the year 1630. The English observe that those people are generally very full of them, and wanting beds and Linen they become the most loathsome objects imaginable; for having nothing but hard mats to lie on, when the pustules break they stick to the mats, and all their skin is flead off, and in this condition they catch cold and die in the utmost torture; which makes the natives dread the small-pox much more than a pestilence.

Boston the capital founded.

The small-pox fatal to the Indians.

Divisions among the planters.

The cross in the colours expunged as idolatrous.

There happened great divisions about this time (1634) among the brethren. Their writers relate, that Mr. ROGER WILLIAMS, who was chosen to succeed Mr. SHELTON deceased, as Pastor of the Church of Salem, being a rigid Brownist, precise and uncharitable, and of turbulent passions, was near setting the whole country in a flame. This father taught, that it was not lawful for an unregenerate man to pray, nor for a good man to join in prayer with those he thought unregenerate: That it was not lawful to take an oath to a Magistrate; and thereupon refused the oath of allegiance, and advised his congregation to do the same: And declared that their charter granted by the King of England was void, and an instrument of injustice which they ought to renounce as injurious to the natives; his Majesty having no power to dispose of their lands to his subjects: That Magistrates had nothing to do with matters of the first table of the decalogue, and therefore there ought to be a general and unlimited toleration for all religions: To punish men for matters of conscience was persecution. For holding which tenets the Magistrates banished him the Massachusetts Colony as a disturber of the peace of their church and commonwealth: But such an influence had his exhortations on some of his followers, that in the height of their zeal they cut the cross out of the King's standard, declaring it to be an idol; and the people thereupon became divided in their opinions, whether it was lawful to have the cross in their colours or not. Several furious books were printed and published on each side the question, and most of their militia refused to march with their colours so long as the cross remained in them, lest they should be thought to do honour to an idol; while others were for following the King's colours with the cross in them, lest their deserting them should be interpreted a casting off their allegiance to the crown of England: But at length the Magistrates and Officers compromised the matter in the following manner: They ordered that all castles and ships should have the same colours as formerly, but that the cross might be omitted in the colours belonging to the regiments of militia. To return to ROGER WILLIAMS, who started and encouraged these notions. So much were his congregation devoted to him that many of them chose to accompany him in his

banishment. Whereupon he led them to the southward, beyond the bounds of the Massachusetts jurisdiction, and there became the founder of another petty state, calling the country Providence, which it retains to this day; and here says the New-England writers, they incorporated a church, proceeding from one whimsey to another until they crumbled to pieces, every one following his own fancy; inasmuch that religion itself grew into contempt, and the publick worship of God was generally neglected among them.

However, they tell us, that ROGER made a good civil Governor, remained in those parts above forty years, and regained his reputation even among the Massachusetts Planters who had banished him, and was very instrumental in obtaining the charter of Rhode-Island, to which his plantation of Providence was annexed; adding, that if he had never meddled with divinity he would have been esteemed a great and useful man.

In the mean time Mr. VANE arrived in the Massachusetts Colony, a gentleman that made a much greater noise afterwards both in Old and New-England than ever ROGER WILLIAMS had done. Their writers represent Mr. VANE at this time as a hot-headed young fellow, whose zeal for pure religion drew him over thither: His first design was to have settled a new colony on the banks of the river Connecticut; but being complimented with the government of the Massachusetts on his arrival, he resolved to stay there.

He was no sooner advanced to the government, but he appeared to be a person of little conduct, and by no means equal to the post he was preferred to: He was, they tell us, a violent enthusiast, openly espousing the antinomian doctrines, and gave such encouragement to their preachers, that he had very near overturned their infant church and commonwealth, if some of the wisest of them had not put an end to his reign, by electing another Governor as soon as the year expired.

He returned afterwards to Old England, where his father being principal Secretary of state he was elected a member of the Long Parliament; and what a share both father and son had in fomenting the Grand Rebellion against King CHARLES I. all the world are apprised; nor did any man act with more zeal, or rather more malice, against the royal family and monarchy itself during the usurpation, than this gentleman, which occasioned his being left out of the act of indemnity by King CHARLES II. But to return to the Massachusetts planters; the brethren flocking over to them continually, so that they began to be straitened for want of room, and the Indians on their western frontiers beginning to be troublesome, they detached a party of an hundred men to the banks of the River Connecticut, that they might plant that country and serve as an out-guard to their more eastern settlements. And these adventurers beginning their march in the month of June, and travelling on foot with their wives, children and baggage, about nine or ten miles a day, arrived at the River Connecticut in less than a fortnight, where they founded the town of Hartford, now the capital of Connecticut, on the west-side of that river; and soon after laid the foundation of Windsor, Weathersfield and Springfield in the same province; and finding themselves beyond the limits of the Massachusetts jurisdiction, they chose a Governor and Magistrates among themselves, and made such laws as they thought fit

fit in imitation of the Colony from whence they came; and in this state they remained till the restoration of King CHARLES II. when they applied to his Majesty for a patent; and in the year 1664 obtained a very ample charter, authorising them to elect their own Governor, Council and Magistrates, and enact such laws as they thought most advantageous to the colony, not opposite to the laws of England; the benefit whereof they enjoy to this day: The colony of New-Haven, and most of the Narraganset country being annexed to it by the same charter, and constituting but one government at present. New-Haven and the Narraganset country it seems had been granted by King CHARLES I. to the Earl of Warwick in the year 1630, and purchased of that Earl by WILLIAM Viscount Say and Seal, ROBERT Lord BROOKS, ROBERT Lord RICH, CHARLES FIENNES, Esq. Sir NATHANIEL RICH, JOHN PYM, Esq. JOHN HAMPDEN, Esq. and other male-contents, who fomented the Grand Rebellion against King CHARLES I. for a place of refuge, in case their conspiracy against that Prince had not succeeded; and they were once upon the point of transporting themselves thither with the most noxious of their party, being in doubt of carrying their point in the senate. OLIVER CROMWELL, 'tis said, was actually on board in the River Thames, intending to have transported himself to New-England; but such multitudes of people were embarking at the same time for the plantations, that it was thought proper to publish a proclamation (dated the 30th of April 1637) prohibiting all people to transport themselves without license, whereby CROMWELL, Sir ARTHUR HASLERIG, Mr. JOHN HAMPDEN, and several other disaffected gentlemen, were prevented going thither; and succeeding in their rebellion afterwards beyond their expectation, they sold their interest in these plantations to other adventurers, who united with the Connecticut Colony, and became one government, as has been intimated already.

New
Hamp-
shire and
Maine
planted.

In the mean time other English adventurers possessed themselves of the countries of New-Hampshire and Maine to the northward of the Massachusetts, which for some time remained separate governments; but afterwards united themselves with the Massachusetts, and continued so till the reign of King CHARLES II. when the Massachusetts charter was adjudged to be forfeited. And in the charter which was granted to the Massachusetts by King WILLIAM III. after the revolution, the provinces of Maine and Plymouth were annexed to the Massachusetts, but Hampshire was made a distinct government immediately depending on the crown, which appoints the Governor, Deputy-Governor, Council and Magistrates there; as will appear further under the head of Government: I shall only add here, that all the New-England provinces were planted and pretty well peopled within the space of seventeen or eighteen years, and a very beneficial fishery carried on at the same time on their coasts by the Merchants of Old-England, who with the fish, taken here annually, purchased the merchandize of Spain and Portugal.

Hitherto the English colonies had lived in peace with the Indians. Some little misunderstandings and slight skirmishes had happened indeed, but these differences had been amicably composed, and no formal war yet entered into with the natives: But upon the Massachusetts penetrating into the

V O L. III.

heart of their country, and taking possession of the province of Connecticut, without any previous treaty, or so much as notice given them of their intention, the Indians immediately concluded they should be extirpated, or at least enslaved by these strangers; and the Pequots, the most potent nation in those parts, thereupon fell upon the English before they had perfected their settlements on Connecticut River, killed nine men, and carried two women into captivity; and then endeavoured to form a confederacy with the rest of the Indian nations against the English for their common defence. But the Narragansets, ancient enemies of the Pequots, refused to come into their measures, and determined to take part with the English, notwithstanding the Pequots represented that nothing could now preserve their country from a foreign yoke but a strict union among themselves: That the Narragansets, if they favoured the English, would only have the satisfaction of being destroyed last; conjuring them therefore, as they valued their own preservation, to forget all quarrels among themselves, and unite in the defence of their common country against so formidable an enemy: That it was true, the fire-arms of the English seemed to render them invincible in a body, yet they might surprise them when they were dispersed in small parties, or busied in building and fortifying their towns; they might cut off their provisions, harraßs their troops, and so distress them by perpetual alarms, if they were unanimous; that they would be glad to retire again to the sea-coasts, and probably abandon their country; whereas if they defer it till more of them came over, and they were suffered to complete the fortifications of their towns, it would then be in vain to struggle for the recovery of their lost liberties, and they must submit to such terms as these foreigners should be pleased to impose on them.

But such was the resentment of the Narragansets against their former enemies the Pequots, who had frequently triumphed over them, that they were not to be removed with any arguments they could use; the prospect of satiating their revenge, on a people that had often insulted them, made them not consider the consequences of assisting the English; or perhaps, like some other people, they chose rather to be slaves to foreigners than to their neighbours, and might hope for better terms from the English by an early submission.

Thus were the Pequots left alone to defend themselves against these powerful invaders, infinitely superior to them both in their arms and in the art of war; and what was still more unfortunate, several Indian nations joined in confederacy with them, and contributed to the conquest of their country. However, they assembled their troops, determining to make the best defence they could; and on the other hand the Governor of the Massachusetts sent a detachment of an hundred and sixty men to support the new Colony of Connecticut, who were joined by five hundred of their Indian allies, who vowed to live and die with the English; but the Narragansets no sooner came in sight of the Pequots than most of them deserted the service and run away; however, the English advanced and drove the Pequots before them, who retired into two forts that were defended only by stakes and bushes, one of which the English entering in the night-time set fire to their thatch'd huts; and the Pequots, endeavouring to make their escape from the flames, were most of them cut in pieces, either by the

English

CHAP.
V.

English or their Indian allies, who now returned to the slaughter of the flying enemy; tho' they could not be persuaded to face them while they were unbroken; and of five hundred Pequots that were shut up within this fort (as it was called) not more than six or seven escaped: This victory being obtained with the loss only of two English men killed and twenty wounded.

The English advancing towards the other fort the garrison mutinied against SASSACUS their Sachem, and he was forced to abandon it; his people thereupon retiring to the woods and swamps; whither being pursued by the English and their allies, some hundreds more of them were killed, and near two hundred men, women and children taken prisoners; who were divided between the colony and the Narraganset Indians: As to those that fell to the share of the English, the males were sent slaves to the Bermudas, and the females distributed in their own families; which success struck such a terror into the Indian Sachems that many of them came in and desired to be taken into the protection of the English. As for SASSACUS, the great King of the Pequots, he fled with most of his subjects to the Maquas; who, at the instance of the Narragansets, cut off his head, and the Connecticut colony possessed themselves of his dominions, as the New-England writers acknowledge. But after this, it is to be presumed, they will no longer affirm that they obtained the lands of the Indians by purchase, or the voluntary grants of the natives.

Who possess their country.

Divisions among the English, occasioned by the numerous and monstrous heresies and errors that were broached at this time.

To proceed in their history. While the Massachusetts were thus successful against their enemies abroad, they were in great danger of being destroyed by their intestine divisions at home, as the celebrated MATHER, and after him Mr. NEAL relate. Familistical and antinomian errors, according to these writers, over-spread the colony, the rise of which they ascribe in a great measure to one Mrs. HUTCHINSON; who observing that the men used to meet once a week at Boston to repeat the sermons they had heard the preceeding Sunday, and to pass their judgments on the doctrines contained in them, she apprehended it might be as expedient for the zealous women to have the same kind of meetings, grounding her opinion on that passage of scripture, that the elder woman ought to teach the younger; and accordingly assembled three or fourscore women at her house every week, where she repeated the sermons of her teacher Mr. COTTON, and made her remarks on them. Among other things she taught her disciples, that believers were personally united with the spirit of God, and that the revelations the saints were indulged with, were of equal authority with the holy scriptures; that their ministers were legalists, men that were unacquainted with the spirit of the gospel and with Christ himself: And the whole country became immediately divided into two factions, the one zealous for the covenant of works, and the other for the covenant of grace, as they called them. The colony of Plymouth were so furious for the latter, that they starved and discarded all their old ministers who were of another opinion, and set up mechanicks in their stead. The town of Boston also was infected with antinomianism; whereupon the fathers of the Massachusetts Colony thought fit to call a synod to censure their errors, of which they enumerated above four-score, some of them, according to the abovesaid writers, the most mon-

strous and absurd that ever were broached: And when Mr. WHEELRIGHT, one of their Ministers, and Mrs. HUTCHINSON persisted to avow their opinions, the synod called in the lay powers to their assistance, and caused WHEELRIGHT, Mrs. HUTCHINSON, and many more of their adherents, to be banished the colony, and fined and imprisoned others, without which wholesome severities they suggested it was impossible for their church or commonwealth to subsist: For, say they, these men were for turning the government upside down, and excluding the Magistrates as unqualified for their offices, because they were men of legal spirit, and inclined to a covenant of works.

One party banishes the other.

Those that were thus banished, and many more of their friends, hereupon retired to Rhode-Island, which they planted in the year 1639, and purchasing that tract of land over-against it on the continent, where the towns of Providence and Warwick are situated, they became a separate colony, and in proportion to the extent of their territories, which are but small, are now as flourishing a people as any in New England; tho' Dr. MATHER and the rest of the Massachusetts fathers load them with the most scandalous reproaches, representing them as a generation of libertines, familists, antinomians, and quakers, whose posterity, for want of schools and a publick ministry, became so barbarous, they say, as not to be capable of speaking good English or good sense.

On the other hand, the good people of Rhode-Island charge the Massachusetts fathers with persecution for conscience-sake, the very motive which induced them all to leave their native country: And they glory in it, that in this colony no man's conscience was ever forced, or any manner of compulsion used in matters of religion to this day.

Charge the Independents with persecution.

Notwithstanding these divisions among the English, the natives remained quiet for some time after the defeat of the Pequots, or Connecticut Indians; and in the year 1641 the great King or Sachem MASSASOJET came to Plymouth with his son MOGANAM, to confirm his ancient league with the English, both of them promising to remain faithful subjects to the King of Great-Britain; and the colony on the other hand promised to protect and defend them against their enemies.

MASSASOJET renews the treaty of alliance with the Plymouth Colony.

And now the civil wars breaking out in Old-England, and the faction at London carrying all before them, the brethren put a stop to their embarkations for New-England, and instead of transporting themselves thither, a great many gentlemen and non-conformist Ministers returned to Old-England at this time (1641) either to new model the church here, or to assist in subduing their Prince and country; in order to erect such another commonwealth at home as they had established in New-England; among whom were EDWARD WINSLOW, afterwards one of the Commissioners of the navy under the usurpers, EDWARD HOPKINS, a Commissioner of their admiralty, GEORGE DOWNING, afterwards Sir GEORGE DOWNING, employed as envoy in Holland by the usurpers, and afterwards by King CHARLES II. SAMUEL MATHER, JOHN KNOWLES, THOMAS ALLEN, HENRY WHITFIELD, and the infamous HUGH PETERS, CROMWELL's chaplain and buffoon, who made a jest of all religions and all forms of government.

The New-England heroes return to England, and join the rebels, an. 1641.

In

CHAP.

V.

The government of New-England modelled like that of Holland.

In the mean time those they left behind them in New-England, kept pace with the disaffected here, or rather led the way in casting off their allegiance to the crown of Great-Britain: And in the year 1643 the four principal colonies of New-England (viz.) the Massachusetts, Plymouth, Connecticut, and New-Haven Colonies entered into an association or confederacy; like that of the United Provinces, to defend themselves against all mankind.

They exclude all that differ from them from places in the government.

Each province assumed sovereign power, and agreed to send deputies to a certain place, where they were to form a council like that of the States General, and negotiate their common concerns, especially those relating to peace and war, and the adjusting their several quotas and proportions of men and money; but their resolutions were to be of no force till confirmed by the respective colonies. They also copied so far after the Dutch as not to suffer any denomination of christians but those of their own church, to have any posts or places in the government, and laid dissenters to independency under very great restraints and hardships; of which the presbyterians, anabaptists, antinomians, and other sects complained very loudly: They represented, that they had a natural right to be admitted to a share in the government as well as the independents without taking the oaths and covenants that were required of them, and were evidently inconsistent with the oath of allegiance: And that it was still more oppressive to fine and imprison them for neglecting to take such oaths, and press them into the military service against their wills, as many of them were: They preferred a petition therefore to the government to have these grievances redressed, which being rejected, they appealed to the parliament of England, and sent over Agents thither to lay their case before the Houses; at which the independent preachers exclaimed in their pulpits, calling it an unjust and rebellious appeal against the people of God, and denounced judgment against those that promoted it.

Conversion of the Indians.

While the independents thus persecuted their brethren in New-England, their historians inform us; they appeared no less zealous in converting and civilizing the Indians that lived amongst them; and as these poor creatures were absolutely in their power, I find they submitted to whatever their masters dictated; and thereupon the independent fathers boast of the hundreds and thousands they converted in the space of a few years. But this seeming conversion appears to be owing altogether to force and compulsion; for I do not find they ever made converts of any Indians but those in the little islands upon the coast, and such as resided within their bounds. There is scarce an instance of a convert made beyond the walls of their towns; or if there were any such they have now deserted their communion, all the Indians on the borders of New-England, that are at liberty, being roman catholicks at this day, the fruits of the jesuit missions. And here give me leave to mention some few of those customs the New-England fathers of those days compelled their converts to observe, which were such as these: That the women should not wear their hair loose and flowing, but tied up; and that they should not go with naked breasts: That the men should not wear long hair, or kill their Lice between their teeth; and that they should not commit fornication, or beat their wives: That they should not attend the pawawing, or superstitious ceremonies

and forceries of their priests: That they should lay aside the custom of howling, greasing their bodies, and adorning their hair: That they should not steal, get drunk, or break the sabbath: That they should pray in their wigwams with their families, and say grace before and after meat. Their writers add, that having instructed a great many hundred Indians in the christian religion, they proceeded to baptize and admit them to the communion; and several congregational churches were formed out of them, after the manner of the independents, about the year 1660. They also printed catechisms, the practice of piety, and even the bible itself in the Indian language. Several Indians were ordained preachers, and some specimens are given us of their sermons and prayers; from whence it is not difficult to discover who were their masters, and where they learned their divinity: The chief apostles in these notable conversions of the Indians were Mr. ELLIOT, Mr. MAYHEW, and Mr. COTTON.

Doctor INCREASE MATHER, Minister of Boston, and Rector of their university of Cambridge, in his letter to Doctor LEUSDEN, hebrew professor at Utrecht, and dated the 12th of July 1687, tells him, that there were then six churches of baptized Indians in New-England, and eighteen assemblies of catechumens: That there were there four English Ministers who preached in the Indian tongue, and twenty four Indians who were preachers: And Dr. COTTON MATHER, son of INCREASE MATHER, who has brought down their ecclesiastical history to the year 1695, says, there were then three thousand adult Indian christians in the islands of MARTHA'S Vineyard and Nantucket; but the Indians on the continent, and especially at a distance from the coast, it appears, have but little regard to the independent missionaries. Mr. EXPERIENCE MAYHEW, in his visitation of the Pequot and Mohegin Indians, in the years 1713 and 1714, observed that the remains of those nations were under strong prejudices against the christian religion; and that one of their Sachems bid him go and make the English good first before he preach'd to them; objecting that some of the English kept Saturday, others Sunday, and others no day at all for the worship of God; so that if his people were inclined to turn Christians, they could not tell what sect to be of. Others, after they had heard him preach, said, they did believe the being of a God, and worshipped him, but as every nation had its peculiar way of worship, so they had theirs, and they thought their way good, and there was no reason to alter it. Another said, that the difficulties of the Christian religion were such as the Indians could not endure; their fathers had made some trial of it, but found it too hard for them, and therefore quitted it; and they were no more able to undergo the hardships of it than their fathers: That they did not see men were ever the better for being Christians, the English Christians cheated the Indians of their lands, and wronged them in other instances; and their knowledge of books only rendered them more artful and cunning to cheat others, and therefore seemed to do them more hurt than good; and one of their priests plainly told Mr. MAYHEW, if the Indians made him any promises of becoming Christians, they would not keep them, but as soon as he was gone, they would get drunk, and be as bad as ever.

The Indians prejudiced against the independent.

My

CHAP. V. My author (Mr. NEAL) having finish'd his account of the conversions of the Indians, proceeds to censure the independent church of New-England for not allowing liberty of conscience, telling us they fined two anabaptists for separating from them, and whipped a third at the common whipping post; and that they afterwards passed an act of assembly to banish all anabaptists the colony. But they appeared still more severe against the quakers in the year 1656; for having fined, imprisoned, and whipped many of them, and finding this would not reclaim them, tho' some of them were almost whipped to death, a law was made for cutting off their ears, and boring their tongues through with hot irons; and lastly, they made it death (in the year 1658) for a quaker to return from banishment; and three of them actually suffered death at Boston by virtue of that act, in the year 1659, viz. WILLIAM ROBINSON, of London, merchant, MARMADUKE STEVENSON, of Yorkshire, husbandman, and MARY DYAR.

Several quakers put to death.

STEVENSON, a little before his execution, signed a paper, wherein he says, "That when he was following his plough, in the east part of Yorkshire in Old-England, he was in a sort of rapture, and heard a secret voice in his conscience, saying, I have ordained thee a prophet of the nations: And in obedience to this voice he left his family and employment, and went first to Barbadoes, in the year 1658, and from thence to Rhode-Island, where, as he was visiting the seed, the word of the LORD came to him, saying, Go to Boston with thy brother WILLIAM ROBINSON; and for yielding obedience to this command of the ever living GOD, and not obeying the commands of men, he suffered." And ROBINSON also left a paper of the like tenour.

These executions, says my author (Mr. NEAL) raised a great clamour against the government, and sullied the glory of their former sufferings from the bishops; for now it appeared that the New-England puritans were no better friends to liberty of conscience than their adversaries; and that the question between them was not whether one party of Christians ought to oppress another, but who should have the power of doing it. The quakers themselves observed upon these executions, that the law for putting them to death was contrary to the laws of England, and consequently a forfeiture of their charter: And if it was not contrary to the laws of England, it was certainly contrary to the laws of God, which allowed every man a right of private judgment, or to judge for himself in religious matters. They added, that if it was an offence to make profession of their religion, the punishment they inflicted upon it, however, was too severe; for they were not charged with felony or treason, but only with a contempt of authority and GOD's ordinances, which might deserve a fine or the pillory, but were never punished with death in any civilized nation.

However, the government still continued to put this sanguinary act in execution, and having banished several quakers more, put to death WILLIAM LEDDIA, a foreigner, in the year 1660; who told them, when he was brought to the gallows, That he suffered for bearing his testimony for the LORD against the deceivers and the deceived. Nor did the puritans of New-England cause these bloody persecutions to cease, till

they received the following order from King CHARLES II.

CHARLES REX.

"Trusty and well beloved, We greet you well. Having been informed that several of our subjects among you, called quakers, have been, and are imprisoned by you, whereof some have been executed, and others (as hath been represented to us) are in danger to undergo the like; we have thought fit to signify our pleasure in that behalf for the future, and do hereby require, That if there be any of those people called quakers, amongst you now, already condemned to suffer death, or other corporal punishment; or that are imprisoned, and obnoxious to the like condemnation, you are to forbear to proceed any further therein, but that you forthwith send the said persons (whether condemned or imprisoned) over into this our kingdom of England, together with their respective crimes or offences laid to their charge, to the end such course may be taken with them here as shall be agreeable to our laws and their demerits; and for so doing, these our letters shall be your sufficient warrant and discharge. Given at our court at Whitehall, September the 9th, 1661, in the 13th year of our reign.

"Subscribed, to our trusty and well beloved JOHN ENDICOT, Esq. and to all and every other the Governor or Governors of our plantation of New-England, and of all the colonies thereunto belonging, that now are, or hereafter shall be; and to all and every the Ministers and Officers of our said plantation and colonies whatsoever within the continent of New-England.

By his Majesty's command.

WILLIAM MORRIS.

The same author observes, that all the colonies of New-England were not equally severe against the quakers. They suffered but little in the districts of Connecticut and New-Haven; but Plymouth colony copied after the Massachusetts, as appeared by a letter from Mr. JAMES CUDWORTH to his friend at London, dated the 10th of December, 1658, wherein Mr. CUDWORTH says: The condition of things amongst us is sad, and so like to continue. The antichristian persecuting spirit is very active. He that will not whip and lash, persecute and punish men that differ in matters of religion, must not sit on the bench, or sustain any office in the commonwealth. By our law, if any man entertain a quaker but a quarter of an hour he forfeits five Pound; and if any man see a quaker, he is obliged to give notice to the next Constable, tho' he lives five miles off, and the Constable is to apprehend him; and if he do not presently depart, to whip and send him away. Divers have been whipped in our colony; and to tell you truly, the whipping them with that cruelty as some have been whipped, and their patience under it, has gained them more disciples than their preaching could have done.

There

CHAP. V. There is another law in our colony, which provides, that if a quaker's meeting be held in any man's house or ground, the owner thereof shall pay forty Shillings, and the preacher and every hearer the like sum. Our civil powers (says the writer) are so exercised in matters of religion and conscience, that they have no time to do any thing that tends to promote the civil prosperity of the place. We must now have a state religion, such as the powers of this world will allow, and no other. A state ministry (clergy) and a state maintenance for them: And we must worship and serve the LORD JESUS as the world shall appoint us: We must all go to the publick place of meeting in the parish where we dwell, or forfeit ten Shillings for absenting: Fourscore were presented last court for not coming to the publick meetings.

But notwithstanding the independents of New-England persecuted every other denomination of Christians, when they addressed King CHARLES II. on his restoration, they implored that he would grant them that invaluable blessing, liberty of conscience, which they denied to every body else; and endeavoured at the same time to justify their usage of the quakers. They pretended also to merit his favour, by telling him, That they were not seditious as to the interests of Cæsar, nor schismatick as to matters of religion (which was equally true, for they had taken part with every species of usurpers against church and crown from the beginning of the civil wars till the restoration.) The next thing I meet with remarkable in their history, is a dispute among the independents of New-England, in the year 1662, whether the children of persons baptized (who had not entered into covenant to be obedient to that church, and been formally admitted members after they were of years of discretion) might be baptized; and upon calling a synod of their preachers, it was decreed, that the children of such persons ought not to be baptized.

In the same year they began their prosecution of witches, and put to death one Mrs. GREENSMITH for acts of witchcraft said to be committed on the body of ANNE COLE, who being taken with fits, accused this GREENSMITH as the occasion of them. Their Ministers relate that the prisoner was prevailed on also to confess, that the devil appeared to her in the shape of a Deer, and that she talked with him, though she did not enter into covenant with him, and he had carnal knowledge of her body; from whence it appears that the devil is flesh and blood, and not a spirit, and indulges himself in the same pleasures as those of human race, according to the New-England creed; but of this hereafter, when I come to speak of those numerous murders that were committed there under a colour of law for the like pretended crimes. In the year 1664 Connecticut and New-Haven procured the charter already mentioned from King CHARLES II; which united those two colonies, and empowered them to elect their own Governor, Council, and Magistrates, and make laws. The same year King CHARLES made a grant to his royal Highness JAMES Duke of York (his brother) of the provinces of New-York and New-Jersey, then called Nova Belgia, which the Dutch pretended to have purchased of Mr. HUDSON, an Englishman, about the year 1608, and afterwards planted in 1623; and the latter end of this year a squadron of men of war with land

forces on board, under the command of ROBERT CARLISLE, sailed from London, and arrived at the mouth of Hudson's River, now New-York. The Governor, it was said, was stricken with a stroke, and the inhabitants chose to take the oath of allegiance to the King of England, and to William of Orange, now Albany, an Englishman, who had been up Hudson's River, also with a squadron, in the possession of the Dutch, and which remained in the possession of the King, having been confirmed to them by the treaty of peace that was made at the end of the war.

The displeasure of the government (in England) says Mr. NEAL, still ran against the anabaptists and quakers (says the writer) being very severe in putting the laws in execution against them, whereby many honest people were ruined by fines, imprisonment and banishment, which was the more extraordinary, the writer observes, because their brethren in England pretended to groan under persecution there. Sad complaints were sent over every summer of the severity of the government of New-England against the anabaptists, which induced the dissenters in London to send a letter to the Governor of the Massachusetts, signed by their preachers, Dr. GOODWIN, Dr. OWEN, Mr. NYE, Mr. CARYL, and nine more, intreating him to make use of his authority and interest for restoring such of them to their liberty as were in prison on account of religion, and that their sanguinary laws might not be put in execution for the future. In this letter they tell the Governor they hoped he would not give an advantage to their adversaries, who sought pretences and occasions against their liberty, and were too apt to retort upon them, that persons of their principles could not bear with dissenters from them, and lest it to his wisdom therefore to consider if it was not advisable at present to put an end to the sufferings and confinement of the persons censured, and restore them to their liberty.

But this letter, says Mr. NEAL (my author) made no impression on them; the prisoners were not released, nor the execution of the laws suspended. The persecuted quakers also sent over a petition or representation to his Majesty, where, in having enumerated the hardships their friends suffered during CROMWELL's usurpation, they add, "And now, O King, since the very day the LORD brought thee into this land again, and gave unto thee thy regal power, have they in thy name made strange and cruel havock of thy true subjects, in putting to death and banishing: "And in thy name, with many torturing whippings of old and young at posts, and at wheels of great guns, and at carts tails, dragging the naked bodies of parents, and children through divers long towns, through the dirt and filth of their chanel and cart-ways: And in thy name commanding one friend and brother to help imprison the other; yea, in thy name they have lately pressed the son to help to force his tender father and mother to goal sundry miles in the extremity of the winter-season, to the hazard of their lives: And such as refused to obey their unnatural and abominable commands, they have fined in their courts. And thus from court to court do these monsters of men, in thy name,

The quakers petition to King CHARLES II.

CHAP. V. "fine and break open the houses of the quakers; and rob them of their goods, and take away that they should eat in, and that they should drink in; yea, the very cloaths from their backs in the winter, and the bed they should lie on, while they keep the body sundry miles off in prison; driving husbands and wives divers miles to prison; in times of great frost and snow, keeping them close prisoners in a very cold room, to the endangering of their lives, and to the ruin of their families, had not the Lord preserved them. All this, and much more too tedious to mention at this time, have they done to the servants of the Lord in New-England, in thy name, saying that thou ownest their doings, and esteamest their laws as thy laws: And these hard things have the servants of the Lord patiently suffered and sustained at their hands for no other cause but for their faithful obedience to the spirit of the Lord in their hearts, which spirit of holiness teacheth them, that forced worships and worshippers are both an abomination to the Lord. These few Lines are written not from any desire of the least revenge from thy hand upon them, but that thou mayest know it, and make known thy dislike of their wickedness, that so the blood of the innocent there, if possible, might not be laid to thy charge in the terrible day of the Lord."

The quakers also reflected severely upon the dissenting preachers in London, because they did not mention them in the letter they wrote to the Governor of New-England in behalf of the other sects: And in the reign of Queen ANNE, Mr. NEAL observes, the principal quakers in London presented the following short memorial to the dissenting Ministers of that City, viz.

"There being several severe laws, made by your brethren in New-England in the Massachusetts bay and province, against our friends the people called quakers, only for their conscientious dissent from the national way there, if you are for liberty of conscience to those that dissent from you, and are willing our friends in New-England should enjoy the like liberty of conscience there as you with us do here, we request you to manifest your sincerity herein, not only by shewing your dislike hereof to your brethren there, but also by your concurrent application with us to the Queen, that she would be favourably pleased to disallow of all such laws."

The dissenters of London thereupon writing over to their brethren in New-England, desired the quakers might be allowed liberty of conscience there.

The independent answer to the quakers charge of persecution.

Doctor COTTON MATHER, a New-England preacher, in the name of the rest answered, that there could not then (in the reign of Queen ANNE) be any severe laws in force there on account of religion, because their charter expressly provided, that liberty of conscience should be allowed there for ever in the worship of God to all Christians, except papists.

But the severe laws they complained of (says MATHER) were only such as these; 1. The law which requires all persons of a proper age, quality and condition, to attend the military exercises on four training days in a year; as also to be furnished with arms and ammunition fit for service, on the penalty of a moderate fine therein expressed. Now, the government does not insist

upon the quakers personal appearance, but upon their paying the fine, in case of default, as many other gentlemen and inhabitants of the country chuse to do; but the quakers will do neither. Tho' they enjoy the protection of the government, they will do nothing towards the security and defence of it; which is the more extraordinary, since all the world knows that the quakers in Pennsylvania, in the year 1692, on occasion of a piracy, hired men with money, and supplied them with ammunition and fire-arms to recover their sloop from the privateers.

Another branch of the law provides, that there be military watches kept in every town at such times, in such places, and in such numbers, and under such regulations as the chief Officer in each town shall appoint, and that all persons able of body, or that are of estates (not exempt by law) shall by themselves, or some meet person in their stead, attend the same, on the penalty therein expressed. But the quakers, though the country was then at war with the French and Indians, would neither provide arms and ammunition, nor watch and ward; they would neither march out against the enemy nor keep garrison at home, nor pay the penalty which the law provides for defaulters. It is true, the quakers pay the taxes raised by the general assembly for the maintenance of the army, but refuse to submit to the penalty which the law inflicts on personal defaulters in the trained-bands, which has obliged the Officers sometimes to distrain their goods; but the quakers have no more reason to complain of this, than of the practice of their own friends in Pennsylvania, who have not only fined their brethren for declining to serve on juries, but have violently taken away their goods for non-payment, though they pleaded the laws of England, which exempt quakers from serving on juries.

The other severe law which the quakers complain of, is that which obliges them, as well as the other Inhabitants, to pay their proportion of assessment for the maintenance of the Ministers legally chosen and settled. This law extends only to such places where the Minister's salary is raised by assessment; for in Boston, and some other places, it is raised by a voluntary contribution, and there nothing is demanded of them. But if this law was universal, it is no greater a hardship than they are under from the national Church of Old-England; and yet the Governors of New-England have something more to say for themselves; for in a considerable part of the province, the original grants of the lands were made with this condition, that there should be certain taxes paid out of them as a sort of quit-rent, towards the maintenance of the established ministry: Now, tho' the quakers are in possession of some of those lands, and have raised estates upon them, yet they deny to pay the quit-rent, because it is to support a ministry they do not approve of.

Now if this be a true state of the case (says MATHER) I leave the reader to judge whether the quakers had reason to raise such a cry of persecution against the New-English government, or to prefer a supplication to Queen ANNE against them, when they enjoyed the same privileges with the rest of their fellow-subjects of that country.

Thus I have given some account of the divisions among the New-England sectaries, and of the persecuting spirit of the Independents or governing party there, which will be enlarged upon hereafter. It is time now to return to the civil history of this province, which has not yet been brought down

lower

CHAP. V. lower than the year 1673, when there happened one of the most remarkable occurrences that is to be met with upon record, and can by no means be omitted here, because it shews how America was or might be, first peopled; an event that has perplexed all inquisitive people that have hitherto treated on that subject.

A boat with men in it drove from the coast of Spain to New-England. A vessel being bound from the Straights to London, the crew mutinied against their master and officers, and having put them into the long-boat, with a small quantity of provisions, about an hundred leagues to the westward of the coast of Spain, the mutineers set sail with the ship for New-England, where they arrived in a few weeks; but to their great surprise met with their master and his officers soon after their coming on shore, for the wind having blown briskly from the eastward from the time the ship parted from the long-boat, and the officers labouring hard at their oars, they had the good fortune to make the coast of New-England before their provision was all spent; and the Captain informing the Magistrates of Boston of the matter, the crew were apprehended, tried and convicted of piracy; and FOREST, the chief of the mutineers, with several more of the criminals, were executed for the fact at Boston this very year 1673; which does not only shew the possibility of peopling America by ships, or even boats driven from the coasts of Europe or Africa, but that it must have been very strange, if no such accident had ever happened, when the Phœnicians and Carthaginians were so long masters of the western coasts of Europe and Africa, and of the Canary Islands, and other islands that lie between this and the American continent; especially as the wind always sits easterly between the tropicks, and six or seven degrees beyond either tropick. But to proceed in the history of New-England.

The history of New-England resumed. The Indians until now made scarce any attempts for the recovery of their liberties, after the Pequot Nation was subdued in the year 1637. Their respective sovereigns remained at variance among themselves, and frequently called in the English to revenge their domestick quarrels, appealing to them when they apprehended themselves injured, and making the English arbiters of all their differences; who cunningly played one against another, until they were so weakened by their private quarrels, that our colonies found themselves in a condition to give law to the whole country; after which they proceeded to enlarge and strengthen their frontiers, using the natives as their slaves and vassals; which the Indians might easily have foreseen would be the consequence of calling in a people so much superior to themselves to assist in the conquest of their domestick enemies, if they had not been blinded and infatuated with an insatiable thirst of revenge.

There may also be other reasons assigned for their courting and submitting to the English: They might be so terrified by their fire-arms at their first arrival, as to apprehend them irresistible, and might hope to obtain the better terms by a ready submission. They might hope perhaps to gain advantages in point of traffick also by entering into alliances with them; and probably were imposed on by the fair pretences of the adventurers, who assured them they had no other design than trade, and to exchange the valuable merchandize of Europe for what their country afforded; and desired only to purchase some small parcels of land to secure their effects,

and enable them to carry on their traffick with advantage.

These or some such reasons, no doubt induced the Indians to permit the English to settle amongst them, and to give them but little disturbance for thirty years and upwards; but when they found the English used them every where like a conquered people, and there was not much distinction made between those that had submitted and entered into alliances with them, and those who had not, but that they were all now equally slaves, and compelled to part with their religion as well as their liberties, they entered into a general confederacy to shake off this insupportable foreign yoke, in which they were encouraged by the following considerations.

1. The tyranny of the English had rendered them more unanimous than formerly.

2. Their fire-arms were no longer terrible; the English had taught the natives the use of guns, given them powder and shot, and employed them in shooting game, so that the Indians were become better marksmen than their masters.

3. The English now looking upon themselves to be secure, and believing the Indians would never dare to make head against them, had neglected to fortify their towns, and discipline their forces, which rendered it much easier to drive them from their coasts at this time than it was when they stood upon their guard, as in an enemy's country.

In these circumstances, METACOMET (the son and successor of the great MASSASOET King of the Wampanoags, who had formerly taken the christian name of PHILIP upon him, when he renewed the treaty of alliance his father made with the colony of Plymouth,) observing the encroachments of the English, who had in a manner deprived him of his authority, treating him and the neighbouring Sachems as their vassals.

This prince, eminent for his valour and conduct, dispatched messengers privately thro' all the tribes of Indians, inviting them to a general revolt, as the English termed it, of which the government of Plymouth received advice by one SAUSAMAN, who had changed his religion several times, and was now pleased to profess himself a christian. PHILIP being informed that his design had taken air, and who had betrayed him, ordered some of his people to surprise and kill SAUSAMAN as he went to visit his converts (for the English it seems employed him as a missionary among the natives) and the Sachem's orders were executed with great privacy; for three or four Indians met SAUSAMAN on the road, and killed him as he was going over a pond that was frozen, and cutting a hole in the ice thrust his body under it, leaving his hat and gun near the place, that it might be thought he fell in accidentally: And it seems those that found his corps were of that mind, for they buried him without inquiring farther into the matter. But the Magistrates of Plymouth suspecting some foul play, ordered the body to be dug up, and a jury, half English and half natives, to sit upon it; who found that his neck was broke, his head very much swelled, and several bruises on his body, and gave their verdict that he was murdered. But the first intimation, who were the authors of his death, according to the credulous Dr. MATHER, proceeded from the bleeding of the corps on its being touched by an Indian named TOTOS, one of King PHILIP's council; though afterwards (tis said)

A general conspiracy against the English.

The conspiracy discovered by SAUSAMAN.

Who is killed by the Indians.

The murderers put to death by the English.

CHAP. V. (said) another Indian came in as a witness, and swore positively that he saw TOBIAS and two more murder SAUSAMAN; and tho' all three of them denied the fact when they were brought to the gallows; yet one of them breaking the rope confessed that he saw the other two murder the deceased, but still avowed his own innocence.

A war
commen-
ces there-
upon.

King PHILIP driven from Mount Hope.

From hence it is evident that the colony had assumed the government of the Indians as well as of the English: And this instance of it was no doubt a fresh provocation to the Sachem PHILIP, and the more so as they had taken upon them to put to death one of his principal Ministers without laying the matter before him, or demanding satisfaction in an amicable manner. And though he smothered his resentment some months, he was no sooner prepared to execute the scheme he had formed, but he suffered his people to insult the English settlements; and when complaint was made to him, he returned such haughty answers as discovered he no longer intended to submit to their usurpations. In the month of June 1675, things came to an open rupture, for the Sachem encouraged his soldiers to plunder some plantations almost in view of his palace of Mount-Hope; and a party of English being sent out to protect them, fell into an ambuscade of Indians, who fired from the bushes and killed six or seven of the Plymouth men, and then retired to the woods. Whereupon the Governor of Plymouth immediately dispatched an express to the Massachusetts, and the rest of the united colonies, with advice that the war was actually begun, and to demand the troops they were respectively obliged to send to his assistance by the articles of the confederacy.

These succours being arrived, the English attacked the Sachem in his palace of Mount-Hope, which, after a faint resistance he abandoned (the place being surrounded by the English plantations) and retired to the Pocasset Indians on the sea-coast; whereupon the English marched into the country of the Narragansets, whose fidelity they suspected, compelled them to deliver up several of their Sachems as hostages, and sign a treaty, whereby they obliged themselves to assist the confederated colonies against King PHILIP and his adherents; after which receiving intelligence that King PHILIP was fortifying himself in a swamp covered with bushes, in the Pocasset country, the English surrounded the place with their forces, and by blocking up the avenues to it proposed to reduce him by famine. But PHILIP escaped in the night-time on a float of timber over a river that ran by the side of the swamp or morass, and fled to the Nipmuck Indians, who inhabited the inland country on the east side of the river Connecticut. Here PHILIP assembled a considerable army, and soon became master of most of the English plantations in this country; and four-score of the English retiring to a place of difficult access, he besieged them in it; but the confederated colonies sending a detachment to the assistance of their friends, the siege was raised, and PHILIP retreated further westward, being pursued as far as the river Connecticut. Several skirmishes in the mean time happened between the English and Indians in the other colonies; all the nations of Indians having by this time taken arms to recover their expiring liberties, which they were now too late convinced were in the utmost danger. And in some encounters they were successful. They attacked Captain BEERS, who com-

manded a party of six and thirty men, killing the Captain and twenty more, the rest making their escape to Hadly; after which the enemy cut off the heads of the slain, fixing some of them on poles by the high-way side, and hanging up others by the jaws on the boughs of trees; which Major TREAT marching with a body of four-score men to revenge, and fighting after the Indian manner in the woods, where every man endeavoured to cover himself by some tree from the enemy's shot, the Indians, who were ten times his number, and better marksmen, killed seventy of his men; and the remainder had been cut off if Captain MOSELY (hearing the continual fire) had not come in to their assistance; after which PHILIP's men retired, having lost about an hundred of their companions, as the New-England histories relate. However, it appears from the same histories, that the Indians were still masters of the field, and among other places burnt and plundered the town of Springfield, situated on the river Connecticut; and the New-England people were now so sensible of their weakness, that they had recourse to fasting and prayers to deprecate the divine vengeance, and inquire into the crying sins of the land, which they held to be the occasion of these calamities; but in their bead-roll of sins they never took notice of the most crying sins of injustice and oppression of the Indians, over whose persons and country they had usurped the dominion, and which were indeed the sole occasion of this war, and of the calamities they most justly suffered in it.

However, bad as their cause was, they met with some success soon after, which they held to be the effect no doubt of their fasts. They received intelligence, or pretended they had intelligence, that the Narragansets had harboured some of King PHILIP's soldiers, which they determined amounted to a declaration of war; and therefore in the beginning of winter, 1675, without sending to enquire the truth of the advice, or expostulating with the Narragansets, they invaded their country with twelve or fifteen hundred English destroying it with fire and sword; and the people thereupon retiring into a swamp, which they endeavoured to fortify by cutting down trees, and raising a breast-work, the English stormed and carried the place, killing a thousand Indians in arms, among whom were twenty of their Captains of great fame: Besides these were massacred multitudes of old men, women and children, who fled hither on the invasion, this being esteemed the best natural fortification, and the most inaccessible in the country of the Narragansets. The English lost in the action six of their bravest Captains, and eighty-five Soldiers, besides an hundred and fifty that were wounded.

This slaughter of the Narragansets did not go long unrevenged; for all the Indian nations on the frontiers of New-England immediately took the field (and calling in the French of Canada to their assistance, as their histories relate) they burnt and plundered the towns of Mendon, Lancaster, Marlborough, Sudbury, Chelmsford, Weymouth, and even the town of Medfield, within twenty Miles of Boston, the capital of the Massachusetts, carrying many of the inhabitants into slavery. From hence they marched into the colony of Plymouth, where the war first began, laid the town of Warwick in ashes, and surprised Plymouth, the capital of that colony,

CHAP. V. Two parties of English cut off by the Indians.

The Narragansets massacred.

The Indians burnt and plundered the English towns.

CHAP. V. lony, but were beaten out of it again; and being pursued by fifty English, and twenty Christian Indians, they formed an ambuscade, into which the English fell and were all cut in pieces, except one Englishman, and twelve of their Indian allies. After this King PHILIP's people burnt the towns of Rehoboth, Providence, Andover, and several more; the inhabitants having deserted them and fled for refuge to places that were more defensible.

They cut off two detachments of English.

In the mean time a detachment of seventy English under the command of Captain WADSWORTH and Captain BRATTLEBANK, marching to the assistance of their friends, were surrounded by five hundred Indians, who killed fifty of them on the spot, and took some prisoners after a very obstinate engagement, wherein it is said above one hundred Indians were slain. However, it is agreed on all hands, the Indians obtained the victory, and, according to the New-England histories, put their prisoners to death by the most unheard-of tortures. But notwithstanding the Indians were generally successful during the winter, when the season was so rigorous that the English forces could not keep the field, fortune began to frown on them in the beginning of the year 1676.

The Indians ruined by their divisions. King PHILIP's troops were defeated in several encounters, and the potent nation of the Mohawks, upon some quarrel with PHILIP, entering into a league offensive and defensive with the English, he was no longer able to make head against his enemies, but fled to his fortress of Mount-Hope in Plymouth Colony, where the war began. And here he shut himself up, refusing to surrender, but was at length killed by a musket shot, on the 12th of August 1676. The brave Queen of Pocasset, his most faithful ally, lost her life a few days before. This heroic savage being surprized by a detachment of the English, animated her men as long as there was any hopes of success, and when they deserted her, fled to a river-side, where missing of her canoes, she attempted to cross the river and was drowned.

PHILIP killed. The Queen of Pocasset defeated and drowned.

The character of King PHILIP is, that he was ever an implacable enemy of the English nation; a bold and daring Prince, with all the pride, fierceness, and cruelty of a savage, and a mixture of deep cunning and design. He had the address to engage all the Indian nations in his neighbourhood in the war against the growing power of the English; and when his affairs became desperate, chose rather to die than survive the liberties of his country, and submit to a foreign yoke: That he was no less an enemy to the Christian religion than to the dominion of the English, never suffering any of them to preach to his people, telling their missionaries he did not care a button for their gospel.

The Indians on the south-west entirely subdued. Upon the death of King PHILIP, his adherents either submitted to the English government or dispersed, some of them flying to Albany, and others beyond the river Piscatawa; which put an end to the war on the south-east of New-England, and so broke the strength of the Indians there, that they never attempted an insurrection afterwards: But the war of the frontiers of New-Hampshire and Maine (that is, on the north and the north-east) still continued. The Massachu-

The war on the north-east.

set writers inform us, that the English adventurers, who first possessed themselves of the provinces of Maine and New-Hampshire, lived dis-

CHAP. V. perfed all over those countries without building a single town or fort in it for their defence; and behaved themselves however very insolently, treating the Indians as slaves, and cheating and imposing upon them in their traffick; though their trade would have been very advantageous to them if they had dealt fairly and upon the square, inasmuch as they purchased Beaver-skins and other rich Furs of the natives for trifles.

The Indians had long borne with the insults and outrages committed by the English of these colonies; but when they found they were engaged in a war with their countrymen on the south-west, they also had recourse to arms, over-run and plundered the provinces of Maine and Hampshire, the English flying before them to the towns in the Massachuset Colony; and those which could not escape thither were either cut in pieces or carried into captivity. Whereupon the Massachusets detached a body of two hundred men to oppose the Indians on the north-east, who had the good fortune to surprize four hundred of the enemy and make them all prisoners. Upon which success the Indians were induced to come to a treaty with the English, and a peace was concluded on the 12th of November, 1676, on the following terms, viz.

1. That the Indians should deliver up all the English prisoners they had taken, with their effects, and make satisfaction for the losses the English had sustained. 2. That the English furnishing the Indians with powder and shot, they should trade with no other people; and, 3. That those who had been concerned in massacring the English in their houses before war was declared, should be put to death, or delivered up to the English.

A peace with the northern Indians.

Upon the conclusion of this treaty some few English prisoners were released, but others being still detained in captivity, the English ordered a detachment of two hundred men to march to the north-east, to compel the Indians to perform their part of the articles; which they were so far from obtaining, that the English, in a subsequent treaty, were obliged to promise to deliver a certain quantity of corn annually to the northern Indians, as a tribute or acknowledgment for that part of the country they had planted.

Broken. Another disadvantageous treaty.

In the year 1684, the colony of New Hampshire finding themselves continually exposed to the invasion of the French and their confederate Indians of Canada, surrendered their charter, and put themselves immediately under the protection of the crown of England, and ever since their Governor, council, and Magistrates have been appointed by the King; and about the same time judgment was obtained, on a Quo Warranto, against the Massachuset and Plymouth Colonies. On the other hand, the Connecticut and Rhode-Island Colonies submitting themselves to his Majesty's pleasure, no judgment was given against them, and they afterwards resumed their ancient form of government, which they have been permitted to exercise ever since: But the Massachuset and Plymouth Colonies were governed by the crown of England in an arbitrary manner, till King WILLIAM granted a new charter to the Massachusets, in which were comprehended the colonies of Maine and Plymouth, as has been observed already.

A surrender of the New Hampshire charter.

Judgment against the Massachuset charter.

A new charter granted the Massachusets.

In the mean time King CHARLES II. granted a commission to HENRY CRANFIELD, Esq. to be Governor of the Massachuset Colony; and he remained

CHAP. V. maintained in that post till the reign of King JAMES II. who appointed JOSEPH DUDLEY, Esq. a native of New-England, and one he thought acceptable to them, as being a member of the independent sect, to succeed Mr. CRANFIELD; but they were so far from approving Mr. DUDLEY's administration, that they rose in arms, made the Governor prisoner, and sent him to England, and at the same time threw off their allegiance, pretending to revive their former charter by their own authority; and actually proceeded to the choice of Magistrates, after they had deposed those appointed by the crown. However the King constituting SIR EDMUND ANDROS their Governor, in June 1686, impowered him and four of the council to frame laws for the government of the colony, which the Massachusetts thought fit to submit to for some time; and all the Judges, Magistrates, and Officers civil and military, were preferred to their posts by SIR EDMUND ANDROS.

An insurrection in New-England.

Sir EDMUND ANDROS made Governor.

A war with the Indians.

During this gentleman's administration, namely, in the year 1687, the Indians on the north-east of New-England, supported by the French of Canada and Nova Scotia, began to commit outrages on the northern frontiers of New-England, for which they gave the following reasons: 1. That the English had neglected to pay the tribute of Corn, as was stipulated by the last treaty of peace. 2. That they obstructed their fishery in the river Saco, by pitching nets and seines at the mouth of it. 3. That the English had turned cattle into one of their islands and eaten up their Corn; and, 4. That their lands were actually patented out to the English; which seems to be too true, for the New-England writers tell us they threatened the Surveyors to knock them on the head when they came to lay out those lands: And indeed I don't find the English denied any part of the charge, only replied, that the Indians ought to have complained of these grievances first, and seen if they would not have been redressed in an amicable way, before they had proceeded to acts of hostility.

As to the French, their principal complaint was, that the English had made some encroachment on their territories in Canada: But however, as they were incorporated with the Indians by intermarriages, and were become in a manner one people with them, it could scarce be expected they should stand neuter; and in fact we find they have supported these Indians in all their wars with the English ever since.

The revolution.

The people of New-England deposed their Governor.

SIR EDMUND ANDROS, who was at this time at New-York, hearing the frontiers of New-England were invaded by the French Indians of Canada, returned to Boston, and having endeavoured to accommodate matters in vain, marched against the enemy in the winter of 1688, at the head of a thousand men; whereupon the Indians retiring into the woods, he built and garrisoned two forts to defend the frontiers, and sent the rest of his forces into winter quarters, and before the next spring, 1689, advice came of the revolution in Old-England. Whereupon the people rose and made the Magistrates and Officers of Boston prisoners, and summoned Governor ANDROS, who was retired into the castle, to surrender, which, after some time, he thought fit to do, observing the whole country disposed to revolt. Upon his return to England, King WILLIAM approved his conduct, tho' great complaints were made of

the tyranny of his administration, and in the year 1692 he was constituted by that Prince Governor of Virginia.

In the mean time the gentlemen of New-England were pleased to call an assembly of representatives by their own authority, who voted that the government was devolved upon the people, and appointed SIMON BRADSTREET, Esq. their Governor, and THOMAS DANFORTH, Esq. Deputy-Governor, with the same council or assistants they had elected in the year 1686. But their declaration that the government was devolved on the diffusive body of the people, was attended with some ill effects; for the common people, now looking upon themselves as so many sovereigns, took upon them to plunder every one they did not like, and among the rest the friendly Indians; but while they were in this confusion, a letter arrived from King WILLIAM and Queen MARY, dated the 12th of August, 1689, requiring them to obey their Magistrates till they received further orders.

Still the Indians continued to ravage the frontiers, killed great numbers of English, and were guilty of very barbarous actions (as the New-England writers relate) in which they met with little opposition while the government remained in that unsettled condition. At length the celebrated SIR WILLIAM PHIPS, in the year 1690, raised a body of seven hundred men, and observing that the Indians were constantly supported in their wars by the French, who had possessed themselves of Nova Scotia or Acadia, a country which of right belonged to the English, and that their principal fortress was at Port-Royal, he resolved to embark with his troops, and endeavour to reduce that place; but before I give an account of the success of that expedition, I shall take this opportunity to inform the reader who this SIR WILLIAM PHIPS was, and the memorable occasion of raising his fortune.

This hero was born of mean parents, anno His rise in 1650, at a small plantation on the banks of the world. river Kennebeck, the north-east frontier of New-England. His father was a Gunsmith, and left his mother a widow with a large family of small children: This WILLIAM being one of the youngest, kept Sheep in the wilderness till he was eighteen years of age, and was then bound apprentice to a Ship Carpenter. When he had served his time, he went to sea, and having been successful in some small adventures, at length discovered a rich Spanish wreck, near the Port of La Plata in Hispaniola, which gained him a great reputation in the English court, and introduced him into the acquaintance of some of the greatest men in the nation.

The galleon, in which this treasure was lost, had been cast away upwards of fifty years, and how Captain PHIPS came to the knowledge of it does not appear to me; but upon his applying to King CHARLES II. in the year 1683, and acquainting his Majesty with the probability there was of recovering it, the King made him Commander of the Algier Rose, a frigate of 18 guns, and 95 men, and sent him to Hispaniola, in search of the prize. Here he was informed by an old Spaniard of the very place where it was lost, and began to fish for it, but his ship's crew looking upon it as a romantick undertaking, after some little trial despaired of success, and compelled him to return to England without effecting any thing:

CHAP. V. And tho' the Captain assured the Ministry that the impatience of the seamen only prevented his success, the court refused to be concerned in the Enterprize any further, and it was dropped for some time. However, the Captain continuing his application to some great men, the Duke of Albemarle, and several other persons of distinction, fitted him out again in the year 1686; and arriving at the port De la Plata with a ship and tender, the Captain went up into the woods, and built a stout canoe out of a Cotton Tree, large enough to carry eight or ten oars. This canoe and tender, with some choice men and skilful divers, the Captain sent out in search of the wreck, whilst himself lay at anchor in the port. The canoe kept busking up and down upon the shallows, and could discover nothing but a reef of rising shoals, called the boylers, within two or three foot of the surface of the water. The sea was calm, every eye was employed in looking down into it, and the divers went down in several places without making any discovery, till at last, as they were turning back, weary and dejected, one of the sailors looking over the side of the canoe into the sea, spied a feather under water, growing, as he imagined, out of the side of a rock; one of the divers was immediately ordered down to fetch it up, and look out if there was any thing of value about it. He quickly brought up the feather, and told them that he had discovered several great guns; whereupon he was ordered down again, and then brought up a pig of silver of two or three hundred Pounds value, the sight of which filled them with transports, and convinced them sufficiently, that they had found the treasure they had been so long looking for. When they had buoyed the place, they made haste to the port, and told the Captain the joyful news, who could hardly believe them, till they shewed him the silver, and then with hands lift up to heaven, he cried out, Thanks be to God we are all made! All hands were immediately ordered on board, and sailing to the place, the divers happened to fall first into the room where the bullion had been stored, and in a few days brought up 32 ton of silver, without the loss of any man's life. When they had cleared the store room they searched the hold, and amongst the ballast of the ship found a great many bags of pieces of eight. It is observable, that these bags having lain so long under water amongst ballast, were crusted over with a hard substance like lime-stone, to the thickness of several inches, which being broken with irons contrived for that purpose, the rusty pieces of eight tumbled out in prodigious quantities. Besides these things they found vast treasures of gold, pearls, jewels, and every thing that a Spanish galleon used to be laden with. There was one ADDERLEY of Providence, who had been with Captain PHIPS in his former voyage to this place, and promised to assist him again if ever he should make a second adventure, who met him with a small vessel at port De la Plata, and with the few hands he had on board took up six ton of silver for themselves. They both staid till their provision was spent, and then the Captain obliging ADDERLEY and his men not to discover the place of the wreck, nor come to it himself till next year; they weighed anchor and returned. The reason of this obligation was, because the last day of their fishing the divers brought up several sows of silver, which made the Captain imagine that there was a great deal of treasure yet behind,

tho' it afterwards appeared that they had in a manner quite cleared the ship of her bullion before they left her. The Captain steered directly away for England without calling at any port by the way, and arrived the latter end of the year, with about three hundred thousand Pounds sterling, sixteen thousand of which, after all charges paid, and gratuities to the sailors, came to his own share: Besides which, the Duke of Albemarle made his wife a present of a golden cup of a thousand Pounds value.

Some of King JAMES's courtiers would have persuaded him to have seized the ship and its cargo, under pretence that the Captain had not rightly informed him of the nature of his project when he was graciously pleased to grant him his patent; but the King replied, that PHIPS was an honest man, and that it was his council's fault that he had not employed him himself, and therefore he would give him no disturbance in what he had got; but as a mark of his royal favour conferred upon him the honour of knighthood. But to proceed in the history.

I left Sir WILLIAM embarking his forces in New-England, for the reduction of Acadia, who sailing from Nantaset on the 20th of April 1690, came before Port-Royal (now Annapolis) the capital of Nova Scotia, on the 11th of May; and the place being then but poorly fortified, the garrison made scarce any defence, but surrendered upon condition of being conducted to Canada. Most of the French inhabitants choosing to remain in the town, took the oaths to King WILLIAM and Queen MARY, over whom Sir WILLIAM having appointed a Governor returned to Boston on the 30th of the same month, having reduced another French settlement at the mouth of St. John's River, in the bay of Fundi, by the way: And the English kept possession of this country till the peace of Ryfwick, anno 1697, when King WILLIAM thought fit to resign it to the French. But Queen ANNE being better apprised of the importance of this country to the English, obliged the French to yield up their pretensions to Nova Scotia and Acadia at the peace of Utrecht, anno 1712, the town of Port-Royal now bearing the name of Annapolis in honour of that Queen. But to proceed.

The success Sir WILLIAM PHIPS met with in the reduction of Nova Scotia encouraged him to attempt the conquest of Canada, which would have rendered the English masters of all the north-east part of America; and to support him in this enterprize, the people of New-England fitted out a fleet of two and thirty sail, putting on board of it two thousand men under his command: And it was concerted with the western colonies, that a thousand English and fifteen hundred Indians should march over land from Connecticut and New-York at the same time, and attack the fortrefs of Montreal, situate above Quebec, on the river St. Lawrence, that the French might be obliged to divide their forces.

The fleet set sail from the town of Hull, on the 9th of August, but contrary winds prevented their coming before Quebec till the 5th of October; and the detachment which marched over land not meeting with the canoes or boats the Indians had promised to provide to transport them over the lakes, they were obliged to return home, which gave Count FRONTENAC, the Governor of Canada, an opportunity to unite all his forces in the defence of Quebec; and when Sir WILLIAM

CHAP. V.
The value of 300,000l. sterling fitted up.

Port-Royal taken.

And St. John's. Resign'd to the French by King WILLIAM. Recovered by Queen ANNE. Port Royal now called Annapolis.

The reduction of Canada attempted.

CHAP. V. **LIAM** sent him a summons to surrender, he did not only slight the summons, but threatened to hang up the Officer who brought it, telling him they were a pack of pyrates, having no commission from the true King of England.

Sir WILLIAM PHIPS hereupon landed fourteen hundred men, giving the command of them to **Colonel WHALLEY**, with orders to attack the town on the land-side, while he battered it with his ships from the river: But **WHALLEY** making his descent a league and a half from the town, to which the way lay through a wood that the French had fortified, he was twice repulsed and could never penetrate it. Whereupon **Sir WILLIAM PHIPS** ordered his men to embark again, resolving to land them close to the town; but a storm arose in the night which dispersed the fleet, and at the same time it grew so extreme cold that many of their men fell sick. Whereupon it was thought advisable to return home: And before they reached Boston, they lost a thousand men by the rigour of the season.

The enter-
prize de-
feated.

Mr. DUMMER also observes that their troops did not fall by the sword of the enemy, but the losses they sustained were occasioned by famine and various disasters in their return home, and chiefly by the early approach of a severe winter, which made it impracticable for provisions to follow them. Certain it is they were very unfortunate in being detained so long by contrary winds, that the summer was spent before they could enter upon action. It had been much better after this accident to have deferred the expedition till another year. In that cold climate it is scarce ever practicable to make a winter's campaign; and the storms, fogs, and difficulty of the navigation in the river Canada, or St. Lawrence, after the autumnal equinox, make that voyage extremely hazardous. Whoever therefore shall attempt Quebec hereafter, will do well to begin the enterprize before midsummer, or they must never hope for success. But to return.

During this expedition of **Sir WILLIAM PHIPS** to the westward, the war was carried on very briskly in the east. Four or five hundred French and Indians crossed the bay of Casco in canoes, and surprised the town of Casco, making the inhabitants prisoners of war. Whereupon all the smaller garrisons thereabouts abandoned their forts, and retired to Saco: And three hundred men being detached under **Major CHURCH**, to make head against the enemy on the frontiers, the Major did not only recover the town of Casco, but forced the enemy to retire to the woods, and the Indians soon after desired a truce; which was agreed to at the fortrefs of Saghedoc, on the 29th of November, to continue till May, 1691.

A truce
with the
eastern In-
dians.

Still **Sir WILLIAM PHIPS** had his heart fixed upon the conquest of Canada, an enterprize of the last consequence to the british plantations, and embarked for England in the beginning of the year 1691, to solicit the court of England for a supply of troops from thence; but **King WILLIAM** wanted all his forces to make head against the French in Europe, and could not spare him any: When **Sir WILLIAM** found it in vain therefore to continue his application on that head, he employed his interest with the New-England agents to obtain a restoration of the Massachusetts charter: And tho' they did not succeed in this, they procured another with ample privileges, which the New-England people were not so well pleased with however as the old patent, because by the

A new
charter
granted
to New-
England.

new patent the appointment of a Governor; Lieu-tenant-Governor, and Secretary, was reserved to the crown, and the power of the militia vested in the Governor, as Captain-General; whereas, by their former patent, the Governor and all Officers, civil and military, were appointed by the general assembly. However, his Majesty was pleased to indulge the New-England agents so far as to suffer them to name their first Governor by the new charter, and they thereupon desired **Sir WILLIAM PHIPS** might be the man; which the King granted, and **Sir WILLIAM PHIPS** was appointed Captain-General and Governor in chief of the Massachusetts Bay in New-England.

CHAP. V.
**Sir Wil-
liam
Phips
Governor.**

In the mean time the truce of Saghedoc being expired, the war was revived in New-England, and carried on with various success. The English defended their garrison towns in the province of Maine pretty well; but the open places and their plantations were generally plundered and destroyed, and great cruelties exercised on such of the English as were made prisoners.

The war
commen-
ces again.

Sir WILLIAM PHIPS arriving at New-England with the charter he had obtained, about this time, the people appeared discontented that their privileges were abridged in so many particulars: However, the general court appointed a day of thanksgiving for the safe arrival of their Governor, and transmitted an address of thanks to his Majesty for granting them a new charter. And now **Sir WILLIAM** applied himself with his usual diligence to carry on the war against the Indians on the north-east; who still continued to harass and plunder the English settlements and massacre the inhabitants; and marching with a body of four hundred and fifty men over the river Kennebeck, after he had repulsed the savages, he caused a fort to be erected near the mouth of the river Pemaquid, which he named William-Henry Fort, for the defence of the frontiers, being one of the strongest and most regular fortifications that has been seen in that part of the world; and proved an excellent barrier against the incursions of the Indians; who being now weary of the war sent an ambassador to Pemaquid to make proposals of peace; and a treaty being thereupon agreed to, the following articles were concluded on the 11th of August, 1693.

Pemaquid
Fort built.

1. That all the Indians on the north-east of Merimack River should acknowledge themselves subject to the crown of England, and promise to abandon the French interest. 2. That they should set all the English prisoners at liberty without ransom. 3. They agreed that the English should quietly enjoy all their plantations in this country; and 4. That trade should be under such regulations as the government of New-England should prescribe. And for the performance of these articles they delivered to **Sir WILLIAM PHIPS** the Governor several hostages, as pledges of their fidelity: And the Governor, on the other hand, promised them his protection.

Peace con-
cluded
with the
Indians.

Towards the end of this war the people of New-England appeared perfectly distracted with apprehensions of their being over-run with witches and evil spirits, one neighbour prosecuting another capitally for witchcraft with the utmost violence; in which they were so much encouraged by their preachers, and countenanced by their Magistrates, that no man's life was safe. Strange were the mistakes, says my author (**Mr. NEAL**) which some of the wisest and best men in the coun-try

New-
England
bewit-
ched.

CHAP. V. try committed on this occasion: And it must have proved fatal to the whole province if God had not mercifully interposed.

PARIS, a preacher, the prime author of the delusion.

Mr. PARIS a preacher at Salem, began the tragedy the latter end of the year 1691, under pretence his daughter and niece were under an ill tongue (the former of them being nine, and the latter eleven years of age;) and what was thought an evidence of their being afflicted by witches, was their creeping into holes and corners, and lying under chairs and stools. They had also, it is said, something like convulsion fits, and complained of their being bitten and pinched by invisible agents; and Mr. PARIS suspecting an Indian woman in his house named TITUBA, and two others whom the children cried out tormented them in their fits, to be the witches, they were examined before a Magistrate; and TITUBA, frightened out of her wits at the charge, confessed that she and the two other women had afflicted the children: But upon her enlargement (for they never put any to death that confess themselves witches,) she declared that her master had beaten and abused her to make her confess and accuse such as he called witches; and that whatever she had said by way of confession and accusing others, was the effect of such usage.

The witnesses threaten, to extort a confession.

The form of the indictment against BURROUGHS.

The form of their indictments may be seen in that preferred against one of their preachers, viz. Mr. GEORGE BURROUGHS, Minister of Falmouth.

Wherein they charge, that the said GEORGE BURROUGHS, on the ninth of May, in the fourth year of King WILLIAM and Queen MARY, and divers other days and times before and after, certain detestable acts, called witchcrafts and sorceries, had wickedly and feloniously used, practised, and exercised, within the town of Salem, in the county of Essex, in and upon MARY WALCOT of Salem, single woman; by which said wicked acts, the said MARY WALCOT, on the ninth of May aforesaid, and divers other days and times, was tortured, afflicted, pined, consumed, wasted, and tormented, against the King and Queen's peace, &c.

Upon this and three indictments more for bewitching three other women, Mr. BURROUGHS was brought to his trial, on the fifth of August, 1692.

The evidence against him.

The witnesses against him were five women, who pretended to be bewitched by him, and eight confessing witches; the latter swearing he was the principal actor in their nightly revels, and was promised to be made King of Satan's kingdom, then about to be erected: And the bewitched persons unanimously deposed, that a spectre, resembling the prisoner, but invisible to others, tormented them in their fits. One of the witnesses testified, that the prisoner pressed her to set her hand to a book, and inflicted cruel pains on her when she refused. Others deposed he sounded a trumpet for the witches to rendezvous at a sacrament, and tempted those he tormented to partake with them. Another said, he carried her to the top of a high mountain, and shewed her glorious kingdoms, telling her he would give them all to her if she would sign his book.

The confessing witches testified, he gave them puppets, and thorns to stick into the puppets, for afflicting other people; exhorting them to bewitch all the people of Salem, but to do it gradually.

VOL. III.

Some people of credit deposed, that he had the strength of a giant, and instanced in his lifting great weights; but he shewed that an Indian in court had done the same.

CHAP. V.

Others testified, he had been a cruel man to his wives; who often complained to the neighbours his house was troubled with evil spirits.

The prisoner denied the whole charge, and declared it to be his opinion, that never any person made a formal contract with the devil, or could send the devil to torment other people at a distance. However, he was convicted, and sentence of death passed on him.

The prisoner convicted.

Being brought to his execution, he made solemn protestations of his innocence, and concluding his prayer with the LORD's prayer, expressed so much devotion and resignation, that the people were moved to pity him; and it was expected the Magistrates who attended him would have respited his execution: But his accusers cried out he was assisted by the Devil; whereupon he was turned off, and after he was cut down dragged into a hole, not being suffered to have a decent burial in the usual burying-place.

His execution.

Doctor MATHER, giving an account of the circumstances of several persons said to be bewitched, relates, "that their limbs were horribly distorted and convulsed; that they were pinched black and blue; that pins were invisibly run into their flesh; and that they were scalded until they had blisters raised in them. One of them (says he) was assaulted by a spectre with a spindle in its hand, which no-body else in the room could see, until the afflicted in one of her agonies, snatch'd it out of the spectre's hand, and then all the company saw it. Another was haunted by a spectre in an invisible sheet; but the afflicted in one of her fits tearing a piece of it away, it became visible: Sometimes poison has been forced on the afflicted by an invisible hand, which, when they have drank, they have presently swollen, and afterwards been relieved by the medicines usually given in such cases. Sometimes they have complained of burning rags forced into their mouths, which no body else could see, yet the burns have remained on their mouths afterwards. Sometimes they have complained of irons heating in the fire to brand them, the marks of which they have carried to their graves. The spectres (says he) usually personated some persons whom the afflicted knew, and (which is very strange if true,) when they wounded the spectre, the person whom the spectre represented was wounded too: For example, one of the afflicted said, that the spectre that tormented her was D—H— and pointing to a certain place in the room, she cried out, there is D—H—; upon which a man with his rapier struck at the place, and the afflicted told him that he had given her a small prick about the eye; soon after which D—H— being apprehended, confessed herself a witch; and that in troubling the girl that had impeached her she had received two wounds, one about the eye, which she shewed the Magistrates, and another in the side. If the accused cast their eyes on the afflicted, the afflicted, tho' their faces were turned another way, would fall into a swoon, and continue in it until the hands of the accused came to touch them; and it was often found that the flesh of the afflicted was bitten, so that the print of teeth was very visible;

MATHER'S account of these transactions.

24 P

CHAP. V. "and there would appear just such a set of teeth, as was in the accused, even such as might be clearly distinguished from other people's. In a word, the afflicted (as the Doctor observes) in a few days time arrived to such a refining alteration upon their eyes, that they could see their tormentors: They saw a Devil of a little stature, and of a tawny colour, attended with spectres, that appeared in more human circumstances: These tormentors used to tender the afflicted a book, requiring them to sign, or touch it at least, in token of their consenting to be listed in the Devil's service; which, if they refused, the spectres under the command of the black man tortured them with prodigious molestations."

The Doctor's account exploded.

BUT Mr. CALEF of Boston, in his book entitled, *More wonders of the invisible world*, has endeavoured to invalidate the Doctor's account of things: He declares that the story of the sheet was a known forgery, it having been provided by the afflicted person the day before: And he does not doubt but the spindle was so too. He adds, that the print of the set of teeth was nothing but the afflicted's biting themselves; and that sometimes instead of finding a set of teeth, the accused have not had a tooth in their heads.

And to shew yet farther the wickedness of these afflicted persons, he mentions an accident at the trial of SARAH GOOD, which, if true, ought alone to have invalidated their evidence for the future. The story is this: While SARAH GOOD was upon her trial, one of the afflicted fell into a fit, and cried out that the prisoner's spectre was stabbing her with a knife, but had broke it in her body; and to confirm the truth of her relation, she plucked a piece of the blade out of her breast, and shewed it in court. But there was a young man present, who, seeing the blade, had the honesty and courage to claim it for his, and to declare before the Judges, that he broke his knife but the day before, and threw away that part of the blade in the presence of the afflicted person; but that he had the handle with the other part of the blade in his pocket, which he delivered into court: And upon comparing them together, they were found to be parts of the same knife; upon which the Judge only reprimanded her, and bid her tell no more lies.

'Tis certain that these suspected wizards and witches were convicted on very slender evidence; for the court allowed the witnesses to tell stories of twenty or thirty years standing, about over-setting of carts, the death of cattle, unkindness of relations, or unexpected accidents befalling them after some quarrel; all that was alledged against them, to the purpose, being either from the distempered persons themselves, or from those who had been frightened into a confession of their being witches by the threatnings of the Magistrates, or encouraged to it by the hopes of mercy.

The evidence against all of them incompetent and ridiculous.

Great part of the evidence given against these unhappy people also appears exceeding ridiculous. One testified, he bought a Sow of the prisoner which was troubled with fits soon after. Another, that the prisoner's spectre so oppressed him in his bed that he was not able to stir; but on calling for help it vanished. Another, that twelve years before the trial the prisoner often came to his house, and soon after his child was troubled with strange fits. Another deposed, that having a controversy with the prisoner about her fowls, he was grievously oppressed by something in her

likeness the night following. Another time he was troubled with a black Pig; but going to kick it the Pig vanished. A millar deposed, that going to receive some money of the prisoner, he had not gone three rods from her before he lost it: And at another time, having been discoursing with her, he had parted from her but a very little time before one of the wheels of his cart sunk into the earth in very plain ground, and he was forced to call for assistance to get it out, but going to view the hole afterwards there was no sign of it.

Two other men deposed, that being employed to repair one of the prisoner's collars, they found several puppets made of rags and Hogs bristles with headless pins in them; and a jury of women being impanell'd to search her, found a preternatural teat on her body, but upon a second search, three or four hours after, there was none to be found.

JOHN ALLEN testified against another prisoner, that refusing to carry some pipe-staves for her, she told him, he had as good, or his Oxen should not do him much service; and he replying, do you threaten me, you old witch? I will throw you into the brook. She ran away, but his Oxen afterwards run mad into the sea, and were all drowned except one.

Another deposed, that as he lay in his bed one night, the prisoner jumped in at a window, took hold of his feet, and drawing his body into a heap, lay upon him two hours, so that he could neither speak or stir; but at last he caught hold of her hands, and bit three of her fingers to the bone, whereupon she went down stairs and out of doors.

One KEMBAL testified that, upon some disgust, one of the prisoners told him his Cow should do him no good, and it died next morning: And another time, refusing to buy one of the prisoner's Puppies, he was frighted with a black Dog as he came out of the woods, which flew upon him, and he thought would have torn his throat out; but upon naming the name of CHRIST it vanished away: Which he supposed to be a piece of the prisoner's black art, to revenge himself on him for not buying his Puppy.

SARAH ATKINSON deposed, that the prisoner came on foot from Amesbury to her house at Newbury in an extraordinary wet season, when it was not fit to travel, and yet the soles of her shoes were hardly wet; which last piece of evidence, Dr. MATHER observes, put the prisoner into great confusion.

And here, says Mr. NEAL (who was far from being an enemy of the Doctor,) I can't forbear making one remark upon these as well as upon all the trials that Dr. COTTON MATHER has published to the world on this occasion; that when he has given us the depositions of the witnesses against the prisoners at large, he passes over their defence in such general words as these, they said nothing worth considering; their discourse was full of tergiversations and contradictions; they were confounded, and their countenances fell, &c. whereby his reader is left in the dark, and rendered incapable of judging of the merits of the cause. If the defence of the prisoners were so weak and confused as the Doctor represents, it had been for the advantage of the court to have exposed it at large to the world; but if not, it is very hard that it should be smothered.

But

CHAP. V. But upon such evidence as this, twenty-eight persons received sentence of death, of which nineteen were executed, and one (namely) GILES CORY, was pressed to death, all of them dying with strong protestations of their innocence. GEORGE JACOBS, sen. being condemned, the Sheriff's officers came and seized all he had, even to his wife's wedding-ring. Hard was the case of this old man! who was convicted by the evidence of his grand-daughter, who, to save her own life, confessed herself a witch, and was forced to appear against her own grandfather and Mr. BURROUGHS. On the day before their executions she came to Mr. BURROUGHS, acknowledged her guilt, and begged his pardon on her knees; who not only forgave her, but also prayed with and for her. The day after their executions she wrote the following letter to her father.

Honoured father,

"After my humble duty remembered to you,
 "hoping in the LORD of your good health,
 "as blessed be GOD I enjoy, though in abundance of affliction, being close confined here,
 "in a loathsome dungeon, the LORD look down
 "in mercy upon me, not knowing how soon
 "I shall be put to death, by means of the afflicted persons, my grand-father having suffered already, and all his estate seized for the King. The reason of my confinement is this,
 "I having through the Magistrates threatnings, and my own vile and wretched heart, confessed several things contrary to my conscience and knowledge, though to the wounding of my own soul; the LORD pardon me for it, but oh! the terrors of a wounded conscience who can bear! But blessed be the LORD, he would not let me go on in my sins, but in mercy I hope to my soul would not suffer me to keep it in any longer, but I was forced to confess the truth of all before the Magistrates, who would not believe me; but it is their pleasure to put me here, and GOD knows how soon I shall be put to death. Dear father, let me beg your prayers to the LORD on my behalf, and send us a joyful and happy meeting in heaven. My mother, poor woman, is very crazy, and remembers her kind love to you, and to uncle, viz. D—A—, so leaving you to the protection of the LORD, I rest your dutiful daughter,

From the dungeon
 in Salem-prison,
 Aug. 30, 1692.

MARGARET JACOBS.

There were eight more condemned besides those that were pardoned, but on account of their becoming evidences they were first reprieved, and then pardoned; and between three and four hundred more were imprisoned or accused: Indeed, the whole country (says Mr. NEAL) was in confusion, every one being jealous of his neighbour.

Mrs. CARY of Charles-Town being committed to Cambridge prison and laid in irons, her husband attended the trials of some others, and observing that the spectral evidence was received, together with idle and malicious stories against peoples lives, contrived his wife's escape, and fled with her to Rhode-Island, and afterwards to New-York, where they staid till the storm was over.

Mr. PHILIP ENGLISH and his wife also fled, whose estate Mr. CORWIN the Sheriff seized, to the value of 1500*l.* which was wholly lost, except about 300*l.* which was afterwards restored.

Mr. DUDLEY BRADSTREET, a Justice of peace in Andover, having granted out warrants against thirty or forty for supposed witchcraft; and seeing cause at length to refuse granting any more, was with his wife accused of killing nine persons by witchcraft, and forced to fly the country.

Mr. JOHN BRADSTREET, brother to the Justice, being accused of afflicting a poor Dog, and riding upon him through the air to witch-meetings, was forced to fly for his life into Piscataqua government; but the Dog was put to death.

Captain JOHN ALDIN, a man of good reputation and esteem, being examined at Salem, and committed to Boston Goal, May 31, after fifteen weeks imprisonment made his escape. And afterwards returning again, surrendered himself to the superior court at Boston, none of his former accusers appearing against him.

Another gentleman of Boston, being accused by the afflicted at Andover, ventured to stand his ground, and sent a writ by some particular friends to arrest his accusers in 1000*l.* action for defamation, with instruction to inform themselves of the certainty of the proof; which so frightened the poor creatures, that from that time the accusations at Andover generally ceased.

Things were indeed come to a wretched pass, no man being sure of his life or fortune for an hour; and no wonder, considering the infamous methods that were made use of to bring people into the snare: There was a society of gentlemen at Salem, like that for the reformation of manners in London, who engaged to find out and prosecute all suspected persons; and many were imprisoned by their means.

Mr. JOSEPH BALLARD's wife of Andover falling sick of a malignant fever, of which she died, her husband fancied her bewitched, and sent horse and man forty miles to Salem to fetch some of these distempered wretches that pretended to the spectral sight, to tell who it was that afflicted her: When they came they fell into their fits, and accused one person as sitting on the head, and another on the lower parts of the afflicted. No sooner was the scene opened but the whole town was alarmed, and more than fifty were complained of for afflicting their neighbours in a few weeks; here it was that many were made to accuse themselves of riding upon poles through the air to witch-meetings; many parents believed their children to be witches, and husbands their wives.

Things went on in the old channel till the afflicted over-acted their parts so far as to accuse some of the nearest relations of Dr. INCREASE MATHER, and of the Governor himself; it was time then to make a stand: Accordingly we find the very next sessions, which was January 3, 1692-3, when fifty-six bills were preferred against persons for witchcraft, the grand jury brought in thirty ignoramus; and of the remaining twenty-six, the petty jury convicted but three, whom the Governor pardoned: Nay, the people's eyes were so far opened by this time, that they would not convict people upon their own confessions; for when MARY WATT's confession was produced as evidence against her, the grand jury would not accept it, but looking upon her as a distemper'd person, brought in the bill ignoramus; and though the court sent them out a second time, they returned again with the same verdict.

And indeed all the confessions that were made sent to me either the effects of a distempered brain,

CHAP. V. brain, or extorted from persons to save their lives.

Hence it was, that the husbands and children of some upon their bended knees have prevailed with them to confess every thing that was laid to their charge: * Others have been wearied out with long and tedious examinations before private persons for many hours together, till they yielded to any thing; the question being then asked, were you at such a witch-meeting? Or have you signed the Devil's book? If they replied yes, the whole was drawn out into the form of a confession. That this was really the case, will appear by the following certificate, signed by the hands of half a dozen honest women, whose consciences would not suffer them to disguise the truth any longer.

" We whose names are under-written, inhabitants of Andover: Whereas that horrible and tremendous judgment beginning at Salem-Village in the year 1692, by some called witchcraft, first breaking forth at Mr. PARIS's house, several young persons being seemingly afflicted did accuse several persons for afflicting them, and many there believing it to be so, we being informed, that if a person were sick, the afflicted persons could tell what or who was the cause of that sickness; JOSEPH BALLARD (of Andover's) wife being sick at the same time, he either from himself, or the advice of others, fetched two of the persons called the afflicted persons from Salem-Village to Andover, which was the beginning of that dreadful calamity that befel us in Andover; and the authority in Andover believing the said accusations to be true, sent for the said persons to come together to the meeting-house in Andover (the afflicted persons being there;) after Mr. BALLARD had been at prayer, we were blind-folded, and our hands were laid upon the afflicted persons, they being in their fits, and falling into these fits at our coming into their presence, as they said some led us, and laid our hands on them, and then they said they were well, and that we were guilty of afflicting them: Whereupon we were all seized as prisoners by a warrant from the justice of the peace, and forthwith carried to Salem; and by reason of that sudden surprisal, we knowing ourselves altogether innocent of that crime, we were all exceedingly astonished and amazed, and consternated and affrighted out of our reason; and our dearest relations seeing us in that dreadful condition, and knowing our great danger, apprehending that there was no other way to save our lives, as the case was then circumstantiated, but by confessing ourselves to be such and such persons, as the afflicted represented us to be: They out of tender love and pity persuaded us to confess what we did confess, and indeed that confession, that is said we made, was no other than what was suggested to us by some gentlemen, they telling us that we were witches, and they knew it, and we knew it, and they knew that we knew it, which made us think that we were so; and our understanding and our reason, and our faculties being almost gone, we were not capable of judging of our condition; as also the hard measures they used with us rendered us incapable of making our defence, but we said any thing, and every thing they desired, and most of what we said was but in effect a consenting to what they said. Some

time after when we were better composed, they telling us of what we had confessed, we did profess that we were innocent and ignorant of such things; and we hearing that SAMUEL WARDWELL, who had renounced his confession, was condemned and executed, some of us were told that we were going after WARDWELL.

CHAP. V.
One executed for denying his confession.

If this confession had been made a little sooner, while the spectral evidence was in repute, it had cost the confessioners their lives; for it is impossible to express the blind fury and zeal of the people against the prisoners, who believed every thing the afflicted said, and disbelieved every thing the accused offered in their own vindication.

When neither promises nor threatnings could bring persons to confession, they sometimes made use of violence and force, as appears by the moving letter that Mr. PROCTOR sent to the Ministers of Boston a few days before his trial; which because it gives a clear account of this matter, I will transcribe in his own words.

To the reverend Mr. MATHER, MOODY,
BAILY, ALLEN, WILLARD.

Reverend gentlemen,

" The innocence of our case, with the enmity of our accusers, and our judges and juries, whom nothing but our innocent blood will serve their turn, having condemned us already before our trials, being so much incensed and enraged against us by the Devil, makes us bold to beg and implore your favourable assistance of this our humble petition to his excellency. That if it be possible our innocent blood may be spared, which undoubtedly otherwise will be shed if the LORD does not mercifully step in, the Magistrates, Ministers, Juries, and all the people in general being so much incensed and enraged against us by the delusion of the Devil, which we can term no other, by reason we know in our consciences we are all innocent persons; here are five persons who have lately confessed themselves to be witches, and accuse some of us of being along with them at a sacrament since we were committed to close prison, which we know to be lies. Two of the five are carriers sons, young men who would not confess any thing till they tied them neck and heels, till blood was ready to come out of their noses; and 'tis credibly believed and reported, that this was the occasion of making them confess that they never did; by reason they said one had been a witch a month, another five weeks, and that their mother had made them so, who had been confined here these nine weeks. My son WILLIAM PROCTOR, because he would not confess when he was examined that he was guilty, they tied him neck and heels, till the blood gushed out of his nose, and would have kept him so twenty-four hours, if one more merciful than the rest had not taken pity on him, and caused him to be unbound. These accusations are very like the popish cruelties; they have already undone us in our estates, and that will not serve their turns without our innocent blood. If it can't be granted that we may have our trials at Boston, we humbly beg that you would endeavour to have these Magistrates changed, and others put in their room; begging also and beseeching, that you would

* They were never executed if they confessed, unless they recanted their confession.

CHAP. V. " please to be here, some of you, if not all, at
 " our trials, hoping thereby you may be the means
 " of saving our innocent bloods; desiring your
 " prayers to the LORD on our behalf, we rest
 " your poor afflicted servants,

JOHN PROCTOR, &c.

But this Letter had no effect, PROCTOR and his fellow prisoners being convicted and executed a little after. Such methods as these being made use of, it is no wonder that the number of confessing witches amounted to fifty, not one of whom were put to the trial whether they would abide by their confessions when they came to die: Unhappy creatures! who were forced to do the drudgery of taking away the lives of their neighbours to save their own. But upon the afflicted's over acting their part, as I observed before, the tide of the people's affections began to turn, and they who a little before were in danger of being torn in pieces by the mob, were now universally lamented and pitied. All further prosecutions were now stopped, the accusations of the afflicted were entirely disregarded, the prison doors were set open to all that were under confinement by the accusations of the afflicted, and Sir WILLIAM PHIPS, after some time, pardoned all that were under sentence of condemnation.

But besides the blood that was spilt upon this occasion, several persons and families were ruined in their estates and reputations, partly by long imprisonment, and partly by the avarice of the Officers who took possession of their houses in their absence; and tho' I am fully satisfied that the zeal of the government in this affair proceeded from their regard to the glory of God (continues Mr. NEAL) yet I must say, that the Magistrates were too partial in their behaviour towards the accused; and that Sir WILLIAM PHIPS himself treated them with too much severity, by ordering them to be laid in irons, and countenancing the popular cry against them.

The whole country were by degrees made sensible of their mistake, and most of the actors in this tragedy repented the share they had in it. One of the honourable judges that sat on the bench at these trials on a fast day, in a full assembly at the fourth meeting in Boston, delivered in a paper to be read to all the people, acknowledging his having fallen into some errors in the trials at Salem, and begging the prayers of the congregation that the guilt of such miscarriages might not be imputed to the country in general, or to him and his family in particular. And while this paper was reading, he stood up in view of the whole assembly.

The jury likewise published a paper signed with their own hands in the following Words:

" We whose names are under-written, being
 " in the year 1692, called to serve as Jurors in
 " court at Salem, on trial of many who were by
 " some suspected of doing acts of witchcraft upon
 " the bodies of sundry persons, do confess that
 " we ourselves were not capable to understand,
 " nor able to withstand the mysterious delusions of
 " the powers of darkness and prince of the air,
 " but were, for want of knowledge in ourselves,
 " and better information from others, prevailed
 " with to take up with such evidence against the
 " accused, as on further consideration, and further
 " informations, we justly fear was insufficient
 " for the touching the lives of any, Deut.
 " xvii. 6. Whereby we fear we have been instrumental
 " with others, though ignorantly and un-

VOL. III.

CHAP. V. " willingly, to bring upon our selves, and these
 " people of the LORD, the guilt of innocent
 " blood, which sin the LORD saith in scripture
 " he would not pardon, 2 Kings xxiv. 4. That
 " is, we suppose, in regard to his temporal
 " judgments; we do therefore hereby signify to
 " all in general, and to the surviving sufferers in
 " especial, our deep sense of, and sorrow for our
 " errors in acting on such evidence to the con-
 " demning of any person.

" And do hereby acknowledge that we justly
 " fear that we are very sadly deluded and mis-
 " taken, for which we are much disquieted and
 " distressed in our minds, and do therefore hum-
 " bly beg forgiveness first of God for CHRIST's
 " sake for this our error, and pray that God
 " would not impute the guilt of it to our selves,
 " nor others; and we also pray that we may be
 " considered candidly and aright by the living
 " sufferers, as being then under the power of a
 " strong and general delusion, utterly unacquaint-
 " ed with, and not experienced in matters of that
 " nature.

" We do heartily ask forgiveness of you all,
 " whom we have justly offended; and declare,
 " according to our present minds, we would
 " none of us do such things again for the whole
 " world; praying you to accept of this in way
 " of satisfaction for our offence; and that you
 " would bless the inheritance of the LORD, that
 " he may be intreated for the land.

 THOMAS FISK, jun. SAMUEL SAYER,
 JOHN DANE, ANDREW ELLIOT,
 JOSEPH EVELITH, HENRY HERRICK, sen.

And Dr. COTTON MATHER, who writ the Dr. MATHER
 forementioned trials, has since declared it as his confesses
 opinion, that things were carried too far, as ap- his errors.
 peared to him: 1. From the great number of
 persons accused. 2. From the quality of the per-
 sons accused, some of whom were persons of blame-
 less and holy lives. 3. From the number of the
 afflicted, which encreased to about fifty. This
 (says he) gave just ground to suspect some mistake.
 4. From the execution of the prisoners, not one
 of which confessed their guilt at their death, tho'
 several of them were persons of good knowledge
 and sober lives, and dyed in a serious and affect-
 ing manner. And as for the confessors (says he)
 we had no experience whether they would abide
 by their confessions when they came to die; they
 being all reprieved and pardoned. 5. Because,
 when the prosecutions ceased, the afflicted grew
 presently well. The accused are generally quiet,
 and we have had no disturbance since that time for
 these five years.

I have often wondered that no publick notice was NEAL'S
 ever taken either of the afflicted persons or con- remarks
 fessing witches. If the agitations of the afflicted on these
 were voluntary and artful, the blood of the inno- prosecutions.
 cent certainly lay at their doors; but if not, they
 should have been treated as lunatics, or as per-
 sons, who, being possessed by an evil spirit, had
 been the unhappy instruments of taking away the
 lives of their honest neighbours. The confessing
 witches may possibly deserve a little more com-
 passion if their confessions were extorted by vio-
 lence, or arose from the pure necessity of saving
 their lives this way and no other (as I believe was
 the case of most of them;) but yet their bear-
 ing false witness against their neighbours, and
 dipping

CHAP. dipping their hands in their innocent blood, ought not to have been passed over in silence.

Mr. PARIS indeed, in whose house this tragedy began, and who had himself been a witness, and a zealous prosecutor of the accused, felt the effects of the people's resentment some time after; for his people not only withdrew from his communion, but presented several petitions and remonstrances to the Magistrates and Ministers of Boston to obtain his removal: They declared, "That Mr. PARIS's believing the Devil's accusations, and readily departing from all charity to persons of blameless lives and conversations upon such suggestions; his promoting accusations, and his partiality therein; his stifling some and encouraging others; his going to MARY WALUT and ABIGAIL WILLIAMS, to know who afflicted the people in their illnesses, and his taking an oath that the prisoners by their looks knocked down the pretended sufferers, tho' it is certain he knew nothing of the matter;" obliged them to refuse him for their Minister. The Ministers of Boston did every thing they could to make up the difference; and Mr. PARIS himself, in the year 1694, made a publick acknowledgement of his error, begging pardon both of God and man; but the people insisting that they neither could nor would sit under the ministry of a man who had been an instrument of the misery and ruin of so many of their relations and friends, he was at last removed.

The Indians profelytes to the Jesuites.

The confusion occasioned by these prosecutions were no small hindrance to the cultivating a good correspondence with the Indians on the conclusion of the Peace of Pemaquid, in the year 1693. However, Sir WILLIAM PHIPS, the Governor, did not entirely neglect it. He assembled the Sachems on the frontiers, made them presents and opened a free trade with their tribes. He proposed also the leaving among them some converted Indians, to instruct them in the Christian religion, and they thereupon made great protestations of their fidelity and future friendship; but as to religion they desired to be excused, and would not suffer any preachers or missionaries to remain amongst them; for the French jesuites and Popish priests had already profelyted this people, and indeed created in them an abhorrence of the religion of the English; suggesting that their ancestors were the crucifiers of our SAVIOUR, and themselves the persecutors of all good catholics.

Sir WILLIAM PHIPS impeached and sent for to England.

He dies.

Sir WILLIAM was no less unfortunate in his administration at home than in his attempts to convert the Indians; for his government was not only disturbed by people who pretended to be possessed and bewitched, but a strong faction was formed against him, that ascribed all their grievances to his conduct: To him they imputed it, that their privileges were abridged by the new charter, and that their taxes were so high, occasioned by the needless expences he had put them upon, of building fort Pemaquid, and other fortresses on their frontier: And they proceeded so far as to exhibit articles against him to the privy-council of England; whereupon he was recalled to defend himself; but carrying over with him an address from the general assembly in his favour, he was not only acquitted, but promised to be restored to his post: However he fell ill of a fever in London, and dyed there on the 18th of February, 1694-5, in the 45th year of his age.

In the mean time the French spirited up the Indians of Canada and Nova Scotia to break the peace with the English within a year after it was made; and the Savages falling upon the plantations and open towns on the frontiers, massacred great numbers of the inhabitants, and carried more into captivity: And the French joining their forces with the Indians, in the year 1696, surprised the important fortrefs of Pemaquid and demolished it.

Fort Pemaquid surprised by the French and demolished.

In the year 1697, the French and their Indian allies made preparations to invade New-England by sea and land; but Lieutenant STOUGHTON detaching five hundred men to the north-east, under the command of Major MARCH, the enemy was repulsed on that side, and obliged to fly into the woods; and the French fleet at the same time being shattered by a tempest, thought fit to return to the river Canada without attempting to make a descent. There were afterwards some small skirmishes upon the frontiers, but no considerable action; and in December 1698, advice arrived of the conclusion of the peace of Reswick; whereupon the Sieur FRONTENAC, Governor of Canada, advised his Indian allies to release their prisoners, and make the best terms they could with the English; for his master being now at peace with that nation, he could no longer support them; and the Indians taking his advice, made their submission at Casco, on the 7th of January, 1698-9 promising to perform the articles they had agreed to in the year 1693, and declared they had never broke them, if they had not been incited to it by the French jesuites.

The peace of Reswick.

The Earl of Bellamont was about this time made Governor of New-England and New-York, but resided chiefly at the latter, leaving the administration of the Government of New-England to Lieutenant-Governor STOUGHTON; and a war commencing in Europe between the confederates and the French, in the year 1702, New-England was soon involved in it. In this war the New-England people made another effort for the recovery of Port-Royal in Acadia, but were not successful in their first attempt. However, being assisted the next year with five hundred regular troops, commanded by Colonel NICHOLSON, they carried the place.

The war renewed.

The English take Port-Royal again.

Encouraged by this success, the ministry in Old-England proposed the attacking of Canada once again; and the colonies of New-England and New-York readily came into it, and actually made considerable levies of men and money to assist and support that enterprize, being in daily expectation of a squadron of men of war, and a body of land forces from Great-Britain, to enter upon action; but our Generals on this side being unwilling to spare any troops from Flanders, the enterprize was laid aside until the year 1711: When the Generals as well as the ministry, being changed, that important expedition was revived, and Admiral WALKER was commanded for New-England with a squadron of twelve men of war, six store ships, and forty transports; on board whereof were five thousand veteran troops, under the command of Brigadier-General HILL. All manner of warlike stores, and forty horses, for the use of the artillery, also were put on board; and with these the Admiral arrived at Boston on the 25th of June 1711, having been seven weeks and three days in his passage from Plymouth. Whereupon the land forces were set on shore on Nodd's Island, in the Massachusetts Bay, to refresh themselves, and wait

Another expedition against Canada, 1711.

Admiral WALKER and General HILL arrive at Boston.

CHAP. V. wait until all things were in readiness to besiege Quebec, the capital of Canada. Here the forces lay waiting for provisions until the 20th of July, when they were re embarked, and on the 25th two New-England regiments also were added to them, and embarked on board the fleet, by the command of Governor DUDLEY.

In the mean time General NICHOLSON, Governor of New-York, assembled a body of two thousand English and thirteen hundred Indians, who were ordered to embark on the rivers which fall into the lake of Ontario, usually called the lake of Canada, or Frontenac, and to get into the river of St. Lawrence, and attack the fortress of Montreal, situated in an island of that river in order to make a diversion, and divide the French forces, while Admiral WALKER and General HILL should attack Quebec. But our unfortunate fleet never reached that city; for arriving in the mouth of the river Canada, there fell so thick a fog that their pilots were at a loss which way to steer, having no soundings to direct them; and it afterwards blowing hard, they were driven upon the north shore among the rocks, where they lost eight of their transports with eight hundred men on board, and the whole fleet was in danger of being shipwrecked. Whereupon they made the best of their way to the east-ward, and coming to Spanish-River-Bay, they held a council of war, on the 4th of September, wherein it being considered that they had but ten weeks provision for the fleet and army, and that the navigation was so bad at this time of the year in those parts that they could not depend on supplies of provision from New-England, it was unanimously resolved to return home; and setting sail accordingly (after they had detached some ships and forces to Boston and Annapolis) the fleet arrived at Portsmouth on the 9th of October following; where, to complete their misfortune, the Edgar, the Admiral's ship was blown up, and seven hundred people perished, including the sailors wives and those that came to welcome their friends home: But the Captain and most of the Officers being then on shore, escaped the terrible blow.

Part of the transports cast away.

The Admiral and General return to England.

As for General NICHOLSON, and the forces that were designed to make a diversion by besieging Montreal, an express being sent after them with the advice of the loss of the transports in the river Canada, they returned to New-York without attempting any thing. And thus unhappily ended an expedition, which if it had succeeded, would have made us masters of the best part of North-America, and driven the French entirely from that continent: And as people are apt to blame one another where they fail of success, we find the Admiral and General complaining that their being detained at Boston for want of the provisions and reinforcements the government of New-England had promised, until the summer was spent, and then not being furnished with good pilots there, were the occasions of their misfortune. The New-England people, on the other hand, alledged, that it was not too late in the year but they might have succeeded, if the General and Admiral had been hearty in the enterprize.

But perhaps neither of them were much to blame. We may rather ascribe the ill success they met with to the want of a good understanding between Old and New-England, and to the wind and weather, which the wisest and bravest commanders cannot provide against.

CHAP. V. An enterprize of this nature had been concerted in Old-England some time before, as has been observed already, and the New-England people had made great preparations to second it; but when they had put themselves to a very great expence, our Generals in Flanders would spare no troops for this service; whereby all the trouble and charges they had been at were lost. When this project therefore was revived, the New-England people determined to wait till the fleet and army should arrive at Boston before they began their preparations, and the rather because there had been a change of the ministry; for they were jealous that the new ministry had but little friendship for them. When the fleet and army therefore came into the bay, they were forced to wait a whole month for the forces and provisions they were to take in there. The colony indeed urge in their defence, that no port in Great-Britain could have furnished such a fleet and army with provisions sooner; which I agree to be true, and that they were very hearty in the enterprize after they saw the forces arrive; for nothing could be of more importance to them than the conquest of Canada. But they ought to have had their forces and provisions ready on the arrival of the British squadron, when they had notice of their coming; for that month's delay, in the finest season of the year, was certainly a vast disadvantage to the enterprize: And whatever some malicious and envious spirits in Old-England might suggest to the contrary then, and have repeated since the disaster happened, it is very evident that all imaginable encouragement was given to the undertaking in England, and that the Officers employed used the utmost diligence and circumspection in the execution of their orders: For the squadron and land forces actually sailed from Plymouth the beginning of May, and arrived at Boston on the 25th of June, the best season in the world to execute the scheme that had been laid, if the New-England people had been in a readiness to join them, and furnished them with good pilots; in both which articles they were apparently defective: And to these, and the cross winds and fogs, and the badness of the navigation in the river Canada the latter end of the year, as has been intimated already, the ill success of this enterprize is principally to be imputed, and not to want of zeal or conduct in the Admiral or General; for they were so intent upon the enterprize, that they avoided engaging a squadron of French men of war, under the command of DE GUY TROEN, rather than the design upon Canada should be defeated; and for this they were severely censured by some who did not consider the importance of the enterprize they were going upon: And the pressing orders they had to use all imaginable dispatch while the fair season lasted, an expedition of the like kind having miscarried once before, when the government of New-England had the sole management of it, purely by its being undertaken too late in the year; and more men were lost in that expedition, than there were in this.

The delay in furnishing provisions the occasion of the ill success in the expedition against Quebec.

The year following, anno 1712, was concluded the peace of Utrecht, in which New-England was included; and as Nova-Scotia and Acadia were yielded to Britain by that treaty, the fisheries on those coasts and in the bay of Fundi, which are equal, if not preferable to the fisheries of Newfoundland) became solely vested in the subjects of Great-Britain.

Nova-Scotia and its fisheries yielded to Great-Britain by the peace of Utrecht.

There

CHAP.

V.

The trade of New-England interferes with that of Great-Britain.

They refuse to allow the Governor a fixed salary.

The constitution of the Massachusetts Colony.

There have not been many transactions of any great moment in New-England since the peace of Utrecht, unless it be their falling into some manufactures and foreign trades, which interfere with the manufactures and trade of Great-Britain, as has been touched upon already, and will be considered further when I come to treat of the disputes between the sugar islands and the northern colonies.

The assembly of New-England have also had a long contest with the court of Great-Britain about settling a fixed salary on their Governor, which they refusing to comply with, that matter was proposed to have been laid before the parliament; and the people of New-England beginning to apprehend their charter in some danger, employed Mr DUMMER, one of their Agents, to appear in print as their Advocate; a gentleman the best qualified for that office of any writer I have met with; for he evidently acts the part of an advocate, concealing or mitigating their errors in government, and setting their best actions in the most advantageous light: Which brings me to enquire into the constitution of the respective colonies, which are comprehended under the name of New-England; and first of that of the Massachusetts.

It is observed by Mr. DUMMER, already mentioned, that by the new charter granted to the Massachusetts (the most considerable of the New-England Colonies) that the appointment of a Governor, Lieutenant-Governor, Secretary, and all the Officers of the admiralty, is vested in the crown: That the power of the militia is wholly in the hands of the Governor, as Captain-General: That all Judges, Justices and Sheriffs, to whom the execution of the law is intrusted, are nominated by the Governor, with the advice of the council; and that the Governor has a negative on the choice of counsellors peremptory and unlimited; and that he is not obliged to give a reason for what he does in this particular, or restrained to any number: That all laws enacted by the general assembly, are to be sent to the court of England for the royal approbation; and that no laws, ordinances, elections (of Magistrates I presume he means) or acts of government whatsoever are valid without the Governor's consent in writing.

By these reservations (in the opinion of this gentleman) the prerogative of the crown and the dependance of this colony are effectually secured: Whereas we find the Lords Commissioners of trade and plantations, in their representation to the house of commons, anno 1732, observing that notwithstanding the power seems to be divided between the King and the people in the Massachusetts Colony, the people have much the greatest share; for they do not only chuse the assembly of representatives, but this assembly chuse the council (equivalent to our house of lords) and the Governor depends upon the assembly for his annual support, which has frequently laid the Governor of this province under the temptation of giving up the prerogatives of the crown, and the interest of Great-Britain: That this colony as well as others ought to transmit to Great-Britain authentick copies of the several acts passed by them; but they sometimes neglect it, and pass temporary laws which have their full effect before the government here can have due notice of them: And if the laws of this colony are not repealed within three years after their being presented,

they are not repealable by the crown after that time.

And here it may be proper to mention some observations of Mr. DUMMER and other New-England writers in relation to the administration of the Governors and Officers of our plantations, as well as on the government itself.

That Governors are apt to abuse their power, and grow rich by oppression, experience shews us, (says Mr. DUMMER.) We have seen, not many years since, some Governors seized by their injured people, and sent prisoners to Whitehall, there to answer for their offences. Others have fallen victims on the spot, not to the fury of a faction or a rabble, but to the resentment of the whole body of the people, rising as one man to revenge their wrongs. Others, after being recalled, have been prosecuted at the King's-bench Bar, pursuant to an act of parliament made in the reign of the late King WILLIAM, whereby it is provided, that Governors shall be impleadable at home for any injuries done in their governments abroad. We have had more than one flagrant instance of this very lately, where Governors have been convicted and censured, not so properly for oppressing, as for a direct plundering their people, and such other acts of mis-rule and lawless power, as one would not have thought it possible they should have committed, if experience had not shewn it to be more than possible.

I do not, however, intend by what is here said to reproach our own nation, as if we were greater sinners than others, or to reflect on the present times, as if they were worse than the former. I know that the same abuses have been practised in every age as well as this, and in foreign colonies as well as our own. The ancient Romans were as brave and as virtuous a people as any in the world; and yet their Pro-Consuls and Governors were very guilty in this respect: Their corruption was so notorious as to be distinguished by the name of crimen repetundarum, a phrase not used in any other meaning, and derived from the obligation which the Roman senate laid on their Governors to make restitution.

Nor have the modern governors in the French and Spanish plantations been less criminal. It is a famous story of a great minister at the court of Madrid, who writ to his friend the vice-roy of Peru, that great complaints were made against him for having extorted immense sums of money from the people in his government; which (says he) I wish may be true, or else you are undone. It seems the same thing that wounded him was necessary to heal him; what put him out of favour was the only thing could restore him.

Indeed it can hardly be expected but these corruptions must happen, when one considers that few gentlemen will cross the seas for a government whose circumstances are not a little strait at home; and that they know by how slight and uncertain a tenure they hold their commissions; from whence they wisely conclude that no time is to be lost: And then for the account to be rendered at home, that is not thought of at so great a distance; for procul a Jove, procul a fulmine.

To enlarge then the power of Governors, is to give them greater power to oppress; and to vacate the charters, is to enlarge their power, the government in that case of course devolving upon them, as we see in those plantations which never had any charters, but are immediately dependent on the crown. There they have in a manner the

CHAP.

V.

Observations on the administration of the plantations by the Governors.

Of the government of the plantations immediately subject to the crown.

CHAP. V. intire legislative and executive powers, or at least, so great an influence on the constituent parts of the former, as leaves them little more than nominal sharers, serving rather as screens to the Governor, than a defence to the people. The militia is absolutely vested in the Governors, which influences all elections of representatives: They appoint Judges, Justices, Sheriffs, and other civil Officers with the consent, it is said indeed, of the council; but that such consent, voluntary or involuntary, will ever be refused, seems too much to be expected, if we consider, that altho' the Governors do not indeed appoint the council, yet they recommend proper persons to the King; and it may be supposed, that a gentleman who is intrusted with the chief command of a province, and is actually on the spot, will be thought the best judge who are fit to serve, and therefore his recommendations will almost always prevail. Besides, if there be a turn to serve, or an emergency real or imaginary, and any of the members should be so refractory as not to give into his measures with an implicit faith, the Governor can suspend as many of them as he pleases; and when he has reduced the board under a number limited in his instructions, he can then fill it up to that number, Instantly, with whom he pleases; and who will they be, may we presume, but such as are passively obedient to his will? And too many such there are to be found in all colonies, so constituted, who are content to be saddled themselves, provided they may ride others under the chief rider. I must farther observe, that where there are no charters, there are courts of equity established, in which the Governor is always Chancellor, and for the most part chief Justice and Ordinary at the same time; which puts the estates, lives, and liberties of the inhabitants, saving the liberty of an appeal at home, intirely in his disposal; and even an appeal in all cases under a considerable sum, in all cases of the ordinary jurisdiction, and in all cases capital, is either disallowed by his instructions, or wholly in the Governor's breast to allow or not.

The sum of my argument is, that the benefit which Great-Britain receives from the plantations arises from their commerce: That oppression is the most opposite thing in the world to commerce, and the most destructive enemy it can have: That Governors have in all times, and in all countries, been too much inclined to oppress. And consequently, it cannot be the interest of the nation to increase their power, and lessen the liberties of the people.

The same writer observes, that all the Officers of the revenue in the plantations are appointed by the crown; and all breaches of the acts of trade and plantations are tried by Judges commissioned by the broad seal, or by warrants from the admiralty of England. That the laws of the country are not pleaded in these courts, but acts of the British parliament; and where they are silent, the civil and maritime laws take place, and the forms of proceeding are regulated after the manner practised in Doctors-Commons. That neither the Judge, nor any of the inferior Officers of the admiralty have salaries, or other dependence, than upon what they get by their fees, and are therefore strongly tempted to receive all business that comes before them however improper for their cognizance.

That the Officers of the revenue are multiplied of late years in the plantations, and guilty of great

CHAP. V. oppressions: The Merchants complain, that by their violent practices, they have driven away all vessels from some parts of the country, insomuch that they have no sloops left to carry their produce to market.

In answer to that prevailing opinion, that the increasing numbers and wealth of this and the rest of the charter colonies, joined to their great distance from Britain, will give them an opportunity in the course of some years to throw off their dependance on this nation, and declare themselves free states, if not checked in time, by being made entirely subject to the crown. He answers, that those gentlemen are but little acquainted with these, or any of the northern colonies, who do not know and confess that their poverty and the declining state of their trade is so great at present, that there is far more danger of their sinking, without some extraordinary support from the crown, than of their revolting from it; besides, they are so distinct from one another in their forms of government, in their religious rites, in their emulation of trade, and consequently in their affections, that they can never be supposed to unite in so dangerous an enterprize: It is for this reason I have often wondered to hear some great men profess their belief of the feasibility of it, and the probability that it will some time or other actually come to pass, and yet at the same time advise, that all the governments on the continent be formed into one, by being brought under one Vice-roy, and into one assembly; for if they in earnest believed that there was, or would be hereafter, a disposition in the provinces to rebel and declare themselves independent, it would be good policy to keep them disunited; because, if it were possible they could contrive so wild and rash an undertaking, yet they would not be hardy enough to put it in execution, unless they could first strengthen themselves by a confederacy of all the parts. On the other hand, another writer is of opinion, that our colonies can never defend themselves against the invasions and outrages of the French and their Indian allies, but by uniting them under one Vice-roy or Generalissimo: He observes, that all Princes and states who have planted colonies, or subdued nations, have given the command of them to particular Governors in subordination to others, who have presided over the whole, for preventing and suppressing sedition; and that each particular government might be strengthened and supported by the rest against the attacks of their common enemies: That in the Roman empire, which contained one hundred and twenty provinces, and near three hundred colonies, there were only four Prefects or chief Governors under the Emperor; and over these extensive countries the Spaniards possess in north and south America, there are but two Vice-roys: In Canada and Louisiana, equal in extent to all the British Colonies, the French have but one Governor in chief, or Generalissimo, who can unite the whole force of the French in that part of the world against any one of the British Colonies he pleases to attack. While the countries in America possessed by the English seem to be in much the same state that Britain was, on the invasion of the Romans, divided under several chiefs, and consequently easily subdued one after another by the united forces of their enemies. Dum singuli pugnabant Universi vincebantur; while they fought in single bodies the whole island was conquered (say the Roman

CHAP. V. Of uniting the colonies under one Vice-roy.

CHAP. V. historians:) So in this country, to draw the parallel, we have at least thirteen colonies governed by their respective Commanders, according to their peculiar laws and constitutions; whereof there is scarce one that can expect relief from one another in the most imminent danger, as experience has often shewn.

Of making all the colonies immediately dependent on the crown. This gentleman also observes, that the colonies depending immediately on the crown, such as Virginia and New-York, have been much less harassed by the Indians, and much better prepared to defend their respective countries when attacked, than the charter governments of New-England; either says he, the latter have not authority enough to prevent the unfair usage the Indians frequently complain of there, or they neglect to give them satisfaction when they are injured, and the frontier plantations are ruined before they can agree to march to their defence.

Of unqualified and corrupt Governors. Another thing that has exposed our colonies to great dangers, he observes, has been the unskilfulness, or corrupt views, of some Governors, and Officers there, who have been left to trust to providence and their own ingenuity for their subsistence: I will not say, that all that go thither are like those in David's camp, in debt or distress, and consequently unqualified to promote the publick weal; but there have been those, who in time of war have supplied their Indian enemies with powder and shot, the French with provisions, and the Spaniards with naval stores: And by keeping up parties and factions, and oppressing the people under colour of their authority, of flourishing colonies, have made very poor ones; but to return to the Massachusetts.

The laws of New-England, and their administration. The laws of the greatest consequence in this colony, and the administration of them, are thus summed up by my author Mr. DUMMER: He says, there is in every county an office, where all conveyances of land are entered at large, after the granters have first acknowledged them before a Justice of peace; by which means, much fraud is prevented, no person being able to sell his estate twice, or take up more money upon it than it is worth. Provision has likewise been made for the security of the life and property of the subject in the matter of juries, who are not returned by the Sheriff of the county, but are chosen by the inhabitants of the several towns, a convenient time before the sitting of the courts. And this election is under the most exact regulation, in order to prevent corruption so far as human prudence can do it. It must be noted, that Sheriffs in the plantations are comparatively but little Officers; and therefore not to be trusted as here, where they are men of ample fortunes. And yet even here such flagrant corruptions have been found in returning juries by Sheriffs, that the house of commons thought it necessary lately to amend the law in this point, and passed a bill for chusing them by ballot.

Redress in their courts of law is easy, quick, and cheap. All processes are in English, and no special pleadings or demurrers are admitted, but the general issue is always given, and special matters brought in evidence, which saves time and expence; and in this case a man is not liable to loose his estate for a defect in form; nor is the merit of the cause made to depend on the niceties of clerkship. By a law of the country, no writ may be abated for a circumstantial error, such as a slight misnomer, or any informality. And by another law, it is enacted,

CHAP. V. that every Attorney taking out a writ from the Clerk's office, shall endorse his surname upon it, and be liable to pay to the adverse party his costs and charges in case of non-prosecution or discontinuance, or that the plaintiff be non-suited, or judgment pass against him. And it is provided in the same act, that if the plaintiff shall suffer a non-suit by the Attorney's mis-laying the action, he shall be obliged to draw a new writ without a fee, in case the party shall see fit to revive the suit. I cannot but think that every body, except gentlemen of the long robe, and the Attornies, will think this a wholesome law, and well calculated for the benefit of the subject. For the quicker dispatch of causes, declarations are made parts of the writ, in which the case is fully and particularly set forth. If it be matter of accompt, the accompt is annexed to the writ, and copies of both left with the defendant; which being done, fourteen days before the sitting of the court, he is obliged to plead directly, and the issue is then tryed. Whereas by the practice of the court of King's-Bench, three or four months time is often lost after the writ is served, before the cause is brought to issue.

Nor are the people of New-England oppressed with the infinite delays and expence that attend the proceedings in Chancery; where both parties are often ruined by the charge and length of the suit. But as in all other countries, England only excepted, Jus & Equum are held the same, and never divided, so it is there: A power of Chancery being vested in the Judges of the courts of common law, as to some particular cases; and they make equitable constructions in others. I must add, that the fees of Officers of all sorts are settled by acts of assembly at moderate prizes for the ease of the subject.

To these laws give me leave to add some others.

If a man commit adultery with a married woman, or maid, or woman espoused, both the man and woman are to be put to death.

The punishment for robbery on the highway, or burglary, for the first offence, is only branding on the forehead; for the second offence, branding again and whipping; and the third offence, death.

Blasphemy is punished with death.

Cruel punishment or correction of servants or children are prohibited; nor shall any court of Justice condemn any offender to receive more than forty stripes.

No man condemned to die shall be executed within four days after condemnation.

Masters of families are to instruct their children and apprentices in the penal laws.

A child upwards of sixteen years of age striking or cursing his parent, to be put to death.

If any parent or guardian shall deny a child timely and convenient marriage, upon complaint to authority, a redress may be had.

No orphan shall be disposed of by a guardian without the consent of some court.

The minority of women in case of marriage is declared to be under sixteen years of age.

Any Magistrate may hear and determine civil causes in his county where the debt or damages do not exceed forty Shillings; and no such causes shall be brought before a court.

False witnesses, forswearing themselves with a design to take away another's life, shall suffer death.

Fornication

CHAP. V. Fornication is punished either by compelling marriage, fining the parties, corporal punishment, disfranchisement, or all of these, as the court shall direct.

No man shall be admitted a freeman but a member of some church in the colony.

No man who is a member of a church shall be exempted from offices.

All Englishmen orthodox in religion, not scandalous in life, who are freeholders of the country and rateable in one single rate at ten Shillings, and twenty four years of age, shall be admitted to the freedom of the common-wealth. Made anno 1664.

Heresy. During the usurpation, anno 1646, they passed a law against hereticks, wherein they recite, that notwithstanding no human power is lord over the faith and consciences of men, yet to avoid damnable heresies tending to the subverting the christian faith, spreading among the inhabitants of this jurisdiction, 'tis enacted, that if any person within this jurisdiction shall broach and maintain any damnable heresies, as denying the immortality of the soul, or the resurrection of the body, or any sin to be repented of in the regenerate, or any evil to be done by the outward man to be accounted sin, or shall deny that CHRIST gave himself a ransom for our sins, or shall affirm that we are not justified by his death and righteousness but by our own merit, or shall deny the morality of the fourth commandment, or shall openly condemn or oppose the baptizing of infants, or shall purposely depart the congregation at the administration of the ordinance of baptism, or shall deny the ordinance of magistracy or their lawful authority to make war and peace, and to punish the outward breaches of the first table, or shall endeavour to seduce others to any of these opinions, every such person lawfully convicted shall be banished this jurisdiction.

Whoever shall revile the office or person of a Magistrate or Minister (Clergyman) shall be severely whipped, and pay the penalty of five Pounds.

Whoever shall publish any heterodox opinions in religion, shall be censured by the county court.

Raw hides, skins, or leather unwrought, shall not be exported, on pain of forfeiture. Anno 1646.

No Horse shall be sold or disposed of to any Indian, on pain of one hundred Pounds.

No Stone-Horse to run in the woods, unless he be well made, and fourteen hands high.

Jurymen shall be chosen by the freemen of each county, a convenient time before the sitting of the court.

No popish priest or jesuit, shall come to, or abide within this jurisdiction, but shall be banished, or otherwise proceeded against as the court of assistants shall direct; and if he return from banishment, he shall be put to death.

No Indians shall be depossessed of their lands or fishing grounds; and any Indians desiring to live among the English, shall have allotments of land.

No man shall sell or dispose of arms or ammunition to the Indians.

No person shall give or sell brandy, rum, or other strong liquors to the Indians.

No person shall sell or dispose of any boat or other vessel to an Indian.

Damage done to the Indians in their Corn or cattle, shall be recompensed. CHAP. V.

The civilized Indians, who live under this government, shall have Indian Commissioners in their several plantations, to hear and determine such differences as a single Magistrate may determine among the English, and shall have Marshals and Constables to execute warrants and orders. They shall also have courts equivalent to county courts among themselves, provided the English Magistrate appoint the fines, and give his consent to the judgments passed; and matters of a higher nature shall be determined by the court of assistants.

No person shall be permitted to pawaw, or perform their idolatrous worship; nor shall the Indians profane the LORD's day.

Strong liquors found in the possession of Indians shall be seized.

Indians found drunk shall be committed till they confess where they had their liquor; and shall pay ten Shillings for being drunk, or receive ten stripes.

Persons allowed to trade with the Indians for skins, may sell them arms and ammunition on paying certain duties to the government, provided such Indians are in amity with the English. This act was made anno 1668.

No person shall be suffered to sit tippling in a publick house above half an hour, except strangers; or to drink above half a pint of wine at a sitting.

No private person to permit people to sit tippling in his house, on pain of twenty Shillings for the first offence, and five Pounds for the second.

All persons prohibited singing in a publick house, or to go into one on a Sunday or lecture-day.

No victualler to suffer a drunken fellow, who has been admonished of his offence by the select men, to come into his house.

The stealing of men is made capital.

No man shall strike his wife, or woman her husband, on pain of ten Pounds, or corporal punishment, at the discretion of the county court.

No man shall make a motion of marriage to any maid, without the consent of her parents or governors, or in their absence, of the next Magistrate, on pain of five Pounds for the first offence, and ten for the second.

Married people shall not live separately without shewing good cause to the court of assistants.

None shall marry any person but a Magistrate, or those that are authorized by the court of assistants, and that after banns three times published in their churches.

The freemen of every town are impowered to settle the wages of servants and labourers there.

If any maim or disfigure his servant, he shall be disfranchised.

The mint shall coin money, Two-pence in the Shilling less in value than English money: The exportation of money prohibited.

Convicted criminals refusing to discover their accomplices may be put to the torture.

Playing in the streets or fields, walking, drinking, visiting, sporting, and travelling on the Sabbath-day prohibited.

No violence shall be offered to any that suffer shipwreck upon the coast, or to their goods; but both shall be harboured and preserved in safety.

CHAP.

V.

Government of Connecticut and Rhode-Island.

As to the two colonies of Connecticut and Rhode-Island, which I comprehend under the title of New-England, these, as has been observed already, are distinct governments, and indulged at present with higher privileges than the Massachusetts Colony; for these, by their respective charters, are authorized annually to elect their own Governors, Deputy-Governors, council and assembly, with the rest of their Magistrates and Officers, civil and military; and to make laws for the government of the colony, provided they are not repugnant to the laws of England; and the people of Connecticut, in their religion, laws and customs, copy pretty closely after their mother colony, that of the Massachusetts.

State of religion there.

As to the state of religion in Rhode-Island Colony, a gentleman of considerable interest there gives me this account of it. He says, they are a very free people in that respect. They consist of episcopalians, presbyterians, anabaptists and quakers; but the quakers are now the most considerable, their present Governor, JOHN WANTON, Esq; being a quaker, as are also several of the council and house of representatives; and as they are principled for a free ministry of the gospel, so consequently there is no forced maintenance in the colony for the ministry of any persuasion, but every different society that is for maintaining a preacher does it voluntarily by a contribution or subscription.

Of New Hampshire.

The fourth and last colony comprehended under the name of New-England, is that of New-Hampshire; which is immediately dependent on the crown, and consequently the King appoints their Governor, Lieutenant-Governor, Council, Magistrates and Officers, civil and military; but the freemen still elect their representatives, as the free-holders in England do with us. The constitution of this, and all other colonies immediately depended on the crown therefore resembles nearly that of Old-England; but in the rest, called charter governments, the diffusive body of the people seem to be vested with the sovereign power, having the election of their Governors, Council, and Magistrates annually, and their laws being made by themselves without the King's concurrence. However their laws are liable to be repealed, and their constitution entirely altered by the King and parliament; which, one would think, should render them extremely cautious in making laws that may prove disadvantageous to their mother country, or promote such trades and manufactures as may interfere with those of Great-Britain; for they may very well expect when this shall be done to any great degree, the parliament will keep a severe hand over them, and perhaps deprive them of their most darling privileges. It may be found expedient hereafter also, even for their own defence and security, to appoint a Vice-roy, or at least a Generalissimo in time of war, who, by the advice of his Council, may assemble and unite the whole force of the plantations against the encroachments and invasions of the French, and assign every province and colony their respective quotas of troops to oppose this formidable rival: Or at least it may be found necessary to make all the colonies immediately dependent on the crown, as Virginia, Carolina, and New-York are; for the

The difference between the charter governments and those immediately depending on the crown.

CHAP. V.
 charter governments are not to be depended on in such exigencies: They may refuse their assistance, or it will probably come too late to be of any service upon a sudden invasion. Half the country may be destroyed before they come to an effectual resolution to raise forces; or at least before they put their resolutions in execution. Nor can it ever be expected that the charter colonies should agree about their respective quotas and supplies of men and money, or indeed know what is necessary for the defence of the whole, so well as the Vice-roy or Generalissimo may, who attentively considers the several colonies and their respective circumstances with an impartial eye. All the difficulty lies in finding a gentleman of probity and capacity equal to so great a trust, or in putting such checks and restraints upon him as may prevent the abuse of such a power without prejudice to the service.

As to the money of New-England, according to Mr. NEAL, they have none at present, neither Silver nor Gold. About fifty or sixty years ago there was money coined in the country, but there is hardly enough left now for the retail business, all their payments among themselves being made in province bills made legal by act of the general assembly, which descend as low as half-a-Crown; so that the gentlemen of New-England carry all their money in their pocket-books: Hence it is that the course of exchange runs so much to the disadvantage of the country, that 100 l. to be paid in London is sometimes worth 220 and 225 l. paid in New-England; so that if a Merchant of Boston should remit his estate to London it would not be worth half so much as it is there; but on the other hand, if a Merchant in London worth a 1000 l. should have a mind to settle in New-England, and carry his effects along with him, he might be worth 3000 l. on his arrival there, and live as well upon it as upon 3000 l. here.

Money of New-England.

Exchange.

A gentleman of Connecticut Colony informs me that they are not allowed the privilege of coining any money there; the Silver and Gold that is among them is what they import from other parts in return for the commodities they export, and passes all by weight, and serves only as merchandize, which for the most part, one way or other is sent home to Great-Britain, to pay for goods imported into New-England from thence; what serves as a medium of trade is their bills of credit from 5 s. to 5 l. bills, of which they have some quantities issued by their government.

The Indians have a sort of money among them, which they call Wampam, and is a parcel of little beads made of the shells which lie on the sea-coast, with holes in them to string upon a bracelet, whereof some are white, and of these six go for a Penny; some black or blue, and of these three go for a Penny.

Indian money.

Besides water-carriage, they have now waggons and Pack-horses. There is a stage waggon which goes from Boston to Newport in Rhode-Island; being seventy miles. Gentlemen also have coaches and chaises, but they travel most commonly on horseback. And there are inns on the roads as well provided for the entertainment of travellers as those of Old-England.

Carriages, travelling and inns.

THE
PRESENT STATE
OF
NOVA-SCOTIA.

CHAP. VI.

Of Nova-Scotia or New-Scotland, and Acadia.

CHAP.
VI.
New-
Scotland.
The situa-
tion and
extent.

NEW-SCOTLAND, in which I comprehend Acadia, is bounded by the bay and river of St. Lawrence on the north-east and north-west, by the Atlantick-Ocean on the east, by the same ocean and the bay of Fundi on the south, and by part of Canada and part of New-England on the west, lying between 43 and 51 degrees of north latitude, and between 63 and 70 degrees of western longitude; being about five hundred miles in length from north to south, viz. from Cape Sable to Cape Gaspe, at the mouth of the river St. Lawrence; and about three hundred miles in breadth from east to west, viz. from Cape Canso to the river Penobscot, which divides New-England from New-Scotland, as I apprehend.

Chief
towns.

This country yet remains undivided into counties or lesser districts, and is still uncultivated, unless in two or three places near the sea-coasts; the rest is all forest: Yet where it has been settled or planted, either by the French or English, the soil appears to be fruitful. The only towns the English have in Nova-Scotia are that of Port-Royal, or Annapolis, situate in the bay of Fundi, and that of Canso in the east, over-against the island of Cape-Breton.

Annapo-
lis.

The town or city of Annapolis lies upon an excellent harbour on the east side of Fundi Bay, capable of receiving a fleet of a thousand ships, and at the entrance of it has sixteen or eighteen fathoms water on one side, and six or seven on the other. The town is pretty well fortified; and here the Governor resides with a garrison of five hundred English. Canso, situated on the eastern shore of Acadia, will probably in time be a very considerable town, on account of an excellent fishery near it; tho' it seems the English have been disturbed, and great encroachments made on their territories and fisheries in Nova-Scotia by the French since the peace of Utrecht.

Canso.
The coun-
try of Aca-
dia still un-
cultivated.

An English gentleman, who wrote of this country in the year 1720, says it must be acknowledged that ever since the peace of Utrecht no care has been wanting to provide this province with

Governors, Lieutenant-Governors, and other inferior Officers both civil and military, and also with a considerable number of regular forces; but with great submission, I think the Orator's question may very pertinently be repeated here, Cui bono? And indeed what great service can be expected from a single garrison whose command reaches no farther than their guns, whilst the whole country is abandoned to the French, who make settlements, and erect forts by order of the Governor of Canada, on all the principal rivers, particularly St. John's, Passamaquady and Penobscot, and have possessed themselves of our fishery at Canso, which is perhaps the best in the world: For tho', according to the true meaning of the 11th article of the treaty of Utrecht, they can claim no more liberty to fish there than on any other part of that coast; yet finding that their new plantations on Cape Breton were scarce habitable, they not only managed their fishery on our ground, and in our harbours, but by the assistance of the Indians pulled down our stages, destroyed our vessels, and proceeded so far as to suffer none of his Majesty's subjects to catch or cure fish at the island of Canso without first paying for a licence from the Governor of Cape Breton; tho' the French have no manner of right to these islands and harbours: If they had it would be an unpardonable crime in that Governor to allow the English to trade or fish there on any account whatsoever. And the reason is because all Governors in America, whether English or French receive express instructions from their respective masters, to put in execution the articles of the treaty of neutrality in America, between King JAMES II. and the late King of France; wherein it is stipulated, that none of the subjects of either King shall trade or fish in the bays, &c. belonging to the other, under the penalty of the vessel so trading or fishing, and lading, being confiscated.

The
French
encroach-
ments
there.

But, as I am informed, the people of New-England have of late asserted their right to those fisheries, and built and peopled the town of Canso, and manage the fishery there to great advantage: However,

CHAP.
VI.

However, the rest of the country still remains unplanted. The greatest part of the European inhabitants are French, who have taken the oaths to the crown of England, and the Indians are for the most part proselytes to the French jesuites; so that if a war should break out again between Great-Britain and France, the French would soon become masters of Acadia and all Nova-Scotia again, in the opinion of some. They have 'tis said, always fifteen hundred regular forces in the neighbouring island of Cape Breton, and would be joined by a French squadron and land forces from Europe in case of a rupture, which, with the assistance of the natives, would enable them, say these gentlemen, to reduce Acadia under their power in a single campaign, ruin the British fisheries here and at Newfoundland, destroy the foreign trade of our northern Colonies, and cut off all communication between them and Europe.

Whereas if this country were peopled and planted by the English, it would not only yield us all manner of naval stores, great plenty of rich Furs and skins, but preserve to us the finest fisheries in the world, secure Acadia against any attacks from Cape Breton, and with the help of an English squadron in time of war protect the trade of the northern Colonies.

Port-Royal, while it was in the hands of the French last war, was justly styled the Dunkirk

of that part of the world; continually harbouring fleets of privateers, and French cruizers, to the ruin of the fisheries and foreign trade of the northern Colonies: And this will probably be the case again if we do not plant this country, and make provision against the attempts of the French while the peace continues; and when this is done, still Cape Breton will remain a thorn in our sides, and probably occasion perpetual skirmishes between the subjects of Great-Britain and France, till either we reduce that island, or the French make a conquest not only of Nova-Scotia, but of New-England itself, and all our northern colonies: And as we have no great reason to fear the French will ever be able to effect the latter, at least in this age, so we must expect they will use their utmost efforts for the preservation of the island of Cape Breton; for whenever this falls into the hands of the English, the French trade to Canada and North-America must infallibly be lost and fall to the share of Great-Britain; and all their hopeful schemes of uniting Canada or New-France to Louisiana, or South Florida, must vanish; for Cape Breton and Newfoundland (already in our possession) lie before the bay of St. Lawrence, and with the assistance of a squadron of men of war stationed there might easily cut off all communication with that river, by which alone Canada or New-France can be approached.

CHAP.
VI.

THE PRESENT STATE OF NEW-BRITAIN.

CHAP. VII.

Of New-Britain, or Terra de Labarador, and Hudson's Bay.

CHAP.
VII.

New Britain and Hudson's Bay. The situation and extent.

NEW-BRITAIN, or Terra de Labarador, in which I comprehend Hudson's Bay and Streights, is separated from Nova-Scotia by the river of St. Lawrence and part of Canada, and extends from 49 to 64 degrees north latitude, lying between 60 and 90 degrees of western longitude.

This cold inhospitable country is but thinly peopled with Indians, and the only part of it that was ever thought worth the planting by any Europeans was the bottom and the west side of Hudson's Bay, where the English have four or

five little forts and factories, the chief of which is fort Albany. The Hudson's Bay company trade thither for furs and skins, to the value of fifteen or twenty thousand Pounds prime cost annually, of which three fourths are Beaver Skins.

The eastern shores of this country were discovered by SEBASTIAN CABOT, for HENRY VII. King of England, about the year 1498. They were afterwards visited by DAVIS and others in their attempts to discover a north-west passage to China; but Captain HENRY HUDSON, who has communicated his name to the bay and

CHAP.
VII.

Produce of the country. The first discovery of it by CABOT.

CHAP. VII. and streights, surrounded almost the whole coast going on shore in several places.

HUDSON'S discovery. Mr. HUDSON made four voyages to the north upon discovery, the first in the year 1607, when he set sail from England in the month of May; and having made the coast of Greenland, sailed as far as 81 degrees 30 minutes, and returned to England on the 15th of September the same year.

In the year 1608, he endeavoured to discover a north-east passage to China, but coming into 75 degrees 30 minutes north latitude on the 9th of June, he found his way so blocked up by mountains of ice that he returned home.

The year following, anno 1609, he made another attempt to find a way to China, by the north-east, but was again prevented by fields of ice near Nova Zembla.

The following year, 1610, Sir THOMAS SMITH, Sir DUDLEY DIGGES, Mr. WOSTENHOLME, and other adventurers, fitted out Mr. HUDSON again, with orders to endeavour to find a passage through Davis's Streights to the South-Sea or Pacifick Ocean. Accordingly Mr. HUDSON set sail from England in April, and on the 4th of June arrived upon the coast of Greenland, from whence he sailed to the Island of Desolation; then he steered almost due west till he discovered a point of land, being part of Terra de Labrador, in the latitude of 60, which is called Desire Provokes, being near the mouth of those streights which afterwards obtained the name of Hudson's Streights: These he entered soon after, and sailing through fields of ice to the north-west for upwards of three hundred leagues by computation, he came to a small streight two leagues over and very deep water, through which he passed between two promontories, calling that to the southward Cape Wostenholme, and that to the north-west Digges's Island, the latter lying in 64 degrees 44 minutes north latitude: And now coming into a spacious sea, wherein he sailed an hundred leagues south, he assured himself he had found the passage into the Pacifick Ocean; but perceiving at length, by the shallow water, that he was embayed, he was extremely disturbed, for there was a necessity now of remaining all winter in this frozen country, there being no possibility of returning through the streights till next summer on account of the ice. He brought his vessel therefore to an anchor in a small creek on the south-west part of the bay, where being in great distress for want of provisions, he was plentifully supplied with wild fowl during the winter, and afterwards in the spring with fish; but the Captain was so intent upon completing his discovery, that he left his men to take and salt up fish and victual the ship, while he search'd every creek and corner of the shore in his sloop for a passage to the South-Sea. During his absence his men did not only neglect to catch fish, but entered into a conspiracy to run away with the vessel and leave him and the rest of their Officers behind, which they put in execution soon after his return, forcing him and eight more into a boat with a very small share of provisions; and they were never heard of from that day to this. The pretence of the mariners for this piece of barbarity being that the Captain had threatened to set part of the crew on shore, for not furnishing the ship with fish when it was in their power.

HUDSON'S men run away with his ship, and leave him to perish.

The conspirators having left their Captain and his companions to shift for themselves, brought

the ship to Digges's Island, where all their provisions being spent, they went on shore, and furnished themselves with great quantities of wild fowl: But GREEN the Captain of the mutineers, and three or four more of the ring-leaders, were surprised by the natives and cut in pieces. Whereupon PRICKET, a servant to Sir DUDLEY DIGGES (whose life the mutineers had spared, in hopes he would have been instrumental in getting their pardon,) took the charge of the ship upon him, and brought her home on the 6th of September, 1611, the crew being all so weak that they were not able to manage their sails without the assistance of some fishermen they met with at sea; and part of them were actually starved to death in the passage.

CHAP. VII.

The ship returns home.

The year following, Sir THOMAS BUTTON pursued the discovery, and passing Hudson's Streights entered the same bay, and leaving the south part of it, which HUDSON had visited, he sailed some hundreds of leagues to the westward, till he arrived at a large continent, which he named New-Wales; and here he lost his ship, coming home in a sloop that he built in the country.

Sir THOMAS BUTTON'S voyage to the bay.

The next adventurer that entered Hudson's Bay was Captain JAMES, in the year 1631: This gentleman sailed to the bottom of the bay, and wintered on Charlton-Island, in 52 degrees odd minutes north latitude, for which reason the south part of this gulph is usually called James's Bay. At his return he gave so dreadful an account of the hazards he sustained in his voyage from the ice, that nobody attempted it again till the year 1667, when Captain GILLAM entered the bay, sailing to a river near the bottom of it in 51 degrees north latitude, which he judged to be a proper place for settling a factory, and called it Prince Rupert's River. Upon his return his owners applied to King CHARLES II. for a patent to plant the country, which they obtained anno 1670, Prince RUPERT being the chief proprietor: And the company have carried on a small but profitable trade thither with some interruptions from the French of Canada almost ever since. The English were encouraged to settle factories here by two Frenchmen, who had been conducted to the bay by some of the natives of Canada. These men returning to France, and proposing the settling of a colony at the bottom of the bay, the project was slighted by that ministry; whereupon the English ambassador at that court engaged these two men in the service of the English, and thereupon preparations were made in England to send a colony to the bay.

JAMES'S voyage thither.

A patent to plant the country, 1670.

The first English Governor that went thither was CHARLES BATLY, Esq; anno 1670, who built a fort on Rupert-River, and gave it the name of Charles Fort; and soon after he caused a factory to be settled at port Nelson, on the west side of the bay, in 57 degrees north latitude but the two Frenchmen (RADISON and GOOSELEER) soon after betrayed that place to the French of Canada; However, in the year 1682 they thought fit to change sides again, and restored port Nelson to the English. In the year 1684 the chief factory of the English was removed to Chickewam-River, and called Albany; and a fort was erected for its defence on the south-west part of the bay. It was designed also to have fixed a colony on Charlton-Island, and to have built warehouses there for their Furs; but the place

Charles Fort. Port Nelson.

Albany Fort.

New-Bri-
tain and
New-
Scotland.

place was afterwards found inconvenient, and de-
serted again. The company were now in posses-
sion of five settlements (viz.) those in Albany-River,
Hayes-Island, Rupert-River, port Nelson and New-
Severn, between port Nelson and Albany, and
their trade in a flourishing condition, when the
French, apprehensive that the English would draw
all the upland Indians to the bay, sent a detach-
ment of troops from Canada under the command
of the Chevalier DE TROYS, who invaded our set-
tlements, and made himself master of Hayes-Island,
fort Rupert, and Albany, in July 1686, though
we were then at peace with France. But the Eng-
lish still remained in possession of port Nelson; and
in the first war between the confederates and the
French, in the year 1693, the English recovered
the rest of their settlements in the bay. During
the last war the French reduced all our settlements,
except Albany, under their power again, but they
were yielded to Great-Britain by the peace of U-
trecht, anno 1713, and we have remained in pos-
session of them ever since.

By the tenth article of this treaty his most
Christian Majesty obliged himself to restore to
Great-Britain the bay and streights of Hudson,
with all lands, seas, sea-coasts, rivers, and places
situate on the said bay and streights, with the
fortresses there erected, in the condition they then
were, with all cannon and ammunition in the same:
And it was agreed that commissaries on the part of
Great-Britain and France should determine within a
year the limits to be fixed between the said bay
of Hudson and the places appertaining to the
French; which limits the subjects of Great-Britain
and France are not to pass over to each other by
sea or land. And commissioners did afterwards set-
tle the limits by an imaginary line drawn from a
promontory situate on the Atlantick-Ocean, in 58
degrees 30 minutes, and running from thence
south-west to the lake Misicossink or Mistassin, and
from thence south-west indefinitely to the latitude of
49; all the countries to the north being assigned to
Great-Britain, and all on the south, between that
line and the river of St. Lawrence or Canada, to
France.

By the eleventh article France was obliged to
make satisfaction to the English company trading
to Hudson's Bay for all the depredations the
French had committed there in time of peace; and
the English were to give the like satisfaction to
the French.

By the twelfth article of the same treaty, Nova-
Scotia or Acadia, Port-Royal or Annapolis-Royal,
with their lands and dependencies, were entirely
yielded and made over to Great-Britain in such
ample manner that the subjects of France were
entirely excluded from all kind of fisheries in the
seas, bays and coasts of Nova-Scotia, especially
those which lie towards the east and within thirty
leagues thereof, beginning from the island of Sable
inclusive, and stretching thence to the south-west
(but I question if this is not a mistake, and it ought
not to have been said to the North-East; for Cape
Sable is the most southerly promontory of Aca-
dia, or Nova-Scotia) however, it is possible this mi-
stake has given the French a pretence to disturb our
fishery at Canso, on the north-east point of Acadia.

The orders of the Admiralty to Captain MID-
DLTON, to endeavour a discovery of the
North-west-passage.

Whereas we have, in obedience to his Majesty's
commands, ordered the Furnace Sloop, whereof

you are Commander, to be fitted out in a proper
manner, to proceed on a voyage towards Hud-
son's Strait, in order to attempt the discovery of
a passage that way into the western American
ocean, and have appointed the Discovery Pink,
WILLIAM MOOR, Master, (who is hereby re-
quired and directed to follow your orders) to at-
tend you on that service, you are hereby required
and directed, so soon as the said Sloop and Pink
are ready for the sea, to fall down to the North,
and when they have been paid what is due to
their companies, to proceed to Leith, and deli-
ver the inclosed packet to Captain HOLBURN,
commander of his Majesty's ship the Dolphin,
containing orders to the said Captain to proceed
in company with you, as far as the islands of
Orkney, for your better security against the pri-
vateers of the enemy, said to be cruising there-
about.

You are accordingly to proceed in company
with the said ship Dolphin as far as the aforesaid
islands, and then to make the best of your way
with the Sloop and Pink under your command,
towards Hudson's Strait, and after passing the
same, to proceed to Carey's Swan's-nest; and
then steer north-westerly, so as to fall in with the
North-west land at Sir THOMAS ROX's Welcome,
or ne ultra, near the latitude of 65 degrees
North.

You are there to make the best observations
you can of the height, direction and course of
the tides, bearing of the lands, depth and found-
ings of the sea, and shoals, with the variation of
the needle.

When you come up with Whalebone Point in
65°, you are to try the best passage in doubling
that land, whether to eastward or westward, in
case it be an island; and on which side soever
you meet the tide and flood, to direct your course
so as to meet the tide, whether north-westerly or
south-westerly.

If after, in doubling that cape, you find either
a strait or an open sea, you are to keep on your
course, still meeting the tide of flood; and if it
be so wide as to lose sight of land, then keep to
the larboard or American shore, steering south-
westerly, so as to take the bearings of the lands
and soundings; and observe whether there are any
inlets, bays, or rivers, to shelter the ships, in
case bad weather, or contrary winds, oblige you
to take harbour; and there make the best plans
you can of such harbours, and the charts of the
coast.

You must make no stay any where, whilst wind
and weather permits, (except for making obser-
vations for your safety in your return) until you
get to the southward of 60 degrees North; and
then, if you continue to find an open sea, make
more careful observations of the American coast or
islands, and of the head-lands, bays, and rivers,
until you make the latitude of 50 degrees, or
any more southerly latitude, in case you find it
convenient to winter on the western side of Ame-
rica; but if you should find it more convenient to
return into the bay to winter, or can make your
passage home in time, after making a discovery
of the passage to the western American ocean,
(which is more eligible) in order to prosecute
the discovery to advantage next season, then you
need proceed no farther southerly than 50 or 60
degrees latitude, and make all proper observa-
tions of the tides, bays, head-lands, shoals, and
rocks on both sides, if the passage be narrow, or
on

CHAP. VII. on which ever side the wind and weather permits you, with the variation, or any other curious observations you can make.

* If you find any inhabitants upon the coast, or any populous nations to the southward, you are to endeavour by all proper means, to cultivate a friendship and alliance with them, presenting them with such trifles as they value, and shewing them all possible civility and respect; but to take caution, if they be numerous, not to let yourself be surprized, but to be constantly on your guard against any accidents.

* If you find it proper to winter on the other side of the passage, get to a warm climate not more northerly than 42 degrees in some safe harbour, that may be of use in a future settlement; and rather in an island, if there be a good harbour, which would be safer than on the continent for an infant settlement.

* If your place of wintering is within a proper distance to be supplied by the natives on the continent, take proper seeds, of fruit-trees, plants, grain and pulse, and sow them in the spring, or in case you find any civilized nation, who want such kinds, you may present some to them, and make them sensible of their use and manner of culture.

* In places where you meet with inhabitants, make purchases with their consent, and take possession of convenient situations in the country, in the name of his Majesty of Great-Britain.

* But when there are no inhabitants, you must take possession by setting up proper inscriptions as first discoverers and possessors.

* If in your passage you meet with any ships trading to the western countries, eastward of Japan, or any Japanese ships, and you apprehend any danger from them, either from their force or number, you are to proceed no farther in the discovery, but immediately to return, that ships of sufficient force may be sent out next season, to begin a trade, or make a settlement, without any apprehension of disturbance from any powerful nation on that side, lest any accident should prevent your return, and discourage any farther attempts to be made for the future.

* If you should arrive at California without any apprehension of danger, and chuse to winter in 42 degrees (where CAXTON is said to have found a civilized nation and good harbour) or more southerly, then endeavour to meet Captain ANSON in the month of December, before the arrival of the Manila ship at the Cape St. Lucas, the southern Cape of California, and leave a copy of your journal with him, lest any accident should happen to you upon your return, and so the discovery be lost, and it might prevent ships being sent out to your relief in case of shipwreck.

* But for as much as, in an undertaking of this nature, several emergencies may arise, not to be foreseen, and therefore not so particularly to be provided for by instructions before-hand, you are in such case to proceed, as upon advice with your Officers, you shall judge may be most advantageous to the service on which you are employed.

* When you return home, you are to proceed into the river Thames, and send our Secretary an account of your arrival and proceedings, for

VOL. III.

our information. Given under our hands the 20th of May, 1741.

CHAP. VII.

To Captain MIDDLETON,
Commander of his Majesty's Sloop the Furnace,
Deptford.

CHA. WAGER.
THO. FRANKLAND.
GLENORCHY.

By command of their Lordships,
THOMAS CORBETT.

By the Commissioners for executing the office of Lord High-Admiral of Great-Britain and Ireland, &c.

* You are hereby required and directed during the course of your intended voyage, not to give any disturbance or molestation to any of the ships or sloops, employed in the service of the Hudson's Bay Company, but to give them all protection and assistance that lies in your power, whenever any opportunity offer of your being serviceable to them. Given under our hands the 29th of May, 1741.

To Captain MIDDLETON,
Commander of his Majesty's Sloop Furnace.

CHA. WAGER.
VERE BEAUCLERKE
GLENORCHY.

By command of their Lordships,
THOMAS CORBETT.

Captain MIDDLETON's account of the extraordinary degrees and surprizing effects of Cold in Hudson's Bay, North-america, read before the Royal Society, Oct. 28, 1742.

I observed that the Hares, Rabbits, Foxes and Partridges, in September, and the beginning of October, changed their native colours to a snowy white; and that for six months, in the severest part of the winter, I never saw any but what were all white, except some Foxes of a different sort, which were grizzled, and some half red, half white.

That lakes and standing waters, which are not above 10 or 12 feet deep, are frozen to the ground in winter, and the fishes therein all perish.

Yet in rivers near the sea, and lakes of a greater depth than 10 or 12 feet, fishes are caught all the winter, by cutting holes through the ice down to the water, and therein putting lines and hooks. But if they are to be taken with nets, they cut several holes in a strait line the length of the net, and pass the net, with a stick fastened to the head line, from hole to hole, till it reaches the utmost extent; and what fishes come to these holes for air, are thereby entangled in the net; and these fish, as soon as brought into the open air, are instantaneously frozen as stiff as stock-fish. The seamen likewise freshen their salt provisions, by cutting a large hole through the ice in the stream or tide of the river, which they do at the beginning of the winter, and keep it open all that season. In this hole they put their salt meat, and the minute it is emerged under water, it becomes pliable and soft, though before it's immersion it was hard frozen.

Beef, Pork, Mutton, and Venison, that are killed at the beginning of the winter, are preserved by the frost, for six or seven months, intirely free from putrefaction, and prove tolerable good eating. Likewise Geese, Partridges, and other Fowl, that are killed at the same time, and kept with their feathers on, and guts in, require no other preservative but the frost to make them good wholesome eating,

CHAP.
VII.

eating, as long as the winter continues. All kinds of fish are preserved in the like manner.

In large lakes and rivers, the ice is sometimes broken by imprisoned vapours; and the rocks, trees, joists and rafters of our buildings, are burst with a noise not less terrible than the firing off a great many guns together. The rocks, which are split by the frost, are heaved up in great heaps, leaving large cavities behind; which I take to be caused by imprisoned watery vapours, that require more room, when frozen, than they occupy in their fluid state. Neither do I think it unaccountable, that the frost should be able to tear up rocks and trees, and split the beams of our houses, when I consider the great force and elasticity thereof. If beer or water is left in mugs, cans, bottles, nay in copper-pots, though they were put by our bedsides, in a severe night, they are surely split to pieces before morning, not being able to withstand the expansive force of the inclosed ice.

The air is filled with innumerable particles of ice, very sharp and angular, and plainly perceptible to the naked eye. I have several times this winter tried to make observations of some celestial bodies, particularly the emersions of the Satellites of Jupiter, with reflecting and refracting Telescopes; but the metals and glasses, by that time I could fix them to the object, were covered a quarter of an inch thick with ice, and thereby the object rendered indistinct, so that it is not without great difficulties that any observations can be taken.

Bottles of strong beer, brandy, strong brine, spirits of wine, set out in the open air for three or four hours, freeze to solid ice. I have tried to get the Sun's refraction here to every degree above the horizon, with ELTON's quadrant, but to no purpose, for the spirits froze almost as soon as brought into open air.

The frost is never out of the ground, how deep we cannot be certain. We have dug down 10 or 12 feet, and found the earth hard frozen in the two summer months; and what moisture we find five or six feet down, is white like ice.

The waters or rivers near the sea, where the current of the tide flows strong, do not freeze above 9 or 10 feet deep.

All the water we use for cooking, brewing, &c. is melted snow and ice; no spring is yet found free from freezing, though dug never so deep down. All waters inland are frozen fast by the beginning of October, and continue so till the middle of May.

The walls of the house we live in are of stone, two feet thick, the windows very small with thick wooden shutters, which are close shut 18 hours every day in the winter.

There are cellars under the house, wherein we put our wines, brandy, strong beer, butter, cheese, &c. Four large fires are made in great stoves, built on purpose, every day; as soon as the wood is burnt down to a coal, the tops of the chimneys are close stopped with an iron cover: This keeps the heat within the house (though at the same time the smoke makes our heads ach, and is very offensive and unwholesome;) notwithstanding which, in four or five hours after the fire is out, the inside of the walls of our house and bed-places, will be two or three inches thick with ice, which is every morning cut away with a hatchet. Three or four times a day we make iron shot of 24 pounds weight red-hot, and hang them up in the windows of our apartments. I have a good fire in my room the major part of the 24 hours; yet all this will

not preserve my beer, wine, Ink, &c. from freezing.

CHAP.
VII.

For our winter dress we make use of three pair of socks of coarse blanketing or duffil for the feet, with a pair of deer-skin shoes over them; two pair of thick English stockings, and a pair of cloth stockings upon them; breeches lined with flannel; two or three English jackets, and a fur or leather gown over them; a large beaver cap, double, to come over the face and shoulders, and a cloth of blanketing under the chin; with yarn gloves, and a large pair of beaver mittings hanging down from the shoulders before, to put our hands in, which reach up as high as our elbows; yet notwithstanding this warm cloathing, almost every day, some of the men that stir abroad, if any wind blows from the northward, are dreadfully frozen; some have their arms, hands, and face blistered and frozen in a terrible manner, the skin coming off soon after they enter a warm house, and some have lost their toes. Now their lying in for the cure of these frozen parts, brings on the scurvy in a lamentable manner. Many have died of it, and few are free from that distemper. I have procured them all the helps I could, from the diet this country affords in winter, such as fresh Fish, Partridges, Broths, &c. and the doctors have used their utmost skill in vain; for I find nothing will prevent that distemper from being mortal, but exercise and stirring abroad.

Coronæ and Parhelia, commonly called Halo's, and Mock-suns, appear frequently about the Sun and Moon here. They are seen once or twice a week about the Sun, and once or twice a month about the Moon, for four or five months in the winter, several Coronæ of different diameters appearing at the same time.

I have seen five or six parallel Coronæ concentric with the Sun several times in the winter, being for the most part very bright, and always attended with Parhelia or Mock-suns. The Parhelia are always accompanied with Coronæ, if the weather is clear; and continue for several days together, from the Sun's rising to his setting. These rings are of various colours, and about 40 or 50 degrees in diameter.

The frequent appearance of these Phenomena in this frozen clime seems to confirm DESCARTES's hypothesis, who supposes them to proceed from ice suspended in the air.

The Aurora Borealis is much oftner seen here than in England; seldom a night passes in the winter free from their appearance. They shine with a surprizing brightness, extinguishing all the stars and planets, and covering the whole hemisphere: Their tremulous motion from all parts, their beauty and lustre, are much the same as in the northern parts of Scotland, Denmark, &c.

The dreadful long winters here may almost be compared to the Polar parts, where the absence of the Sun continues for six months; the air being perpetually chilled and frozen by the northerly winds in winter, and the cold fogs and mists obstructing the Sun's beams in the short summer we have here; for notwithstanding the snow and ice is then dissolved in the low-lands and plains, yet the mountains are perpetually covered with snow, and incredible large bodies of ice continue in the adjacent seas. If the wind blows from the southern parts, the air is tolerably warm, but insufferably cold when it comes from the northward, and it seldom blows any otherwise than between the north-east and the north-west, except in the two summer months, when we have, for the major part, light gales between

CHAP. VII. tween the east and the north, and calms. The northerly winds being so extremely cold, is owing to the neighbourhood of high mountains, whose tops are perpetually covered with snow, which exceedingly chills the air passing over them. The fogs and mists that are brought here from the Polar parts, in winter, appear visible to the naked eye in isicles innumerable, as small as fine hairs or threads, and pointed as sharp as needles. These isicles lodge in our cloaths, and if our faces or hands be uncovered, they presently raise blisters as white as a linen cloth, and as hard as horn. Yet if we immediately turn our backs to the weather, and can bear our hand out of our mitten, and with it rub the blistered part for a small time, we sometimes bring the skin to its former state: If not we make the best of our way to a fire, and get warm water, wherewith we bathe it, and thereby dissipate the humours raised by the frozen air; otherwise the skin would be off in a short time, with much hot, serous, watry matter coming from under along with the skin; and this happens to some almost every time they go abroad, for five or six months in the winter, so extreme cold is the air when the wind blows any thing strong.

Now I have observed, that when it has been extreme hard frost by the Thermometer, and little or no wind that day, the cold has not near so sensibly affected us, as when the Thermometer has shewed much less freezing, having a brisk gale of northerly wind at the same time. This difference perhaps may be occasioned by those sharp pointed isicles beforementioned striking more forcibly on a windy day, than in calm weather, thereby penetrating the naked skin, or parts but thinly covered, and causing an acute sensation of pain or cold: And the same reason, I think, will hold good in other places; for should the wind blow northerly any thing hard for many days together in England, the isicles that would be brought from the Polar parts by the continuance of such a wind, though imperceptible to the naked eye, would more sensibly affect the naked skin, or parts but slightly covered, than when the Thermometer has shewn a greater degree of freezing, and there has been little or no wind at the same time.

It is not a little surprising to many, that such extreme cold should be felt in these parts of America, more than in places of the same latitude on the coast of Norway; but the difference I take to be occasioned by the winds blowing constantly here, for seven months in the twelve, between the north-east and north-west, and passing over a large tract of land, and exceeding high mountains, &c. as beforementioned: Whereas at Drunton in Norway, as I observed some years ago in wintering there, the wind all the winter comes from the north and north north-west, and crosses a great part of the ocean clear of those large bodies of ice we find here perpetually. At this place we have constantly every year nine months frost and snow, and unufferable cold from October to the beginning of May. In the long winter, as the air becomes less ponderous towards the Polar parts, and nearer to an equilibrium, as it happens about one day in a week, we then have calms and light airs all round the compass, continuing sometimes twenty-four hours, and then back to its old place again, in the same manner as it happens every night in the West-Indies, near some of the islands.

The Snow that falls here is as fine as dust, but never any Hail, except at the beginning and end of

winter. Almost every full and change of the moon, very hard gales from the north.

The constant trade winds in these northern parts, I think, undoubtedly to proceed from the same principle which our learned Dr. HALLEY conceives to be the cause of the trade winds near the Equator, and their variations.

“Wind, says he, is most properly defined to be the stream or current of the air; and where such current is perpetual and fixed in its course, it is necessary, that it proceed from a permanent and unintermitting cause, capable of producing a like constant effect, and agreeable to the known properties of air and water, and the laws of motion of fluid bodies. Such an one is, I conceive, the action of the Sun’s beams upon the air and water, as he passes every day over the oceans, considered together with the nature of the soil and situation of the adjoining continents. I say, therefore, first, that according to the laws of statics, the air which is less rarefied and expanded by heat, and consequently more ponderous, must have a motion towards those parts thereof which are more rarefied, and less ponderous, to bring it to an equilibrium, &c.”

Now, that the cold dense air, by reason of its greater gravity, continually presses from the Polar parts towards the Equator, where the air is more rarefied, to preserve an equilibrium or balance of the Atmosphere, I think, is very evident from the wind in those frozen regions blowing from the north and north-west, from the beginning of October until May; for we find, that when the Sun, at the beginning of June, has warmed those countries to the northward, then the south-east, east and variable winds continue till October again; and I do not doubt but the trade winds and hard gales may be found in the southern Polar parts to blow towards the Equator, when the Sun is in the northern signs, from the same principle.

The limit of these winds from the Polar parts, towards the Equator, is seldom known to reach beyond the 30th degree of latitude; and the nearer they approach to that limit, the shorter is the continuance of those winds. In New-England it blows from the North near four months in the Winter; at Canada, about five months; at the Dane’s settlement in Streights Davis, in the 63d degree of latitude, near seven months; on the coast of Norway, in 64, not above five months and a half, by reason of blowing over a great part of the ocean, as was before-mentioned; for those northerly winds continue a longer or shorter space of time, according to the air’s being more or less rarefied, which may very probably be altered several degrees, by the nature of the soil, and the situation of the adjoining continents.

The vast bodies of ice we meet with in our passage from England to Hudson’s Bay, are very surprising, not only as to their number, but magnitude. It is in truth unaccountable how they are formed of so great a bulk, some of them being immersed 100 fathom or more under the surface of the ocean; and a fifth or sixth part above, and three or four miles in circumference. Some hundreds of these we sometimes see in our voyage here, all in sight at once, if the weather is clear. Some of them are frequently seen on the coasts and banks of Newfoundland and New-England, tho’ much diminished.

When I have been becalmed in Hudson’s Streights for three or four tides together, I have taken my boat,

boat, and laid close to the side of one of them, sounded, and found 100 fathom water all round it. The tide floweth here above four fathom; and I have observed, by marks upon a body of ice, the tide to rise and fall that difference, which was a certainty of its being a-ground. Likewise in a harbour in the island of Resolution, where I continued four days, three of these isles of ice (as we call them) came a-ground. I sounded along by the side of one of them, quite round it, and found 32 fathom water, and the height above the surface but 10 yards; another was 28 fathom under, and the perpendicular height but nine yards above the water.

I can in no other manner account for the aggregation of such large bodies of ice but this: All along the coasts of Straights Davis, both sides of Baffin's Bay, Hudson's Straights, Anticosti, or Labradore, the land is very high and bold, and 100 fathoms or more close to the shore. These shores have many inlets or fairs, the cavities of which are filled up with ice and snow, by the almost perpetual winters there, and frozen to the ground, increasing for four, five, or seven years, till a kind of deluge or land-flood, which commonly happens in that space of time throughout those parts, breaks them loose, and launches them into the Straights or Ocean, where they are driven about by the variable winds and currents, in the months of June, July and August, rather increasing than diminishing in bulk, being surrounded (except in four or five points of the compass) with smaller ice for many hundred leagues, and land covered all the year with snow, the weather being extreme cold, for the most part, in those summer months. The smaller ice that almost fills the Straights and Bays, and covers many leagues out into the ocean along the coast, is from four to ten fathom thick, and chills the air to that degree, that there is a constant increase to the large isles by the sea's washing against them, and the perpetual wet fogs, like small rain, freezing as they settle upon the ice; and their being so deeply immersed under water, and such a small part above, prevents the wind's having much power to move them; for though it blows from the north-west quarter near nine months in twelve, and consequently those isles are driven towards a warmer climate, yet the progressive motion is so slow, that it must take up many years before they can get five or six hundred leagues to the southward: I am of opinion some hundreds of years are required; for they cannot, I think, dissolve before they come between the 50th and 40 degree of latitude, where the heat of the Sun consuming the upper parts, they lighten and waste in time: Yet there is a perpetual supply from the northern parts, which will so continue as long as it pleases the Author of all Beings to keep things in their present state.

Observations of the longitude, latitude, and the declination of the Magnetic-Needle at Prince of Wales's Fort, Churchill River.

Having observed the apparent time of an emersion of Jupiter's first Satellite at Fort Churchill, on Saturday the 20th of March last, 1741-2, at

I find the same emersion happened at London, by Mr. POUND's tables, compared with some emersions actually observed in England near the same time, at

Whence the horary difference of meridians, between Fort Churchill and London, comes out

Which converted into degrees of the equator, gives for the distance of the same meridians } 94° 50'

Wherefore since the time at London was later in denomination than that at Churchill, it follows that, according to this observation, Churchill is 94 degrees 50 minutes in longitude west of London.

I took several other observations, which agreed one with another to less than a minute, but this I look upon as the most distinct and best.

The observation was made with a good 15 foot refracting Telescope, and a two foot Reflector of GREGORY's kind, having a good watch of Mr. GRAHAM's that I could depend upon; for I have frequent opportunities of discovering how much its variation amounted to, and constantly found its daily deviation or error to be 15 seconds too slow; by which means it was as useful to me for all purposes, as if it had gone most constantly true without any change. This watch I kept in my fob in the day, and in bed in the night, to preserve it from the severity of the weather; for I observed, that all other watches were spoiled by the extreme cold.

I have found from repeated observations, a method of obtaining the true time of the day at sea, by taking eight or ten different altitudes of the Sun or Stars, when near the Prime Vertical, by Mr. SMITH's or Mr. HADLEY's quadrant, which I have practised these three or four years past, and never found from the calculations, that they differed one from another more than 10 or 15 seconds of time. This certainty of the true time at sea is of greater use in the practice of navigation, than may appear at first sight; for you thereby not only get the variation of the compass without the help of altitudes, but likewise the variation of the needle from the true meridian, every time the Sun or Star is seen to transit the same. Also having the true time of day or night, you may be sure of the meridian altitude of the Sun or Star, if you get a sight 15 or 20 minutes before or after it passes the meridian; and the latitude may be obtained to less than 5 minutes; with several other uses in astronomical observations; as the refraction of the atmosphere, and to allow for it, by getting the Sun's apparent rising and setting, which any body is capable of doing, and from thence you will have the refraction.

If we had such a Telescope contrived as Mr. SMITH recommends to be used on ship-board at sea, now we can have an exact knowledge of the true time of the day or night from the above instruments and a good watch, we should probably be able to observe the eclipses of the first Satellite of Jupiter, or any other Phenomenon of the like kind, and thereby find the distance of meridians or longitude at sea.

The variation of the magnetic-needle, or sea-compass, observed by me at Churchill in 1725, (as in Numb. 393 of the Philosophical Transactions for the months of March and April 1726,) was at that time north 21 degrees westerly, and this winter I have carefully observed it at the same place, and find it no more than 17 degrees, so that it has differed about one degree in four years, for in 1738, I observed it here, and found its declination 18 degrees westerly. I have carefully observed, and made proper allowance for the Sun's declination and refraction, and find the latitude here to be 58 degrees 56 minutes north: But in most parts of the world, where the latitudes are fixed by seamen, they are for the most part falsely laid down, for

CHAP. VII. want of having regard to the variation of the Sun's declination, which, computed at a distant meridian, when the Sun is near the equator, may make a great error in the Sun's rising and setting, azimuths, &c.

The foregoing relation having been given by Capt. MIDDLETON, to the late worthy President of the Royal Society, Sir HANS SLOANE, Bart. he was pleased to communicate the same to the Society, and at the same time, as the surviving trustee of the late Sir GODFREY CAPLEY, to nominate Capt. MIDDLETON to receive this year the prize Medal, given annually by the Royal Society, in consequence of Sir GODFREY's benefaction; and the same was accordingly presented to the Captain on St. Andrew's day last, 1742.

An abstract of Capt. CHRISTOPHER MIDDLETON's journal, when he attempted to discover a north-west passage, by order of the Lords of the Admiralty, anno 1742.

I sail'd from Churchil the first day of July, and continued sailing with a fair wind till the third, when we saw an island, the two extremities bearing N. by E. and E. by N. lying in the latitude of 63° N. and longitude from Churchil $3^{\circ} 40'$ E. which I take to be the same which Fox named Brook-Cobham. On the fifth day, I saw a Headland on the north side of the Welcome, bearing N. W. by N. seven or eight leagues distance, in the latitude of $63^{\circ} 20'$, and longitude from Churchil 4° E. Here I tried the tides several times, and found close in with the land the tide to run two miles an hour from the N. by E. which I take to be the flood; and by the slack, from several trials, I found that a West or a W. by N. Moon made high water, having a full Moon that day. On the 8th day saw the north side of the Welcome, with much ice in shore; I tried the tide and found it set E. N. E. two fathoms. On the ninth, continuing my course and sailing through much ice, I was obliged at length to grapple to a large piece. The Tender did the same to keep off from the shore, the wind blowing us right upon it. I tried the tide frequently, and could discover neither flood nor ebb by my current log. Here we were fast jamm'd up in ice, being totally surrounded for many miles, and the wind setting it right upon us, it was all ice for ten leagues to windward, and we were in great danger of being forced ashore; but it happily falling calm, after we had lain in this condition two or three days, the pieces of ice separated, or made small openings, we being then within two miles of the shore; and with no small difficulty hauled the ships from one piece to another, till we got amongst what we call sailing ice, that is, where there are such intervals of water, as a ship by several traverses, may get forwards towards the intended course. In this manner we continued till we saw a fair Cape, or Headland, to the northward of Whalebone Point, in the latitude of $65^{\circ} 10'$ N. and longitude from Churchil $8^{\circ} 54'$ E. This I named after my worthy friend, Cape Dobbs. I had very good soundings between the two shores of the Welcome, having 46, 48 and 49 fathoms water. At the same time that I saw Cape Dobbs, I saw a fair opening bearing N. by W. which, according to my instructions, I stood in for among the sailing ice. It was just flood when we entered it; the tide running very strong, which, by observation afterwards, I found to run five or six miles an hour: I run over

V O L. III.

some rocks on the north side of it very luckily, CHAP. VII. being just high water, and anchored in about 34 fathoms: But as soon as the tide of ebb was made, it ran so strong, and such quantities and bodies of ice came down upon us, that we were obliged to steer the ship all the time, and keep all hands upon their guard, with ice poles to shove off the ice; notwithstanding which, we brought our anchor home, and taking hold again, one of the arms of the anchor was broke off.

The next day I sent my lieutenant in the boat to seek out some securer place for the ships, it being impossible to keep a float where we were: Some Uskimay Savages came off to us, but had nothing to trade; I used them civilly, made them some presents and dismissed them. As soon as I got the ships secured, I employed all my officers and boats, having my self no little share in the labour, in trying the tides, and discovering the course and nature of this opening; and after repeated trials, for three weeks successively, I found the flood constantly to come from the eastward, and that it was a large river we were got into, but so full of ice there was no steering the ships with any probability of safety, while the ice was driving up and down with the strong tides. Here I lay not a little impatient to get out; went several times in my boat towards the mouth of the river, and from a hill that overlook'd part of the Welcome, saw that place full of ice, so that I found there was no time lost by our being in security; however, I sent my Lieutenant and Master in the eight oar'd boat, to look out for a harbour near the entrance of the river, but they found none; and it was a small miracle they got on board again, for they were so jammed up with ice, which driving the strong tides, would inevitably have stove the boat to pieces, and all must have perished, had it not been for an opening in a large piece of ice into which they got the boat, and with it drove out of the rivers mouth; but when the tides slack'd the ice opened as usual, and they rowed over to the north shore, so got in with the flood. I several times sent the Indians on shore to see if they knew any thing of the land, but they were quite ignorant of it. In this vexatious condition I continued three weeks, resolving to get out the first opportunity the river was any thing clear of ice, and make what discoveries I could by meeting the flood tide. This river, which by frequent trials of the lands soundings, tides, &c. I was able to take a draught off, I nam'd the river Wager, after the Right Hon. Sir CHARLES WAGER.

On the third of August, the river for the first time was a little clear of ice; and accordingly, in pursuit of our discovery, on the fifth by noon I got into the latitude of $66^{\circ} 14'$, we had then got into a new streight much pestered with ice; and on the north side of which we saw a Cape, or Headland, bearing north; we had deep water and very strong tides within four or five leagues of it. I nam'd this Headland Cape Hope, as it gave us all great joy and hopes of its being the extreme north part of America, seeing little or no land to the northward of it. We turned, or worked round it the same night, and got five or six leagues to the N. by W. before we could perceive any otherwise than a fair opening; but about noon the sixth day, after having got into the latitude of $66^{\circ} 40'$, found we were embayed, and by two in the afternoon, could not go above three leagues further; and having tried the tides all the forenoon, every two hours, till two o'clock in the afternoon, found neither ebb nor flood, yet deep waters. From this it was concluded that we had

overshot

CHAP.
VII.

overshot the streights on the north-east shore, from whence the flood came; and as there was no proceeding above three or four leagues further, it was agreed upon by all to return back and search narrowly for a strait, or opening, near where we found the strong tides. On the seventh, after we were confirmed the flood came in at the N. E. from the E. by S. I went on shore in the boat and found it flowed 15 feet three days after the full, and a W. by S. Moon made high water: I travelled 12 or 15 miles from hill to hill inland, till I came to a very high mountain, from whence I plainly saw a strait, or opening, the flood came in at; and the mountain I stood upon being pretty near the middle of this strait, I could see both ends of it; the whole being about 18 or 20 leagues long, and six or seven broad, and very high land on both sides of it, having many small islands in the middle and on the sides of it; but it was all frozen fast from side to side, and no appearance of its clearing this year, and near the 67th degree of latitude, and no anchoring the ships, being very deep water close to the shore, and much large ice driving with the ebb and flood, and but little room if thick weather should happen, which we continually expect in these parts. It was agreed upon in council to make the best of our way out of this dangerous narrow strait, and to make observations between the 64th and 62d degree of latitude. The Frozen Strait I take to run towards that which BYLOR named Cape Comfort, and the bay where FOX had named a place, Lord Welton's Portland; it is in the latitude of 66° 40', and 12° 49' east from Churchill.

Pursuant to the Resolution, we bore away and tried the tides on the other side the Welcome, sounding and observing close in shore, but met with little encouragement. On the eleventh of August, I once more saw the island of Brook Cobham, and continued trying the tide, and still finding the flood came from the eastward, and by coasting along the Welcome, was certain of its being the main land, though there are several small islands and deep bays, and saw several black Whales, of the right Whalebone kind. I worked off and on by Brook Cobham; sent the northern Indians on shore upon the island, who, at their return, gave me to understand it was not far from their country, and desired I would let them go home, being tired of the sea. I kept them with assurances that I would act according to my promise, and finding no probability of a passage in two or three days after, I gave them a small boat well fitted with sails and oars, the use of which they had been taught, and loaded it with fire-arms, powder, shot, hatchets, and every thing desirable to them. They took their leave of me, and I sent another boat for water, which accompanied them on shore, the southern Indian being with them.

The southern Indian who was linguist for the northern ones, returned with the boat, being used to the English customs at the factory; and desirous of seeing England, being a willing handy man, I brought him with me. And the same evening which was the 15th of August, I bore away for England, thinking to have tried the tide at Carey's Swan's-nest, but could not fetch it. On the 20th saw Mansell's isle. On the 21st Cape Diggs was in sight. On the 26th made Cape Resolution, and arrived at Carleton, in Pomona, one of the islands of Orkney: Most of my men being so very much afflicted with the scurvy, and otherwise sick and distempered, that I shall be obliged to leave part

of them behind me, and only wait to impress hands CHAP.
VII.
to carry the ship safe to London.

The remarks of Mr. DOBBS (who projected this voyage) upon Capt. MIDDLETON's journal, in several letters to the Captain, with Capt. MIDDLETON's answers to them.

Mr. DOBBS to Captain MIDDLETON.

Dear Sir,

' I had both yours from Orkneys, and the duplicate you wrote when you arrived in the Thames, which I immediately answered from Lisburn, congratulating you upon your safe arrival with the ships after so dangerous a discovery; and at the same time, expressing my concern at your not having found the passage, as we had reason to have expected it, if you had found things agreeable to the former journals. I directed for you as formerly in London-Street, near Ratcliff-cross, but found by a letter I had from Mr. ALLAN last night, that you have not got my letter. Since I have not a duplicate of what I wrote, I shall now again mention the chief points I wrote to you before to be resolved in, and desire your answer and opinion upon the whole, and hope you will still send me the copy of your journal, and the draught you made of what you discovered.

' I am convinced from the extract you have sent me of your journal, that from the Welcome in 64°, to the latitude of 67°, there are no hopes of a passage on that coast; and if there is any, it must be further north, and consequently attended with more difficulty; this seems to be ascertained by your finding so large a river as that of Wager to the northward of Whalebone Point, and the Cape you have honoured me with the name of; and if the fresh stream there is large, the continent thro' which it runs must be so much the broader in that place. I should have been glad to have one of your northern savages understand the language of the Eskimaux savages which came on board you, for they might then have given you some account of that country and neighbouring sea, if any near it to the westward.

' You observed, that a W. by N. Moon made high water, and a W. by S. above Cape Hope in 66° 40', consequently the tide at the Welcome must flow from the other as it is later; but you not acquainting me, whether the lands to the eastward, or starboard, as you sailed North, were continuous islands, makes me at a loss to know whether the tide there came from the eastward or from the north-eastward by Cape Hope, and the new strait you discovered from the mountain, through which the tide came, from near Cape Comfort on Weston's Portland, where the strait you saw ended. Now the difficulty I find in accounting for this, makes me desire your opinion upon it; you have confirmed that a W. by N. Moon makes high water at the Welcome, and a W. by S. above Cape Hope. BYLOR and BAFFIN affirm, that a S. by E. Moon makes high water at Cape Comfort; if that be fact, can the tide, in so small a way, from Cape Comfort to your bay above Cape Hope, be eight points later and only two points later in going from Cape Hope to the Welcome, since you were there as near Cape Comfort as the Welcome, and therefore as the strait you saw was made up of broken

CHAP. VII. broken lands, or islands to the north-eastward, whether around these islands a northern tide might not have set about some of these Head-Lands, as well as a south-eastern tide from Hudson's strait?

I also desire your opinion, whether the great quantity of ice you found near the Welcome, not mentioned by FOX or SCROOGS, was caused by the winter's having been more severe there than usual, or whether you imagine it was the usual quantity which is there every year; and since you saw black Whales at the Welcome, from whence do you imagine they came, since none have ever been mentioned to have been seen passing or repassing Hudson's strait?

These were the chief things I would have had your opinion upon. But as upon the whole, I apprehend it would be in vain to push it any farther that way; I think the only safe way now, is by the rivers of Nelson, or Churchill, by going up to their end, from thence descending such rivers as fall from thence into the western ocean. This can only be done by laying open the trade, and dissolving the company for so far, and then making proper settlements higher up upon these rivers to the south-westward in a more temperate climate; and therefore I desired your assistance, if you approved of it, to inform me as much as you could of these rivers and inland countries, with their climates, and what advantages we might have by making settlements up those rivers, in the bottom and western side of the bay, which must enlarge our trade, and secure our settlements there from the French, and regain the trade which has been lost to them by the monopoly of the company.

As this, since the other has failed, would be a publick benefit, I have been preparing all I can to enforce it, and should be glad to have what further accounts or materials you can furnish me with, from any journals you have had, or accounts of these climates, countries and trade, and then I shall make no doubt of engaging the merchants to join us in opening that trade, and settling those countries.

Left this should miscarry, as well as my last, I have inclosed it to Mr. ALLAN to deliver it to you, and hope to have your answer as soon as you can conveniently, with your journals and draught.

I wish you health and prosperity in all your undertakings, and am, with great esteem,

Dear Sir,

your most obedient

humble servant

Dublin, November
19, 1742.

A. DOBBS.

Captain MIDDLETON to Mr. DOBBS.

S I R,

London, November
27, 1742.

I had the favour of yours of the 20th ult. which happened to lie some days at my former habitation, before it was forwarded to me; and I shall transmit you the chart, together with the journal, and other observations, by the first convenient opportunity. In the mean time, I shall give you the best satisfaction I am able, with relation to the difficulties that have occurred to you. And first, it is to be noted, that all the

land along the east side of the Welcome, from 64° of latitude to the Frozen Streights, is one continued level land, somewhat like Dungeness, low and shingly, the great tides you mention, which flow up the river Wager, and off Cape Dobbs, come all from the Frozen Streights, E. by N. by compass, according to the course of the new Streight, that we passed between Cape Dobbs and Cape Hope, the mean variation between the said Capes 40° westerly, and makes the true course of this strait nearest N. 40° easterly; the said strait ends to the westward of Cape Hope, in a bay 20 leagues deep, and 15 leagues broad, which lies W. N. W. by the true bearings; and we carefully surrounded it, sailing up to the very bottom within 2 or 3 leagues, and found no appearance of a passage for either tide or vessels. All the way as I sailed from Cape Hope, quite down to the bottom of this bay, I tried the tide; and all round I found neither ebb nor flood, which must have appeared had there been any. The land was all very high and bold, ascending into the country to a vast height, without any breaks, so that had there been a passage here we could not have missed of it.

With regard to the tide, which you think would have been obstructed from flowing so rapidly to Wager river, if the strait was froze fast from side to side.

I need only observe to you, that at Churchill, all the winter, the tide ebbs and flows up the river in the same manner as if there was no ice, being lifted every tide of flood from 12 to 18 feet, all except what is fast to the ground, and falls again upon the ebb, though 8 or 9 feet thick. Now close to the north end of the Frozen Streights is 100 fathoms of water or more, and probably that depth may continue the whole length; and then there is passage free for the flood and ebb to pass without lifting; but I observed this ice was all cracked round the shore, and on the island at Churchill.

You seem to be at a loss how to account for the black Whales getting to Brook Cobham, if they do not pass and repass by Hudson's Streights. Now, 'tis true, I never saw any above 20 leagues up Hudson's Streights; but I have traded with Indians off Nottingham and Diggs, for Whalebone just fresh taken; for my own part, I cannot think these Whales come round Cary's Swan's-Nest, but thro' the Frozen Streights under the ice; for we saw many of them in Wager river, and in 63° latitude, and these may not come thro' Hudson's Streights, but to the northward, as all the north side of Hudson's Streights appear to be the broken land and islands; and Cumberland Bay, Baffin's Bay, and Streights Davis may have a communication with this new Frozen Streights, and Whales, &c. may come from thence.

It is hardly possible to account for the difficulties about the tides; for though it flows E. S. E. at Resolution, and S. by E. at Cape Diggs, which makes five points in running 130 leagues; yet it is but one point in going down to Albany and Moose river, for there it flows south, and the distance 250 leagues.

So from Humber to Cromer, on the Lincolnshire coast (as I mentioned formerly) is but 14 leagues; at one place it flows W. by S. at the other N. W. Likewise from the Frozen Streights to Churchill is but two points difference, or one hour and half of time, in the distance of 200 leagues;

CHAP. VII. leagues; so that I think no rule can be fix'd, where tides flow into deep bays, obstructed by islands or counter tides.

The ice I met with in the Welcome, was most of it to the northward of all the parts before discovered; so that none who went before me could have seen it; for most of it lay to the north of Whalebone-Point; and every year is not alike, with respect to wind bringing it to the southward; and it is intirely directed by the winds here, as well as in all other parts of the bay. In our way to Churchill, there was less ice than usually happens; and it was also sooner clear in the spring, by 15 days than common.

Undoubtedly there is no hope of a passage to encourage any further trial between Churchill and so far as we have gone; and if there be any further to the northward, it must be impossible for the ice, and the narrowness of any such outlet, in 67 or 68° of latitude, it cannot be clear of ice one week in a year, and many years, as I apprehend, not clear at all.

In any other attempts, I shall be glad to give you all the assistance I can, and furnish you with any other informations that you may think needful to promote your design; but I hope never to venture myself that way again.

My friends being out of the Admiralty, I find there will be a great deal of difficulty to get any thing done for me in the Navy at present; or to procure any other recompense for my loss these two summers in leaving the Hudson's-bay service, where I should have 1400 l. in the time that I have acquired but 160 l. in the Government's. I remain, with great sincerity and respect,

Sir,

your most obedient,

humble servant,

C. MIDDLETON.

P. S. The Eskimaux, and the northern Indians I had with me, were utter strangers to each other, in manners and language; neither could I make these Eskimaux understand me by the Vocabulary I had of the language of those in Hudson's Streights.

Mr. DOBBS to Captain MIDDLETON.

Dear Sir,

I have your last favour of the 27th of October, in answer to the difficulties I started, which you have fully answered; so that I am fully convinced there can be no passage N. W. by Sea, as we seemed to have had reason to expect; and therefore it would be very wrong to think of attempting it for the future. But I am still of opinion, that the publick may have a great advantage by the Hudson's Bay trade; if it be laid open, and the country settled higher up upon these great rivers, which run into the bay, by Moose, Albany, the Severn, the Nelson river; and these settlements, as the rivers come from great lakes to the south-westward of the bay, would be in a much more temperate climate, than at the mouths of the rivers, among the swamps, where they and the bay continue a much longer time frozen, than farther into the country; so that whoever would settle higher up, might have very

comfortable and beneficial settlements, and not only secure all the country and trade westward of Moose river from the French of Canada, but also by making a settlement near the lake Errice, westward of Pennsylvania, above the great fall of Magara, secure all the navigation of the lakes, and cut off their communication with the Mississippi, and also secure a great deal of the trade to the north-eastward of these lakes, to Rupert's river, and the East Main. To shew this to more advantage, I should want a better description of the rivers and lakes to the westward of the bay; I have extracted from Monsieur JEREMIE, all the knowledge the French acquired, whilst they possessed Fort Bourbon upon Nelson river, who was himself some hundred leagues up among the lakes which fall into Nelson river, which are in a temperate climate, and run through rich countries. Now if you concur in this scheme, we might, by joining in this scheme, and adding what further you have observed, or have collected from such of the company's factors or servants, who may have been curious to search into these rivers, give a much greater light in the description of those countries and rivers, as well as charts of the bay, and account of the several climates, as may fully convince the publick of the benefit to be made of these countries by opening the trade, and settling upon the Rivers. I have already sketched out from what I have read, and the journals you gave me from Albany, and the nature of their trade, what may shew the advantage may be made of that trade, but it will be much more complete, from what you are capable to furnish; and if you have no thoughts of publishing something of this nature from yourself, I shall be glad of your joining with me in this attempt; I know Lord CARTERET, WINCHELSEA, and several others, who will support it, if a proper plan be laid before them; and probably, by the heads of these rivers we might gain a communication with the nations upon the western sea, which may be of advantage, though nothing so great, as if the discovery had been made by sea.

I shall be glad to have your thoughts upon this, and what materials you think you could furnish towards it; and if we can prepare a reasonable plan, I shall go over and push it with all my friends.

I have a letter from Mr. SAMUEL SMITH yesterday, that he has forwarded to me your last journal, and that you will send me your draught as soon as you have got it copied, for which I am very much obliged to you.

I should be very glad to hear that you were employed in some way satisfactory to you by the publick, which you have so just a right to, after having quitted the company's service in order to serve the publick; and with it was in my power to contribute to it, I should do it with great pleasure, and would go over upon that very account, if it could be of advantage: In the mean time, I wish you all happiness, and hope to hear from you, being with great esteem,

Dear Sir,

your most obliged, and

obedient humble servant,

A. DOBBS.
Captain

Dublin, Decemb.
14, 1741.

CHAP.
VII.

Captain MIDDLETON to Mr. DOBBS.

Sir,

I was duly favoured with yours of the 14th of December; and am sorry that I could not return my answer sooner, but the ill state of health that I laboured under, prevented me in this as well as many other of my affairs.

It gives me much satisfaction to find, that you approve of the solutions I sent, in regard to the difficulties you proposed; and that you are convinced I have done all that was necessary to put the impossibility through those seas to the westward out of question; in such manner as to render any attempt needless for the future: But on the contrary, I should have been infinitely pleased, had our expedition succeeded according to the reasonableness of your expectation.

I have seriously considered your proposition of laying open the Hudson's Bay trade, and settling the country higher up, upon those great rivers which run into the bay; and though I may agree with you in the great advantage the publick would reap from such a settlement, (could it be made) in the obstruction it would give to the French, both as to their trade, and the cutting off the communication with the Mississippi, yet I must declare my opinion, that it is altogether impracticable upon many accounts; for I cannot see where we could find people enough that would be willing, or able to undergo the fatigue of travelling those frozen climates, or what encouragements would be sufficient to make them attempt it, with such dangerous enemies on every side; no Europeans could undergo such hardships as those French that intercept the English trade, who are inured to it, and are called by us Wood-runners, (or Coureurs de Bois) for they endure fatigues just the same as the native Indians, with whom they have been mixed and intermarried for two, three, or more generations.

As to the rivers you mention, none of them are navigable with any thing but Canoes, so small, that they carry but two men, and they are forced to make use of land carriages near the fourth part of the way, by reason of water falls during that little summer they enjoy.

Out of 120 men and officers the company have in the bay, not five are capable of venturing in one of those Canoes, they are so apt to overturn and drown them. Many of our people have been twenty years and upwards there, and yet are not dextrous enough to manage a Canoe; so there would be no transporting people that way.

Should there happen a French war, the best step we could take towards rooting them out of America, would be, in the first place, to take Canada; which I make no question might be done, if attempted in a proper manner, and at a right season of the year.

Had Sir HOVENDEN WALKER succeeded when he was sent upon that expedition, it would undoubtedly have been of great advantage to us; for at that time the French were not one tenth part so numerous as now, that they have intermarried with the natives, and over-run the whole country, so that it is become a matter of infinite difficulty to root them quite out of their possessions and trade in America.

I look upon Sir HOVENDEN WALKER's miscarriage in his expedition, to be owing to this;

VOL. III.

that he did not arrive there till the latter end of August, at which time he ought to have been returning: And whenever a war happens again with France, should it be thought proper to attempt the taking of Canada, we ought to be in the river of St. Lawrence by the first day of June at the farthest; and as to the difficulties Sir HOVENDEN complained of, from the uncertainty of the currents, fogs, &c. they are such as we now make no account of conquering in Hudson's Bay and Streights, where they are certainly greater: I can set the currents and tides in any weather, even under a mainail in a storm of wind, so as to discover both how fast, and upon what point of the compass it sets; and then as to observing the latitude in foggy seasons, I have seldom mis'd two days together, if it be tolerable smooth water, as you will find in our journals. Now I apprehend that the navigation in the river St. Lawrence must be attended with much fewer inconveniencies than in Hudson's Streights, and those coasts where we have no soundings, much ice, great fogs, with strong tides, and various currents.

This is the principal matter that I can think of at present; had not my indisposition prevented me, I should, before this time, have drawn up some further account of our voyage, but I have nothing material worth imparting to you further, except a chart of the whole Bay and the Streights, which will be engraved in a little time; for you already have my journals and observations, as well as the accounts of those that attempted the discovery before me.

I am very much obliged to you for your kind wishes, and all the favours you have conferred on me, and am as yet quite uncertain as to what their Lordships intend to do for me; they treat me with great respect, and such as I have the honour to know, to wit, my Lord WINCHELSEA, Lord BALTIMORE, and Admiral CAVENDISH, have all promised me their favours. I am,

Sir,

your most obedient,

January 1742-3.

humble servant,

To A. DOBBS, Esq.

C. MIDDLETON.

Mr. DOBBS to Captain MIDDLETON.

Dear Sir,

In my last to SAMUEL SMITH, I inclosed one for Lord CARTERET, open for your perusal, upon our scheme of opening a trade to the bay, to which I refer you; and in SAM's letter hinted at what I discovered from your journal at large; that you have made a much greater progress in the discovery of the passage, than you imagined when there; and that from the lights I have got from your journal, I can almost prove that you were in the passage, and that Wager river is properly Wager Streight, and not a fresh water River; and that the way you entered it was one, though not the greatest and easiest way into the Streight: I only want your chart of the whole new discovered coast, to establish or contradict my judgment of it, which I am informed is come to Dublin, but not yet sent to me.

24 X

However,

CHAP.
VII.

‘ However, I cannot delay imparting my present thoughts of it, and my reasons from your journal, to shew you were in the Streight, but not in a fresh river; and that the chief cause of your taking it for a river was from the quantity of ice, the straitness of the tide, and its following you from the eastward, and not meeting the flood from the westward, which was one of the greatest proofs we went upon, before you left us. Now this last objection is answered; that had the ocean flowed in near Whalebone Point, as we at first expected, we must then have expected to have thereabouts met the tide of flood from the westward; but since we find the communication is by a streight, or passages through islands and broken lands, as in the Magellanic Streights; there the tide continues to rise, until it meets the tide from the other ocean, and the flood is not to be expected to meet us until we have at least got thro’ half the length of the Streight; and if you will look into NARBOROUGH’S account of the Magellanic Streights, you will find that a parallel instance. Those Streights are no where above four leagues wide, in most places not above two leagues, and in the narrow, at the east entrance, not above a league wide; and yet he went about fifty leagues into the Streights, before he met the western tide. Now you have full stronger reasons for Wager’s river being a Streight; it was but six or seven miles wide at the entrance on the east-side, and but from 16 to 44 fathom deep; as you went up, it increased to four, five, six, and seven leagues wide; Deer Sound, seven miles wide, goes off from it, and probably others not mentioned in the journal; since the Lieutenant, when he was last up 12 leagues above it, says, he tried every other inlet, to try if he could meet a contrary tide or other passage out, but the depth increased to 70 and 80 fathoms; your mentioning also the height and cragginess of the coast, and not mentioning their being covered with snow, though you mention that Brook Cobham was, makes me conclude that they were not covered with snow; and there being neither trees nor grass, still confirms me that the whole was a Streight of salt water, and that you were not come into fresh water; but the number of Whales and fish, seen as high as he went, and none being seen below, nor where the ships lay, in Savage Cove and Sound, is a demonstration to me, not only that it was salt water, but also that they came in from the westward, and that you would have found less ice the higher you went; because the Whales could not come there, without a passage tolerably free from ice, otherwise they would have come as far as where your ships lay, but did not because of the ice; and that must be the reason why you did not see them, when you went up to Deer Sound, because the ice was not then broke up where you were, as it was afterwards when the Lieutenant went up, and probably was much sooner up to the westward; from the Whales also, which you saw in the bay or inlet between 63° and 64°, and those seen by Fox in the same place, and by SCROOGES in 64° 8’, and towards Whalebone Point, where they had no ice, though you met a great deal there; I conclude, there has been more ice thrown in there this year, than usually is; and that all that coast is a broken coast with islands, and inlets, as Cape Fullerton was, as mentioned by SCROOGES; and consequently conclude, that the Whales came into the corner of the bay, from the upper end

‘ of the Streight you were in; and that you happened into the most northerly and narrow entrance into that Streight, and consequently most pestered with ice, and that the most easy and largest inlet is to the south-ward of Whalebone Point, betwixt that and the head-land near Brook Cobham in 63° 20’.

‘ My reasoning upon your journal I would have you consider of; for I really think you have proved the passage, though you were not at once able to perfect it.—What is only necessary to fix or alter my judgment, would be an account of the Lieutenant’s and Master’s observations, the last time they went up the Streight; what depths they had upon sounding, what breadth the channel continued, which way it was directed, what sounds went off from it on either side; a great deal depends upon their recollection of these things, as well as whether they met with more or less ice, whether snow upon the land or not; for as to the tides following them in a Streight it is no objection.

‘ If their accounts confirm the others I have taken from the journal, I think I may congratulate you upon your having found the so-much-wish’d-for passage; and if it be one, am convinced the more southerly entrance, through which the Whales come into the bay, will be free from ice.—I beg to have your sentiments upon this, as soon as you can consider it, and have an answer from your Officers, for the presumption will be a great inducement to open the trade to the bay; and in a further discovery, there needs no wintering in the bay, only getting there in the middle of July, and pushing as far in the Streight as can be done in the month of August, and then returning in September home, which is better than wintering at Churchill, until the passage through leads them to a warmer climate on the other side.

‘ I shall add no more, but that I am with great Esteem,

Dear Sir,

your most obedient,

Lisburn, January
22, 1742-3.

humble servant,

A. DOBBS.

Your answer and Lord CARTERET’S will determine my going over next month.

Captain MIDDLETON to Mr. DOBBS.

Sir,

‘ Yours I received of the 22d of January. And I also saw yours to Mr. SMITH, with the inclosed to my Lord CARTERET, upon opening the trade to the bay.

‘ You say, I have made a much greater progress in the discovery of the passage, than I imagined when there; and that from the light you have got from my journal, you can almost prove that I was in the passage; and that Wager River is properly Wager Streight, and not a fresh water river; and that the way I entered it was one, tho’ not the greatest and easiest way into the Streight.

‘ You also observe, if there be a communication between the bay and the western American ocean, or a passage through islands and broken land as in the Magellanic Streights, the tide will continue to rise until we have got half-way through, and then meet the ocean tide. This I thought of when there, and made several trials of, and also ordered my Officers to observe the course, direction and height of the tides at the farthest they went

CHAP.
VII.

CHAP. VII. went up, as you will find in the inclosed order.

Now, as it flowed at Savages Sound 15 feet, the same day and tide that it flowed but 10 feet at Deer Sound, and 15 leagues above Deer Sound on the west-side but six feet, the tides kept their regular course as high up as I was myself, which was five leagues above Deer Sound; that is about seven hours ebb, and five hours flood; 20 leagues up; whereas if there had been a tide from the westward to have met this, it must have raised the tide higher the further we went up, as you say it does by NARBOROUGH's account of the fore-mentioned Streights, and the flood would have run not above two hours; as he found it there. All these observations confirmed me, that it could not be a Streight as you seem to think.

You speak of many Whales that we saw on the coasts, and in Wager River, some of which certainly came in at where our ships entered; for I saw several in the Welcome, and some off Cape Dobbs, after we came out, and before we went in. The high land and deep water gave me great hopes, before I tried the above-mentioned tides. Brook Cobham was covered with snow when we went out; but in our return home, there was none upon it; the snow on the land in the River Wager, was much wasted before we got out of it upon the tops of the mountains; but in the vallies it lay very thick, and hard enough to bear waggons and horses.

As to any passage or broken lands between River Wager and $62^{\circ} 40'$, I am certain I searched that coast very narrowly all the way, and stood into every bay so near, that the Indians I had on board knew all the coast, and would have had me set them on shore at Cape Fullerton; for they knew the way to Churchill, and had travelled that way several times in the summer; which they could not have done if that Cape were an island, or any large river there, for they have no canoes, neither is there any wood there to raft over with, as to the southward.

The copy of the Lieutenant and Master's report, I have here inclosed; but what is wanting there, I shall mention here; the river five leagues above Deer Sound, is eight or nine leagues broad; the channel is 70 or 80 fathoms deep in the middle, and lieth near N. W. by true chart; as far as they went up, they met with as much ice or more than below, where the ships lay; when I was up, I could go no further for ice than I did, and could not get over to the west-shore but once for ice all the time we were in the river; so my real opinion is, that this river cannot be above one week or two, at most, clear of ice in a year, and many years not clear at all.

For the reasons I mention in my observations on the effects of cold, when the winds blow from the N. W. quarter, there must certainly be much land to the westward, covered with perpetual snow, and the land from the water's side ascends gradually up into the country, and is very high, as I saw from off the high land above Deer Sound. This is all I have time to think upon at present. I am, with great respect,

your most obedient,

humble servant,

C. MIDDLETON.

CHAP. VII. A summary state of Mr. DOBBS's Objections, and Capt. MIDDLETON's Answers.

The only places where Mr. D— presumes there may be a passage from Hudson's Bay to the western ocean of America, are on the coast, betwixt Brook Cobham, in latitude 63° , or through Wager River, by him supposed to be a Streight.

From Brook Cobham to Whalebone-Point, has been so frequently and so carefully coasted and searched, that all hopes of meeting with any inlet, that may lead to a passage any where throughout all that extent, has been given up for at least an hundred years past. However, Captain MIDDLETON, in his return back from the Frozen Streight to Brook Cobham, very carefully re-examined all this shore, keeping as close into it as the islands and rocks would permit him with safety; and saw all the main land, and bottoms of the bays, as is explained in the log-book, which shews the coast and distance sailed every hour; in halling off or on to deepen or shoalden the water, which his journal expresses less particularly, especially from Whalebone-Point to Brook Cobham, (for the rest of that course northward he had traversed outward bound.) He had very little hazy weather, except in the night, and then he lay by till day-light; and halled in as near the shore as he durst; so that it was impossible for him to miss any inlets, where there could be any hopes of a passage. Off Cape Fullerton, he met with rocks and broken ground five leagues distant, which forced him to hali further off to deepen his water, and lay to for moderate clear weather between the shores. But when it cleared up, he stood in N. and N. by W. into 40 odd fathoms: If he came within that depth, he fell into broken ground, sudden shoaldings, ripplings and over-falls. Between latitude 64° and 63° , he had better soundings, and came near the land, though at night he was obliged to keep a league or two further out, and drive, standing in shore again by day. He was never more than four or five leagues from shore but once, and that was towards morning in expectation of day-light. In most other places, he was not above two or three leagues from land, and in nine fathom water off the head-land in $63^{\circ} 20'$. He observed all the north-side of the Welcome to be high land, and it appeared very near at four or five leagues distance, as far as Brook Cobham. The reason why he did not send his boat a shore to try the tides, was because most of his men had lost the use of their limbs, or were otherwise so sick, that if he had mann'd the boat, the remaining hands would have been insufficient to have worked the ship, and handed the sails. However, the tides were so far from being neglected by him, that he tried them frequently, and almost every hour; as also the currents, which he could do as well on board, or in a boat near the ship, in the channel, and much better than within head-lands, or near islands, which by forming eddies produce an irregularity in them.

This account of Captain MIDDLETON's examination of the aforesaid coast, does not only appear from the log-book to be true, but is further circumstantially confirm'd as to particulars by the Master, in his answer to queries 12 and 13, and by the affidavits of T. TOWNS, V. VON SOBRIEK, and G. GRANT, though it be contradicted by Mr. DOBBS's three evidences; one of which, viz. the the

CHAP. VII. the Lieutenant, acknowledges it all in his journal.

Now it is just to remark, that though Mr. DOBBS had himself the drawing up of Captain MIDDLETON's instructions, yet they do not mention a single word about looking for a passage, or examining the tides all along this coast. Is it not then a strong argument, that Captain MIDDLETON had the discovery very much at heart, that, at a time, when, on account of the very sick and helpless condition of most of the hands, it had otherwise been both desirable and prudent for him to have made home-wards as fast as he could, he should, as appears from the Council held the eighth day of August, himself propose a re-search of this coast for a passage, which had been so often attempted in vain by others, and perform it so carefully too as is set forth above, when he was not otherwise in point of duty held to it at all.

This point being discuss'd, it remains now only to examine, whether a passage may be reasonably presumed upon through Wager River or not?

Mr. DOBBS's Reasons that Wager River is a Streight, and no fresh water river.

REASON I.

From its increase and depth in advancing from its entrance.

ANSWERED.

This is frequent in fresh Water Rivers, as all those, especially, know, who are acquainted with the Swedish and Norwegian coasts, where the fresh rivers, or ferries, as they call them, are often not above ten or twelve fathoms at the entrance, and yet they extend to vast breadths, and discover no ground even with lines of two or three hundred fathoms.

REASON II.

From the height of the neighbouring lands.

ANSWERED.

The lands about the aforefaid ferries are full as high as any Captain MIDDLETON saw near Wager River.

REASON III.

From the want of trees and shrubs on any lands near it, though such are always found in the same or more northerly latitudes upon fresh water rivers.

ANSWERED.

All those who have travelled this country between latitude 58° and $66^{\circ} 30'$ by land, agree, that higher than 61° they saw neither tree nor shrub, but only moss; even among fresh rivers and lakes.

REASON IV.

From its being full of black Whales, Seals and Sea-horses, at twenty leagues above the entrance, with numbers of Whales at the west-end, where none were seen below Deer Sound, or without the mouth of the river, or in any part of Hudson's Streight or Bay, except about Brook Cobham, being an indication that they all came out of the sea from the westward.

ANSWERED.

It does not appear from any journals, reports, or answers, that one Whale was seen higher than Deer Sound, which is but fifteen leagues up; whereas

the westward is above 30 leagues; or that one Sea-horse or Seal was seen in any part of the river. But that several were seen just without the mouth of the river in the Welcome, is attested by the log-book, and by the affidavits of TOWNS, VON SOBRIEK, and GRANT. And Captain MIDDLETON has traded fresh Whalebone in all parts of the Bay and Streights, where the Eskimaux frequent; which could not be, if the Whales, from whence they get it, were not killed there; because, in ten or twelve days after they are dead, the bone all drops from their mouths; all which amounts together to almost a demonstration, that the Whales, both in the Bay and Wager River, come from the north-east, which is also somewhat confirmed from the great number of Indian store-houses of oil, tinn, and blubber, not above eight leagues up, on the north-east coast of the river; whereas their proper habitations are on the main, on the other side the river. Moreover, if these Whales came out of any sea from the westward, they would have been seen in plenty the higher they had gone up, which was not so. However, conclusions drawn from Whales being seen in any place, are at the best but very precarious.

REASON V.

From broken lands north-westwards, and a great collection of waters seen at a distance, full of islands, on the south-west-side.

ANSWERED.

It is most likely, that these watery spaces seen at a distance, are the same sort of lakes of melted snow from the mountains, as were every where seen from the eminencies they ascended in that country, to overspread the vallies. But be that as it will, there was no coming near them for the rapidity of the water-falls, that hindered the boat from going higher up than she did, and the immense quantities of ice along the south-west shore.

Captain MIDDLETON's reasons why Wager River has no communication with the sea westward.

REASON I.

Because the tide of flood comes in at its mouth from the eastward.

REASON II.

Because it flowed eighteen feet at the entrance; but thirteen at Deer Sound; and the highest the boat could go for water-falls, no more than five or six feet.

REASON III.

Because the water was found to be so fresh in the mid-channel above Deer Sound, that the men freely drank it along-side the boat instead of beer; and the higher they went they found it the fresher.

REASON IV.

Because no Whales were seen there but at the entrance of the river, and at Deer Sound, this being an argument that they came not from any sea to the westward; but entered by some inlet from the north-east.

REASON V.

Because travellers, which have gone from Churchill by land, as high as the Arctic circle, affirm, that they met with neither salt water river, nor sea, in any part of their journey.

Further

Further objections of Captain MIDDLETON
to a north-west passage.

If there were any passage between Churchill and Whalebone Point, near latitude 65° , it would have been long enough ago found out, by one or another of all those who have been that way; some of them several years together; as Sir THOMAS BUTTON and FOX; Governor KELSEY, three or four voyages, the last in my memory; NAPPER, HANDCOCK, Governor KNIGHT, VAUGHAN, and SCROGGS; who went to trade and make discoveries in all the bays, coves, and creeks along shore, several of whom harboured every night; and Governor KELSEY exchanged two of his own Indians for two Eskimaux, kept them at Fort York a whole year, learned them some English and then returned them to their friends. Afterwards, as he went along that coast, he saw and spoke with them several times, but could get no intelligence from them which afforded him the least probability of a passage.

All the Indians I have ever conversed with, who were at the Copper-mine, agree in this; that they were two summers going thither, pointing towards the north-west and Sun-setting, when at Churchill; and that where this Mine is, the Sun, at a certain season of the year, keeps running round the Horizon several times together, without setting. Now we know from the principles of Cosmography, that this cannot be true of any place, whose latitude is less than 67 or 68 degrees, even allowing for the effects of refraction; and if the credibility of the testimony of these simple Indians be called in question, I can mention that of Mr. NORTON, who was Governor at Churchill above twenty years, and had travelled almost a year north-westward by land with his country Indians. This Gentleman has often affirmed the same thing of the Sun; and that in his whole journey he met with no salt river, nor tree, nor shrub, but only moss; and that he and his retinue were reduced to such extremity as to eat moss several days; having nothing else that could serve them for sustenance, but their leather breeches, which they eat up also. Now it will appear, from a just trigonometrical computation, that Churchill being in latitude 59° , and the Mine in latitude 67° , and the bearing N. W. the difference of longitude between Churchill and the Mine is $17^{\circ} 45'$. But Wager river's entrance being in latitude $65^{\circ} 20'$, and 10 degrees of longitude east of Churchill, the difference of longitude between the mouth of the river and the Mine is $27^{\circ} 45'$, and their distance in the arch of a great circle, or their nearest distance, no less than 700 miles. From what I have here made out concerning this Mine, and the way to it, upon the report of the Indians and of Governor NORTON, it follows, even to demonstration,

1st. That neither Wager river, nor any other river or sea does extend so far westward, from any part of Hudson's bay, in less than latitude 65° , as to cross the rout that lies between Wager river and the Mine. And, 2dly, that if there be any passage at all, it must run up so high northward, as to cross the parallel of 67° , on the east side the Mine, and consequently must be frozen up, and absolutely unnavigable the whole year.

Many years we cannot pass the strait outward-bound before the latter end of August, and then with incredible fatigue and perpetual danger of losing lives and ships. Two out of three were lost

V O L. III. NUMB. CXXXVIII.

within these sixteen years. After passing the strait, there is still the bay to cross, in which I was detained no less than six weeks in ice, the last voyage I undertook for the company. I never was able to arrive at the factory above five or six times before the 20th of August, in three and twenty voyages I have made thither: And it is a standing order not to attempt to come back the same year, unless we can sail from the forts by the tenth of September. Till a little above twenty years ago, a voyage was seldom made without wintering.

Now supposing there were another strait on the western coast of Hudson's straits, or between latitude 61° and 63° , and that this strait were about as long and as wide as that.

In the first place, there could be no entering it before the latter end of August for ice, whether from England or your wintering place in the bay: For though we got at Churchill river by the first day of July last year, yet the like has not been known these twenty years, by a fortnight at least. But notwithstanding so favourable a winter, and early a spring, had we not worked night and day tides; from the beginning of April to the middle of June with infinite labour in cutting out our ships, which were bedded twenty three feet in the ice and hard frozen snow, as may be seen in the journals, we should not have got out so soon by a month. After all, this was of no service in forwarding us; for being got into a bay, we found all the shores lined with ice for many leagues, so that no opening could be entered; and the great rivers and straits, beyond 61 degrees, are full of it until the middle or latter end of August, and many years not clear at all. I have been fast myself in Hudson's straits for some days in September, till a north-west wind happened to set me and the ice a going together. Of all the sloops in my time which the company have sent, almost every year along the coast towards the Welcome, either upon trade or discovery, none but Scroggs could ever get beyond latitude 64 for ice; and since the year 1718 they have lost two sloops and a ship that way.

Many of them could not get beyond $62^{\circ} 20'$. Now all this well weighed, what chance have ships for passing such a strait as we have supposed.

But grant there was no ice to prevent a ship's passing about the latter end of August, yet at that season the winter begins to set in here, with hard gales and such quantities of drifting snow, that it is out of all human power to handle a sail, or keep the deck.

Of all this I furnished Mr. DOBBS with the most exact and particular account I was able to give him several years ago: But no matters of fact have power to convince him; and his scheme rests entirely upon presumptions, which all observations and experience directly contradict. I have perused all the company's journals about this discovery, as well as all others I was able to procure, whether in print or manuscript, from the year 1615 down to the present time. My inclination has led me that way these many years, as much or more than his, or almost any man's living, as all my acquaintance, and himself too, know very well. I wintered at Churchill for this purpose in 1721, and made all possible enquiry then, as well as the last year, among all the Indians and English who had travelled inland to the northward; and I am thoroughly satisfied that any further search must be less, either by sea or land.

Mr. Donns's description of Hudson's bay, with the advantages that would accrue to Great-Britain, by encreasing and strengthening our colonies and settlements on that coast, and the probability there still is of discovering a north-west passage through the bay.

Hudson's bay is situate between 51 and 65 degrees north latitude, and from 78 to 95 west longitude from London, being in length from Nodway and Moose rivers, in the bottom of the bay, to Whalebone point, 14 degrees; which, at 69 English miles to a degree, is about 970 miles; and in breadth to Diggs's isle, the east entrance of the bay, to the land westward of Churchill-river, 200 leagues, of 20 to a degree, 690 miles, surrounded by a great continent, except the opening of Hudson's streight, and the north-west side of the bay, which appears to be all broken land, the surrounding coast being above 3000 English miles.

These countries, though most of them are in cold climates, yet in the coldest parts, even north of the polar circle, are inhabited by the Eskimaux Indians; and by the Whalebone and oil, skins and furs got their at present, are of considerable advantage to those who are concerned in that trade; and if the trade was laid open, would be of vastly greater benefit to Britain, by affording a considerable market for our coarse woollen and iron manufactures; and by forming proper settlements in healthy and sheltered situations, out of the swampy grounds, there might be comfortable settlements made in most places, and very tolerable, even in the worst and coldest parts of that continent, which are the north-east and north-west sides of the bay; but in the southern and western sides of the bay, there might be made as comfortable settlements as any in Sweden, Livonia, or the south-side of the Baltick; and farther into the country south-west, the climate is as good as the southern part of Poland, and north part of Germany and Holland, nothing being wanted to make it so, but the building convenient houses with stoves, such as are used in the same climates in Europe.

The coast, from Hudson's streight to 57°, is pestered with ice in the beginning of summer, occasioned by the quantity which comes out from the several inlets there, as well as that which comes from Hudson's and Davis's streights; these islands of ice being frequently carried as far as the banks of Newfoundland, before they are dissolved; but the rest of the coast to the southward, from 57 to 52°, is free from ice.

Along that coast a very fine fishery might be carried on, there being as fine and large fish there as any upon the coast of Newfoundland, and at the same time a trade for furs might be introduced with the natives, the furs upon the east main being as fine as any in America, and richer than those to the southward. The French from Canada get the most of these at present, there being none to interfere with them in that trade, it being too far from the factories in the bay, and at present it is open to any who should go there to trade or fish; and it would prevent the natives, by getting a market nearer home, from going so far to trade with the French; our goods also could be afforded cheaper than the French goods from Canada.

Nelson river, called by the French the river Bourbon, lies in 57 degrees north latitude. In Hays island upon this river, is York Fort: The winter, which begins about Michaelmas and ends in May

here, is very cold, but they seldom want provision, for the sportsmen kill as many hares and partridges as they please: One year when the French had eighty men in garrison, they killed ninety thousand Partridges and twenty five thousand Hares.

At the end of April, the Geese, Bustards, and Ducks, return in such numbers, that they kill as many as they please; they also take great numbers of Cariboux or Rain-Deer, in March and April they come from the north to the south, and extend then along the river 60 leagues; they go again northward in July and August; the roads they make in the snow are as well padded, and cross each other as often as the streets in Paris; the natives make hedges with branches of trees, and leave openings in which they fix snares, and thus take numbers of them. When they swim the rivers in returning northwards, the natives kill them in canoes with lances, as many as they please. In summer they have the pleasure of fishing, and with nets take Pike, Trout, and Carp, and a white fish something like a Herring, by much the best fish in the world; they preserve those for their winter provision, by putting them in snow, or freezing them, as also the flesh they would preserve: They keep thus also Geese, Ducks, and Bustards, which they roast with the Hares and Partridges they kill in winter.

The country about fort Nelson is very low, it is filled with woods of small trees, and is very marshy. The natives live by hunting and fishing; Seals abound there, which are larger than those of Canada; they sell the oil extracted from them at the fort, which is better and clearer than nut oil. They have Bustards and wild Geese in great numbers, and sell the feathers at the fort. The white Partridges are as large as Capons. They have white Foxes and Martin Zobelins fairer than those in Muscovy.

There comes down generally to port Nelson annually to trade with the English, about one thousand Indian men and some women, in about six hundred canoes.

There are eight kinds of Beavers received at the Farmer's office

The first is the fat winter Beaver, killed in winter, which is worth 5 s. 6 d. per pound.

The second is the fat summer Beaver killed in summer, and is worth 2 s. 9 d. per pound.

The third is the dry winter Beaver, and fourth the Bordeaux, is much the same, and are worth 3 s. and 6 d. per pound.

The fifth the dry summer Beaver, is worth very little, about 1 s. 9 d. per pound.

The sixth is the coat Beaver, which is worn till it is half greased, and is worth 4 s. 6 d. per pound

The seventh the Muscovite dry Beaver, of a fine skin, covered over with a silky hair; they wear it in Russia, and comb away all the short down, which they make into stuffs and other works, leaving nothing but the silky hair; this is worth 4 s. 6 d. per pound.

The eighth is the Mittain Beaver, cut out for that purpose, to make Mittains to preserve them from the cold, and are greased by being used, and are worth 1 s. 9 d. per pound.

Mr. BURNET, when he was appointed Governor of New-York in 1727, finding that the French in Canada were in possession of all the Indian fur trade, through all the countries adjoining to the Canadese lakes, except what trade the English carried on with the six Iroquese nations, (the Tuskeruro nation

CHAP.
VII.

on now united to the others, making the 6th tribe) and knowing that the chief support of the colony at Canada was the benefit they made by their Indian fur trade, thought it of great moment to gain that trade to our colony of New-York from the French; upon enquiring into the nature of that trade, and manner of carrying it on, he found, that the French at Quebec and Montreal, were chiefly supplied with European goods from the merchants at New-York, where they had them at much easier terms, than they could have them from France; by which he found we could trade upon much better terms directly with the Indians, than with the French, and would by that means make all the Indians our friends; and consequently by our giving them our goods cheaper at the first hand, we might gain most of that trade from the French, and by that means weaken their colony at Canada, whose chief support is from that trade; accordingly, he prohibited the trade from New-York to Canada, by an act he got passed in the assembly there; and being opposed in it by the merchants trading to Quebec, who appealed against it to the council in England, at last got the act confirmed by the council; by this means a trade was opened directly with the western Indians through the Iroquese country, and an intercourse and familiarity, of consequence, betwixt all these nations and our colonies; the assembly was at the expence to build and fortify a trading house at Oswega, on the Cadarakui or Frontenac lake, in the neighbourhood of the Iroquese, near the Onontagues, and have from that time maintained a garrison there; by this means they have gained a considerable part of the trade which the French formerly had with the western Indians, and all the allies of the Iroquese now trade with us, as well as those on the Illenese lake, Missilimakinae, and Saut St. Mary. Before that time a very inconsiderable number were employed in that trade; now above 300 are employed at the trading house at Oswega alone, and the Indian trade since that time has so much increased, that several Indian nations come now each year to trade there, whose names before were not so much as known to the English.

The Indians in their voyages being obliged to go ashore every day to hunt for provisions, delays them very much; for their canoes are so small, holding only two men and a pack of 100 Beaver's skins, that they can't carry provisions with them for any time; if they had larger canoes they could make their voyages shorter, and carry many more Beavers to market, at least four times as many, besides other skins of value, which are too heavy for their present canoes; this, and the high price set upon the European goods by the company in exchange, discourages the natives so much, that if it were not that they are under a necessity of having guns, powder and shot, hatchets, and other iron tools for their hunting, and tobacco, brandy, and some paint for luxury, they would not go down to the factory with what they now carry; at present they leave great numbers of furs and skins behind them. A good hunter among the Indians can kill 600 Beavers in a season, and can carry down but 100, the rest he uses at home, or hangs them upon branches of trees, upon the death of their children as an offering to them, or use them for bedding and coverings; they sometimes burn off the fur, and roast the Beavers like pigs, upon any entertainments, and they often let them rot, having no further use of them. The Beavers, (according to LA FRANCE) are of three colours; the brown red-

dish colour, the black, and the white; the first is the cheapest, the black is most valued by the company, and in England; the white, though most valued in Canada, giving 18 shillings, when others gave 5 or 6 shillings, is blown upon by the company's factors at the bay, they not allowing so much for these as for the others; and therefore the Indians use them at home, or burn off the hair, when they roast the Beavers like Pigs, at an entertainment when they feast together; he says these skins are extremely white, and have a fine lustre, no snow being whiter, and have a fine long furr or hair; he has seen fifteen taken of that colour out of one lodge or pond. The Beavers have three enemies, Man, Otters, and the Carcajon, or Quequehatch, which prey upon them when they take them at an advantage; the last is as large as a very great Dog, it has a short tail like a Deer or Hare, and has a good furr, valued at a Beaver and half in exchange. The Beaver's chiefest food is the Poplar or Tremble, but they also eat Sallows, Alders, and most other trees not having a resinous juice; the middle bark is their food; in May, when the wood is not plenty, they live upon a large root which grows in the marshes, a fathom long, and as thick as a Man's leg, the French call it Volet; but the Beavers are not so good food as when they feed upon trees. They will cut down trees above two fathoms in girth with their teeth, and one of them observes when it is ready to fall, and gives a great cry, and runs the contrary way, to give notice to the rest to get out of the way; they then cut off all the top twigs and smaller branches two or three fathoms in length, and draw them to their houses which they have built in their ponds, after having raised or repaired their pond head, and made it staunch, and thrust one end into the clay or mud, that they may lie under water all the winter, to preserve the bark green and tender for their winter provision; after cutting off the small branches, they cut and carry away the larger, until they come to the bole of the tree. The Beavers are delicious food, but the tongue and tail the most delicious parts of the whole; they are very fat from November until the end of March; they have their young in the beginning of summer, at which time the females are lean by suckling their young, and the males are lean the whole summer, when they are making or repairing their ponds and houses, and cutting down and providing timber and branches for their winter store. They breed once in a year, and have from ten to fifteen at a litter, which grow up in one season; so that they multiply very fast, and if they can empty a pond, and rake the whole lodge, they generally leave a pair to breed, so that they are fully stocked again in two or three years.

The Loup Cervier, or Lynx, is of the Cat kind, but as large as a great Dog; it preys upon all beasts it can conquer; as does the Tyger, which is the only beast in that country that won't fly from a man.

The American Oxen, or Beeves, have a large bunch upon their backs, which is by far the most delicious part of them for food, it being all as sweet as marrow, juicy and rich, and weighs several pounds.

The Indians west of the bay, living an erratic life, can have no benefit by tame fowl or cattle; they seldom stay above a fortnight in a place, unless they find plenty of game. When they remove, after having built their hut, they disperse to get game for their food, and meet again at night, after having

CHAP.
VII.

CHAP. VII. having killed enough to maintain them for that day; they don't go above a league or two from their hut. When they find scarcity of game, they remove a league or two farther, and thus they traverse through these woody countries and bogs, scarce missing one day, winter or summer, fair or foul, in the greatest storms of snow, but what they are employed in some kind of chase. The smaller game, got by traps or snares, are generally the employment of the women and children, such as the Martins, Squirrels, Cats, Ermins, &c. The Elks, Stags, Rain-Deer, Bears, Tygers, wild Beeves, Wolves, Foxes, Beavers, Otters, Corcajeu, &c. are the employment of the men. The Indians, when they kill any game for food, leave it where they kill it, and send their wives next day to carry it home. They go home in a direct line, never missing their way, by observations they make of the course they take upon their going out; and so judge upon what point their huts are, and can thus direct themselves upon any point of the compass. The trees all bend towards the south, and the branches on that side are larger and stronger than on the north side, as also the Moss upon the trees. To let their wives know how to come at the killed game, they from place to place break off branches, and lay them in the road, pointing them the way they should go, and sometimes Moss, so that they never miss finding it.

In winter, when they go abroad, which they must do in all weathers, to hunt and shoot for their daily food, before they dress they rub themselves all over with Bears grease, or oil of Beavers, which does not freeze, and also rub all the fur of their Beaver coats, and then put them on; they have also a kind of boots or stockings of Beaver's skins well oiled, with the fur inwards, and above them they have an oiled skin laced about their feet, which keeps out the cold, and also water, when there is no ice or snow; and by this means they never freeze, nor suffer any thing by cold. In summer also when they go naked, they rub themselves with these oils or grease, and expose themselves to the Sun, without being scorched, their skins always being kept soft and supple by it; nor do any Flies, Bugs, or Musketoos, or any noxious insect ever molest them. When they want to get rid of it, they go into the water, and rub themselves all over with mud or clay, and let it dry upon them, and then rub it off; but whenever they are free from the oil, the Flies and Musketoos immediately attack them, and oblige them again to anoint themselves.

The Indians make no use of honey; he saw no bees there but the wild Humble Bee; but they are so much afraid of being stung with them, they going naked in Summer, that they avoid them as much as they can; nor did he see any of the Maple they use in Canada to make sugar of, but only the Birch, whose juice they use for the same purpose, boiling it until it is black and dry, and then using it with their meat. They use no milk from the time they are weaned, and they all hate to taste cheese, having taken up an opinion that it is made of dead men's fat. They love Prunes and Raisins, and will give a Beaver skin for twelve of them to carry to their children, and also for a Trump or Jew's-Harp. He says the women have all fine voices, but have never heard any musical instrument. They are very fond of all kind of pictures or prints, giving a Beaver for the least print, and all toys are like jewels to them.

CHAP. VII. When he got to the natives, southward of Pachegoia, he had about thirty Cowries left, and a few small bells less than Hawk's bells; when he shewed one of them, they gave him a Beaver skin for one, and they were so fond of them, that some gave him two skins, or three Martin's skins for one, to give their wives to make them fine. The Martins they take in traps, for if they shoot them, their skins would be spoiled; they have generally five or six at a litter.

He says the natives are so discouraged in their trade with the company, that no Peltry is worth the carriage, and the finest furs are sold for very little. When they came to the factory in June 1742, the prices they took for the European goods were much higher than the settled prices fixed by the company, which the Governors fix so, to shew the company how zealous they are to improve their trade, and sell their goods to advantage. He says, they gave but a pound of gunpowder for four Beavers, a fathom of tobacco for seven Beavers, a pound of shot for one, and ell of coarse cloth for fifteen, a blanket for twelve, two fish-hooks, or three flints for one, a gun for twenty-five, a pistol for ten, a common hat with white lace for seven, an ax for four, a bill-hook for one, a gallon of brandy for four, a check shirt for seven; all which are sold at a monstrous profit, even to 2000 per cent. Notwithstanding this discouragement, the two fleets which went down with him, and parted at the great Fork, carried down 200 packs, of 100 each, 20000 Beavers; and the other Indians who arrived that year, he computed carried down 300 packs of 200 each, 30000, in all 50000 Beavers, and above 9000 Martins.

The furs there are much more valuable than the furs upon the Canada lakes, sold at New-York; for these will give five or six shillings per pound, when the others sell at three shillings and six-pence. He says, that if a fort was built at the great Fork, sixty leagues above York Fort, and a factory with European goods were fixed there, and a reasonable price was put upon European goods, that the trade would be wonderfully increased; for the natives from the southward of Pachegoia, could make at least two returns in a summer, and those at greater distances could make one, who can't now come at all; and above double the number would be employed in hunting, and many more skins would be brought to market, that they can't now afford to bring for the expence and low price given for them. The stream is so gentle from the Fork to York Fort, on either branch, that large vessels and shallops may be built there, and carry down bulky goods, and also return again against the stream; and the climate is good, and fit to produce grain, pulse, &c. and very good grass and hay for horses and cattle.

As to the trade at Churchill, it is increasing, it being at too great a distance from the French for them to interfere in the trade. In the year 1742 it amounted to 20000 Beavers; There were about 100 Upland Indians came in their canoes to trade, and about 200 northern Indians, who brought their furs and peltry upon sledges; some of them came down the river of Seals, 15 leagues northward of Churchill, in canoes, and brought their furs from thence by land. They have no Beavers to northward of Churchill, they not having there such ponds or woods as they choose or feed upon, but they have great numbers of Martins, Foxes, Bears, Rain-Deer, Buffaloes, Wolves, and other beasts of rich furs, the country being mostly rocky, and covered

CHAP. VII. covered with a white moss, upon which the Rain-Deer or Cariboux feed. There is a great deal of small wood of the Spruce or Fir kind near the old factory, but the wood improves as it is further up the river from the bay, where they have Juniper, Birch and Poplar, and more southerly the timber is larger, and there are greater variety of trees. They are under great inconveniences at the New Fort, which is upon an elevated situation, upon a rock without shelter, close by the shore, surrounded with snow and ice for eight months in the year, exposed to all the winds and storms that happen, where they can have no conveniency of grass, or hay, or gardening, and yet they had four or five Horses there, and a Bull and two Cows near the factory; but they were obliged to bring their hay from a marshy bottom some miles up the river, to feed them in winter; but if a settlement were made higher up the river southward, some leagues from the bay, in shelter, without the reach of the chilling winds, they would have grass and hay sufficient, and might have also gardens and proper greens and roots propagated there.

The soil and climates are vastly different in the several countries adjoining to the bay. The east main from Slude River to Hudson's Streight, is least known, there being no factories fixed there for trade, although the best sable and black Fox skins are got there. Here the Nodway or Eskimaux Indians live, who are in a manner hunted and destroyed by the more southerly Indians, being perpetually at war with each other. They seem not to be natives of America, but rather Europeans from Greenland. The French imagine they are descended from Biscayners, they having beards up to the eyes, which the Americans have not; they are of a white complexion, not copper coloured like the other Americans, having black, strong hair. They live in caves under the snow in winter, feeding upon Seals flesh and dried fish, drinking the oil, and using it for their lamps, with which they also grease their bodies, which defends them from the piercing icy particles in the air. If, when travelling, a storm of snow is too violent for them to withstand, they dig a hole in the snow five or six feet deep, and cover the hole with skins or branches, and so lie warm under the storm. Upon this coast, in latitude 59° , near Cape Smith, is a passage lately discovered into an inland sea, 300 leagues in circuit, which, if a proper use was made of it, would open a considerable trade for furs into the heart of the Terra de Labarador, which the company now neglects for fear of expence, as they do all the coast on the east main, having only a house with seven or eight servants, at Slude River, in latitude $52^{\circ} 30'$. It is near the south side of this sea that the rich Lead Mine has been lately discovered, which would also turn to very good account, if a settlement was there in about lat. 56° or 57° ; it would be in as good a climate as at York Fort or New Severn, which is in a climate equal to the middle part of Sweden or Livonia, being in the latitude of Edinburgh; and if one was made in 59° near Cape Smith, it would be equal to that now at Churchill.

Rupert River, in about latitude 51° is in a very good climate, and is a fine river, well wooded, having eight feet water at the entrance, and the tide rises eight feet; the river is a mile over, and cometh from the southward of the east; it is about 150 leagues from St. Margaret's River, which falleth into St. Lawrence in Canada. A little to southward of Rupert's is Frenchman's and Nod-

VOL. III.

way rivers; these run from S. E. and S. S. E. from sources a great way up in the country; the last is five miles broad to the falls. These, though in so good a climate, are all neglected by the company, upon account of the neighbourhood of the French, who have encroached upon them, and have a trading house upon the head of Rupert's River, by which they have engrossed almost all the trade of the east main. To avoid expence they will not fix a sufficient factory there to recover so great a trade, nor will allow any other from Britain to settle there and trade, choosing rather to give it up to the French than to their countrymen, that they may preserve their present monopoly to themselves. The factories at present on Moose River, in latitude $51^{\circ} 28'$, and in Albany, in latitude 52° on the south-west of the bay, are at present in a very tolerable climate, being the same with these already mentioned, but would be in a vastly better climate, if they were fixed some miles higher up, at some distance from the chilling winds in the bay, where it appears all sorts of grain and pulse would grow to perfection, and most kind of European fruits. Here they may have Horses, Cows, Sheep, and all domestick animals, here being excellent grass, and very good hay may be made of it, which would improve by feeding and cutting it for their use in winter; and all sorts of grain may be had for their use, as well as for the inhabitants, wild oats or rice growing in abundance spontaneously farther up the rivers to the southward, at some distance from the bay. The Moose River is a noble, large river, which cometh from two branches, southward and south-westward of the bay, for some hundred miles from the mountains above the Huron, and upper lakes, to near latitude 48° . There are several falls upon it, but above the falls it is again navigable a great way into the country, from whence the natives come down some hundreds of miles in their canoes to trade at the factory; yet, from the avarice of the company, they have in a manner left that southern trade to the French, having allowed the French to have a trading house upon, or near the southern branch of Moose River, within three days journey, not 100 miles from that factory; who, at so many hundred miles from Canada, undersell the company, and carry away all the valuable furs, leaving only the refuse to them, because of the exorbitant prices they take for their goods from the natives in exchange. If the trade was opened, and these rivers on the bottom of the bay were settled farther up in the country, they would have a very temperate, fine climate, with all necessaries for life, and even for luxury. Here are very fine woods of all kinds of large timber for shipping or building, where they have all sorts of fruit and grain, tame cattle and fowl. The rivers abound with excellent fish, and the woods with wild-fowl, and most kind of wild beasts for profit or pleasure. Gooseberries, Raspberries and Strawberries, grow wild in the woods, every thing in gardens would grow with proper culture. In the country the snow and frost breaks up in March, and does not begin again until about November.

Albany River is also very considerable, in latitude 52° , and cometh from W. S. W. and within land has the same climate and other advantages; at present the situation of the factories of Moose and Albany are very unhappy, being placed in the swamps, at the mouths of the rivers; for the company's chief aim being trade, they don't regard the soil, aspect, or situation, where they fix them, provided they are upon navigable rivers, where their ships

CHAP.
VII.

can approach them, and where the natives can come in their canoes; so that their factories there are placed in a low swampy ground, which is overflowed by the rivers upon the breaking up of the ice, which makes them much moister and warmer in summer, and colder in winter, from the quantity of ice there is in winter in the rivers and bay: If they had fixed them higher up in the country, where the thaw begins much sooner than at the bay, they would have had a happier situation, and a quite different climate and soil. How can it be expected that any thing can thrive in their garden, or be brought to perfection? when the floods in the latter end of April leave flakes of ice several feet thick in their gardens, which are not dissolved until the latter end of May; and yet after that time, when they dig their gardens, they have very good coleworts and turnips, green pease and beans, when if they had been situate higher up in the country from the bay, they might have had all sorts of fruit, grain and roots in perfection, and tame cattle and fowl for their use; at present the company's servants depend upon the fish and wild-geese they take for their winter store. They have Pike, Trout, Perch, and white Trout in great perfection in all their rivers; but the principal fish they take is a little larger than a Mackarel, of which 13 or 14000 are taken at Albany in a season, which supplies them and their Indian friends in winter, these they take after the rivers are frozen over, keeping holes open in the ice in a strait line, at proper distances, through which they thrust their nets with poles, and the fish coming there to breathe, are maul'd or entangled in the net; these they freeze up for winter without salt. The wild-geese come to these rivers from the southward in the middle of April, as soon as the swamps are thawed, at which time they are lean; they stay until the middle of May, when they go northward to breed; they take at Albany in that season about 1300 for present use; they return again with their young about the middle of August, and stay until the middle of October, when they go farther southward; they save generally about 3000 of these, which they salt before the frost begins, and what they take afterwards they hang up in their feathers to freeze for winter store, without salt; the natives shoot them in the swamps. There are three kinds, one a grey Goose, which, without giblets, weighs from six to ten pounds, another which they call Whaweys, are from four to six pounds; they have also Swans, grey Plover exceeding fat, white Partridges as big as Capons in abundance, all winter and spring, which feed upon the buds of Spruce, Birch, and Poplars.

All the eastern and southern trade is in a manner lost to the French, and a considerable part of the south-western trade, they scarce preserving the trade at York Fort and Churchill River to themselves; so that were the trade laid open, and the southern and western countries settled, we might not only regain that trade from the French, which would probably increase our profit from 40,000 l. which the company gain at present upon their trade, to 100,000 l. but we might in a short time increase it to 200,000 l. by supplying the natives with woollen-goods, iron tools, guns, powder and shot, at reasonable rates; for by this treatment, and fixing factories for goods higher up the rivers, upon Rupert's, Moose, Albany, and Nelson rivers; by having markets nearer them and cheaper, the number of hunters would increase, and would bring four times as many furs, besides other valuable skins,

not worth the carriage at present, and they would make two returns for one, and many come from greater distances, which don't now come at all; and we should have all that now perish and rot, and they use at home, by getting better and cheaper European goods in return, and a shorter and quicker carriage to market; this would make them more industrious, and would preserve the lives of many of them, who can't subsist now without fire-arms and iron tools, having in great measure lost the use of arrows; and instead of our exporting to the value of 2 or 3000 l. which is the most the company exports in one season, we might export to the value of 100,000 l. in coarse woollen and iron manufactures, powder, shot, spirits, tobacco, paint, and toys, which would afford subsistence and employment to our industrious poor, and yet the merchant might gain near Cent. per Cent. upon his trade. By increasing our settlements to the southward, in the bottom of the bay, we should by this encouragement make all the natives our friends, by underselling the French, and securing the trade, and force the French out of their trade upon the east main, and countries north of Huron, and the other Canada lakes, and become so powerful, as not to fear the French in case of a war; whereas at present, if a war should commence, the company in a few weeks would lose all their factories in the bottom of the bay; and York Fort, where they have but twenty-five men, would soon after fall into their hands; for they have none but the Prince of Wales's Fort at Churchill that is in a state of defence, and even there they keep but twenty-eight men to defend a fort in which they have forty guns mounted. Such is the melancholy situation of our factories and trade in so extended a country at present, from the monopoly and covetousness of the company, who have been in possession of part of these countries to the southward from the time of their charter in 1670, above seventy years; and have enjoyed the rest uninterrupted from 1714, near thirty years; yet, though they have had the most extensive powers granted to them that were ever granted to any company, the whole property and exclusive trade of all these countries, and all others they should discover from thence not possessed by any Christian power, with a power to make war, raise troops, and fit out ships of war to preserve their possessions, to induce them to discover, plant, and improve these countries, and to extend the British trade, by finding out a passage to the western ocean of America; yet they have been so base to their country, as not only to neglect it themselves, but to prevent and discourage any attempt to find out so beneficial a passage, and have also prevented any persons from settling in those countries, which would have effectually secured all their factories, and put them out of danger of being insulted by the French in case of a war; and this with a view only of keeping a monopoly and exclusive trade to themselves from the rest of the British merchants, which they have no right to by law, it being only granted by charter, without act of parliament. But supposing they had a legal right, they have forfeited their right by not settling these countries, and preventing any of his Majesty's subjects from settling there; so that they have forfeited their right to all these countries except their present factories, upon account of their not taking in and settling upon those lands. Besides, they have not only neglected to find a passage to the western ocean, but have also refused to look for it, and have discouraged and endeavoured to seduce others

CHAP.
VII.

CHAP.
VII.

others from finding it, by offering rewards or bribes to Captain MIDDLETON, who was employed by the government to make that discovery, as he informed me; though the attempting that discovery was the chief prayer for their patent, and the principal motive which induced King CHARLES to grant them their charter, which was then given to some of the most considerable noblemen, gentlemen and merchants, in England; but now is confined to eight or nine private merchants, who have engrossed nine tenth's of the company's stock, and by that means are perpetual directors; the small proportion of stock which is in other hands, when sold, being purchased by those who have in a manner engrossed the whole, it not being allowed to go to a publick market.

Churchill river in latitude 59° a noble river, navigable for 150 leagues, and after passing the falls, navigable again to far distant countries, abounding in mines of copper, and other rich commodities, even to the western sea; so that the southern and western parts of the bay would, in some time, afford an inexhaustible fund for trade; nor is the east-side of the bay despicable, about the new discovered inland-sea, where there are rich furs, and mines of lead. What an immense trade might be begun and carried on from these countries; for the natives, being numerous, and of a humane disposition, inclined to trade, upon having an equitable trade with us, would be soon civilized, and become industrious, in such rich and delightful climates? What a vent might be had in those countries for our woollen, iron and other manufactures, may be easily conceived: So that by opening the trade, and settling these countries, the French in time would be confined to the rivers which fall into the river St. Lawrence, and be deprived of all their north-western trade.

To the making such settlements some objections have been made by the friends of the company; as the great difficulty of getting people to go to settle and plant in so cold a country, and the difficulty and danger attending the making settlements higher up upon the rivers, and navigating them, they being so full of falls and rapids, that can only be navigated by the natives in small canoes made of Birch bark, which cannot contain above two men with any cargo; and in these they are often over-set, and in danger of being drowned, and of spoiling their goods; that they are often obliged to carry their canoes and cargo from place to place, which obstructs greatly, and delays the navigation, and that scarce five men out of 120, which the company now have in the bay, will venture themselves in, or can conduct such canoes, without imminent danger of being drowned, and consequently these hardships and difficulties will counterbalance the profit to be made of settling higher up in the country, upon the rivers in pleasanter and warmer climates.

To this we may answer, that by the accounts already given here of these climates and countries by impartial persons, who do not want to disguise the truth, it appears that the cold is tolerable even at these disadvantageous settlements at present in the bay, and that upon passing only five or six leagues up the rivers into the country, the climate is so altered, as to be equal to those of the same latitudes in Europe; and that these prodigious accounts of the effects of cold are calculated only to serve the company, in order to prevent people from going there to settle, and encroach upon the company's monopoly of trade.

As to the difficulty they make about navigating these rivers in those small canoes; and the small number of those employed by the company, who will venture in them, or can conduct them, we answer, that their servants, being at present no gainers by trade, will not endeavour to learn to navigate these canoes, where there is any risque, and care necessary to prevent the danger; besides, the company allows them no time to learn, by confining them to their factories whilst the Indian trade continues, and the navigation is open; and at other times keep them employed in cutting wood for firing, bringing it home, and in shooting, fishing, and digging in their gardens, to supply themselves with provisions, to lessen the company's expence; so that they are allowed no time to learn to navigate these boats, or to go up the rivers to observe the soil and climate, or what improvements might be made in the country: But if they were masters of their own time, and could advance their wealth by trade, and found a considerable profit to arise to them by their dexterity in managing these canoes, and the great pleasure and satisfaction they would have, by living in a fine climate among these lakes and rivers, they would be as enterprising and dexterous as the *Curreur de Bois*, and be as able to navigate among these water falls as the French. Neither is it impracticable to prevent even these canoes from over-setting, by out-lagers or blown bladders fixed to their sides; or other kinds of boats may be used, such as are made at Torneo, in Sweden, upon the rivers falling into the Bothnic gulph.

Another objection is, that it is a difficult and dangerous navigation into the bay, and the trade is not worth the risque.

To this we answer, that the navigation is not so dangerous as it is apprehended to be, but appears to be more so by the insinuations and report of the company and their friends, who give it out in order to deter others from venturing and interfering in their trade; and for that reason they oblige their captains, under a penalty, not to publish any charts of the bay and streight. Captain MIDDLETON, who was in their service, made above twenty voyages to different parts of the bay, and never lost a ship, nor had any accident in these voyages; nor have I heard that the company, in about 23 years, have lost any ships in that trade but two, and the men and cargo were saved by Capt. MIDDLETON. Where Captains are careful in the ice, there is not much danger; it is of great advantage to them that there is no night at that season they enter the bay, where the quantity of ice is greatest; and when they return in September, or even in October, all the ice is in a manner dissolved, or passed out of the streight into the ocean, and none seen that can obstruct their passage.

It is probable that during the whole winter, from October to March, there is no ice in the streight to obstruct their passage into, or out of, the bay; for a ship which chanced to be closed up with ice in an inlet, by the breaking of the ice got out, and came through the streights at Christmas, without finding any ice in the streight to prevent her passage: For the ice which is formed in bays and rivers in winter, does not break up and get into the channel or streight, until it begins to thaw upon the shores in March and April; at which time it is carried by the winds and tide into the streight, and obstructs the passage in May and part of June, until it is dissolved; yet even then good pilots know how to avoid it, and get into the eddy tide, out of the current, where the ice is more open, and not drove

CHAP.
VII.

CHAP.
VII.

drove together by the winds and current, as it is in the channel; but these difficulties would lessen every day, if the trade were opened, and the voyages were more frequent by the greater number of ships, which would make many more experienced pilots; and as there is now a more accurate chart published of the strait and bay by Captain MIDDLETON, with the islands, soundings, tides and variation, the navigation will become less dangerous daily, and coves and places of shelter for ships will be found out by the numbers of ships which would then pass, and be trading in these seas, which are now unknown.

We may therefore apprehend, that the danger from the ice is more in imagination than reality, when care and judgment are employed; for ships are mostly inclosed in ice in calm weather and fogs, when the ice prevents the motion of the sea, stormy weather disperses and breaks the ice and blows off the fogs, and ships keep a good offing from the ice, unless they get under the lee of a large island of ice, and then they fasten to it and drive along with it, whilst the smaller ice to leeward is drove from them by the wind; and the large islands being many fathoms deep in the water, come on ground before the ships are in danger of being forced on shore in shallow water.

The greatest danger and delay from the ice is in the entrance into the strait; for the first 40 leagues from thence the quantity is less, and they pass on with less difficulty, and after getting into the bay, the north-west side is freest from ice, the bottom of the bay is full of low flat ice, which is all dissolved in the latter end of summer.

Upon the whole, except two ships which were lost in King WILLIAM's reign, and a French ship, after an engagement with our ships, when they attacked Fort Nelson, we have heard of none but the ships already mentioned which have been lost in that voyage. The two ships which went with BARLOW in 1719, to find the north-west passage, contrary to the inclinations of the company, if they did not make the passage, were probably in the winter surprized by the natives, and were not lost in the ice; for they say that the natives in about latitude 63°, where they suppose they were lost, are shy since that time, in trading with the company's sloops, which they apprehend to be from a consciousness of guilt, fearing that it might be known, and they should be punish'd for it.

THE Arguments produced by Mr. DOBBS and Capt. MIDDLETON, for and against a north-west passage, carry each of them such an air of probability, that it is difficult to know what to determine; but one thing seems very certain, namely, that if there be a passage that way into the Pacifick ocean, the voyage is so exceeding hazardous that few people will ever attempt it. Neither would it turn to account if we could penetrate that way into this ocean, for we have already more colonies and settlements in America than we can cultivate and improve. Thus far indeed Mr. DOBBS is infinitely in the right, that we ought to extend our commerce and establish more colonies in Hudson's Bay, and support them by strong forts and garrisons against the encroachments of the French in Canada; for the Indians in this part of the world take off our woollen and iron manufactures, and

send us their skins and furs, whalebone and oil in return, upon more advantageous terms than we can traffick with any other people. It is evident also, that here might be a Whale fishery and Cod fishery established to very great advantage, on these extensive coasts in the neighborhood of the bay, from both which the nation might reap great advantages, if the adventurers were encouraged and supported by the government. And 'tis probable, either the ministry or the parliament, or both, will be apply'd to e'er long upon this head; but when the adventurers shall have demonstrated how beneficial this traffick and these fisheries may be to the nation in general, and to the undertakers in particular, what may we expect will be the consequence? why, probably, the present company, or some other select merchants, will offer the government to lend them a sum of money, on condition of their being incorporated to the exclusion of all other subjects of Great-Britain; so that instead of an illegal precarious patent, this monopoly will probably be established by act of parliament, as was the case of the East-India company about forty years ago.

Great complaints were made against the East-India company's monopolizing that trade; it was look'd upon as a great grievance that the rest of the subjects of Great-Britain, should be excluded from trafficking thither, and the patent was therefore adjudged void; but upon the company's lending the government a sum of money, this very monopoly that was universally exclaimed against and allowed to be a grievance, was established by act of parliament; but possibly we have nothing of that nature to fear at this day, while publick spirit reigns so conspicuously among the present ministry.

It has been observed already, that further discoveries, especially to such remote regions as may be found in the Pacifick ocean, can be of little advantage to this nation; and the reason is, that the plantations we have already, do, or may produce every thing we can want (except the fine spices which the Dutch have monopolized and usurp'd the dominion of.)

If Carolina was cultivated and the planters encouraged and supported by the government, this colony would in a few years produce wine, oil, and silk; and the more northern provinces would (and do in some measure already) furnish us with pitch, tar, masts, yards, and all other naval stores; whalebone whole, oil, furs, skins, &c. and were the coasts of Hudson's Bay and the Terra Labrador planted and improved, as they ought, we should be furnished with all these articles in greater plenty than any nation in Europe, which would not only prevent our sending vast sums abroad for them to foreign nations, but if these colonies were peopled and improved, they would themselves take off most of our home manufactures; and as we find the German, Swiss and other nations, ready to embark and settle in our plantations, there will be no need of depopulating Old-England to plant them. The King would acquire a great increase of subjects, on inviting foreigners to settle there, and our plantations would be so strengthened as not to fear the insults or attacks either of the French or Spaniards. It is highly probable the English would maintain their superiority in North-America, and even subdue their rivals in that part of the world.

The only new acquisitions I could wish the English would make during this war, are those of St. Augustin and Quebeck, which would render the

British

CHAP. VII. British dominions in the continent entire, and make us masters of the navigation of the gulph of Mexico and the river of St. Lawrence: Our plantations contiguous on the continent, would then extend two thousand miles in length; and were the south of Florida well peopled and fortified, we might bid defiance both to the French and Spaniards in that part of the world.

And as St. Augustin and Quebeck are of such consequence to the traffick of Great-Britain, and the security of her plantations, it is amazing to me, when we had such formidable land and naval forces in America

for two years together, they were never employed in the reduction of those fortresses, but on the contrary, Mr. OGLETHORPE was allowed only a single regiment to attack St. Augustin, where the garrison was more numerous than the besiegers; and nothing but a repulse could be expected, while our troops lay rotting on the island of Cuba; the greatest naval armament that ever was known in those seas, remained perfectly unactive, without attempting or even designing any thing for the honour or service of the nation, that ever I could learn.

THE PRESENT STATE OF NEW-YORK, NEW-JERSEY, &c.

CHAP. VIII.

Of New-York, New-Jersey, and the Indian nations under their protection.

CHAP. VIII. I MAY properly throw New-York and New-Jersey together, upon several accounts: 1. Because they have usually the same Governor.

2. The constitutions of their respective governments do not differ in any particular. 3. Because they lie contiguous; and, 4. The climate, soil, and produce are pretty near the same.

The Iroquois, or five nations.

It may be proper also to comprehend the whole country of the Iroquois, or five nations, with all the lands which lie north of them as far as the river of St. Lawrence or Canada, within the limits of New-York, these being all under its protection, and included within the patent granted to the Duke of York by King CHARLES II. tho' it must be confessed the French have made large encroachments on these limits.

Situation and extent of the whole.

I shall therefore bound the provinces of New-York and New-Jersey, with their dependencies, by the river of St. Lawrence, which separates them from Canada or New-France on the north-west and north, by New-England, New-Scotland, and the Atlantick-Ocean on the east, by

Vol. III.

the same Ocean on the south, by Pennsylvania and Maryland on the south-west, and by the lakes of Erie and Ontario on the west; and shall extend these united countries from 39 to 47 degrees north latitude, and from 74 to 80 degrees of western longitude, exclusive of Long-Island, the east end whereof lies in 72 degrees of western longitude.

New-Jersey and the south part of New-York are generally low level countries, but ascending fifteen or twenty miles up Hudson's River to the northward the country becomes rocky and mountainous; and whatever has not been cultivated by the English, is covered with woods, so clear however from underwood, that travellers easily pass through them with Horses and carriages.

The Atlantick Ocean washes its southern shores, in which are several capacious harbours, especially near the mouths of Hudson's River, and the rivers Raritan and De la War, and on the coasts of New-Jersey and Long-Island, the chief capes or promontories being that of Cape May, at the entrance of De la War Bay, and that of Sandy-

CHAP. VIII.

Face of the country.

Seas, harbours, and capes.

CHAP. VIII. Sandy-Point, or Sandy-Hook, before the entrance of Raritan-River.

Lakes.

On the north and west of the five nations lie several spacious lakes, the most considerable whereof, are those of Champlain, Ontario, and Erie.

Champlain or Corlaer Lake.

The lake Champlain, or Corlaer, extends itself from north to south, between Montreal and Albany, being about two hundred miles in length; and, by a stream which falls into the great river St. Lawrence, has a communication with that river on the north, while the southern part of the lake, on which the French have built the fort called the Sacrament, extends almost to Hudson's River, on which Albany stands, and would give the French an easy access to New-York and New-England, if some forts had not been built by the English further north to cover those frontiers from their invasions, of which the chief is fort Nicholson.

Ontario Lake.

The second lake is that of Ontario, called by the French Frontenac, and by some Cataracui, while others give it the name of The Lake of Canada, because the river Canada or St. Lawrence, issues out of it: But the first and most proper name that was given to it was that of Iroquois, the shores of it on the south and east at least being inhabited by the Iroquois or five nations. This lake is about an hundred leagues in length, and forty in breadth, abundance of rivers falling into it on the south-east especially; but the greatest bodies of waters fall into it from the river Niagara or Oniagara, being a streight or chanel between the lake of Erie and this lake, in which is one of the most remarkable cataracts or waterfalls in the world, which prevents both ships and boats passing from one lake to the other.

Niagara cataract.

This cataract, according to father HENNEPIN, falls from a precipice one hundred fathom, or six hundred feet high. He adds, that the cataract makes such a prodigious noise that people cannot hear one another speak at some miles distance; and it is said that the waters throw themselves over the precipice with such a force, that they form an arch under which men may ride on horseback.

But Mr. VANDREIL, Governor of Canada, who ordered his son, with some skilful people, to measure the height of the cataract, in the year 1721, found father HENNEPIN egregiously mistaken in several particulars. They informed the Governor that the cataract was occasioned by a vast ledge of rock which lay quite cross the channel a little before the stream enters the lake Ontario; and that the waters did not fall perpendicularly more than twenty six fathom, or an hundred and twenty six feet, but below this cataract there were numbers of small ledges or stairs cross the river, which lowered it still more till it came to run more level; and if all the descents were put together, the difference of the water above the cataract, and those on the level below, might be as much as father HENNEPIN makes it, tho' the cataract, upon a perpendicular, was no more than twenty six fathom.

They observed also, that the noise of the waters was not so great as the father makes it, for people might converse together close by; nor did the stream form an arch that people could pass under it, for the waters fall in a manner downright. But they observed with him that the mist or shower which the fall creates, is so extraordinary as to be seen at five leagues distance, rising as high

as the common clouds, and when the sun shines, forms a glorious rainbow.

CHAP. VIII.

Those gentlemen add, that the stream is much narrower and deeper at the falls than either above or below them, being here but a quarter of a mile over; and that from below there is no coming nearer the falls by water than about six miles, the torrent is so rapid, and has so many whirlpools in it.

The French formerly built two forts on the lake Ontario, the one on the north east part of it, where the river of St. Lawrence issues out of it, called by the Indians Cataracui, and by the French Fort Frontenac, and the other on the south-west part of the lake near the abovesaid cataract, called Fort Niagara, but the Iroquois blocked up the latter, and starved that garrison. They obliged them also to abandon Fort Frontenac, and demolished both about the year 1688; but I am informed the French have wheedled the Iroquois by their priests to permit them to erect those forts again under the notion of warehouses for the security of their goods.

The third lake I mentioned is that of Erie, separated from the lake Ontario by the streight or river of Niagara. This lake extends from the country of the Iroquois to the westward, about four hundred miles in length, and is near an hundred miles broad. From the lake of Erie there is a passage through the lake St. Clair into that of the Hurons, and so into the lake Illinois, near which rises a river which falls into the Mississippi; but from the best information I can get, there is no continued navigation from the lake Erie to the Mississippi, nor is Mississippi River navigable in all parts of it, as the French once flattered themselves, there being several cataracts or steep falls in it.

The chief rivers in these countries are, 1. Hudson's River. 2. The Mohawk River. 3. Onandaga, or Oswego River. 4. The Raritan. 5. Maurice River: and, 6. De la War River.

1. Hudson's River, rising from a small lake between the lakes of Ontario and Champlain, and running south-east before it reaches Albany, then turns directly south, from whence it continues its course due south an hundred and fifty miles to the city of New-York, and afterwards falls into the sea between Long-Island and States-Island.

2. The Mohawk River, which rising in the country of the Onandagas, runs almost due east till it falls into Hudson's River, near the town of Albany.

3. The River Onandaga, which runs from east to west through the country of that name, and falls into the lake Ontario, at Oswego town.

4. The River Raritan, which rising on the north of Jersey, runs to the south-east, falling into the sea near Perth Amboy.

5. Maurice river, which rising also in Jersey runs south, falling into the mouth of De la War Bay, not far from Cape May. And,

6. The River De la War, which forms the western boundary of the province of Jersey, rises in the country of the Iroquois, and running almost due south falls into the ocean between Cape May and Cape Hinlopen, being navigable two hundred miles and upwards for ships of two or three hundred tons.

The air of these countries is colder in winter and warmer in summer than in Old-England, the north part of them differing very little from New-England. The north and north-west winds are exceeding

CHAP
VIII.

exceeding cold, but the air both in winter and summer more settled and serene than with us: And indeed the weather is always more variable in islands than on the continent, and usually warmer in winter. It is to be ascribed to the winds blowing over a long tract of snow from the north-west, that makes these countries colder than islands and some other continents that lie much further north.

The situa-
tion of the
five na-
tions.

Of the three grand divisions of the country to be described, I shall begin with that inhabited by the five nations and their allies, who anciently possessed the whole. This is bounded by Canada on the north, by New-York proper on the east, by Pennsylvania, Maryland, and Virginia on the south, and by the lakes of Erie and Ontario on the west. Great part of the country for many hundred miles beyond those lakes also hath been conquered by the five nations; and several more have courted their alliance and that of the English, and actually entered into a confederacy with both, particularly the Tuscaroras, who lie between the Onandagas and the Oneidos, and are now reckoned a sixth nation. The Nicarriages of Missilimakinac, situated on the further part of the Huron's Lake, were also at their request received to be a seventh nation in this alliance at Albany, on the 30th of May 1723, eighty men of that nation being present at their admission, as representatives of that people, and acknowledging the King of Great-Britain their Sovereign.

The at-
tempts of
the
French to
make
themselves
masters of
the lakes.

The chief trade with the distant Indians being at Oswego, where the river Onandaga discharges itself into the lake of Ontario, the French might entirely deprive the English of that trade, if they were masters of the lakes of Ontario and Erie, as they flattered themselves they were when they had built the forts of Cataracui or Frontenac, and Niagara already mentioned, but the Iroquois obliged the French to abandon them; and tho' they may have rebuilt and repossessed those forts, and erected more since they were driven from thence by the five nations, they find it their interest however for the present to suppress their native insolence, and treat the Indians as well as the English with more humanity than they did formerly: They have been convinced by experience that they are not yet strong enough to reduce the five nations and their Indian allies supported by the English; and therefore suffer the natives to trade with us pretty quietly. But as they are continually increasing their forces in Canada, and by their missionary priests daily proselyting the Indians to their religion, and intermarrying with them, they will, it is presumed, in time be powerful enough to expel us entirely from those lakes, and monopolize the trade of the country; unless we reduce those forts, or erect other ourselves, and keep armed vessels on the lakes of Ontario and Erie: For it seems the country of the five nations, which lies contiguous to New-York, has but few wild beasts in it; and consequently affords scarce any skins or furs. The Iroquois therefore hunt in the countries beyond the lakes, where skins are more plentiful; and the riches those people possessed of this kind were the principal inducements to the Iroquois to make a conquest of some of them, and enter into alliances with others, who were content to admit the Iroquois to hunt in their country on the west side of the lakes, upon condition they would permit those distant Indians to pass through the country of the Iroquois, and trade with the English and other Europeans;

which trade, as has been intimated, must be entirely lost to Great-Britain, if we suffer the French to continue their fortifications on the lakes of Erie, Ontario, Champlain, which in reality belong to the Iroquois our confederates. The French are wise enough at present indeed to give us but little disturbance, lest they should alarm us before their designs are ripe for execution; but I wish we do not neglect the erecting forts and armed vessels to protect that trade till it is too late to endeavour the recovery of it.

There are five grand articles which weigh very much with the Indians in determining them what European nation they shall adhere to. 1. A beneficial trade, or the being supplied on fair and reasonable terms with cloathing, strong liquor, arms, ammunition, and other European merchandize. 2. A mild administration, without oppression or tyranny. 3. A religion that gives them but little trouble or disquiet. 4. The suffering their tribes to marry and incorporate themselves with the Europeans. 5. And lastly, an assurance that the nation that they enter into an alliance with is both willing and able to protect them against their enemies, whether Europeans or Indians.

1. In the first of these articles we have the better of the French and Spaniards. Our colonies can supply the Indians with goods cheaper and in greater quantities than they can, and we generally deal fairly and upon the square with them.

2. In the second also we have the advantage, the Indians being treated as our brethren and fellow subjects almost every where (except in New-England;) which has occasioned their having been more frequently in a state of war with New-England than with any other British Colony.

3. But as to the third article, that of religion, the French succeed much beyond our missionaries; for the popish fathers are not only much more numerous in that part of the world, but they are abundantly more artful and more indulgent to their converts; they press nothing with rigour, but accommodate themselves to the dispositions, and even superstitions of their proselytes, gaining them by degrees, and persuading them to part with one beloved vice or custom after another; whereas the New-England independents, who have dressed up the Christian religion in the most frightful form that ever it put on, expect their proselytes should conform to their absurd and rigid rites all at once, and in a manner compelled the Indians to be of their sect in the islands on the coast, and in settlements where the Indians were in their power, which gave the remoter Indians an abhorrence of their religion: And as for the rest of our colonies, they have made but very feeble attempts towards the conversion of the Indians. They are so destitute of clergymen in some provinces, that the very planters are become heathens, or at least as ignorant of christianity as the Indians themselves.

The French priests on the contrary have been so successful in their missions, even among the five nations, that they have persuaded part of the nation of the Mohawks, once esteemed the firmest friends of the English, to remove their habitations from the neighbourhood of Albany to Canada: And indeed we are in much more danger of the French missionaries than of the French arms on that side. If their future success be answerable to the past, they may possibly in time gain over the several tribes of Indians from us without the assistance of a military force. We ought to insist therefore

CHAP

an alliance
with any
European
nation.

1. Trade:

2. Liber-

3. Reli-

CHAP.
VIII.

therefore, that the Indians in alliance with us expel the jesuites and priests their country, if we hope for their friendship long. It does indeed put some stop to these conversions that the Indians cannot be supplied with goods upon such easy terms from the French as from us, on which account they seem divided between their temporal and spiritual interests; and unless they prove more zealous catholicks than their brethren on this continent we shall not lose them suddenly; especially if we consider how vast an extent of country the several Indian nations inhabit that trade with our colonies, some of which are scarce yet known to the French.

4. Inter-
marriages.

As to the fourth article of marrying and incorporating our people with the Indians, here the French and Spaniards have a vast advantage of us. The English are unaccountably squeamish in this particular, and the colonies, especially those of New-England, seem to prohibit it; which raises in the natives a disgust and aversion of our people. It is natural for men to slight those who seem to despise them, and the Indians are not so dull of apprehension as not to discern we treat them in this instance either as a species below us, or at least less perfect than our selves. Besides, we lose all the interest in them that such alliances would give us. The relation of husband and wife, fathers and children, are the strongest ties in nature, and in a few years must make the Indians one people with such European nations as promote these alliances; of which the French are so sensible that they oblige every male planter, sent over at the charge of that government (and these are very numerous,) to take an Indian wife on his arrival,

5. Protec-
tion.

As to the fifth article, that of protection, there is no doubt but we are as yet able to protect our Indian allies as either the French or Spaniards are, especially if the forces of our colonies were united, and under a uniform direction: But if we continue to suffer the French to encroach upon our territories, build forts and armed vessels upon the several lakes, and take all the passes that command the country, the Indians will have but too much reason to conclude that they will one day be masters of their country, unless the English exert themselves in like manner, and oppose their invasions, and consequently will be induced to abandon our interest by way of self preservation. They will infallibly go over to those they find better able to protect them. It might make them cautious indeed how they put themselves in their power, if they were acquainted with the tyranny and oppression of the French government; but as their missionaries set every thing of this kind in the most favourable light, and treat their disciples with kindness and condescension at present, in order to gain them over to their party, they are in a great measure ignorant what they must submit to when the French have established their dominion in North-America.

Persons of
the Iro-
quois.

As to the towns and buildings of the Iroquois, their stature, complexion, shape, and habits, they so much resemble the neighbouring Indians already described in these particulars, that it is perfectly unnecessary to say any thing on these heads; however, as the French generally represent them in Europe as the most barbarous people on the face of the earth, affirming that they are devourers of their own species; it may be proper to observe what character others have given of them, and even some more impartial writers of their own.

Monfieur DE LA POTERIE describing the five nations in his history of North-America, says, when we speak of the Iroquois in France, we represent them by a common mistake as mere barbarians thirsting after human blood, but their true character is very different. They are indeed the bravest and most formidable people of North-America, but at the same time as polite and judicious as can well be conceived; which appears not only from the management of their affairs with the French and English, but with almost all the Indian nations of this vast continent.

CHAP.
VIII.
The ge-
nius and
temper of
the five
nations.

Mr. COLBEN, an Englishman, who wrote their history says, notwithstanding the five nations live under the darkest ignorance, yet a bright and noble genius shines through those black clouds. The most celebrated Roman heroes have not discovered a greater love for their country, or a greater contempt of death in the cause of liberty. I think (says he) they have outdone the Romans, especially those who murdered themselves to avoid shame or torment; for our Indians have refused to die meanly by their own hands when they thought their country's honour at stake, and have given up their bodies willingly to the most cruel torments their enemies could inflict; to shew that the five nations consisted of men whose courage and resolution could not be shaken. They sully, however, these noble virtues by that cruel passion of revenge, which they think (according to COLBEN) not only lawful but honourable to exert without mercy on their country's enemies. And in this only, says he, they deserve the name of Barbarians.

Another gentleman of English extraction, tho' a native of this country, and Resident a considerable time among the Iroquois at Albany, assures me they are an exceeding hospitable good-natured people, not given to revenge, unless when they are drunk; and the instances that have been given of it are no evidence of a vindictive temper, for the cruelties they inflicted on some French prisoners and their Indian allies were by way of retaliation of the like cruelties first exercised by the French on their people. It is observed that the French in the first wars they had with the Iroquois, when they imagined that people were not able to resist the force of their arms, used them in this barbarous manner, and taught the Indians those cruelties they now complain of; and which gave the Iroquois such an abhorrence of that nation as has been very advantageous to the English interest ever since.

The French missionaries probably find no small difficulty at this day in removing the just prejudices the Iroquois entertain of the French when they come to make proselytes among them; the conduct and behaviour of the French in America having been directly opposite to the principles of the Christian religion, which they pretend to instruct the Indians in.

As to the government of the Iroquois, Mr. COLBEN informs us that every nation is a distinct republick, but that they have for time immemorial been united in a confederacy against all other Indian nations; that they are governed by their respective Sachems or civil Magistrates in time of peace, and by their warriors or Captains in their wars; and that the authority both of the one and the other is obtained and continued only by the opinion the rest of their nation have of their conduct or valour; and that they are laid aside when

ment of
the five
nations.

CHAP.
VIII.CHAP.
VIII.

when they cease to merit the esteem of their countrymen. That their Sachems and Captains are usually poorer than the common people, giving away and distributing all the presents and plunder they get among the people, so as to leave themselves nothing: For, says COLBEN, if they are once suspected of selfishness, they grow mean in the opinion of their countrymen, and consequently lose their authority; from whence one would be apt to conclude that their Chiefs were elective, and their dignities not hereditary; which is directly contrary to all other accounts I meet with of their constitution, most writers agreeing that the post of Sachem is hereditary: And my Albany correspondent confirms this opinion, adding, (as other American historians do,) that the next male-heir by the mother's side succeeds the preceding Sachem: Which is certainly true, not only here but in several other parts of North-America. But so far these nations may have the appearance of Republicks, that the chief Sachem, or King, seldom determines any thing of consequence without the concurrence of the several inferior Sachems or Lords of his nation; and his influence on his people vanishes when he loses their esteem.

My Albany friend also observes, that every nation of the Iroquois is divided into three tribes, which take their names from three animals, viz. 1. The Turtle or Tortoise. 2. The Bear; and 3. The Wolf; and that each of these three tribes has its Chief or Aquajander. The Aquajander of the Turtle tribe being superior to the other two; and the Aquajander of that tribe in the Mohawk nation (called the Carihoge) is the Sovereign or Emperor of all the six nations; here he does not comprehend the seventh nation of distant Indians situated beyond the lakes.

He observes further, that these Chiefs have some honours paid them by their subjects, but their authority he thinks is very inconsiderable, and their revenues nothing: That there are no courts of judicature in the six nations or any other law but custom; and in case of murder the nearest relation is the avenger of blood.

Their forces and wars.

They have no standing forces, but every able-bodied man takes up arms when honour or the defence of his country calls him out. Before they march, their Captains and warriors assemble at a feast, and whoever partakes of it thereby enlists himself for that service. On this occasion they paint themselves and appear in their best apparel; the old men rise up by turns in the assembly and make speeches, setting forth the noble actions, the valour and courage of themselves and their ancestors, together with the cowardice and weakness of their enemies, to animate the warriors. After supper they have a war dance, and the next day they march out and discharge their pieces as they leave the town, their leader singing the war song. When they meet their enemies, every one shelters himself behind a tree, from whence as opportunity offers he fires at the foe.

They take off the scalps of those they kill, and bring them home, preserving them as trophies of their victories. When they take a prisoner they present him to some family which hath lost a relation in the war; if they receive him, he is immediately admitted to all the honours and estate of the deceased, and he takes his name and titles; but if rejected, the poor wretch is condemned to some cruel death. But this piece of barbarity they are said to have learned from the French,

VOL. III.

who to strike a terror into the natives, used to treat their Indian prisoners in this inhuman manner in their first wars.

Other writers observe, that they adopt all their young captives into their families, by which means they supply the losses they sustain in their wars; so far are they from torturing or putting them to death, unless provoked by tortures first inflicted on their friends.

As to their marriages, children are entirely at their parents disposal, and when both parties are agreed, the lover presents his mistress with a mantle as a pledge of his affection. Some time after the parents present the parties to their Chiefs, and declare the intended marriage; after which they go to feasting and dancing, and the marriage is consummated; the man continues with his parents and the woman with hers till they have children. He visits his wife every night, and is admitted to conjugal embraces, but returns home in the morning. Whatever he takes in hunting he brings to his wife and leaves to her disposal.

They do not allow a plurality of wives, but divorces are common. They appear very modest, and are never seen to commit indecent familiarities, or even to kiss before company. The women are delivered with great ease, and without the assistance of a Midwife or any other woman; and immediately after their delivery go to hard labour, which they esteem the best means to a speedy recovery. They are all extremely fond of their children, and think a numerous offspring one of the greatest blessings.

As to the religion of these people, as far as I can learn (says my Albany friend) they acknowledge a supreme being, whom they style the preserver of the universe; but seldom pay any religious worship to him unless in public calamities, and then they offer sacrifices of every thing they possess, and pray for deliverance from their calamities. They also offer thank-offerings for any public blessing. I cannot learn that they have any idols or representations of the Deity among them. When it thunders, they take it to be a sign of God's displeasure, and will say to one another, how angry he is! and often cry out, it is enough, have done. They believe a future state of rewards and punishments, but they have very obscure notions of it; and seem to think that the rewards of the good will consist in the enjoyment of those pleasures he was most fond of in his life. At their funerals they furnish the deceased with all necessaries, as meat, drink, cloathing, arms, and ammunition. They make great lamentation for the dead, and constantly go morning and evening to the graves of their deceased friends and relations, and howl most hideously, and never fail to leave some provision on the grave.

Various attempts have been made to convert these people to christianity, especially by the French priests, who by the negligence of our own people and their great zeal to gain converts to popery have met with too great success; having drawn off great part of the Mohawk nation from their alliance with the English, and even persuaded them to leave their native country and settle in Canada; where they have built them a stately church, and have three or four priests residing constantly among them. Those who remain true to the English (on account of their nearness to the Dutch settlements) have been instructed by the Dutch and English Ministers occasionally as they

25 B

CHAP.
VIII.

came to trade, and have always shewn a disposition to embrace the gospel; yet their instructions being transient and but seldom repeated, are soon forgot, and indeed but lamely administered by the help of an ignorant interpreter. About twenty years ago the society for propagating the gospel sent over a missionary, who resided among them six or seven years, but being a gentleman advanced in years, he made a very slow progress in their language, and was not able to bear the fatigues of such an undertaking, which obliged him to leave them; since which time they had no instruction but what they occasionally received from the English and Dutch Ministers at Albany. A good foundation however was laid by the society's missionary, and those other gentlemen at Albany: They are all brought to the profession of christianity and almost all baptized, and some of them seem to have a tolerable notion of it, and have earnestly desired a missionary to be sent among them. To encourage this good disposition in them, the society two years ago appointed a catechist among them, a native of America, by the recommendation of the clergy of New-York, who has resided among them, applied himself to the study of their language, and has met with very good success. He is since come to London for holy orders, and appointed missionary among them.

They be-
come trac-
table of
late.Drinking
their chief
vice.

He has taught several of the natives to read and write their own language; and finds them very desirous of instruction, and is much beloved by them.

The only vice which appears to reign among the Iroquois is drunkenness; but they are very much reformed since they have had a missionary residing among them. They have forsaken their old superstitions and barbarities, and seem to be much more civilized than their more distant neighbours; they constantly attend the publick worship, and never fail addressing their Creator morning and evening in their families; and abstain from all labour on the Lord's day. I doubt not (says my correspondent) were provision made, and encouragement given to missionaries to undertake this work, many more of them might be civilized and become proselytes to the protestant religion; which would prevent their being corrupted and seduced by the enemies of our nation to desert the British interest.

Missionaries of the Church of England seem much more acceptable to the Indians than those employed by the people of New-England, who are rigid dissenters, and make more use of force than persuasion in their intercourse with that people; and this has occasioned the Indians on the frontiers of New-England to adhere so constantly to the French, and hearken to the popish missionaries.

Wars be-
tween the
Iroquois
and the
French.

The Iroquois have been at war with the French almost ever since their arrival in Canada, and suffered very much at first by their fire-arms, having never before seen such instruments of destruction: The French also had the advantage of being assisted by the Adirondacks, the ancient enemies of the Iroquois, in their encounters with the five nations: but the Iroquois entering into an alliance with the English, and being furnished with fire-arms and ammunition, defeated the French in their turn, carried the war into Canada, burned and plundered Montreal, killed several thousand of the French and their Indian allies, and obliged them to abandon their forts on the lakes of Ontario and Erie, as has been related already; which has made the

French very cautious how they provoke the five nations of late years, especially as they find them no less celebrated for their conduct and stratagems in war than for their bravery.

CHAP.
VIII.

These people make it a constant rule in war to leave as little to chance as possible; and notwithstanding they know themselves superior in strength and number to their enemies, never engage them in a fair field as we call it, but lay ambuscades, and make use of their wits to surprize them unprepared; by which means they do not only save their own forces, but take more prisoners than they could in an equal engagement; and as they incorporate the younger captives in their families, their very prisoners prove an additional strength to these confederated nations.

While they were at war with the Adirondacks and Hurons (allies of France) in order to amuse the French, they sent and desired peace; which was consented to, on condition the Iroquois would receive some missionary priests and jesuits amongst them, and be instructed in the Christian religion. This the five nations promised to comply with; but the fathers were no sooner arrived amongst them than they made them close prisoners, threatening to cut their throats if the French did not stand neuter in this war; after which they fell upon the Hurons and Adirondacks with such fury, that those nations were in a manner extirpated. And this may have given occasion to some of those exclamations of the French against the Iroquois as a perfidious and barbarous people; however, it appears the popish missionaries have not been altogether deterred by such examples from attempting to make proselytes amongst them, tho' they proceed possibly with more caution than heretofore; for we find they have not only wheedled part of the Mohawk nation to desert the English interest, but have frequently prevailed with the other nations to invade the frontiers of New-England, Virginia, and Maryland, when they could not persuade them to disturb the colonies of New-York or Pennsylvania.

However, the Indians have been frequently brought to acknowledge their offences of this kind, and promise to live peaceably with Virginia and the rest of the British Colonies. A speech of one of their Sachems on such an occasion may be a curiosity worth the reader's perusal: The Sachem first addressing himself to the Governor of New-York, said,

Brother CORLAER, (the name they give that Governor.)

"Your Sachem is a great Sachem, and we are
"but a small people; but when the English came
"first to New-York, Manhattan, Virginia, Ar-
"giske, and to Maryland, Yakokranagary, they
"were then but a small people, and we great:
"Then because we found you a good people, we
"treated you civilly, and gave you land: We
"hope therefore now that you are great, and
"we small, you will protect us from the French;
"if you do not, we shall loose all our hunting
"and Beavers. The French will get all the Bea-
"ver. They are now angry with us, because
"we carry our Beaver to our brethren, the Eng-
"lish.

"We understand that because of the mischief
"which has been done to the people and cattle of
"Virginia and Maryland, we must not come
"near the heads of your rivers, nor near your
"plantations, but keep at the foot of the moun-
"tains; for tho' we lay down our arms as friends,
"we

CHAP. VIII. "we shall not be trusted for the future, but looked upon as robbers: We agree however to this proposition, and shall wholly stay away from Virginia; and this we do in gratitude to Corlaer, who has been at so great pains to persuade you, great Governor of Virginia, to forget what is past.

"We thank the great Sachem of Virginia, that he has so readily forgiven and forgot the evil that has been done; and we on our parts gladly catch at, and lay hold on the chain." Then each of them delivered an ax to be buried, and gave a belt.

"Let your friend the great Sachem that lives on the other side the great lake know this, that we being a free people, tho' united to the English, may give our lands, and be joined to the Sachem we like best. We give this Beaver to remember what we say."

The English have from time to time, once in two or three years, constantly renewed and confirmed their treaties with the five nations, particularly in the year 1722. We find that the Governors of New-York, Virginia, and Pennsylvania, met the Sachems or Kings of the five nations, with the Sachems of the more distant Indians, their allies at Albany, and renewed all former leagues and ties of friendship. Those Indian Princes giving the usual presents of Furs and Wampum as pledges of their fidelity and resolution to observe the articles agreed on; but we scarce ever meet with the Governors of New-England at these treaties; the reason whereof seems to be, that New-England seldom hath a good understanding with the Indian nations; but whenever it is in their power, treat them rather as a conquered people than as friends and confederates: There are some instances however where New-England has been comprehended in such treaties, and indeed all the rest of the British Colonies, tho' their Governors have been absent from the congress.

It may be necessary to observe here that the reason the Iroquois give the Governor of New-York the name of CORLAER is, that one CORLAER, a Dutchman, was the first European employed to treat with them as allies and confederates. And the same CORLAER being drowned in passing the lake that lies between New-York and Canada, that lake is called by them Corlaer also; though the French gave it the name of Champlain, from a French Officer of that name, who put them upon erecting forts on this lake, which has made the French very near and troublesome neighbours to the British Colonies.

New-York Proper. The situation. The second grand division of the province of New-York to be described is that of New-York Proper, which is bounded by Canada on the north, New-England on the east, the ocean on the south, and the five nations and New-Jersey on the west; and is about two hundred miles in length from north to south (that is) from the mouth of Hudson's River to the lake of Champlain or Corlaer; and it might be extended two hundred miles farther north if we possessed all the country we claim as far as the river St. Lawrence: But the French having built forts on the lake Champlain have in a manner expelled us from the north part of this country. The English only possess the country south of that lake at present, and this is exceeding narrow in most places, particularly between Connecticut Colony on the east and New-Jersey on the west, it is scarce twenty miles broad. But to this we must

add the island of Manhattan, which the city of New-York stands upon, Staten-Island, and Long-Island, all which lie before the mouth of Hudson's River, and are comprehended in New-York Proper.

This province is divided into ten counties, which going from north to south down Hudson's River are, Albany, Ulster, Dutchess, Orange, King's County, Chester, New-York County, Queen's County, Suffolk County, and Richmond County, which are pretty well replenished with plantations and farms, but have not many great towns in them. The chief towns are New-York City, Schenectida, Albany, Westchester, Jamaica Town, Hempstead, Oyster-bay Town, Huntington, Richmond, Rye, New-Rochel, North-castle, Southampton, and Brook-haven; in all or most of which towns are missionaries, either Ministers, School-masters or Catechists, sent over and maintained chiefly by the society for the propagation of the gospel, as will appear by the list hereafter inserted.

New-York City is situated in 40 degrees 40 minutes north latitude, and 74 degrees 4 minutes western longitude, at the south end of York County, being an island in the mouth of Hudson's River, about fourteen miles long and two or three broad. As this town stands upon an eminence, and contains upwards of a thousand houses well built with brick and stone, with a wall and forts, which serve as well for ornament as defence, there is scarce any town in North-America that makes a better appearance. It is also an excellent harbour, furnished with commodious keys and warehouses, and employs some hundreds of ships and vessels in its foreign trade and fisheries.

The publick buildings are the several churches belonging to those of the church of England, to the Swedes of the Lutheran persuasion, to the Dutch Calvinists, the French Refugees, and the English Sectaries; but the church of England may well be looked upon as the established religion, because the constitution of the government is the same as in England; the rest, however, are tolerated, and capable of posts in the government, and of sitting in the house of representatives, as I apprehend.

The other publick buildings are the town-house, and that where their general assemblies and courts of justice are held. As to their fortifications, they are not, I doubt, capable of defending them against an European enemy any more than those in the rest of the plantations, for this unanswerable reason, because they were lately confessed to be so bad that it was not fit to enquire into the state of them, lest foreigners should be acquainted with our weakness on that side. There are indeed four hundred regular troops sent from England to garrison this and some other towns of this province, of which two companies always are, or ought to be, upon duty in this city; but admitting they were always complete, and never so well disciplined, this seems to be but a very inconsiderable force to defend a province of this importance against an invasion, unless their country militia be more to be depended on than that of Great-Britain.

As New-York may be looked upon to be the frontier garrison in the south against an invasion from any maritime power, so Schenectida Town and Fort, in the county of Albany, twenty miles north of the town of Albany, may well be deemed

ed their frontier on the north against the French of Canada and their Indian allies, who, in the year 1688, surpris'd and almost demolished the town with the works about it, but they have since been repaired and enlarged, and fort Nicholson and some other forts erected; in which and in Albany the rest of the regular troops are quartered for the defence of that frontier.

Albany is a considerable town, situated on Hudson's River, an hundred and fifty miles north of New-York, having a fort erected for its defence: And here it is that the Sachems or Kings of the five nations meet the Governors of our northern Colonies to renew their alliances, and concert measures for their defence against their common enemies, as has been intimated already.

South-west of the island and county of New-York lies Staten-Island, being about ten miles in length and six in breadth, and in it are a great many good farms and plantations, but not one town that I can meet with.

Long-Island lies east of Staten-Island, and south-east of that of New-York, opposite to the colony of Connecticut, being an hundred and fifty miles in length, and generally about twelve in breadth, and contains three of the counties above-mentioned, viz. Queen's County, Suffolk County, and Richmond County. The chief towns in Queen's County are Jamaica and Hempstead. In Suffolk County the chief town is Oyster-Bay. The town of Richmond gives name to Richmond County, in which also is the town of Southampton, in the south-east part of the island; and there also are situated the towns of North-Castle and New-Windfor.

There is a celebrated plain in the middle of Long-Island sixteen miles long and four broad, to which they have given the name of Salisbury Plain, having (as it is said) as fine a turf as that on Salisbury Plain in Old-England; and there being an excellent breed of Horses in the island they have races here every season; to which the gentlemen of New-England and New-York resort, as they do to New-Market with us.

There are still some good towns which lie in the county of Westchester on the continent, east of the mouth of Hudson's River; the chief whereof are Westchester and Rye.

This is one of those colonies denominated a royal government, the legislative power being lodged in the Governor, council and assembly; the Governor, council, and Officers of state being appointed by the crown.

As to the produce and trade of this country, these articles being much the same here as in New-England, New-Jersey, and Pennsylvania, I shall treat of them all together in the description of Pennsylvania: And there also the reader will meet with the abstract of the history of New-York, New-Jersey, and Pennsylvania; their story being so interwoven that it is scarce possible to speak of one without including the other.

The third and last grand division I proposed to describe is that of New-Jersey, bounded by an imaginary line drawn from the river De la War to Hudson's River, in 41 degrees north latitude on the north, by Hudson's River, which separates it from New-York, and by the Atlantick-Ocean

on the east, by the same ocean on the south, and by De la War Bay and River, which separates it from Pennsylvania, on the west, lying between 39 and 41 degrees of north latitude, and between 74 and 76 degrees of western longitude; and is about an hundred and forty miles in length from north to south, and between three and four-score in breadth from east to west.

It was heretofore divided into two parts by a line drawn almost through the middle of it from north to south, and distinguished by the names of East and West-Jersey, being granted to different proprietors; but the proprietors of both having thought fit to surrender their charters to the crown, the whole now constitutes one royal government. The Jerseys have now but one council and one house of representatives, and the Governor of New-York is usually Governor of the Jerseys by a different commission, the Governor, council, and Officers of state being appointed by the King, as in New-York Proper.

This county is subdivided into the counties of, 1. Berghen. 2. Essex. 3. Middlesex; and, 4. Monmouth on the east. 5. Burlington. 6. Gloucester. 7. Salem; and, 8. Cape May, counties on the west. The chief towns are, 1. Perth-Amboy, the capital of the county of Middlesex, and

of all East-Jersey, pleasantly situated at the mouth of Raritan River; and had it been built according to the intended model, would have been one of the finest towns in North-America; but planters have not resorted to it, as was expected, notwithstanding it is so commodiously situated for trade that ships of three hundred tons may come up in one tide and lie before the Merchants doors; but the town of Elizabeth, situated to the north-ward of it, flourishes much more, and may still be deemed the most considerable town in the province.

2. Berghen, the capital of the county of the same name. 3. Elizabeth Town, already mentioned, capital of the county of Essex. 4. Middleton. 5. Shrewsbury; and, 6. Freehold, in the county of Monmouth. 7. Burlington, or Bridlington, the capital of the county of Burlington and of all West-Jersey.

This town is situated in 40 degrees 40 minutes of north latitude, on an island in the middle of the river De la War, to the northward of Philadelphia in Pennsylvania, and on the opposite side of the river. The houses are handsomely built of brick, and laid out into spacious streets with commodious keys and wharfs, to which ships of two or three hundred tons may come up. It has also an handsome market-place, a town-house or guild-hall, where the courts of justice were heretofore held, and two good bridges over the river, the one called London-Bridge, and the other York-Bridge; and having an easy communication with Philadelphia and the ocean by the river De la War, carries on a brisk trade. 8. Gloucester, the capital of the county of the same name; and, 9. Salem, capital of the county of Salem, and situated on the river Salem, which falls into De la War Bay. This is said to be one of the best towns in West-Jersey, whether we consider its situation, buildings or trade.

The produce of this province, its trade and history will be found in the description of Pennsylvania.

~~~~~  
Situation  
and ex-  
tent.

**P**ENNSYLVANIA lies between 39 and 42 degrees of north latitude, and between 75 and 79 degrees of western longitude, being bounded by the country of the five nations or Iroquois on the north, by New-York and New-Jersey, from which it is separated for the most part by De la War Bay and River on the east, and by Maryland on the south and west, being about two hundred miles in length from north to south, and almost of equal breadth in the three northern counties, but the three southern counties are not more than twenty or thirty miles broad from east to west, that is, between De la War Bay and Maryland, from which the three southern counties are divided by an imaginary line drawn from north to south: But these limits are not yet entirely settled, I find, the Lord Baltimore and the family of the PENNS being at this day engaged in a suit of chancery about them.

Rivers.  
De la War  
River.

The chief rivers in Pennsylvania are, 1. The river De la War, which rising far north in the country of the Iroquois, takes its course to the southward, and dividing this province from that of New-Jersey, falls into the Atlantick-Ocean, between the promontories of Cape May and Cape Hinlopen, being navigable for two hundred miles and upwards with large vessels; but has a cataract or steep fall in it above Bristol, which renders the navigation impracticable to the northward of the county of Bucks.

Sasqua-  
hanna  
River.

2. The second river in this province is that of Sasquahanna, which rising likewise in the country of the Iroquois, runs south through the middle of Pennsylvania, and falls into the bay of Chesepeak, being navigable also for large ships.

School-  
kill River.

3. The third river is that of Schoolkill, which having its source also in the country of the Iroquois, runs south, almost parallel to the rivers De la War and Sasquahanna, and at length turning to the eastward falls into the De la War at the city of Philadelphia: This river also is navigable for large ships as far as the city of Philadelphia, and

V O L. III. NUMB. CXXXIX.

for boats an hundred miles higher. These rivers and the numerous bays and creeks in the bay of De la War, capable of harbouring the largest fleets, render this country admirably situated to carry on a foreign trade.

CHAP.  
IX.  
~~~~~

The east side of the province of Pennsylvania the west being still uncultivated) is divided into six counties, which taking them from north to south are, 1. Buckingham. 2. Philadelphia County. 3. The county of Chester. 4. Newcastle County. 5. The county of Kent; and, 6. The county of Suffex.

Counties
and chief
towns.

In the county of Buckingham, the most northerly of any in this province, the chief town is Bristol, situated on the river De la War, opposite to Burlington in New-Jersey, and twenty miles north of the city of Philadelphia. In this county also lies the manour house of Pensbury, elegantly built by PENN the first proprietor, and situated on an eminence which commands the county, being almost surrounded by the river De la War.

Bristol.

Pensbury.

The county of Philadelphia lies south of that of Bucks, and in it is the celebrated city of Philadelphia, the capital of the province, situated in 40 degrees 30 minntes north latitude, being one of the finest plans of a town that ever was formed. It is an oblong of two miles, extending from the river De la War to the river Schoolkill, the east end fronting the river De la War, and the west the river Schoolkill, each front being a mile in length. Every owner of a thousand acres hath his house in one of the two fronts facing the rivers, or in the high street running from the middle of one front to the middle of the other: And every owner of five thousand acres has an acre of ground in the front of his house, and the rest half an acre for gardens and court yards. In the centre of the town is a square of ten acres, surrounded by the town-house and other publick buildings, and in each quarter of the city is a square of eight acres. The high street, which runs the whole length of the town, is an hundred feet wide, parallel to which run eight

Philadel-
phia
County
and City.

25 C

streets,

CHAP.
IX.

streets, which are crossed by twenty more at right angles, all of them thirty feet wide; and several canals are let into the town from each river, which add to the beauty and conveniency of the place. There is also a fine key two hundred feet square, to which ships of four or five hundred tons may come up; with wet and dry docks for building and repairing of ships, magazines, warehouses, and all manner of conveniencies for importing and exporting of merchandize. There are already fourteen or fifteen hundred houses in the city, most of them well built with brick, but there are still a great many more wanting to complete the plan: However, more could not have been expected than has been done in so short a time, the ground not having been laid out much above fifty years.

Oxford
Town.

The town of Oxford also is situated in the county of Philadelphia, but I meet with no description of it; however, I take it to be a considerable place, inasmuch as a missionary is maintained here by the society for the propagation of the gospel. German Town, situated to the northward of the city of Philadelphia, also is said to be a thriving populous place, inhabited chiefly by the Dutch, or those of Dutch extraction. In this county is the city of Radnor, situated on the south-west side of Schoolkill River, being the capital of a large country planted by the Welch, and extremely well improved by them.

German
Town.Radnor
Town.

To the south of the county of Philadelphia lies that of Chester, the capital whereof is the town of Chester, situated on the river De la War, which is about three hundred miles broad at this place; and to the southward of Chester lies the town of Chichester. Either of these ports are capable of receiving and harbouring the largest fleets secure from storms.

Chester
Town and
County.Chichester
Town.Newcastle
County
and Town.

The county of Newcastle lies south of that of Chester, the capital town being of the same name. This is said to be a town of the briskest trade in the province next to that of Philadelphia, and has an iron mine in the neighbourhood of it. The town of Apoquinemink lies upon the river De la War also, south of Newcastle, and is a place of good trade.

Apoqui-
nemink
Town.The county of Kent.
Dover
Town.

The county of Kent lies south of that of Newcastle, the chief town whereof is Dover, being a commodious port.

The county of Suff-
sex.
Lewes
Town.

The most southern county is that of Sussex, the capital town whereof is Lewes, being a secure harbour and a town of trade.

The several
kinds of govern-
ment in
English
America.
Royal
Govern-
ments.

Pennsylvania and Maryland are now the only proprietary governments of all our American Colonies; for, as has been intimated already, there were originally three sorts of government established by the English on the continent of America, viz. 1. Royal Governments. 2. Charter Governments; and, 3. Proprietary Governments.

1. A Royal Government is properly so called because the colony is immediately dependent on the crown, and the King remains Sovereign of the colony: He appoints the Governor, council, and Officers of state; and the people only elect their representatives, as in England. Such are the governments of Virginia, New-Hampshire, New-York, New-Jersey, and both Carolina's, tho' the Carolina's were till very lately Proprietary governments.

Charter
Govern-
ments.

2. A Charter Government is so called, because the company incorporated by the King's charter were in a manner vested with sovereign authority to establish what sort of government they saw fit: And these companies have generally thought fit,

(as I apprehend) to transfer their power to the populace; for in these governments the freemen do not only chuse their representatives, but annually chuse their Governor, council and Magistrates, and make laws without the concurrence, and even without the knowledge of the King, and are under no other restraint than this, that they enact no laws contrary to the laws of England; if they do, their charters are liable to be forfeited.

Such is the government of Rhode-Island, and I think of the colony of Connecticut in New-England; and such was the government of the Massachusetts, Maine and Plymouth formerly; but their first charters being adjudged forfeited in the reign of King CHARLES II. the charter granted to the Massachusetts by King WILLIAM III. has reserved the appointment of a Governor to the crown: But the house of representatives chuse the council with the Governor's concurrence, and the Governor and council appoint the Magistrates and Officers of state; from whence it appears that the government of the Massachusetts, in which the colonies of Maine and Plymouth are now comprehended, is in some instances different from either of the two former species of government, or rather a mixture of both.

The Mas-
sachusetts
a mixture
of the two
former.

3. The third kind of government I proposed to describe is the Proprietary Government, properly so called because the proprietor is vested with sovereign authority: He appoints the Governor, Council and Magistrates, and the representatives of the people are summoned in his name, and by their advice he enacts laws without the concurrence of the crown; but by a late statute, the proprietor must have the King's consent in the appointing a Governor when he does not reside in the plantation in person, and of a Deputy-Governor when he does: And all the Governors of the plantations are liable to be called to an account for male-administration by the court of King's-Bench in England by another statute. But the only Proprietary Governments now in being, as has been observed already, are that of Maryland and this of Pennsylvania; and the family of the PENNS, descendants of WILLIAM PENN, the original proprietor of Pennsylvania, being at present pretty numerous, the administration of the government in this colony seems to be lodged in the Deputy-Governor, who is from time to time appointed by the heirs of PENN with the concurrence of the crown.

Proprietary
Govern-
ments.

As to the right Great-Britain hath to these countries which now go under the names of New-York, New-Jersey, and Pennsylvania, it appears they were discovered with the rest of the continent of North-America, in the reign of HENRY VII. by SEBASTIAN CABOT for the crown of England, and have ever since been claimed by the Kings of England as part of their dominions: But Sir WALTER RALEIGH was the first that attempted to plant colonies on these shores in the reign of Queen ELIZABETH, and in honour of that Prince's gave the eastern coast of North-America the name of Virginia. Two companies being afterwards erected by charter in the reign of King JAMES I. and authorised to make settlements in Virginia, the first company sent colonies to that part of the continent which still bears the name of Virginia, and the other made settlements in New-England, then called North-Virginia, as has been related already.

In the mean time Mr. HUDSON, an Englishman, having discovered that part of the coast which lies between Virginia and New-England, and

CHAP.
IX.

and being about to make a settlement at the mouth of that river which now separates New-York from New-Jersey, and to which he gave the name of Hudson's River, the Dutch pretended to purchase this country of him; and about the year 1608 began to plant it, and by virtue of that purchase laid claim to all those territories which now go under the name of New-York, New-Jersey, and Pennsylvania: But there remaining some vacant spaces on the coast which were not actually possessed by the Hollanders, the Swedes sent a fleet of ships thither, and planted part of it with their countrymen. However, the Dutch proved too powerful for the Swedes, and compelled them to submit to their dominion, allowing them however to enjoy the plantations they had settled, and the privileges of the rest of their subjects.

But the English not admitting that either the Hollander or the Swede had any right to these countries which were first discovered for the crown of England by CABOT, and a part of them afterwards planted under charter from Queen ELIZABETH and King JAMES, which, 'twas presumed, gave the English a right to all the countries included within the limits granted by those patents, as these of New-York, the Jerseys, and Pennsylvania actually were. King CHARLES II. in the first Dutch war, anno 1684, transferred all those countries, then in possession of the Dutch, viz. New-York, the Jersey's, and the northern part of Pennsylvania, to his brother JAMES Duke of York, afterwards King JAMES II. and Sir ROBERT CARR was sent over with a squadron of men of war and a body of land forces to reduce them; and on his appearance before the city of Amsterdam, now New-York, the Dutch Governor thought fit to surrender that capital; and the rest of the towns in the possession of the Hollanders, and the Swedes followed his example; and tho' some relate that the Dutch recovered the possession of them again, yet certain it is, all these countries were yielded and confirmed to the English by the treaty of peace between England and Holland that followed soon after.

The Duke of York parcelling out these countries to under-proprietors, among whom WILLIAM PENN, Esq; son of Sir WILLIAM PENN, Admiral in the Dutch wars, was one: All the rest of the proprietors sometime after surrendered their charters again to the crown, whereby New-York and New-Jersey became royal governments, while PENN remained proprietor of that part of the country which had been granted to him; and King CHARLES II. making him another grant, in the year 1680, of that part of the country which now constitutes the rest of Pennsylvania, in consideration of money due to his father, Sir WILLIAM PENN, from the government, PENN the son united the countries he possessed by both grants into one; and giving them the name of Pennsylvania proceeded to the planting colonies there in the year 1681, the Dutch and Swedish inhabitants chusing still to reside here, as they did in New-York and the Jerseys: And they and their descendants enjoy the same privileges as the rest of his Majesty's subjects in these plantations do; and are now in a manner become the same people with the English, speaking their language, and governed by their laws and customs.

But Mr. PENN, notwithstanding the grants he had obtained from the crown and the Duke of York, did not look upon himself, it seems, to be the real proprietor of the lands granted him, till

he had given the Indians what they esteemed a valuable consideration for their interest in them; and disclaiming also the use of the carnal weapon according to the principles of his sect, he could never propose entering upon the country, which had been so granted him, by force.

The first thing therefore he did after his arrival on the coast of America in the year 1681, was to procure a conference with the Indian Sachems or Kings, in order to treat with them for the purchase of their lands; and the natives, being few in number, and making scarce any other use of their country than to hunt in it, readily hearkened to his proposals; and he purchased countries of many miles extent at a very moderate price, paying for them in cloathing, tools, utensils, and toys, to the entire satisfaction of the natives.

Mr. PENN, in a letter to his friends in England on the situation of his affairs at that time, relates, "That he had attended the Indian Kings and their Councils in several treaties for the purchase of their lands, and for adjusting the terms of trade between them; and that their order was thus: Their King (says Mr. PENN) was seated in the middle of an half moon or semi-circle; his Council, the old and wise, sitting on each hand; behind them, at a little distance, sat the younger men in the same figure. Having consulted and resolved their business, the King commanded one of them to speak to me: He stood up, and came to me, and in his King's name saluted me, taking me by the hand, and telling me, he was ordered by his King to speak to me; and that now it was not he, but the King, that spoke, because what he should say was the King's mind. He first prayed me to excuse them that they had not complied with me in a former meeting: He feared there might be some fault in the interpreter, being neither Indian nor English; besides, it was the Indian custom to deliberate before they resolved; and that if the younger people and owners of the land had been as ready as he, I had not met with so much delay. Having thus introduced his matter, he fell to the bounds of the land they had agreed to dispose of and to the price. During the time this person spoke, not a man of them was observed to whisper or smile. The old were grave, the young reverend in their deportment; when they spoke, which was but seldom, it was warmly and elegantly. I have never seen more natural sagacity, considering them without the help of tradition; and he will deserve the name of wise, that is too hard for them in any treaty about a thing they understand. When the purchase was agreed, great promises passed between us of kindness and good neighbourhood, and that the Indian and English must live in love as long as the sun gave light. After which, another made a speech to the Indians, in the name of all the Sachems or Kings; first to tell them what was done; next to charge and command them to love the Christians, and particularly to live in peace with me, and the people under my government: That many Governors had been in the river; but that no Governor had come himself to live and stay there before; and having now such an one that had treated them well, they should never do him or his any wrong. At every sentence of which they shouted, and said amen in their way."

By

CHAP.
IX.

CHAP.
IX.

By governor living himself among them, they meant proprietary; for they had had several Dutch and Swedish Governors in De la War River. The land thus bought was entered upon by the under purchasers, who purchased by the hundred or the thousand acres what the proprietary bought by miles.

So prodigiously did this colony increase in a very few years, that the same Mr. PENN, in another letter to his friends in England, says, "We consume eighteen thousand Pounds yearly of English growth, and return of our productions what augments the revenues of the crown of England thirty thousand Pounds"; which is but a trifle to the returns they make at this day. Their success was chiefly owing to their human and friendly treatments of the Indians, with whom the Pennsylvanians scarce ever had a quarrel: This good understanding continuing even to our times, as appears by the Indians of the five nations agreeing with Sir WILLIAM KEITH; Governor of Pennsylvania in the year 1722, to remove still further back into the wood with their families, and to leave a tract of one hundred thousand acres of land and upwards to be cultivated by the English; at which congress one of their Sachems made the following speech, in the name of the rest:

Brother ONAS. [The title they give the Governor of Pennsylvania.]

They acknowledge Pennsylvania has always observed its treaties with them, as they have done on their part, and promise to do for the future.

"You have told us how WILLIAM PENN, that good man, did, on the first settlement of the province of Pennsylvania, make leagues of friendship with the Indians, and treated them like brethren; and that, like the same good man, he left it in charge to all his Governors who should succeed him, and to all the people of Pennsylvania, that they should always keep the covenant and treaties he had made with the five nations, and treat them with love and kindness. We acknowledge, that his Governors and people have always kept the same honestly and truly to this day. So we on our part, always have kept, and for ever shall keep firm peace and friendship with a good heart to all the people of Pennsylvania. We thankfully receive and approve of all the articles in your proposition to us, and acknowledge them to be good, and full of love: We receive and approve of the same with our whole hearts, because we are not only made one people by the covenant chain, but we also are people united in one head, one body, and one heart, by the strongest ties of love and friendship.

Brother ONAS.

"You desire there may be a perpetual peace and friendship between you and the five nations, and between your children and our children; and that the same may be kept as long as the mountains and rivers endure: All which we like well, and on our parts desire that the covenant and union, made with a clean and true heart between you and us, may last as long as the sun and moon shall continue to give light; and we will deliver this in charge to our children, that it may be kept in remembrance with their children and children's children to the latest ages: And we desire, that the peace and tranquillity that is now established between us may be as clear as the sun shining in its lustre, without any cloud or darkness, and that the same may continue for ever.

Brother ONAS,

"We have well considered all you have spoken, and like it well, because it is only the renewing of former leagues and treaties, made between the government of Pennsylvania and us of the five nations, which we always believed we were obliged to keep; and as to the accident of one of our friends being killed by some of your people, which has happened by misfortune, and against your will, we say, that as we are all in peace, we think it hard, that the persons who killed our friend and brother should suffer: And we do, in the name of all the five nations, forgive the offence, and desire you will likewise forgive it, and that the men who did it may be released from prison and set at liberty, to go whither they please, and we shall esteem that as a mark of regard and friendship for the five nations, and as a farther confirmation of this treaty."

The next article I proposed to treat of was the province and traffick of the colonies which lie north of Virginia and Maryland, viz. New-England, New-York, the Jerseys, and Pennsylvania.

Mr. DUMMER, in his apology for New-England, endeavouring to shew the importance of these colonies to Old-England, observes, "That there is no sort of British Manufacture but what the people of New-England take off in great or less proportion, as they have ability to pay for it; every thing for use, convenience, or ornament, and (I say it with regret) for the luxury and pride of life, they receive from Great-Britain.

"Some of the oldest and most experienced traders to those parts make their imports from Old-England arise to the value of three hundred thousand Pounds, and exports from thence to Great-Britain are equally beneficial to this kingdom; they brought bullion hither as long as they had any left, and now they are so exhausted, that they can no longer send Silver directly to Old-England, they continue to remit it thither by the way of Spain, Portugal, and the Streights: It is there they sell their fish, and the produce of it comes hither in Gold or Silver, or bills of exchange, which is the same thing.

"Other and better returns than money itself they make in masts, the fairest and largest in the world; besides Pitch, Tar, Turpentine, Rosin, Plank-knees for ships, and other species of timber for various uses. These, especially Pitch and Tar, were formerly purchased of the Swede with Crown-peices at intolerable prices; but since the encouragement given for their importation from New-England, they have fallen to half the value. It is to be farther considered, that what we take of these commodities from our plantations is brought home in our own ships, and paid for with our manufactures.

"New-England also imports logwood, for the dying our Woollen goods, in quantities sufficient for our own use, and a surplus, with which we furnish Holland, Hamburg and other markets in Europe. It is wholly owing to the indultry of the people of New-England that this useful commodity is reduced from 30 and 40l. per ton, which we used to pay for

CHAP.
IX.

They desire the Englishmen may be pardoned, who killed one of their people by accident.

The produce and traffick of the northern Colonies.

Of New-England.

CHAP. IX. it to the Spaniards, to 12l. per ton, which is the present price; and out of this 12 l. there is 4l. 5s. paid to the crown for custom.

"Other articles might be mentioned; as, "Whale-Oil and Fins, which are yearly imported from New-England in no contemptible quantities. They are useful in several manufactures; and if not had from thence, must have been purchased of the Dutch with ready money, and at excessive prices.

"It is true, New-England makes no Sugar, but it assists the islands that do; without which assistance they could not make it, at least not cheap enough, and in sufficient quantities to answer the markets in Europe. For if the sugar islands were obliged to sow wheat, and plant as much Indian Corn as they wanted, they must needs plant the fewer canes, and by consequence make the less Sugar. From thence they are also supplied with Horses for their mills, timber for their sugar-works, staves for their casks, and what is more considerable, with Barrel-Pork, Mackerel and refuse Cod-fish for their Negroes; without which their labour would yield nothing to their owners; for were they to feed their slaves with beef, and other provisions from Great-Britain and Ireland, the expence of a plantation would devour the whole produce of it. There are now such great quantities of Sugar made in the French and Dutch plantations, and so much imported from Brasil by the Portuguese, that our Sugar Islands need all advantages to make this commodity cheap and in plenty, that we may be able to out-do, or at least equal our neighbours in the foreign markets.

"It may be added, that New-England is a good nursery of seamen for the navy. I believe, I may affirm, that there was hardly a ship during the last war in the royal navy without some of their sailors on board; which so distressed the New-England Merchants, that they were obliged to man their ships with Indians and Negroes.

In another part of the same apology Mr. DUMMER adds, "It were no difficult task to prove, that London has risen out of the plantations, and not out of Old-England. It is to them we owe our vast fleets of Merchant ships, and consequently the increase of our seamen, and improvements of our navigation: It is the tobacco, sugar, fish, oil, logwood, and other commodities, which has enabled us to support our trade in Europe; to bring the ballance of some countries in our favour, which would otherwise be against us, and to make the figure we do at present, and have done for near a century past, in all parts of the commercial world."

Of New-York.

The President and council of New-York, in an address to his Majesty, speaking of their importations from Great-Britain, affirm, that this colony alone consumed more of our Woollen manufactures than all the Sugar Colonies: That the product of this, and of the neighbouring colonies of New-Jersey and Pennsylvania, was chiefly provisions; namely, all kinds of British and Indian corn and grain, salted pork, beef, fish, and strong beer, which they export to the British and other foreign Sugar Colonies; and in exchange for them received Rum, Sugar, Molosses, Cacao, Indigo, Cotton, Wool, &c. Whereof the Rum and Molosses were chiefly consumed in these colonies, and the money and other merchandize applied

VOL. III.

for the most part to make good the ballance of their trade to Great-Britain; and that so great a part of that ballance was paid in money, that they had reason to believe that all the British Sugar Colonies together (except Jamaica) did not import so much Silver into Great-Britain as this single colony of New-York.

Another writer, speaking of the produce and traffick of Pennsylvania, says, their merchandize consists of Horses, pipe-staves, pork, beef, and fish, salted and barrelled up, skins, and furs, all sorts of grain, viz. Wheat, Rye, Pease, Oats, Barley, Buck-Wheat, Indian Corn, Indian Pease and Beans, Pot-ashes, Wax, &c. And that in return for these they import from the Carribbee-Islands, and other places, Rum, Sugar, Molosses, Silver, Negroes, Salt, and Wine; and from Great-Britain, household-goods and cloathing of all kinds, hard-ware, tools, and toys.

They have also some Rice, but no great quantities, and a little Tobacco of the worst sort. These colonies also appear extremely proper to produce Hemp and Flax, where they are cultivated: Their trade with the Indians consists but in a few articles; they receive of the natives chiefly skins and furs of their wild beasts, for which they give them cloathing, arms, ammunition, Rum, and other spirits, in return.

The northern Colonies have also a clandestine trade with the Spaniards upon the coast of Terra-Firma, &c. furnishing them with European goods and merchandize, for which they receive chiefly Dollars in return; and they also trade to the bays of Honduras and Campeachy for logwood, by connivance, as the Spaniards say; but the subjects of Great-Britain insist, that they have a right to that trade; and there is a trade carried on both with the French and Dutch Islands and Surinam by the northern Colonies not at all to the advantage of Great-Britain, and very destructive to the Sugar Colonies; for they take Molosses, Rum, and other spirits, with a great many European goods, from these foreigners; carrying them Horses, provisions and lumber in return, without which the French could not carry on their Sugar manufacture to that advantage they do: But on this article I shall have occasion to enlarge, when I come to treat of the controversy between our Sugar Colonies and the northern Colonies.

Nor is there any doubt to be made but the northern Colonies have set up a great many manufactures, which interfere with those of Great-Britain: They make Woollen Cloth, Hats, hard-ware, and Linen, for their own use, if they do not export them: They have also a pretty many Still-houses and Sugar-bakers, particularly in New-England; and the building of ships not only for the subjects of Great-Britain, but for the French and Spaniards, is become a very considerable employment; and with these ships they pay in part for the Molosses, Rum, and European goods they take of the French. Their enemies represent them (especially the people of New-England) as rivalling Great-Britain in the most considerable branches of the trade, as well as in her fisheries, and threatening destruction to their mother-country; while her friends, on the other hand, suggest, that these colonies take off vast quantities of British manufactures, for which they pay ready money, or merchandize as valuable in return; and affirm, they export no manufactures that are made in England. Great artifice seems to have been used to conceal their manufactures on

25 D

one

CHAP.
IX.

one hand, and to magnify and multiply them on the other; but, upon the whole, I am of opinion, that the northern Colonies still conduce very much to the strengthening and enriching their mother-country, and will do more every day, as they increase in numbers and traffick; nay, I believe, it may be made appear, that our traffick with these and the rest of the British plantations, if we take care to regulate it (as it is our own faults if we do not, when the British legislature commands the whole) is or may be of greater advantage to Britain than all their commerce besides; and, indeed, some acts have already been made for the regulation of this trade, of which I shall give a short abstract hereafter; and, in the mean time, proceed to enquire into the strength and forces of these northern Colonies.

The
strength
and forces
of the northern
colonies.

From one of the representations of the board of trade, already mentioned, they inform the privy-council, that in the colony of the Massachusetts only there were upwards of ninety-four thousand souls, and that their militia consisted of six regiments of foot, and of fifteen troops of Horse, of an hundred men in each troop; and a gentleman of New-England, who understands their circumstances perfectly well, assured me, they could raise twenty-four or twenty-five thousand men, in case of necessity. The same representation shews, that they employed near five hundred sail of ships and

four thousand seamen annually in their trade; and if this calculation be right, it must be allowed, that the rest of the colonies, north of Virginia, and Maryland, viz. Connecticut, Rhode-Island, New-York, the Jerseys, and Pennsylvania, can raise at least as many as the Massachusetts; but as this computation seems to be exceeding short, and we may well add a third more to the whole, I conclude, that the British Colonies which lie north of Virginia and Maryland are able, upon an emergency, to raise three or fourscore thousand landmen, and fit out fifteen hundred sail of such Merchant ships as they use in their trade; and though these ships are too small, and unprovided to resist European ships of war alone, and defend their coasts from invasions from thence, yet they must add great strength to an English Squadron in those seas, whenever we happen to be at war with any European power in that part of the world. All that seems wanting, in order to render these forces useful and capable of opposing an invasion, is a Vice-roy or Generalissimo, empowered, on such exigencies, to require every colony to raise their respective quota's of supplies and troops, and to command them, when assembled in the field; for these are particulars, which it is never to be expected the colonies should agree on among themselves, or at least time enough to prevent the ravages of a potent enemy.

CHAP.
IX.

THE PRESENT STATE OF CAROLINA.

CHAP. X.

Of North and South-Carolina, and Georgia.

CHAP.
X.
Situation
and extent.

UNDER this general title of Carolina are comprehended the several colonies of North-Carolina, South-Carolina, and Georgia. The whole is bounded by Virginia on the north, the Atlantick-Ocean on the east, Spanish-Florida on the south, and by that part of Florida which is still in possession of the Indians on the west, extending from 30 degrees 30 minutes, to 36 degrees 30 minutes north latitude;

and this, upon due consideration, seems to be the true extent of Carolina from north to south; and consequently this country, reckoning 70 miles to a degree in a direct line from south to north, must be 420 miles long; but as the coast tends or stretches from the south-west to the north-east, we may compute it to be about 500 miles in length; though I must confess I have formerly laid it down between 31 and 36 degrees, and then it

CAROLINA
By
H. NOLL Geographer.

The English claim the Property of Carolina from Lat. 36 &c. Degrees as part of Cabot's Discoveries who set out from Bristol in 1498. at the Charge of King Henry 7th but they did not take a Possession of that Country till King Charles the II's time in 1663 who Granted a Patent to divers Persons to plant all the Territories within the North Lat. of 36 to 36 Deg. and so west in a direct line to the South Sea.

THE

CHAP. X. it would have taken up but 5 degrees of latitude. How far the British dominion is to be extended from the Atlantick-Ocean westward, may be still more difficult to determine: If we carry it no farther than the countries actually possessed and cultivated by the English, we must not extend it an hundred and fifty miles west of the sea; but if we comprehend all those nations of Indians which have at one time or other acknowledged the King of Great-Britain their Sovereign, and put themselves under the protection of the Governors of these provinces, particularly the Creeks, the Charokee Indians, and some more distant nations their neighbours, who sent, in the year 1731, seven of their Chiefs to England with Sir ALEXANDER CUMMINS, to do homage in person to King GEORGE II. If we include all these nations, we must extend the British dominions westward as far as the river Mississippi, which is 500 miles at least from the ocean, and then we shall take in one moiety of what the French claim, and have given the name of Louisiana to in their maps; and our map-makers, without the least shadow of reason have copied after them; but if ever they dipped into the history of this part of the world, they must have learned that the English were not only possessed of the eastern side of Florida long before the French discovered the river Mississippi, but have obtained the strongest title to it that any European power can have; namely, the voluntary cession of that country by the Indian Princes and their people to the crown of Great Britain, upon condition of being taken into our protection.

The face of the country.

As to the face of the country, Captains that have gone this voyage assure me, that it is a low level coast, not a hill to be seen from St. Augustin to Virginia, and a great way beyond; and it is generally covered with wood, where the English have not cleared it for their plantations. But it rises into hills about an hundred miles to the westward, and continues rising gradually till we ascend the Apalathian Mountains, as they call the whole chain of hills, which run through Florida from the south-west to the north-east, at about an hundred and fifty miles distance from the ocean. And indeed the natives called all that country Apalach, to which the Spaniards gave the name of Florida, in which is comprehended most of the British Plantations on the continent.

The ancient name Apalach.

A bad coast for navigation.

The sea-coast being low and flat, the sea itself is proportionably shallow, insomuch that a ship of any great burthen cannot approach the shores, except in some few places. There has not yet been found one good harbour on the coast of North-Carolina; the best they have is at Roanoke, at the mouth of Albemarle River, and at Pimlico; and here ships are far from being secure: But I am informed, a frigate is employed at this time to sound the coast, in order to find better harbours, the planters and merchants of North-Carolina being obliged to send great part of their goods either to Virginia or South-Carolina, in order to transport them to England; for there are some good ports in South-Carolina, of which the chief are, Winyaw or George Town, Charles Town, and Port-Royal, which will be described hereafter: The most remarkable promontories I meet with on this coast are, Cape Hatteras in 35 degrees south latitude; Cape Fear to the south of it in 34 degrees, and Cape Carteret to the southward of Cape Fear.

Sea-ports.

Capes.

This country is well watered with lakes and springs, as also with rivers, some of them considerable streams, but few of them navigable for large vessels, being choaked up with sands at the entrance: Of these (beginning from the north) the chief are, 1. Albemarle River. 2. Pentegoe River. 3. Neuse River. 4. Cape Fear, or Clarendon River. 5. Wateree River. 6. Santee River. 7. Ashley River. 8. Cooper River. 9. Colliton River. 10. Cambahe River. 11. Savannah River. 12. Alatomaha River, the southern boundary of Georgia: Almost all these rivers rise in the mountains on the north-west, and taking their course to the east or south-east, fall into the Atlantick-Ocean: Those of Savannah and Alatomaha being navigable some hundreds of miles to the westward, and are said to equal the Rhine in magnitude.

Carolina is happily situated between the extremes of heat and cold, but the heat is more troublesome in summer than the cold in winter; their winters being very short, and their frosty mornings frequently succeeded by warm days: 'Tho' a gentleman that resided there some time observed to me, that once in eight or ten years they have very severe and long frosts. He himself knew the largest rivers frozen, and a great many of their cattle die, for they never house them; but this is more unusual there, than to have the Thames frozen over with us. The air is for the most part serene and clear both in summer and winter, yet I find they have their winter rains and very heavy showers about midsummer: And the wind sometimes changes suddenly from the south-east to the north-west, and blows exceeding cold, which brings distempers on those who do not take care to guard against it; but the country is generally healthful where people live regularly, and use any precaution. Those indeed who after a hot day expose themselves to the cool breezes of the evening, usually feel the ill effects of it; as others do that indulge their appetites in eating fruit and drinking pernicious liquors to excess.

Climate rather hot than cold.

Generally serene weather.

Healthful generally.

They are subject to hurricanes as well as the Caribbee-Islands; but those do not happen every year, and sometimes are so favourable as not to do much mischief in seven years. That was a very terrible one which happened in the year 1729, of which we received the following account.

Hurricanes.

On the first of August, a dreadful hurricane began here, the wind N. and N. by E. and by seven the next morning increased so, that 23 ships then in our harbour, were forced on shore, the wind coming more easterly, and from that time till three hours after, the wind was most violent: Of all the ships in our harbour, only the Fox and the Garland men of war rode out of this hurricane. The Rice near the sea coast was all spoiled by being overflowed with the salt-water; and it is thought this town would have been destroyed, had it been spring tides. It is computed, that about fifteen hundred barrels of Rice, besides skins, were lost. On the second, about eleven at night the wind gradually ceased; yet many sea-faring men were drowned: On the twelfth past, we had a tornado which did much damage to the Rice and Corn in the country, but little or none to the shipping.

The three grand divisions of this country are, 1. North-Carolina. 2. South-Carolina; and, 3. Georgia. North Carolina is bounded by Virginia

The three grand divisions, North-Carolina, South-Carolina, Georgia.

CHAP.
X.

ginia on the north, the ocean on the east, by a line drawn in 34 degrees from the ocean to the mountains on the south; and by that part of Florida possessed by the Indians on the west; and is subdivided into fourteen or fifteen townships or parishes; but there is not one town or church as I can learn in the country, and it is but very lately that the society for the propagation of the gospel has sent one itinerant preacher amongst them.

South-
Carolina.

South-Carolina is divided from North-Carolina by the abovesaid imaginary line on the north, by the ocean on the east, by the river Savannah, which separates it from Georgia on the south, and by the country of the Indians on the west; being subdivided into fourteen parishes or townships, each of them having a good church of brick or timber.

Charles-
Town.

But the chief and almost the only town in both Carolina's is Charles-Town, situate in 32 degrees, 45 minutes north latitude, on the point of a peninsula formed by Ashley and Cooper Rivers; the former of which is navigable for ships twenty miles above the town, and for boats and pettyagers, (large canoes) near forty miles. The other river is not navigable for ships so far, but for boats and pettyagers much farther. The bar before the harbour has sixteen foot water at a low tide, and there is good riding when a ship is got close to the town: The harbour being secured by a fort, called Johnson's Fort, which has about twenty guns in it, level with the surface of the water. The town was regularly fortified some years ago, and several of the bastions next the water are still in being and in good repair; but the bastions, pallisades, and fosse next the land being much damaged by a hurricane, and deemed of too great an extent to be defended by the inhabitants, General NICHOLSON caused them to be demolished. The town now contains upwards of six hundred houses generally well built, some of them of brick, but more of timber, and most of them sashed, forming regular and spacious streets; and their church is much the most magnificent in English America, having three isles, an organ, and gallery all round the church. There are also four handsome meeting-houses in the town belonging to the presbyterians, anabaptists, quakers, and French refugees; and if you survey the adjacent country, says Mr. PURRY, you will see stately buildings, noble castles, and the fields covered with infinite numbers of cattle of all kinds.

Beaufort
Town
and Port-
Royal.

The town of Beaufort is situated on the island of Port-Royal, in 31 degrees 40 minutes north latitude, an hundred miles south of Charles-Town; the continent and island forming a fine capacious harbour, capable of receiving the royal navy of England, if it can get over the bar, as ships of good burthen may; there being eighteen foot water at low water. The island on which the town stands consists of near one thousand acres, and is navigable all round for boats and pettyagers, and one half of it for shipping, having four fathom water close to the high bluff; so that ships may load and unload from the shore without the assistance of boats. The harbour is secured by a fort built about five years since, on which twelve culverins are mounted, but the town and island have no fortification (unless erected very lately); nor is the harbour so well fortified as a place of this importance deserves, especially as it lies so near Spanish Florida, and is said to be demanded by

the Spaniards as a part of their territories. There is not indeed above fifty or threecore houses in the town of Beaufort at present; but from its advantageous situation, and the goodness of its harbour, it is expected that this town will one day be the capital of Carolina: It is already the station for the British Squadron in those seas.

There is another port-town lately erected at Winyaw, about fifty miles to the northward of Charles-Town, to which they have given the name of George-Town, and the society for the propagation of the gospel have a missionary here; but I meet with no further description of it.

The third grand division of Carolina is the new province of Georgia, separated from South-Carolina by the river Savannah on the north, by the ocean on the east, by the river Altamaha, which separates it from Spanish Florida, on the south, and by Indian Florida on the west; nor has any European power so good a claim as the English to this country as far westward as the river Mississippi, since most of the Indian Chiefs between Carolina and that river have acknowledged the King of Great-Britain their Sovereign, and put themselves under his protection, as has been observed already.

The chief towns in Georgia are, the town of Savannah, and the town of Purrysburgh.

The town of Savannah is situated in 31 degrees 20 minutes, about one hundred and thirty miles to the southward of Charles-Town, and thirty miles south of Beaufort and Port-Royal, and about fifty or threecore miles north of the Spanish fort of St. Augustin. Governor OGLETHORPE, in a letter to the trustees of the colony of Georgia, dated the 10th of February, 1732-3, tells them, that he had fixed upon a healthful situation on the river Savannah to build this town upon, about ten miles from the sea; that the river here formed a half-moon, along the south side of which the banks were forty foot high, and on the top a flat, which they call a bluff; that this plain high ground extended into the country five or six miles; and along the river side, about a mile, ships that draw twelve foot water, may ride within ten yards of the bank.

That upon the river side, in the center of this plain, he had laid out the town, and that over against it was an island of very rich land fit for pasture, which he thought ought to be kept for the trustees cattle.

That the river was pretty wide, the water fresh, and from the key they might see its whole course to the sea with the island of Tybe, which lay before the mouth of the river; that the other way they might see the river for six miles up into the country; the landskip was very agreeable, the stream being wide, and bordered with high woods on both sides.

By another letter dated from Georgia the 14th of February 1735-6, they inform us, that above two hundred houses were then regularly built in the town of Savannah.

Purrysburgh also is situated on the river Savannah, about thirty miles from the mouth, and twenty to the westward of the town of Savannah, seven miles above the highest tide. It was formerly called the Ymassee-Port, and stands in a pleasant fruitful plain, being inhabited by a colony of a thousand Swifs, which were carried over by Mons. PURRY at the charge of the trustees of Georgia. But as this town lies on the north side

Town.Purrys-
burgh
Town.

CHAP. X. of the river Savannah, it is in reality in South-Carolina, and not in Georgia. The same letter gives an account of several other towns built; particularly, Buery, Thunderbolt, Fort-Argyle and Westbrook, but does not ascertain their situation; they also relate that Mr. OGLETHORPE was going fourscore miles farther into the country to erect another town and a fort near it on the river Alatomaha; two forts have been erected also on the river Savannah, the one fourscore miles west of the town of Purrysburg, and the other upwards of two hundred miles beyond it: And probably they have erected several other towns and fortresses by this time; for since the King has purchased the propriety of Carolina, I find the following orders have been given for building eleven towns in Georgia and Carolina, viz. two on the river Alatomaha, two on the river Savannah, one at the head of the river Poupon, two at the river Santec, one at the river Watereg, one at the Black River, one at the river Wacomau, and one at the river Pedee.

Eleven towns ordered to be built in Georgia. The lands laid out to each town.

The district of each of these towns is to contain the extent of twenty thousand acres of land, formed into a square, bordering on one of these rivers, and is to be divided into shares or fifty acres for each man, woman, or child of one family; which may be augmented as the planter's shall be in a condition to cultivate a larger quantity of ground; and every one of them was to have an equal share of the better and worse lands, and also the same right on the river.

Extent of each town. Each town was to be formed into a parish, the extent whereof was to be about six miles round the town on the same side of the river; and as soon as the parish contained an hundred masters of families, they were authorized to send two members to the assembly of the province, and were to enjoy the same privileges as the other parishes of the province.

Assembly. The ground of each town being marked out, was to belong in common to all the inhabitants, till distributed in particular shares to each of them. There were to be three hundred acres of land near each town to be common for ever, without being charged with rent; and no person by any former grant, was to take possession of any land within six miles of each town.

A common to each town. As to the Indian towns belonging to the Charokee nation, under the protection of the English, the first I meet with is called Keowee, three hundred miles west of Charles-Town; and Tanassie their capital is an hundred and fifty miles farther west; all the country between the English Plantations, and the Charokees being an uncultivated desert, part of it claimed by the Creek nation, and the rest by the Charokees and their allies; but they make no other use of it than to hunt wild beasts, being the only constant inhabitants of these forests. As to the model of the Indian towns and building in Florida, I must refer the reader to those described in Virginia and Maryland, from which these do not differ. Their animals and vegetables also are the same as in Virginia, only I do not remember the mentioning Buffaloes in that country, which are found in Florida. This is a heavy sluggish animal that resembles an Ox, but is less, and his flesh of a much coarser grain.

Indian towns of Keowee. Tanassie. Animals and vegetables the same as in Virginia.

MONSIEUR PURRY, who carried over the Swiss Colony to Georgia in the year 1733, gives the following account of the soil, productions, VOL. III.

CHAP. X. manufactures, and traffick of Carolina; with a short abstract of the history and success of that colony.

He observes, that all sorts of trees and plants will grow there as well as can be wished, particularly Vines, Wheat, Barley, Oats, Pease, Beans, Hemp, Flax, Cotton, Tobacco, Indigo, Olives, Orange-Trees and Citron-Trees; as also white Mulberry-Trees for feeding of Silk-Worms; and that the lands will not be difficult to clear, because there is neither stones nor Brambles, but only great trees, which do not grow very thick; so that more land may be cleared there in one week, than could be done in Europe in a month. The custom of the country is, that after having cut down these great trees, they leave the stumps for four or five years to rot, and afterwards easily root them up, in order to manure the land.

Trees and plants.

It is very certain that Carolina is in general an excellent country; it is true the ground is sandy, but then it is a sand impregnated with salt or nitre, so that it brings forth in great abundance, as the like soil does in divers parts of Europe: But what is more particular to Carolina, there are a great number of plantations that have been continually cultivated for near sixty years, which yet still produce great plenty, without ever being manured by the least dung, for they never lay any on their grounds; the planter only turns up the superficies of the earth, and all that he plants and sows therein quickly grows and thrives: Those who understand ever so little of agriculture will be obliged to own, that if the lands of Europe were not constantly manured, their strength would be so exhausted, that at length the crops would not pay for their seed. But a man who shall have a little land in Carolina, and who is not willing to work above two or three hours a day, may very easily live there.

Nature of the soil in Carolina.

Wants no dung. Husbandry dry.

Another consideration deserving our notice is the progress of the first colonies, their sudden advancement, the riches of the present inhabitants, the great number of publick expences for which they provide, the great trade which they carry on at present; and lastly their misfortunes and losses, which are entirely repaired. The better to comprehend these matters, we shall only make the following observations, 1. That there were no people in Carolina, till near seventy years ago; for the English did not begin to send any thither till the year 1670. 2. That they had at first a very fatal beginning, being afflicted with sicknesses; and even the plague, which daily diminished the number of the people. 3. The cruel destructive divisions sprung up among them. 4. That they had a very bad government under the Lords proprietors, being almost without justice, order or discipline. 5. That at a certain time the Pirates interrupted their trade and navigation. 6. That they have often had great droughts. 7. That a terrible fire consumed almost all Charles Town. 8. That they have been at great expence in fortifications, publick edifices, churches, &c. 9. That they have often sustained long wars with the French, Spaniards, and particularly with the Indians, who once united all together to destroy the whole province. 10. That notwithstanding all these misfortunes, the people of Carolina, except those who give themselves up to debauchery, are all rich, either in slaves, furniture, cloaths, plate, jewels, or other merchandizes; but especially in cattle, which mites.

The quick improvements made in this colony.

Planted but sixty years ago. The plague there.

Divisions. Bad government under the Lords proprietors.

Plundered by the Pirates.

Droughts.

Fire. Expences of fortifications, &c.

Wars with Indians and Spaniards.

Rich, notwithstanding these calamities.

CHAP. X. which shews the goodness of the country they inhabit.

The most part of those, who came first thither were very poor and miserable. Several of those, who are most considerable, went but as servants.

Load two hundred ships annually. The trade of Carolina is now so considerable, that of late years there have sailed from thence annually above two hundred ships, laden with merchandizes of the growth of the country, besides three ships of war, which they commonly have for the security of the commerce; and last winter they had constantly five, the least of which had above an hundred men on board. It appears from the custom-house entries, from March 1730 to March 1731, that there sailed within that time from Charles-Town two hundred and seven ships, most of them for England; which carried among other goods forty-one thousand nine hundred and fifty-seven barrels of Rice, about five hundred pound weight per barrel; ten thousand seven hundred and fifty-four barrels of Pitch; two thousand and sixty-three of Tar, and eleven hundred and fifty-nine of Turpentine; of Deer-skins, three hundred casks, containing eight or nine hundred each; besides a vast quantity of Indian Corn, Pease, Beans, &c. beef, pork, and other salted flesh; beams, planks, and timber for building, most part of Cedar, Cypress, Sassafras, Oak, Walnut, and Pine.

Trade with the Indians. They carry on a great trade with the Indians, from whom they get these great quantities of Deer-skins, and those of other wild beasts in exchange; for which they give them only Lead, Powder, coarse Cloth, Vermillion, Iron-ware; and some other goods, by which they have a very considerable profit.

Slaves. The great number of slaves makes another part of the riches of this province; there being above forty thousand Negroes, which are worth one with another an hundred Crowns each.

Artificers wanted. Artificers are so scarce at present, that all sorts of work is very dear; Taylors, Shoemakers, Smiths, &c. would be particularly acceptable there. A skilful Carpenter is not ashamed to demand 30 s. per day, besides his diet; and the common wages of a workman is 20 s. per day, provided he speaks English, without which he cannot be understood, and consequently not so useful as others; and when a workman has but 10 s. per day, he thinks he labours for almost nothing, tho' he has his maintenance besides. But this is Carolina money.

Shoes. Most of their shoes are brought from England, and generally sell for 40 s. per pair; not but that they have hides enough, and very cheap, an Ox's hide being sold for 20 s. neither are they destitute of the means to tan them, for they make very good Lime with Oyster-shells; and the bark of Oak-Trees is so plentiful, that it costs nothing but the trouble of gathering. They want only therefore a sufficient number of good Tanners and Shoemakers.

Two hundred thousand Deer-skins exported. I might say the same of Leather-dressers, since they send every year to England above two hundred thousand Deer-skins undressed; yet Carolina produces Oker naturally, and good fish-oil may be had from New-York or New-England very cheap, so that they might be dressed and made up into breeches in the country; for which those skins are very proper, being cool in summer and warm in winter.

No Glass or earthen ware. There is not one Potter in all the province, and no earthen ware, but what comes from England,

CHAP. X. not glass of any kind; so that a pot-house, and a good glass-house, would succeed perfectly well, not only for Carolina, but for all the colonies in America. There is a kind of sand and earth, which would be very proper for these purposes; as also wood and fern in abundance, had they but workmen to make use of them.

The woods are full of wild vines, bearing five or six sorts of Grapes naturally; but for want of Vine-dressers, &c. scarce any Wine is drank there but what comes from Madeira; which is indeed cheap, for a bottle of excellent Wine cost last winter but 2 s. Carolina money, to those who bought it by the hoghead.

The cattle of Carolina are very fat in summer, but as lean in winter, because they can find very little to eat, and have no cover to shelter them from the cold, rains, frosts and snows, which last sometimes three or four days; only the cattle designed for the butchery are fed, and they bad enough, with potatoes, straw and grain; but they always lie in the open field, for there is not one hovel in all the country either for Oxen or Cows. If you object this to the planters, they answer, that such houses or hovels would do very well, but that they have too many other affairs to think of that. The last winter being very severe, about ten thousand horned cattle died of hunger and cold; notwithstanding this, the people will not change their conduct, because they do not understand the manner of ordering cattle, nor even know how to mow the Grass, in order to make it Hay, of which they might have great plenty for fodder. Their ignorance in this respect is very great, which is the reason that Butter is always very dear, being sold last winter for 7 s. 6 d. per pound; and in January and February last, it was sold at Charles-Town for 12 s. per pound; in a word, nothing would be more easy than for persons, who understand country affairs, to grow rich in a little time. There is so great a number of cattle, that a certain planter had last spring two hundred Calves marked, which he let run in the woods with other cattle. Nobody looks after them, or takes any other care, but to bring them together in the evening to lie in a park near the house.

At certain times they kill a great many to send the flesh salted to several other colonies where there is little pasturage; particularly to the Isles of Antilles, the Sugar Islands, and in general to all those of the Torrid-Zone.

Horses, the best kind in the world, are so plentiful, that you seldom see any body travel on foot, except Negroes, and they oftner on horseback; so that when a Taylor, a Shoemaker, or any other tradesman, is obliged to go but three miles from his house, it would be very extraordinary to see him travel on foot.

There is likewise in this country a prodigious number of Swine, which multiply infinitely, and are kept with very little charge, because they find almost all the year Acorns, of which there are five or six sorts; as also Nuts, Walnuts, Chestnuts, herbs, roots, &c. in the woods; so that if you give them never so little at home, they become fat; after which you may salt, and send great quantities of them to the Isles of Barbadoes, St. Christopher's, Jamaica, &c. which produce very good returns either in money or merchandizes.

Of all animals in that country, none are a less charge than Sheep, for they subsist only on what they

CHAP. X. they find in the fields, yet are always in good case and bring forth their Lambs regularly; and there is a particular sort, whose Wool is not inferior to the finest Spanish Wool.

Wool. Flax and Cotton thrive admirably, and Hemp grows to thirteen or fourteen foot in height; but as few people know how to order it, there is scarce any cultivated; besides, they want dung, which is very necessary for that purpose, few plants weakening land so much as Hemp does: However, this is one of the articles which would produce most profit, because the parliament has allowed so much per tun upon all Hemp which comes from the English plantations in America, in order, that in time of war they may have no need of Hemp from Russia and Poland. Besides this encouragement, which is to last above twenty years longer, there is an exemption from some other duties on importation, which, joined together, makes an advantage of about 40 l. per cent. over that of Hemp from other parts.

Rice. Rice and Indian Corn produce at least an hundred fold, and would much more, if the land was better cultivated. The easiness of procuring such a plenty of grain, is the reason that the planters have, or may have at all times a yard filled with Cocks, Hens, Turkeys, Geese, Ducks, &c. also a good Pigeon-house, without being at any expence. There is great plenty of game of all sorts, but especially wild Turkeys, some of which are thirty pound weight; and those who love fowling may easily take them. With Indian Corn they make pretty good bread, because it is much finer and better than in Switzerland, or in any other part of Europe; where it is commonly called Turkey Corn. (This seems to be a mistake; Turkey Wheat is a very different thing.)

Mulberries. Persons may grow rich in Carolina without being at much expence or labour, by planting white Mulberry-Trees for feeding of Silk-worms, there being perhaps no country in the world where those trees grow better, nor where the Silk is finer than in Carolina; they grow so much in so short a time, that we dare scarce mention it. Captain SCOTT had one at the back of his house at Port-Royal not above seven or eight years old, the body whereof was above two foot round. It would be difficult to believe this if it was not confirmed by other Mulberry-trees of four or five years old at Port-Royal, Westmead, Gouscrick and other plantations, the trunks whereof are near a foot diameter; but as all the planters apply themselves chiefly to the production of Rice, Pitch and Tar, there is very little use made of them. However, those who have been in Provence and Languedoc, know that the shipping of a Mulberry-tree, that is, the leaves of a summer, are commonly sold for a Crown, and sometimes two, altho' the Silk of those two provinces is but very indifferent; from whence it may easily be conjectured what riches Carolina would produce if this affair was well managed. All other trees grow there in the same proportion, and much faster than in Europe, but particularly the Peach-tree; for the third year it is commonly loaded with fruit, and is a great tree the fourth year.

Trees. Those that have any desire to go and settle there may farther take notice of three or four observations.

Situation. 1. That South-Carolina is not only situated in the same degree of heat, fertility and temperature of air (which is about 33 degrees latitude) as Barbary, the Isle of Candia, Syria, Persia, Mogolistan,

CHAP. X. China, and in general all the best countries in the universe; but it is also the only country of all those the English possess that is situated in that degree; and there is all the reason in the world to believe, that if there be now an opportunity to have lands there for nothing, this advantage will not continue long; at least it is very certain, that those who shall come first will have the choice of lands, as also the proximity of rivers, much better than those that shall come afterwards.

2. That by means of the Wool, Cotton, Flax, Produce, and Hemp, it will be easy to procure all Linen Cloth necessary, as also good Cloth and Stuffs for cloathing, without being forced to purchase them at a very dear rate from the shops, as most of the planters are at present; and what is still an article very considerable, there will be no danger of wanting provisions in a country so plentiful, unless some accidents happen, which cannot be foreseen by human prudence: We may be assured that hail-stones will not deprive the inhabitants thereof.

3. That Carolina being of all the neighbouring provinces, which the English possess on the continent of North-America, from 29 to 49 degrees of latitude, not only the largest and most productive of necessaries, but also the most southward and nearest to Jamaica, Barbadoes, and all the Islands of the Antilles, which have occasion for salted provisions, bread, wine, fruits and roots, and several other things, we need not hesitate a moment to prefer it to all the other Colonies on the north-side. And besides the great advantages which may accrue to the inhabitants by the fertility of the land and the temperateness of the climate, the situation thereof, for trade, will always draw ships into its ports, which there finding at a reasonable price and in good order all that the other most distant provinces can have, will hardly go so far whilst any thing is to be had in Carolina.

4. And lastly. And what is of greater importance than all is, that there is an entire liberty of conscience and commerce for all that come thither, without paying any thing for it. Justice is Justice, duly administered to all, and every body can say, that what he possesses lawfully belongs to him in full propriety. There are no tenths, imposts, tallies, nor capitation taxes, nor any of those burthens which render so many other people unhappy. In a word, you have all the laws, liberties and privileges there which are enjoyed in England. It is the lower house that has the disposal of the money of the province, and who vote the taxes necessary for the publick service; however, with the approbation of the upper house, and that of his Majesty represented by the Governor.

We whose Names are hereunto subscribed, do attest, that all which is contained in this account of South-Carolina, is the real truth, having been eye-witnesses of most part of the particulars therein mentioned. Done at Charles-Town the 23d of September, 1731.

JOHN PETER PURRY of Neufchatel.

JAMES RICHARD of Geneva.

ABRAHAM MEURON of St. Sulpy in the county of Neufchatel.

HENRY RAYMOND of St. Sulpy.

Notwithstanding the solemn attestation of these gentlemen, their account of Carolina must be read with grains of allowance. It was evidently their intention to represent the country in the fairest

Planters encouraged to go over.

Visuals.

Nearest to the Sugar islands.

Situated well for trade.

Liberty of conscience.

Property secured.

Constitution.

Remarks on Mr. PURRY's account of Carolina.

- CHAP. X.** est light to invite planters to go over and settle there; but it was my good fortune to correspond with another gentleman of figure, who resided in Carolina a considerable time, that has set several matters right, which Mr. PURRY and his friends endeavoured to disguise, or were not sufficiently informed in.
- Corn.** He admits that English Wheat will grow in Carolina, but says it is apt to mildew, and produces but a small grain, the heat drawing it up to a great height, so that there is much straw and little grain; they have therefore their flour from Pennsylvania and New-York, which per hundred weight seldom exceeds the value of an hundred weight of Rice, which growing so much better, is the only grain they propagate there to speak of; altho' some Barley and Oats they have, but they also do as the Wheat run into straw, and produce but a light grain, nor will they keep for the Weevil or Bug.
- Grapes.** The European Grapes which have been transplanted thither, produce their ripe fruit the latter end of June, at which time the heats and rains are so violent and frequent, that they do not ripen kindly, but are mostly rotten before ripe; besides that, the juice, I am apt to think (at that time) would ferment away all the spirits; for in Portugal, where you know I lived many years, their vintage is in October, when the heats are over; probably they will some time make wine from the Grapes of the country, of which they have great abundance and no small variety, and they ripen at a proper season; but at present the people's fortunes will not admit of going out of the common and beaten road, so that very few, if any, have tried them.
- Silk.** Silk does mighty well, and is as good (as Mr. LOMBE, now Sir THOMAS, one of the Aldermen of London, told me) as any of the Italian Silk; but it requires many hands, and the busy time of feeding the worms, which lasts about five weeks, and begins the latter end of March, is just when they are planting and howing their
- Hemp and Flax.** Rice: As for Hemp or Flax, they were beginning to try them when I left the country, but I am told they do not grow well there: The excessive heats must be the occasion of it; therefore North-Carolina, I should think would do better, Georgia worse. I have seen a single plant of Hemp as thick as my leg.
- Coffee.** Coffee has been tried, but will not bear the winter in South-Carolina; what it will do in Georgia I know not; that place is a degree and half to the southward of Charles-Town. As for
- Tea.** Tea we know nothing of it, there never was a plant of it there; but it is in the same latitude as Peking in China, so that it is judged it will thrive there; but that is all that we know.
- Exports.** They produce and ship off yearly about 60,000 barrels of Rice, each containing about four hundred weight neat; they have shipped off about 70,000 Deer-skins at a medium for these ten years past; they did make great quantities of Tar, yet now they send little of that, but chiefly Pitch, the English of late having most of their Tar from Norway; but we send about 20,000 barrels of Pitch a year, and our Tar has reduced the price of that of Norway from fifty Shillings and three Pound a barrel, to twelve and fifteen Shillings; and if something did not bias our people at home more than their judgment, our Tar would still be in demand, and esteemed as good as that of Norway.
- Turpentine.** We have sent home 70,000 barrels in a year; and probably send home 10,000 barrels of Turpentine, and could send more if there was any demand for it. Our yellow or Pitch-pine, is as good for masts and planks as any in the world; and our live Oak the best (not excepting the English) for knees, or what the Carpenters call compass timber for shipping; but none has been yet sent home. We have many other sorts of Oak better than that of New-England.
- They have very little shipping of their own in Carolina, having never built above four or five ships there, but more sloops; however, they load about two hundred sail of ships yearly at Charles-Town, and some at Port-Royal and Winnyaw. They traffick with the natives for Deer-skins, and Bear and Buffaloe-skins; for which they give them Guns, Powder, Knives, Scissars, Looking-glasses, Beads, and many other trifles, and some coarse Cloths, Strouds, Duffels, and coarse Callicoes, &c. for their women; and they carry them on Pack-horses for five or six hundred miles to the westward of Charles-Town, as far as the Chocklaw nation, and the Chikisaws: Tho' they go so far but sparingly, the most of the trade being confined within the limits of the Creek and Charokee nations, which is not above three hundred miles.
- It may be proper to observe here, that North-Carolina produces a good quantity of Tobacco, and but little Rice; and South-Carolina, on the contrary, produces vast quantities of Rice, and little Tobacco; but as to the rest of their vegetables and produce, they are much the same.
- Carolina being justly looked upon as part of the ancient Virginia, since it was hither the first colonies were sent by Sir WALTER RALEIGH, in the reign of Queen ELIZABETH, it was thought fit, after the restoration of King CHARLES II. to revive the British claim to this country, in which no European power had then any settlements; for both the Spaniards and the French, who had sent colonies to this coast (after those misfortunes which drove the first English planters from thence) had abandoned them again for a great many years.
- King CHARLES therefore, well apprized of the happy situation of this country, and that there was a prospect of raising Wine, Oil and Silk, and almost every thing that Great-Britain wanted there, granted a patent, bearing date the 24th of March 1663, to EDWARD Earl of Clarendon, Lord Chancellor of England, GEORGE Duke of Albemarle, WILLIAM Lord Craven, JOHN Lord Berkley, ANTHONY Lord Ashley, Sir GEORGE CARTERET, and Sir WILLIAM COLLITON, to plant all those territories in America, between St. Matheo in 31 degrees, and Luck-Island in 36 degrees, north latitude; and between the Atlantick-Ocean on the east, and the South-Sea, or Pacifick-Ocean on the west: Indeed the Clerks that drew the patent seem to have been mistaken in the latitude of St. Matheo, making it lie in 31, whereas it lies much nearer 30 degrees. However, it is evident, that Prince looked upon his territories to extend as far southward as St. Matheo, and consequently that not only Port-Royal, but the new province of Georgia, and several miles beyond, belonged to Great-Britain; and probably the mistake of the latitude in the above-said patent, was one reason the patentees procured another two years afterwards, viz. 17 CAR. II. extending the bounds of Carolina to Carotock River, or Inlet, in 36 degrees 30 minutes north latitude;

CHAP. X. titude; and as far as 29 degrees south. If his present Majesty therefore has been pleased to bound his dominions in America on the south, by the river Altamaha or May, he has expressed great moderation with regard to the Spaniards. The last patent of King CHARLES II. being a sufficient authority to extend them even beyond St. Matheo, and St. Augustins, which lies within the limits of that patent.

Carolina planted by the English.

The form of government there.

The proprietors empowered to create noblemen.

Perpetual distractions in these colonies.

In danger of being destroyed by the natives.

The King purchases Carolina.

The proprietors did little towards planting Carolina till the year 1670, when they agreed upon a form of government for their colonies, said to be struck out by ANTHONY Lord Ashley, afterwards Earl of Shaftsbury, one of the proprietors, whereby it was provided, that a Palatine should be chosen out of the proprietors, to hold that office during his life, and be succeeded after his death by the next eldest of the proprietors for life; and in like manner the rest of the proprietors and their respective heirs were to succeed to the office of Palatine, according to their seniority. The Palatine, for the time being, was empowered to appoint the Governor of the province; but then, as a check upon him, he was in great part of his administration to act with the concurrence of a council, consisting of seven deputies, appointed by the seven proprietors, seven more chosen by the assembly or representatives of the freemen, and seven of the eldest Landgraves or Caciques; for the proprietors were empowered by their patent to create a certain number of noblemen with the titles of Landgraves and Caciques, (but were restrained from conferring English titles on them, such as Dukes, Earls, Barons, &c.) and these were to constitute the upper house; from whence it appears, that Lord Shaftsbury intended to have a Palatine for chief Magistrate, instead of a King, with an upper and lower house: But then the authority of his Palatine or chief Magistrate was so limited, that he had little more than the name of Palatine: The Lords were to be created by the seven proprietors, and not by the Palatine alone, and consequently would not be in any danger of being creatures of the Palatine, or the Governor appointed by him; but this fine-spun scheme, it seems, never took place in all its projected parts. There were but few Landgraves or Caciques made, nor were they ever summoned to sit in parliament as a house of peers; but the deputies of the seven proprietors, and the great Officers of state, constituted their upper house: And thus did Lord Shaftsbury imagine he had supplied all the defects in the constitution of his mother country. But from hence we may learn how much easier it is to find fault with a constitution, than to mend it; for never did such confusions arise in any government as in this. There were perpetual struggles for superiority, and sometimes the people found themselves intolerably oppressed by their Governors; at others, the people became mutinous and seditious, deposed, tried and banished their Governors; and what was still worse, all agreed to enslave the Indians, which provoked them to murder many of the planters, and plunder their settlements; and the Indians at length became so formidable, that it was expected the English would have been totally extirpated, which compelled the planters to implore the protection of the crown, as the only means to restore tranquillity to these colonies, and oppose the outrages of the natives: His present Majesty therefore, in compassion to these colonies, was pleased to purchase the interest of the several proprietors about

the year 1728; whereby the colonies of North-Carolina are not only become Royal Governments, and modelled now like that of England; but his Majesty, as I apprehend, is sole proprietor, or ground-landlord (if I may so term it) of these pleasant and fruitful countries, and thereby possessed of the largest and fairest demesnes at present of any Prince in Europe: They are of a much greater extent than ever were possessed by the greatest of the Kings of England his predecessors; and our posterity (if not the present generation) possibly may see the crown so greatly enriched by this purchase, as to defray all the ordinary charges of the government out of the revenues of the crown-lands; as the Kings of England antiently did, without depending on the benevolence of the subject. But whether his majesty purchased these provinces of the proprietors as King of England, or as a private gentleman, I confess I am not fully apprised: And if he did not purchase them as King of England, the crown may not be much the richer, tho' his Majesty's posterity in a private capacity will. However, let it be one way or other; I shall beg leave to congratulate his Majesty and the nation upon this happy event, it being now the joint interest of Prince and people to encourage these plantations, which, if well managed, will furnish Great-Britain in time with naval stores, Silk, Wine and Oil, and every thing she wants, which we are at present compelled to purchase of foreigners with an immense treasure; and at the same time advance our own manufactures to a very great degree, by the exportation of them to those countries in return for what we receive from thence.

The King had no sooner purchased the colonies of North and South-Carolina of the proprietors, as related above, but Sir ALEXANDER CUMMINS, a Scots gentleman, was employed to procure a true state of those countries by his own view of the most distant parts of them: Whereupon he set out from Charles-Town on the 13th of March, 1729, accompanied by eight or ten people, traders and others, who had some knowledge of the country; and having travelled as far as Mr. RUSSEL's plantation, an hundred miles to the westward of Charles-Town, Mr. RUSSEL informed him, that the French had been endeavouring for two years passed to bring over the lower Charokees to their interest, and that he had already acquainted the government with the encroachments of the French, who had been building forts in the Creek nation for several years passed.

Sir ALEXANDER taking leave of Mr. RUSSEL arrived at Keowee, the first town of the Charokees, being about three hundred miles from Charles-Town; where he was informed by Mr. BARKER a trader, that the February before messengers came from the lower Creeks to the Charokees, inviting them to come over to the French interest. Whereupon the Charokees directed the Creeks to go to the French and receive their presents first, and then to return to them with their report: And upon the return of those messengers, he (BARKER) expected the lower Charokees would have risen, for at that time they were so unruly the traders durst scarce speak to them.

However, Sir ALEXANDER met with some of their Chiefs that night in the town-house, where they were assembled with three hundred of their people, and received their submission to the King of Great-Britain on their knees; he afterwards

The interest of the Prince and people is to encourage these colonies.

Sir ALEXANDER CUMMINS takes a view of Florida, 500 miles west of Charles-Town.

French forts there.

The Charokees acknowledge the King of Great-Britain their Sovereign.

CHAP. X. caused them to dispatch messengers to all their tribes, requiring the Chiefs of every town to meet him on the 3d of April at Nequassie.

On the 27th of March Sir ALEXANDER arrived at Tassette in the middle of their settlements; and that night there happened such a terrible storm of thunder and lightning as had not been known in the memory of man, at which the Indians were amazed and confounded; and their conjurer (or priest) came the next morning, and told Sir ALEXANDER, he knew he was come to govern their nation, and they must submit to whatever he commanded. On the 29th arriving at Telliquo in the upper settlements, two hundred miles west of Keowee, MOYTOY their chief warrior told him, that the several nations intended to make him their head or Generalissimo, but that was now left to Sir ALEXANDER.

On the 3d of April, Sir ALEXANDER returned to Nequassie, where the King's warriors, conjurers and beloved men of all the tribes assembled, according to his summons: Here with great solemnity he was placed in a chair by MOYTOY's orders, MOYTOY and the conjurers standing about him while the warriors stroaked him with thirteen Eagles tails, and their fingers sung from morning till night; and, as their custom is on solemn occasions, they fasted the whole day.

After this solemnity of stroaking him was over, Sir ALEXANDER, in a speech to them, representing the great power and goodness of his Majesty King GEORGE, who he called the great man on the other side of the great water, said, that himself and all his subjects were to him as children, and they all obeyed whatever the great King ordered; and required MOYTOY and all the head warriors to acknowledge themselves dutiful subjects and sons to King GEORGE, and promise that they would do whatsoever Sir ALEXANDER should require of them (that he might be the better able to answer for their conduct;) all which they did on their knees, calling upon every thing that was terrible to them to destroy them, and wishing they might become no people if they violated their promise of obedience! Sir ALEXANDER then ordered that the head warriors should answer for the conduct of their people to MOYTOY, whom he declared their Chief and Generalissimo, by the unanimous consent of the whole people, and to whom, at Sir ALEXANDER's desire, they all gave an unlimited power over them, provided he were accountable to Sir ALEXANDER for his administration.

April 4th, the crown was brought from Great-Tannassie, which with five Eagles tails, and four scalps of their enemies, MOYTOY presented to Sir ALEXANDER, empowering him to lay the same at his Majesty's feet.

Six of their Chiefs come to England.

Sir ALEXANDER then proposing to take six of their Chiefs to England with him to do homage to the King in person, six of them immediately offered to go with him, and a seventh joined him at his arrival at Charles-Town on the 13th of April, and embarking together in the Fox man of war the 4th of May, they arrived at Dover on the 6th of June, 1730.

The Indian Chiefs having been admitted to an audience by King GEORGE, and in the name of their respective nations promised to remain his Majesty's most faithful and obedient subjects, a treaty of alliance was drawn up, and signed by the six Chiefs on the one side, and ALURED POPPLE, Esq; Secretary to the Lords commis-

sioners of trade and plantations on the other, on CHAP. Monday Sept. 7th, 1730; and the treaty was X. read and interpreted to them.

The preamble whereof recites, that whereas A treaty of alliance with them. the said Chiefs with the consent of the whole nation of Charokee-Indians at a general meeting on the 3d of April, 1730, were deputed by MOYTOY their head warrior to attend Sir ALEXANDER CUMMINS, Bart. to Great-Britain, where they had seen the great King GEORGE; and Sir ALEXANDER, by authority from the said MOYTOY and all the Charokee people, had laid the crown of their nation, with the scalps of their enemies, and feathers of glory, at his Majesty's feet, as a pledge of their loyalty: The great King had commanded the said Lords Commissioners to inform them, that the English every where on all sides of the great mountains and lakes were his people, that their friends were his friends, and their enemies his enemies, and that he took it kindly the great nation of the Charokees had sent them so far to brighten the chain of friendship between him and them, and between their people and his people: That the chain of friendship between him and the Charokee-Indians is like the Sun, which both shines here and also upon the great mountains where they live, and equally warms the hearts of the Indians and of the English: That as there are no spots of blackness in the Sun, so is there not any rust or foulness in this chain, and as the King has fastened one end of it to his own breast, he desires you will carry the other end of the chain and fasten it well to the breast of MOYTOY of Telliquo, and to the breasts of your old wise men, your Captains, and all your people, never more to be broken or made loose; and hereupon we give two pieces of blue Cloth.

The great King and the Charokee-Indians being thus fastened together by the chain of friendship, he has ordered his people and children, the English in Carolina, to trade with the Indians, and to furnish them with all manner of goods that they want and to make haste to build houses, and to plant Corn from Charles-Town towards the town of the Charokees behind the great mountains; for he desires that the Indians and the English may live together as the children of one family, wherof the great King is a kind loving father; and as the King has given his land on both sides of the great mountains to his own children the English, so he now gives to the Charokee-Indians the privilege of living where they please; and hereupon we give one piece of red Cloth.

The great nation of Charokees being now the children of the great King of Great-Britain, and he their father, the Charokees must treat the English as brethren of the same family, and must be always ready at the Governor's command to fight against any nation, whether they be white men or Indians, who shall dare to molest or hurt the English; and hereupon we give twenty guns.

The nation of the Charokees shall on their part take care to keep the trading path clean, and that there be no blood in the path where the English white men tread, even tho' they should be accompanied by any other people with whom the Charokees are at war; whereupon we give four hundred pound weight of gun-powder.

That the Charokees shall not suffer their people to trade with the white men of any other nation but the English, nor permit the white men of

CHAP. X. of any other nation to build any forts or cabins, or plant corn amongst them, or near any of the Indian towns, or upon the lands which belong unto the great King; and if any such attempt shall be made, you must acquaint the English Governor therewith, and do whatever he directs, in order to maintain and defend the great Kings right to the country of Carolina; whereupon we give five hundred pound weight of Swan-shot, and five hundred pound weight of bullets.

That if any Negroe slaves shall run away into the woods from their English masters, the Charokee-Indians shall endeavour to apprehend them, and either bring them back to the plantation from whence they run away, or to the Governor; and for every Negroe so apprehended and brought back, the Indian who brings him back shall receive a gun and a watch-coat; whereupon we give a box of vermilion, ten thousand gun-flints, and six dozen of hatchets.

That if by any accidental misfortune it should happen, that an Englishman should kill an Indian, the King or great man of the Charokees shall first complain to the English Governor, and the man who did it shall be punished by the English laws, as if he had killed an Englishman; and in the like manner, if an Indian kills an Englishman, the Indian who did it shall be delivered up to the Governor, and be punished by the same English laws, as if he were an Englishman; whereupon we give six dozen of spring-knives, four dozen of kettles, and ten dozen of belts.

You are to understand all that we have now said to be the words of the great King whom you have seen; and as a token that his heart is open and true to his children and friends the Charokees, and to all their people, he gives this belt, which he desires may be kept and shewn to all your people, and to their children and childrens children, to confirm what is now spoken, and to bind this agreement of peace and friendship between the English and Charokees, as long as the mountains and rivers shall last, or the sun shine; whereupon we give this belt of Wampum.

O. K. OUKAH ULAH

By command of their K. SHALCLOSKEN
Lordships, White- KETAGUSTAH
hall, September 9, T. TATHTOWE
1730. C. CLOGOITTAH
ALURED POPPLE. K. KOLLANNAH
U. UKWANEEQUA

These are to certify, MOYTOY of Telliquo; that I have seen, perused, and do approve of all the articles contained in the above agreement, to which the Indians above-mentioned have by my advice given their consent.

ALEX. CUMMINS.

The answer of the Indian Chiefs to the foregoing articles, as it was delivered by KETAGUSTAH, the 9th of September, 1730.

"We are come hither from a dark mountainous place, where nothing but darkness is to be found, but are now in a place where there is light.

"There was a person in our country with us, he gave us a yellow token of warlike honour that is left with MOYTOY of Telliquo, and as warriors we received it. He came to us like a warrior from you, a man he is, his talk is upright, and the token he left preserves his memory amongst us.

"We look upon you as if the great King GEORGE was present, and we love you as re-

presenting the great King, and shall die in the same way of thinking.

"The crown of our nation is different from that which the great King GEORGE wears, and from that which we saw in the Tower, but to us it is all one, and the chain of friendship shall be carried to our people.

"We look upon the great King GEORGE as the sun, and as our father, and upon ourselves as his children; for tho' we are red and you are white, yet our hands and hearts are joined together.

"When we shall have acquainted our people with what we have seen, our children from generation to generation will always remember it.

"In war we shall always be as one with you; the great King GEORGE's enemies shall be our enemies, his people and ours shall be always one, and shall die together.

"We came hither naked and poor as the Worm of the earth, but you have every thing, and we that have nothing must love you, and can never break the chain of friendship which is between us.

"Here stands the Governor of Carolina; whom we know. This small rope we shew you, is all we have to bind our slaves with, and may be broken, but you have iron chains for yours; however, if we catch your slaves, we shall bind them as well as we can, and deliver them to our friends again, and have no pay for it.

"We have looked round for the person that was in our country, he is not here; however, we must say, he talked uprightly to us, and we shall never forget him.

"Your white people may very safely build houses near us, we shall hurt nothing that belongs to them, for we are the children of one father, the great King, and shall live and die together.

Then laying down his feathers upon the table, he added, "This is our way of talking, which is the same thing to us, as your letters in the book are to you; and to you beloved men, we deliver these feathers in confirmation of all that we have said."

The Indian Chiefs were entertained and shewn the publick buildings while they remained in London; and having received several presents from the court and private gentlemen, took their passage home again in one of his Majesty's ships; and a patent passed the seals in 1732, appointing the following Gentlemen trustees for the planters of a new province to be called Georgia, and to be taken out of the south part of South Carolina, viz. The Lord Viscount PERCIVAL, JOHN CARPENTER, GEORGE HEATHCOTE, ROBERT MOORE, ROGERS HOLLAND, FRANCIS EYLES, JAMES VERNON, EDWARD DIGBY, JAMES OGLETHORPE, ROBERT HUCKS, WILLIAM SLOOPER, JOHN LAROCHE, WILLIAM BELITHA, Esqrs; JOHN BURTON, B. D. STEPHEN HALES, M. A. The reverend RICHARD BUNDY, ARTHUR BEDFORD, and SAMUEL SMITH, ADAM ANDERSON, and THOMAS CORAM, gentlemen. The patent recites, that his Majesty having taken into consideration the miserable circumstances of many of his own poor subjects, as likewise the distresses of many foreigners who would take refuge from persecution; and having a princely regard to the great danger

The Indian Chiefs return home.

A patent for erecting Georgia into a province. The trustees.

The speech of the Indians on signing the articles.

CHAP. X. danger the southern frontiers of South-Carolina are exposed to, by reason of the small number of white inhabitants there, hath granted a charter for incorporating a number of gentlemen by the name of the Trustees for establishing the colony of Georgia, in America; and they are empowered to collect benefactions, and lay them out in cloathing, arming, sending over, and supporting colonies of the poor, whether subjects or foreigners, till they can build houses and clear lands. And his Majesty farther grants them all his lands between the rivers Savannah and Alatomaha, which he erects into a province by the name of Georgia, for the benefit of the adventurers.

The trustees soon after assembled, and elected the Lord PERCIVAL their President, and ordered a common seal to be made with the following device, viz. On one side the rivers Alatomaha and Savannah, the north and south boundaries of Georgia, and between them the genius of the colony seated with the cap of liberty upon her head, a spear in one hand, and a cornucopia in the other, with this motto, Colonia Georgia Aug. On the reverse, are Silk-worms at work, with this motto, Non sibi sed aliis.— The leader, Minister, and others of the Swits protestants who were going adventurers to Carolina having attended the trustees, they ordered a library of books to be given the Minister for him and his successors, and a sum of money to the planters to subsist them on their voyage, and at their first arrival. For Mr. PURRY on his return from Carolina to Switzerland with the above said description of the country, had prevailed on many industrious persons and their families to the number of four hundred to go with him thither, and while the transports lay in Dover road, Mr. BRINGTON their Minister came to London and received episcopal ordination, so that the reflections which some had cast on the religion of these people seem to be unjustly founded.

In the month of November 1732, Mr. OGLETHORPE, one of the Trustees, sailed with several English families to Georgia; the men being Farmers, Carpenters, Bricklayers, and other working trades, they took with them all manner of tools and instruments proper for their respective employments. There was put on board also twelve tun of Alderman PARSON'S best Beer, and they were to touch at the Madera's, and take in Wine there for the use of the Colony. The planters were instructed in military discipline before they went by the Officers of the Guards, as all others were ordered to be who were sent thither, and furnished with swords and fire-arms; his Majesty also sent over seventy-four pieces of canon, with a proportionable quantity of ammunition, warlike stores, tools and implements for erecting fortresses in proper places; and the Rev. Dr. HERBERT went over with them as Chaplain: Large sums were afterwards collected among the nobility and gentry, and twenty-five thousand Pounds raised at one time by parliament for the support of the planters: For all the Swits, Saltzburghers, and other foreigners, as well as the British planters, were furnished by the said trustees with necessaries and provisions to subsist them in their voyage, and for a year after their arrival, and till they should be able to provide for themselves by their labour and the produce of the country.

Mr. OGLETHORPE arriving at Port-Royal in Carolina with his people, proceeded to lay out

the town of Savannah already described; and in a letter dated from thence, February 10, 1732-3, tells the Trustees, that the Governor and people of Carolina had given him great assistance; that they had ordered a party of horse and their scout-boats to attend and protect the new Colony, while they were employed in erecting the town and works; and had made them a present of an hundred breeding cattle, besides Hogs, and twenty barrels of Rice.

On the 20th of May, 1733, the Chiefs of the lower Creek nation to the number of fifty persons with their attendants arrived at Savannah, and acquainted Mr. OGLETHORPE that they laid claim to all the lands on the south of the River Savannah; but said, as he who had given the English more wisdom had sent them thither for their instruction, so they freely gave and resigned to them all their right in the said lands which they did not use themselves: And having heard that the Charokee Indians had killed some Englishmen, they offered to revenge their death on the Charokees, if Mr. OGLETHORPE commanded them. After which, articles of commerce were agreed on between the Colony and the Creeks, and a lac'd Coat, Hat, and Shirts were given to each of the Chiefs, with a present of Gunpowder, Irish Linen, Tobacco, Pipes, Tape of all colours, Bullets, and eight cags of Rum to carry home to their several towns, with some Cloth for their attendants.

The first ship that carried goods to Savannah was the James, Capt. YOAKLY Commander, of a hundred and ten tons, which arrived there the 14th of June, 1733; and the prize that was ordered by the Trustees to be delivered to the first ship that unloaded there was given to the Captain.

In the year 1734, an alliance was made with another Indian nation called the Natchees, tending greatly to the security of the Colony, and the same year the planters reaped their first crop of Indian Corn, which yielded them a thousand bushels.

Mr. OGLETHORPE returning to England was accompanied by TOMO CHICHI, one of the Kings of the Creek nation, and SENAUKI his Queen, with TOOANAKOWKI their son, and HILLISPILLI one of their war Captains. TOMO CHICHI had an audience of his Majesty at Kensington on the first of August, 1734, when 'tis said he made the following speech:

This day I see the majesty of your face, the greatness of your house, and the number of your people; I am come, for the good of the whole nation called the Creeks, to renew the peace which was long ago had with the English; I am come over in my old days, tho' I cannot live to see any advantage to myself; I am come for the good of the children of all the nations of the upper and lower Creeks, that they may be instructed in the knowledge of the English.

These are the feathers of the Eagle which is the swiftest of birds, and who flieth all around our nations: These feathers are a sign of peace in our land, and have been carried from town to town there; and we have brought them over to leave with you, O great King, as a sign of everlasting peace.

O great King, whatsoever words you shall say unto me, I will tell them faithfully to all the Kings of the Creek nations.

To which his Majesty graciously answered,

I am

CHAP. X. I am glad of this opportunity of assuring you of my regard for the people from whom you come, and am extremely well pleased with the assurances you have brought me from them; and accept very gratefully this present as an indication of their good disposition to me and my people. I shall always be ready to cultivate a good correspondence between them and my own subjects, and shall be glad of any occasion to shew you a mark of my particular friendship and esteem.

TOMO CHICHI afterwards made the following speech to her Majesty.

I am glad to see this day, and to have the opportunity of seeing the mother of this great people.

As our people are joined with your Majesties, we do humbly hope to find you the common mother and protectress of us and all our children.

To which her Majesty returned a most gracious answer.

The war Captain, and other attendants of TOMO CHICHI, were very importunate to appear at court in the manner they go in their own country, which is only with a covering round their waist, the rest of their body being naked, but were dissuaded from it by Mr. OGLETHORPE; however, their faces were variously painted after their country manner; some half black, others triangular, and others with bearded arrows instead of whiskers. TOMO CHICHI and SENAUKI his wife were dressed in scarlet trimm'd with gold.

When they returned they were carried to Gravesend in the King's coaches, and embarked for Carolina on the 30th of October. While they staid in England, which was about four months, they were allowed twenty pounds a week for their table, and were entertained in a most magnificent manner by the court and persons of distinction; whatever was worth their notice in the cities of London and Westminster was shewn them, and nothing was wanting to give them a just idea of the grandeur of the English nation, and their regard for the Creeks. In return for which they promised eternal fidelity. They carried away in presents about the value of 400l. sterling: and 'tis said Duke WILLIAM, presenting the young Prince with a gold watch, exhorted him to call upon JESUS CHRIST every morning when he looked upon it. There went over with them Sir FRANCIS BATHURST, his son, three daughters, and their servants, with many of the relations of the planters already in Georgia, and fifty six Saltzburghers.

Mr. OGLETHORPE, speaking of the religion and government of the Creek nation, in a letter from Georgia to a person of honour in London, says, there seems a door opened to our Colony towards the conversion of the Indians. I have had many conversations with their chief men, the whole tenour of which shews there is nothing wanting to their conversion but one who understands their language well, to explain to them the mysteries of religion; for as to the moral part of christianity, they understand and assent to it. They abhor adultery, and do not approve of plurality of wives. Theft is a thing not known among the Creek nation; tho' frequent and even honourable amongst the Uchees. Murder they look upon as an abominable crime; but do not esteem the killing of an enemy, or one that has injured them, murder. The passion of revenge, which they call honour, and drunkenness, which

they learnt from our traders, seem to be the two greatest obstacles to their being truly christians. But upon both these points they hear reason; and with respect to drinking of Rum, I have weaned those near me a good deal from it. As for revenge, they say, as they have no executive power of justice among them, they are forced to kill the man who has injured them, in order to prevent others from doing the like; but they do not think that any injury, except adultery or murder, deserves revenge. They hold, that if a man commits adultery, the injured husband is obliged to have revenge by cutting off the ears of the adulterer, which if he is too sturdy and strong to submit to, then the injured husband kills him the first time that he has an opportunity so to do with safety. In cases of murder the next in blood is obliged to kill the murderer or else he is looked upon as infamous in the nations where he lives: And the weakness of the executive power is such that there is no other way of punishment but by the revenger of blood, as the scripture calls it; for there is no coercive power in any of their nations. Their Kings can do no more than to persuade. All the power that they have is no more than to call their old men and their Captains together, and to propound to them without interruption the measures they think proper; after they have done speaking, all the others have liberty to give their opinions also, and they reason together till they have brought each other into some unanimous resolution. These conferences, in matters of great difficulty, have sometimes lasted two days, and are always carried on with great temper and modesty. If they do not come into some unanimous resolution upon the matter the meeting breaks up; but if they are unanimous (which they generally are) then they call in the young men, and recommend to them the putting in execution the resolution with their strongest and most lively eloquence. And indeed they seem to me, both in action and expression, to be thorough masters of true eloquence; and making allowances for badness of interpreters, many of their speeches are equal to those which we admire in the Greek and Roman writings. They generally in their speeches use similies and metaphors. Their similies were quite new to me, and generally wonderful proper and well carried on: But in their conferences among the chief men they are more laconick and concise. In fine, in speaking to their young men they generally address to the passions; in speaking to their old men they apply to reason only. For example, TOMO CHICHI, in his first speech to me among other things said, here is a little present; and then gave to me a Buffalo's skin painted on the inside, with the head and feathers of an Eagle: He desired me to accept it, because the Eagle signified speed, and the Buffalo strength: That the English were as swift as the bird, and as strong as the beast; since like the first they flew from the utmost parts of the earth over the vast seas; and like the second, nothing could withstand them: That the feathers of the Eagle were soft, and signified love, the Buffalo's skin warm, and signified protection; therefore he hoped that we would love and protect their little families. One of the Indians of the Charokee nation, being come down to the Governor upon the rumour of the war, the Governor told him, that he need fear nothing, but might speak freely. He answered smartly, I always speak freely, what should I fear? I am now

CHAP. among my friends, and I never feared even among
X. my enemies.

My Carolina correspondent, already mentioned, speaking of the religion and government of the Florida Indians, says, the natives have no religion that ever I could hear of, but are extremely superstitious, and afraid of an evil spirit without any notion of a good one. Their morals (notwithstanding much has been said in favour of them) in my opinion are very loose. They will cheat you if they can; and when they can't pay their debts they knock their creditors on the head; for which reason the legislature have made it a forfeiture of the debt to trust them; so that they may chuse whether they will pay any debts or not.

Religion. They are excessive lovers of drinking, both sexes; and like all the world, except christians, allow of polygamy; and are so charitable to strangers, that they will spare their daughters, or any body but their wives: But adultery they punish by setting a mark of infamy on the woman, and putting her away; and they have been pretty free with some of our countrymen when they have caught them, by putting some to death in a summary way, by a knife or a gun, or cutting off their ears. I have seen one so served. Their government is said to be monarchical; but I own I can't find it out to be so. Their chief commanders, who are honoured by us with the title of Kings, are appointed by our own Governors, by a writing sealed with the great seal of the province; which seal to them is every thing, for they know not a word of the writing. I never heard they did or durst put any man to death for not obeying them; and their conjurors or fortune-tellers, and their war Captains or Generals, are always greater men than their Kings. They pretend to an hereditary succession, and recommend the next in blood, in the male line, to the Governor; but I have been told they often alter that; and I know our Governors have appointed others who have shewn themselves better friends to the English, and these have been obeyed; but indeed very few of their Kings have much power among them. They have something like a council, consisting of about twelve or fourteen, more or less, whom they call beloved men; and those are such as have distinguished themselves in war, and have relations and large families, and consequently some credit and power in the clan they belong to; and by their assistance and concurrence they keep up some face of a government.

Religion of the English in the plantations. Having mentioned the religion of the Florida Indians, I proceed in the next place to enquire into the state of religion among the English in our Colonies on the same continent, of which Dr. BRAY, who visited most of them, gives but a melancholy account, in the year 1700, in his representation to the Bishops of the want of missionaries: And tho' things are altered for the better in some of our Colonies, it remains much as it was in others.

This reverend Doctor relates, that in Maryland, in the year 1700, after great struggles with the quakers, they had obtained an act for the establishment of the church of England there, and a revenue of about four-score Pounds per annum settled upon the Minister of every parish by a tax on Tobacco; but at that time there were many parishes that wanted incumbents.

That the papists in that province were then about a twelfth part of the inhabitants, but their

priests were numerous: And tho' the quakers CHAP. boasted so much of their numbers and riches, upon which considerations they moved the government to excuse them from paying their dues to the established church, they did not make a tenth part of the inhabitants, and did not bear that proportion they would be thought to do in wealth and trade.

That in Pefylvania there was then pretty near an equal number of churchmen (or those that were well disposed to the church) and quakers, but there was a great want of ministers; and there were some independents, but not many, nor much bigotted to their sect. There were also two congregations of Swedes, who were Lutherans, whose churches were finely built, and their Ministers lived in very good terms with the Minister of the church of England at Philadelphia; and the King of Sweden had lately made an addition to their library of three hundred Pounds worth of books.

That in the neighbouring colonies of East and West-Jersey there were some towns well peopled, but entirely left to themselves without priest or altar. The quakers were then a majority there; but there were many however well affected to the church, and he thought six missionaries necessary for both the Jerseys.

That at New-York Ministers were much wanted also, there being but one there: In Long-Island there were nine churches, but no church of England Minister then in the island.

In Rhode-Island, for want of clergy, the inhabitants were sunk into down-right atheism.

In North-Carolina there was not one clergyman then, and but one in South-Carolina.

As to Virginia, the church of England was at that time well established there, and the several parishes generally supplied with Ministers, who had a revenue out of the Tobacco and otherwise, of about an hundred Pounds per annum each.

As to New-England, independency was then, as it still is, the prevailing religion in that country; tho' the church of England gains ground there apace, as appears by the number of missionaries lately settled there.

Doctor BRAY concludes his address to my Lords the Bishops in the following manner:

For my own part, I take this to be so happy a juncture to lay the foundation of lasting good to the church of God in those provinces, that tho' after the expence already of above a thousand Pounds in its service, and tho' it is likely to be still at my own charge when I go again, yet I shall not make the least difficulty in accompanying your Lordship's missionaries whom from your respective dioceses you shall please to send into those parts. And being therefore so little interested myself in the mission, I hope I may with a better countenance, through your Lordship's patronage, presume to offer the following proposals to the very reverend dignitaries and wealthier clergy, and other well-disposed persons of the church, for a small subscription from each of them, towards the maintenance of those Missionaries their brethren, whom your Lordships shall please to send.

Proposals for the propagation of the Christian religion in the several provinces on the continent of North-America.

Whereas it hath pleased God of late to stir up Dr. the hearts of many people in the American Plan- BRAY'S tations, proposals.

CHAP. X. rations, who seemed formerly to have forgot religion, now to be very solicitous and earnest for instruction, so as of themselves to call for those helps which in duty they ought to have been prevented in by us from the beginning: And whereas, to our shame, we must own that no nation has been so guilty of this neglect as ours; the papists of all countries having been most careful to support their superstitions wherever they have planted; the Dutch with great care allowing an honourable maintenance, with all other encouragements for Ministers in their factories and plantations; the Swedes, the Danes, and other small colonies being seldom or never deficient in this particular, and we of the English nation only being wanting in this point: And lastly, whereas tho' it be true, that some of our most considerable plantations have set out parishes and allowances for Ministers, yet it is not so in all; and where some provision is made, it is as yet far short of being sufficient to maintain a Minister; and there is a total neglect of informing the poor natives. Out of all these considerations we do not think a more charitable work can be carried on than as much as in us lies to contribute towards the redress of these great failures: And therefore do subscribe to that purpose the several sums to our names annexed.

The occasion of erecting a society for the propagation of the gospel. The charter.

It seems to have proceeded from this gentleman's representation, in a great measure, that a society was erected the following year, viz. in the 13th of W. III. for the propagation of the gospel in foreign parts, the charter for the establishing whereof has this preamble:

1. Whereas we are credibly informed that in many of our plantations, colonies, and factories beyond the seas belonging to our kingdom of England, the provision for Ministers is very mean, and many others of our plantations, colonies, and factories are wholly destitute and unprovided of a maintenance for the Ministers and the publick worship of God; and for lack of support and maintenance for such, many of our loving subjects do want the administration of God's word and sacraments, and seem to have been abandoned to atheism and infidelity; and also for want of learned and orthodox Ministers to instruct our said loving subjects in the principles of true religion, divers Romish priests and jesuites are more encouraged to pervert and draw over our said loving subjects to popish superstition and idolatry.

2. And whereas we think it our duty, as much as in us lies, to promote the glory of God by the instruction of our people in the Christian religion; and that it will be highly conducive for accomplishing those ends, that a sufficient maintenance be provided for an orthodox clergy to live amongst them, and that such other provision be made as may be necessary for the propagation of the gospel in those parts.

3. And whereas we have been well assured, that if we would be graciously pleased to erect and settle a corporation for the receiving, managing, and disposing of the charity of our loving subjects, divers persons would be induced to extend their charity to the uses and purposes aforesaid.

Know ye therefore, that we have, for the considerations aforesaid, granted, &c.

Accordingly, several Missionaries were sent to the plantations by the said society.

N. B. The society allow ten Pounds worth of books to each Missionary for a library, and

five Pounds worth of small tracts to be distributed among their parishioners; and several other parcels of books as occasion offers, where the society find them wanting.

As to the provinces of Virginia and Maryland, they maintain their own clergy, and the rest of the colonies assign their Ministers glebes, build them houses, and increase their revenues by subscriptions; so that the church of England now makes a considerable figure in most of our colonies, especially in New-England, where the inhabitants where in a manner all independents formerly: North-Carolina, however, seems to be destitute of a clergy still, there being only Mr. Boyd, an itinerant preacher, tho' the country be of between two and three hundred miles extent, and a well peopled flourishing colony; and here the people, now sensible of their misfortune, shew a great disposition for the church of England, and are ever making application for Ministers to be sent amongst them, offering to contribute largely to their maintenance.

North-Carolina still without a clergy.

It is a melancholy consideration, that it has hitherto been thought more necessary to propagate and support the superstitions of the French hugonots and the Scots presbyterians (the former having an allowance of fifteen thousand Pounds per ann. and the other a thousand Pounds per ann.) than to support and propagate christianity in our own plantations; in some of which, particularly North-Carolina, our people have no opportunity of hearing divine service, or having the sacraments of baptism or the Lord's supper administered to them, and are in a manner become heathens for want of them. It is not to be supposed, that one Minister can perform divine service in every part of that well planted colony, two hundred miles in length, and almost of equal breadth; nor do we trouble ourselves with maintaining Missionaries for the conversion of the neighbouring Indians, who seeing no appearance of religion among the English, and probably as little morality, must naturally conclude we have very little of either.

I shall conclude the state of the British Colonies on the continent of America, with some observations on their minerals.

Of the minerals in the British plantations.

It was it seems the expectation of meeting with Gold and Silver mines, that first induced Sir WALTER RALEIGH and other English adventurers to send colonies thither; and we find our Princes, in every charter almost, have reserved a fourth or fifth part of all Gold and Silver ore that should be found there for their own use; and it seems highly probable, that such mines will some time or other be discovered in the mountains of Apalach, for the Silver mines in New-Mexico are upon the same continent, and in the same climate; and from these of Apalach, there are frequently washed down glittering sands, which seem to promise something valuable. Sir HANS SLOANE also informs us in his history of Jamaica, that the Duke of Albemarle, then Governor of that island, shewed him a rich piece of Silver ore, which his father had from the Apalathian mountains on the confines of Carolina. The Portuguese were much longer possessed of Brasil than we have been of this part of Florida, before they discovered any such mines, and now we find there are mines wrought there surprisngly rich: We are yet very little acquainted with the Apalathian mountains, we have no towns or settlements upon them (tho' we may when we please, for there are scarce

CHAP. X. scarce any other inhabitants but wild beasts) our people only pass over them when they go to traffick with the Indians near the banks of the river Mississippi; so that these mountains may be as well furnished with Silver as those in Mexico for any thing we know. But farther, supposing there should happen a rupture between us and the Spaniards, I see nothing that can prevent our passing the Mississippi, and possessing our selves of the mines of St. Barbe, if we make the Indians of those countries our friends, who are frequently at war with the Spaniards. I am apt to think, that neither the forces of the Spaniards or the French would be able to oppose our arms on that side, if our colonies were united in such an enterprize, and well supported by a body of regular troops from Great-Britain.

As to mines of Lead, Iron and Copper, it is evident, our plantations do not want these; for some of them are actually wrought, and these metals manufactured there; which is apprehended may in time prove prejudicial to Great-Britain, since it will lessen the demand for British Iron and Copper, and all manner of manufactures made of those metals: The importation therefore of Iron wrought, or in bars from our plantations, has already been prohibited. But was their Iron and Copper equal to that of Sweden, I cannot see why we might not import them unwrought from our plantations as well as from Sweden, where we pay crown-pieces for them (it is said;) whereas when we have them from our plantations, we purchase them with our manufactures, as we do also Pitch, Tar, and other naval stores; and yet we chuse to take these articles also of our northern neighbours, which I must confess is a mystery to me.

Whether
the discovery
of
Silver
mines

But to return to the Silver and Gold mines, which it is presumed will one day be discovered, or reduced under our power in Florida or New-Mexico; such an event must necessarily make a

considerable alteration in our constitution, if it does not entirely overturn it when it does happen; for as power is the constant attendant on riches, in this case the crown will become possessed of any treasures, which will give it a much greater influence than it has at present, and render parliaments much less necessary; whether it would be to the advantage of Great-Britain therefore, that our colonies should be possessed of mines of any kind may be difficult to determine.

However, I must still be of opinion such mines would be much better in our own hands than in the hands of our rivals; and if we suffer the French to build forts and fix themselves on the Mississippi, or in the neighbourhood of the Apalathian mountains, they will not only be in a condition to invade and harrafs our plantations from north to south, but will possess themselves of the mines there, if there be any, which will render that nation more formidable, even in Europe, than it is at present; and if they should meet with no Silver in those mountains, I am inclined to believe, they will seize the mines of St. Barbe in New-Mexico in a few years; which will affect the Spaniards first indeed, but may probably in the end be of pernicious consequence to the rest of the nations of Europe; and particularly England. It were to be wished therefore, that Spain and England would in time understand their mutual interest, and enter into a defensive alliance in America; at least since the French can only be defeated in their ambitious and covetous views by the united forces of Great-Britain and Spain. If they are suffered to establish themselves in Florida on the banks of the Mississippi, it will be in their power in that case to disturb either the British or Spanish settlements from thence when they please; but the Spaniards seem to be in the most imminent danger on account of their Silver mines,

Better in
our own
hands
than in the
hands of
the
French.

The interest
of
Spain and
Britain to
drive the
French
from Florida.

Jamaica is from East to West 105 miles in length, 50 miles from North to South, in breadth. It was taken from the Spaniards Anno 1655. Kingston which is the Chief Place of Trade since the ruin of Port Royal, lay in length 14 miles & in breadth 12. The Assembly who make the laws with the Governor & his Council, consist of 30 representatives, besides the Magistrate. It was first called 'St. Jago' by Columbus who discovered it. But as the name was afterwards changed to Spanish after James Duke of York.

C H A P. I.

Of the island of Jamaica.

CHAP.
I.
Jamaica.
The name.

THIS Island was called Jamaica by the natives when COLUMBUS discovered it, and he changed the name to St. Jago; but it soon recovered its primitive name, by which it is called at this day.

Situation. Jamaica is situated on the Atlantick-Ocean, between 17 and 18 degrees odd minutes north latitude, and between 76 and 79 degrees of western longitude. It lies near five thousand miles south-west of England, about twenty leagues east of Hispaniola, and as many south of Cuba, and upwards of an hundred and fifty leagues to the northward of Porto Bello and Carthagena, on the coast of Terra Firma.

Extent. This island stretches from east to west, being one hundred and forty miles in length, and about sixty in breadth in the middle; but growing less towards each end, the form is pretty near oval.

The whole island has one continued ridge of hills running from east to west through the middle of it, which are generally called the Blue Mountains. The tops of some are higher than others; one of the highest is called Mont Diablo. Other hills there are on each side of this ridge of mountains which are much lower.

Face of
the country, &c.
from Sir
HANS
SLOANE.

The outward face of the earth seems to be different here (says Sir HANS SLOANE) from what I could observe in Europe; the vallies in this island being very level, with little or no rising ground or small hills, and without rocks or stones. The mountainous part for the most part is very steep, and furrowed by very deep gullies on the north and south sides of the highest hills. The gullies are made here by frequent and very violent rains, which every day almost fall on these mountains, and first making a small trough or course for themselves wash away afterwards whatever comes in their way, and make their chanel extraordinary steep.

The greatest part of the high land of this island is either stony or clay; these sorts of soil resist the rains, and so are not carried down violently with

them into the plains, as are the mould proper for tillage, and other more friable earths; hence it is, that in those mountainous places one shall have very little or none of such earths, but either a tenacious clay, or a honey-comb, or other rock upon which no earth appears.

All the high land is covered with woods, some of the trees very good timber, tall and straight; and one would wonder (says my author) how such trees could grow, in such a barren soil, so thick together among the rocks: But the trees send down their fibrous roots into the crannies of the rocks, where here and there they meet with little receptacles, or natural basons of rain-water, which nourish the roots.

It is a very strange thing (says the same writer) to see in how short a time a plantation formerly cleared of trees and shrubs, will grow foul: Which comes from two causes; the one, the not stubbing up the roots, whence arise young sprouts; and the other the fertility of the soil. The settlements and plantations, not only of the Indians but the Spaniards, being quite overgrown with tall trees, so that there would be no footsteps of them left, were it not for old pallisadoes, buildings, Orange walks, &c. which shew plainly plantations have been there.

There are the same strata or layers of earth one over another, in the fruitful part of the island, as are to be met with in Europe. And the same difference of soil appears here as does in England, on digging of wells, &c.

Most of the savannahs or plains fit for pasture, and cleared of wood, like our meadow land, lie on the south side of the island; where one may ride a great many miles without meeting the least ascent: Some of these plains are within land encircled with hills.

These savannahs, after seasons, i. e. rain, are very green and pleasant; but after long droughts, are very much parched and withered.

The tides here are scarce discernible, there being very little increase or decrease of the water, and

CHAP. I. and that depending mostly, if not altogether, on the winds; so that the land winds driving the water off the island, makes a foot, two, or more ebb, which is most apparent in the morning. In the harbour of Port-Royal one may see the Coral-Rock, then sensibly nearer the surface of the water; and all along the sea-shore the water is gone for a small space, leaving it dry; and this much more on the south side of the island, when the norths blow. On the contrary, the sea-breeze driving the water on the shore of the island, makes the flood; so that in the evening it may be said to be high-water, especially if a south or other wind blows violently into the land for some time together, with which the water comes in and is much higher than ordinary. The breezes being stronger or weaker according to the Moon's age, it may be thought the tides or currents may follow that; but I rather believe, they only are the effect of the winds (says Sir HANS SLOANE.)

Ports. The chief ports in the island, are 1. Port-Royal, a fine capacious harbour, which will be described hereafter, with the town from which it received its name. 2. Old Harbour, which lies seven or eight miles south-west of St. Jago. 3. Port-Morant, at the east end of the island: And 4. Point Negril, at the west end of the island. Besides which, are several more on the south and north sides of the island; but it is dangerous approaching the coast without a pilot, on account of the Coral-Rocks which almost surround it.

Rivers. Sir HANS SLOANE mentions near an hundred rivers in Jamaica, but none of them navigable; for rising in the mountains in the middle of the island, they precipitate themselves down the rocks to the north or south, falling into the sea before they have run many miles, and carrying down with them frequently great stones, pieces of rock, and timber.

Water bad. The Doctor, speaking of their waters, in another place, says, fresh water is very scarce in dry years in the savannahs distant from rivers, so that many of their cattle die with drinking to water. Near the sea the well-water, as at Port-Royal, is brackish. This brackish water, which is very common in wells on sea-shores, is not wholesome, but the cause of fluxes and other diseases in Sailors drinking of it.

Their river water, because of its great descent and precipices, carries with it much clay or earth, whereby it is muddy and thick, and has an odd taste; which in St. Jago or the Town River gave occasion to the Spaniards to call it Rio Cobre, and the English to say, it is not wholesome and tastes of copper; whereas on trial of the sand and other sediments, there is no metal found therein. This river water, if suffered to settle some days in earthen jars, is good.

Springs and petrifying waters. Spring water, at a distance from the sea, is preferred to river or pond water: There are some springs as well as rivers, which petrify their channels, and stop their own course by a cement uniting the gravel and sand in their bottoms.

Hot bath. There is a hot bath or spring near Port-Morant, in the east part of the island, situated in a wood, which has been bathed in and drank of late years for the belly-ach, the common disease of the country, with great success.

Salt springs. A great many Salt springs arise in a level ground under the hills in Cabbage-tree-bottom, about a mile or two distant from the sea, which united make what is called the Salt River.

CHAP. I. Salt is made here in ponds, whereinto the sea or salt water comes, and by the heat of the Sun the moisture being exhaled, leaves the salt, which is in great plenty at the salt ponds about Old Harbour, &c. The salt is not perfectly white, nor in small grains, but in large lumps, and has an eye of red in it, as some Sal Gemmae I have seen come from Spain, or what comes from the island of Salt Tartuga, near the main of America; which is here reckoned the stronger and better salt.

Lagunas or great ponds, there are many here, one whereof, Rio Hoa pond, receives a great deal of water by a river, which yet has no visible rivulet or discharge runs from it.

Some rivers in the mountains rise above and go under ground again in a great many places: Rio d' Oro particularly falls under and rises above ground three or four times; and so it is in many others.

At ABRAHAM'S plantation, on the north side, is a river which has stopt its own course by letting a settlement fall and petrifying its own bottom.

It is ordinary to have cataracts or cascades, in rivers among the mountains, fifty or sixty foot high.

This island being several degrees within the tropick, has the trade-wind continually there, which is on the south side of the island called the sea breeze. It comes about eight o' clock in the morning, and increases or freshens till twelve in the day, and then as the Sun grows lower, so it decreases till there is none at four in the evening. About eight in the evening begins the land breeze, blowing four leagues into the sea, and continues increasing till twelve at night, and decreases again till four, when there is no more of it. This course generally holds true. The sea breeze now and then is more violent than at other times, as at new or full moon, and encroaches very much on the land winds and the norths when they reign, viz. in the month of December, January and February, blow over the ridge of mountains with violence and hinder the sea breeze, which blows stronger and longer near the sea, as at Port-Royal or Passage-Fort, than it does within land, as at St. Jago de la Vega or Spanish town; as contrariwise the land wind blows harder at the town than at Passage-Fort or Port-Royal.

As the trade wind between the tropicks comes not directly from the east, but varies from north-east to south-east, according to the place and position of the Sun, so the sea breeze here has the like variation, not coming always from the same point; on the contrary, the land winds or breezes come always from the ridge of hills, and from the same point of them, and this holds both on the north and south sides of this island. In vallies amongst the mountains, the sea breeze or land breeze has seldom any great influence, but the north winds very much prostrating great trees.

The land wind blowing at night, and the sea breeze in the day-time, no shipping can come into port except in the day, nor go out but soon after break of day.

The norths come in when the sun is near the tropick of Capricorn, and so farthest off southerly. This north is a very cold and unhealthy wind; it is more violent in the night, because it then

CHAP. I. then has the additional force of the land wind with it. It checks the growth of canes and all vegetables on the north side of the island, but is hindered by the ridge of mountains from shewing much of its fury on the south, where it seldom rains with this wind.

Rains. The south winds bring the most lasting rains or seasons. No rains from the land are lasting on the south side of the island.

As at sea in the trade winds one meets with tornadoes, so at land here sometimes will be a violent west, directly contrary to the trade wind; but this happens seldom, and is soon over.

The sea breeze, when it blows hard, is thought to hinder the rain from coming to the plains, it for the most part then raining on the hills. On this account it is that there are in the mountains many springs and rivers, and few or none in the plains; and this is likewise the cause why there is never any want of water in the rivers coming from them through the plains; and likewise that sometimes rivers suffer very great increase and inundations in the plains, when no rain has fallen in the places where such inundations appear.

**Earth-
quakes
from the
same.**

Earthquakes, as they are frequent in Hispaniola where they have formerly thrown down the town of St. Domingo, so they are too common here also. The inhabitants expect one every year, and some of them think they follow their great rains. One happened on Sunday the 19th of February, 1688, about eight in the morning. I found in a chamber, one story high, the cabinets and several other moveables on the floor to reel as if people had raised the foundation of the house. It came by shocks, there were three of them, with a little pause between: It lasted about a minute in all, and there was a small noise accompanied it: It was felt all over the island about the same time, some houses being cracked and very near ruined, and very few escaped some injury. The people were in a great consternation, and the ships in Port-Royal harbour felt it. It was observed that the ground rose like the sea in waves as the earthquake passed along: But this was nothing to the earthquake which happened at Port-Royal, in the year 1692, when that town was almost swallowed up by one; of which I shall give a further account when I come to describe their towns.

Thunder. Thunder is here almost every day in the mountains with the rains there, so that any person in the plains may hear it as well as see the rain. It does not so ordinarily accompany those rains that come from the sea, although when it does it is very violent, and has on the several substances it meets with, either animate or inanimate, the same effects as follow thunder in Europe.

Lightening for the most part precedes thunder in this island as elsewhere: And if it be fair weather, especially in the hottest seasons, it lightens almost all the night, first in one part of the sky or horizon out of some clouds, and then out of others opposite to them, as it were answering one another, as it happens often in the summer in England, &c. and gives occasion to people of fancy to foretel strange wars, &c. when they please; making these apparitions in the air soldiers in battalia, &c.

Hail.

Frost or snow are never seen in this hot climate, but sometimes hail, and that very large, of which, during my being here, I saw one instance; it comes with very great norths, which

reach with great violence to the south side, and throw down every thing before them.

The dews here are so great within land, that the water drops from the leaves of trees in the morning as if it had rained. One riding in the night will find his cloaths, hair, &c. very wet in a small time. But there are few if any fogs in the plains or sandy places near the sea.

The rains here are violent, and the drops very large.

According to the different positions of places, so the rains are more or less violent, and come at different times; but generally speaking, the two great rainy seasons are in May and October, in which months, at new or full moon, they begin and continue day and night for a whole fortnight: So that the earth in all level places is laid under water for some inches, and it becomes loose for a great many inches deep, and consequently the roads are almost unpassable. In the town of St. Jago de la Vega, in those rainy seasons, I was forced to ride on horseback (says Dr. SLOANE) although but from door to door, to visit the sick. And these seasons, as they are called, from their being fit to plant in, are generally so over the whole island; tho' they are much altered in their time and violence of late years, which arises from the clearing much of the country of wood.

In the month of January is likewise expected a season of rain; but this is not so constant nor violent as the other two; and probably may come from the violent north at that time passing over the mountains with part of their rains with them.

The island is divided into fourteen parishes or Towns. They have very few towns; the chief are, 1. St. Jago de la Vega or Spanish-town. 2. Kingston. 3. Port-Passage; and, 4. That of Port-Royal.

St. Jago de la Vega, or Spanish town, is pleasantly situated in a fine plain upon the river de la Cobre, which falls into a bay of the sea that forms the harbour of Port-Royal, about seven miles below. It consists of eight hundred or a thousand houses, and is the capital of the island; for here the Governor resides, and the general assembly and courts of justice are held; This was the capital of the island also when in possession of the Spaniards; and then it was much larger and more magnificent than at present; containing, as it is said, two thousand houses, besides several fine churches and monasteries, which were laid in ashes by the soldiers when it was taken by the English.

Kingston in the Liguanea, is a port town situated on the north side of the bay of Port-Royal, ten or twelve miles south-east of St. Jago; and, since the repeated misfortune of the town of Port-Royal, is become a large and populous place, much frequented by Merchants and sea-faring men.

Port-Passage is a sea-port town, situated at the mouth of the river Cobre, seven miles south-east of St. Jago; and obtained its name from being the greatest thorough-fair in the island, at least between Port-Royal and the city of St. Jago de la Vega. The town is not large, but consists chiefly of houses of entertainment; and being a considerable pass has a fort erected for its defence.

Port-Royal, before it was destroyed by an earthquake, in the year 1692, is thus described by Mr. BLOME:

It

CHAP.

I.

It was situated in the south-east part of the island, at the extremity of a long slip or point of land, running westerly about twelve miles from the main island; having the ocean on the south, and a fine bay of the sea, which forms the harbour, on the north, well defended by several forts and platforms of Guns. The harbour is about three leagues broad in most places, and so deep that a ship of seven hundred tons may lay her side on the shore and load and unload at pleasure; nor does there want good anchorage in any part of it.

The point of land on which the town stood was exceeding narrow, and nothing but a loose sand that afforded neither grass, stones, fresh water, trees, or any thing that could encourage the building a town upon it, but the goodness and security of the harbour.

It contained above fifteen hundred houses, and was so populous and so much frequented by Merchants and planters, that the houses were as dear rented as in the well-traded streets of London.

Three times destroyed.

This was the condition of Port-Royal when Mr. BLOME wrote, in the year 1688. But this unfortunate town has been almost totally destroyed three times in our memory: First, In the year 1692 by an earthquake. Secondly, In the year 1702 by a fire. And, thirdly, In the year 1722, by a violent storm and inundation of the sea.

1. By an earthquake.

It was on the 7th of June, 1792, the earthquake happened, which, in two minutes, destroyed most of the town. The earth opened and swallowed up abundance of houses and people; the water gushed out from the openings of the earth and tumbled the people on heaps; but some of them had the good fortune to catch hold of beams and rafters of houses, and were afterwards saved by boats. Several ships were cast away in the harbour; and the Swan frigate, which lay in the dock to careen, was carried over the tops of the sinking houses, and did not however upset, but afforded a retreat to some hundreds of people, who saved their lives upon her. Major KELLEY, who was in the town at this time, says, the earth opened and shut very quick in some places, and he saw several people sink down to the middle, and others, appeared with their heads just above ground and were squeezed to death. The sky, which was clear before the earthquake, became in a minutes time as red and as hot as an oven. The fall of the mountains made a terrible crack, and at the same time dreadful noises were heard under the earth. The principal streets which lay next the key, with large warehouses and stately brick buildings upon them were all sunk. Part of the town, however, was left standing on a neck of land which run into the sea; at the extremity whereof stood the castle, which was shattered but not demolished. The water of the harbour, says another writer, rose on a sudden with huge waves, and drove most of the ships from their anchors; and immediately the sea retired again two or three hundred yards, leaving the fish dry upon the sand, but returned in less than two minutes and overflowed part of the shore. After the first great shock, as many people as could got on board the ships left in the harbour, not daring to venture on shore for some weeks; the shocks still continuing. It is computed fifteen hundred people were lost in the earthquake, and as many more by sickness, supposed to be occasioned by

the noisome vapours that proceeded from the openings of the earth. CHAP. I.

The earthquake was general all over the island, and the noise in the mountains so terrible, that many of the fugitive slaves that had run away thither returned to their masters. Two mountains which lay between St. Jago and Sixteen-mile-walk joined together and stopped the current of the river, so that it overflowed several woods and savannahs. On the north side of the island above a thousand acres were sunk with the houses and people in them; the place appearing for some time like a lake was afterwards dried up; but no signs of houses were to be seen. At Yellows a great mountain split and destroyed several plantations with the people on them; and one plantation was removed a mile from the place where it formerly lay. The houses were in general thrown down or damaged all over the island; and it is computed that three thousand people were killed with those that were lost in Port-Royal.

The town being rebuilt near the place where the former stood, was a second time destroyed by fire on the 9th of January, 1702-3. Every house was consumed that day, only the two royal forts and magazines were left standing. Whereupon the government looking on the place as unfortunate, ordered the inhabitants to remove to Kingston on the opposite side of the harbour, and there the courts and offices were ordered to be held that used to be held at Port-Royal. However, this was found to be so commodious a station for shipping, that the people some time afterwards ventured to rebuild it a second time.

It was a third time destroyed by a storm and inundation of the sea, on the 28th of August, 1722, of which we received the following account, in a letter from Jamaica.

The sea being raised by the violence of the wind to a much greater height than was ever known before, broke over its ancient bounds, and on a sudden overflowed a large tract of land, carrying away, with an irresistible fury, men, houses, cattle, and every thing that stood in its way: And in this calamity the unfortunate town of Port Royal had its full share. I want words to give you a just description of the horror of that scene which we the unfortunate sufferers beheld, when the sea broke in upon us from all quarters with an impetuous force, concurring with the violence of the wind to cut off all hopes of safety; for we had no other choice but to perish in the waters if we fled from our houses, or of being buried under the ruins if we remained in them. In this dreadful suspense we were held for several hours; for the storm began about eight in the morning and did not sensibly abate till between twelve and one; during which time the wind and sea together demolished a considerable part of the town, laid the church even with the ground, destroyed above one hundred and twenty of the white inhabitants, and an hundred and fifty slaves; and ruined all the store-houses, with the goods and merchandize in them. The situation of the place, it being surrounded on all sides with the sea, rendered it more exposed than any other to the fury of this element; for our only defence against the sea, is a great wall running all along the eastern side of the town, where we used to apprehend most danger. This wall is raised about nine foot above the surface of the water, and is about

2. Destroyed by fire.
3. Destroyed by an inundation.

CHAP. I. about seven foot thick, and for twenty years had proved a sufficient security to the town; but in this storm it broke over the wall with such a force as nothing was able to withstand. Two or three rows of houses that run parallel to the wall were entirely washed away, among which the church, an handsome building, and very strong, was so perfectly demolished that scarce one stone was left upon another. Great part of the castle also was thrown down, tho' it was of a prodigious thickness, and founded upon a rock: And the whole fortress was in the utmost danger, the sea breaking over the walls which stood thirty foot high above the water.

In the highest streets of the town, most remote from the sea, the water was five foot deep, and so rapid that the strongest man could not stem it, so that we were obliged to keep in our upper-rooms, tho' we were in danger of perishing every minute by the fall of the houses, which shook in a very terrible manner, and the roofs were generally blown off.

The morning in which the storm happened, there was a great fleet of merchant ships riding in the harbour, most of which had taken in their full freight, and were to have returned home in a few days, but the storm left only one vessel in the harbour, besides four sail of men of war; and these had all their masts and rigging blown away; but the most sensible proof of the irresistible force of the storm was the vast quantities of stones that were thrown over the town-wall, of which such a prodigious number were forced over, that an hundred Negroes were employed six weeks in throwing them back into the sea, some of them being so large that nine or ten men could not heave one of them back again over the wall. I am sensible this part of the relation will seem strange; but I doubt not obtaining your belief when I affirm it to you for a certain truth.

The town of Kingston also received great damage, abundance of houses being blown down there, and many more shattered and uncovered; abundance of rich goods were spoiled by rain which fell at the same time, and some people were killed. And of all the vessels which rode in Kingston harbour, which were between forty and fifty sail, they were either driven on shore, or over-set and sunk, abundance of sea-men lost, and some large ships with all their loading were thrown upon dry land. The damage which the trading part of the island has sustained by the loss of their shipping and goods is not to be expressed: And the planting interest has shared in the calamity by the loss of their dwelling-houses, Sugar works, and otherwise; and had the fury of the storm lasted much longer universal ruin must have ensued.

Buildings. The buildings of the Spaniards in this island were of timber, seldom more than one story high, and they fixed the principle posts deep in the ground to prevent their being shook in pieces by earthquakes. On the contrary, the English build with brick, and frequently pretty high as in England, which has sometimes proved fatal to them; neither are these brick houses so cool as those of the Spaniards were: Their kitchens are always at a distance from the house, on account of the heat and smells occasioned by their cookery; and they have no chimneys or fire-places in their dwelling-houses. The houses of the great planters also are at a distance from their Sugar-works, to avoid the disagreeable smells: And the Negroes

houses stand at a distance from their masters, being only long thatched huts, furnished with mats to lie on, earthen pots to dress their food, and some calabashes, which serve them for pails, bowls, and dishes.

The inhabitants are either English, or of English extraction born in the island, Indians, Negroes, Mulatto's or Mestize, or the descendants of these.

The English, and those of English extraction, Numbers may be fifty thousand; the Indians are but few; all the natives having been destroyed by the Spaniards, and some only remaining they imported afterwards for slaves, and some few the English have brought hither; the rest, viz. Negroes, Mulatto's, Mestize, and their descendants, may amount to an hundred and fifty thousand, or thereabouts.

The English here follow the fashions of their mother country in their habits, making no allowance for the difference of climate; which Sir HANS SLOANE reproves them for. As to their slaves they work naked, except a piece of linen cloth about their loins; but they have a little canvas jacket and breeches given them by their masters annually at Christmas to wear on holy-days.

The meat of the inhabitants of Jamaica is generally such as in England, namely, beef, pork, and fish, flour, and pease, salted flesh and fish sent from the British Colonies on the continent; on which not only the masters feed, but, according to Sir HANS SLOANE, they are obliged to furnish their servants, both whites and blacks, with three pounds of salt beef, pork, or fish, every week, besides Cassavi bread, yams and potatoes, which they eat as bread, and is the natural product of the country.

There are in the savannahs great plenty of cattle; but they cannot keep beef many days, tho' it be salted; and fresh beef is ready to corrupt in four or five hours. Butchers always kill in the morning therefore, just before day, and by 7 o'clock the markets for fresh meat are over.

Their beef here is well-tasted and good, unless when Guinea Hen-weed rises in the savannahs; which is immediately after rains, or when they are so parched that cattle can find nothing else to feed on.

The Butchers remedy the smell of the Guinea Hen-weed in cattle, by putting them into other feeding grounds before they are slaughtered.

Veal is very common, but none thought good but what comes from Luidas, where the Calves are white-fleshed; whether this comes from this place being mountainous, or bleeding and giving them Chalk as in Essex, I cannot tell; but the price of it was so extravagant, that in the assembly they pass an act that it should not be sold dearer than twelve Pence per pound.

A great part of the food of the best inhabitants, for their own table, is of the produce of the island; viz. swine-flesh, and poultry of their own raising.

The swine are of two sorts, one running wild in the country amongst the woods, which feed on the fallen fruits, &c. and are sought out by hunters with packs of Dogs, and chiefly found in the more unfrequented woody parts of the island. After they are wearied by the Dogs and come to bay, they are shot or pierced through with lances; then being cut open, the bones are taken out, the flesh gash'd, and the skin filled with

CHAP. I. with salt and exposed to the sun, which is called jirking. It is brought home to their masters by the hunters, and eats much like bacon if broiled on coals. These hunters are either blacks or whites, and go out with their Dogs, some salt and bread; and lie far remote from houses in huts in the woods for several days, in places where swine come to feed on the fruits. The Indians are very expert at this sport. The same method is used for wild kine, which are now but very few; and those in the woods on the north-side. Wild Goats there are some on the Salt-pan Hills, not to be seen but in dry seasons when they come down for water.

Swine fed at Crawles are in very great plenty: These Crawles are houses and sties built for feeding and breeding Hogs. The swine come home every night from feeding on the wild fruits in the neighbouring woods on the third sound of a Conch-shell; where they are fed with some ears of Corn thrown amongst them, and let out the next morning, not to return till night or they hear the sound of the shell.

A Palenque is here a place for bringing up of poultry, as Turkeys, which here much exceed the European, and are very good and well-tasted, Hens, Ducks, Muscovy Ducks, and some very few Geese. Muscovy Ducks are here most plentiful, and thrive extremely, they coming originally from Guinea. These poultry are all fed on Indian or Guinea Corn, and Ants nests brought from the woods, which these fowls pick up and devour greedily.

Cattle are penned every night, or else in a short time they run wild: These pens are made of palisadoes, and are looked after very carefully by the planters. The Oxen which have been drawing in their mills and are well-fed on Sugar Cane Tops, are reckoned the best meat if not too much wrought. They are likewise fattened by Scotch Grass.

Turtle (Tortoises) are of several sorts; those of the sea called Green Turtle, from their fat being of that colour, feed on Conches or Shell-fish, and are very good victuals: These are eaten by abundance of the people, especially of the poorer sort of the island. They are brought in sloops, as the season is for breeding or feeding, from the Caymanes, or South Cayos or Rocks near Cuba, in which forty sloops, part of one hundred and eighty belonging to Port-Royal, are always employed. They are worth fifteen shillings a-piece, best when with egg, and brought and put into pens or palisadoed places in the harbour of Port-Royal, whence they are taken and killed as occasion requires. They are much better when brought in first than after languishing in those pens.

They infect the blood of those feeding on them; whence their shirts are yellow, the skin and face of the same colour, and their shirts under the armpits stained prodigiously. This, I believe (says Sir HANS SLOANE) may be one of the reasons of the complexion of our European inhabitants, which is changed in some time from white to that of a yellowish colour, which proceeds from this as well as the jaundice, which is common sea-air, &c.

Land Turtles are counted more delicate food than those of the sea, although smaller.

All sorts of Sea-Turtle or Tortoise, except the green, are reckoned fishy and not good food.

The Manati or Sea-Cow is taken in this island very often in calm bays by the Indians; it is reckoned extraordinary good eating.

Fish of all sorts are here in great plenty; but care must be taken they are not poisonous; this is known by the places where they are; if Manchance Apples are eaten by them they are very dangerous; and these Apples frequently drop into the sea from the boughs of that tree.

Salt Mackarel are here a great provision, especially for Negroes; who covet them extremely in Pepper-pots or Oglis, &c.

What is used for bread here by the inhabitants is very different from that in Europe; that coming nearest our bread is made of Cassavi Flour.

This bread is worth about twenty Shillings and Six-pence the hundred weight; sometimes double that, according to its scarcity. People who feed altogether on this, live as long and in as good health as they who feed on any other sort of bread; tho' the juice pressed from this root is rank poison.

Plantains is the next most general support of life in this island. They are brought in from the Plainwalks, or places where these trees are planted, somewhat green; they ripen and turn yellow in the house before they are eaten. They are usually roasted, after their first being cleared of their outward skins, under the coals. They are likewise boiled in Oglis or Pepper-pots, and prepared into a paste like dumplings; and several other ways. A drink is also made of them.

Potatoes are eat as bread in this place; also roasted under the coals, or boiled.

Yams are likewise used here in lieu of bread, and are prepared as the others; only because they are very large they are usually cut in pieces.

Grains in use here are, 1. Guinea Corn. 'Tis prepared and used as Rice, and tastes as well, and is as nourishing. It is also the food of the poultry and Pigeons.

2. Indian Corn or Maiz, either roasted or boiled, is fed on by slaves; especially the young ears of it before ripe baked under the coals and eaten; this is thought by them very delicious, and called mutton; but it is most used for feeding cattle and poultry.

3. Rice is here planted by some Negroes in their own plantations, and thrives well; but because it requires much beating, and a particular art to separate the grain from the husk, it is thought too troublesome for its price, and so neglected by most planters.

Pease, Beans, and Pulse, of sorts different from those in Europe, are here very common. They are eaten when green as ours of Europe; and when dry, boiled, affording the Negroes very good and strong provisions.

Flour from New-York is counted the best; but this as well as all other flour and biscuit, are very subject to be spoiled with Weevils or small Scabæ, if long kept.

Chocolate is here drank at all times; but chiefly in the morning.

The common use of this by all people in the several countries of America (Sir HANS SLOANE observes) proves its being a wholesome food. The drinking of it warm may make it the more stomachick; for we know by anatomical preparations that the tone of the fibres are strengthened by dipping the stomach in hot Water, and that hot liquors will dissolve what cold will leave unaffected.

Besides these ordinary provisions, the Raccoon, a small quadrupede, is eaten. Rats are likewise fold by the dozen, and when they have been bred amongst

CHAP. I. amongst the Sugar-canes are thought by some discerning people very delicious victuals. Snakes or Serpents, and Cossi (a sort of Worms) are eaten by the Indians and Negroes.

And
Snakes.
Liquors.

The most common drink is water, and reckoned the most wholesome by many, among whom I am one (says Doctor SLOANE;) and he seems to recommend the drinking a draught every morning. Madera is the next most general drink mixed with water. Madera Wines have this particular quality, different from French Wines and all others that are brought hither, that it keeps better in a hot place or exposed to the sun, than in a cool cellar; whereas other wines must be kept cool here, and if you do they turn sour in a short time. Syder, Beer, and Ale, are also brought hither from the northern colonies, or from England, but do not keep well.

Cool drink made of Molosses and Water Perino, Corn-drink, Cane-drink, that made of Sorrel or Pines, are all accounted unwholesome, turning sour in twelve or twenty-four hours, and owing their strength to the Sugar and fermentation they are put into; although I have known some people drink nothing else, and yet have their health very well.

Acajou Wine, made of the fruit so called, is very strong, keeps not long, and causes vomiting; it is reckoned a good remedy in the Dropsy.

Plantin-drink is stronger than any of the others except Acajou Wine, though subject to grow sour in a short time.

The common fuddling liquor of the vulgar is Rum-punch. Rum is made of Sugar-cane Juice, not fit to make Sugar of, being eaten with Worms, growing in a bad soil, or through some other fault; but chiefly of the skimmings of the copper in crop-time, or of Molosses and water fermented about fourteen days in cisterns and then distilled: It has all the good and bad qualities of Brandy, or any fermented and vinous spirit.

Lodgings.

The better sort of people lie as in England, though more on mattresses or quilts, and with little covering. They hold here, that lying exposed to the land breezes is very unhealthy; which I do not believe (says my author) to come so much from the qualities of the air, either manifest or more obscure, as from this, that the air when one goes to sleep here being very hot, the sunbeams having heated it so long, it retains this heat for some considerable time in the night; which afterwards wearing away it grows towards morning very cold, and affects one by the coldness sometimes so much as to awake one if sleeping. This must of necessity check transpiration, and so may be the cause of many diseases. To avoid this, Negroes and Indians sleep not without a fire near them.

Hamacas, or hammocks, are common beds of ordinary white people; they were in use amongst the Indians, and are much cooler than beds, so cool as not to be lain in without cloaths, especially if swung, as is usually the custom here.

Indians and Negroes lie on the floors, generally on mats made of Rushes, with very little or no covering, and a small fire near them in their cottages. Hence the servants who lie not in beds are not said to go to bed, but to go to sleep; and this phrase has generally obtained all over the plantations.

Beds are sometimes covered all over with Gauze, to hinder the Mosquitos, or Gnats, from buzzing

about, biting, or awaking those lying in them. CHAP. I. This is chiefly after rain.

It is esteemed here the wholesomest way to go to bed early and rise early.

Exercises here are not many because of the heat of the air; riding in the mornings is the most ordinary, which by its easy moving the Abdomen, and so consequently its contents, and by that means forwarding the depuration of the blood in the several emunctories there placed, has a very great power in keeping a man in sound health as well as recovering a man when sickly and ill.

The principle vegetables and produce of this island are Sugar-canes, Cocoa of which Chocolate is made, Oranges, Lemons, Citrons, Palms, Coco Trees, Cotton, Indigo, Tobacco, the Pickle Pear, woods for dying, Salt, Ginger, Cod, Pepper, Pimento Drugs, such as Guaiacum, China Root, Sarsaparilla, Cassia, Fistula, Tamarinds, Venella's, gums and roots used in medicines and surgery.

Here grows the Machineel Tree, which bears a beautiful but poisonous apple, and the Mohogany, the timber and planks of both which are now in great esteem with us; and they have the like forest trees as are found in the continent of America in the same climate.

Their animals are Horses, Mules, Asses, Oxen, Sheep and Hogs, Goats and Rabbits; but they have no Deer or Hares.

They have also very good sea and river fish, and poultry, Turkeys, Geese, Ducks wild and tame, Pigeons, Guinea Hens, Snipes, Parrots, Parakeets, and several others already mentioned in speaking of their food.

There are also Alligators, or Crocodiles, in their waters, and they have some Snakes; but the latter are not venomous it is said.

Sir HANS SLOANE speaking of their diseases and remedies observes, that here are the same diseases and the same methods of cure as in Europe: That fluxes and fevers of all kinds, as well as dysenteries or bloody-fluxes, are very common here with all kind of people: And for fluxes provided they were moderate, he gave some easy medicine to forward them; but if attended with a high fever, or there was so great an evacuation that the patient was grown weak, he used to order bleeding: That very often in this distemper, and in the gripes or belly-ach, which is another common disease in this country, occasioned chiefly by drinking sour punch and other pernicious liquors, there was an inflammation in the guts, which often occasioned a gangreen, if not timely remedied: And in this case, besides the usual remedies, he used to order Rice to be boiled in water for their ordinary drink: And in epidemick dysenteries he had known flour boiled in Milk, with some Wax scraped in it, do very great cures. But I must refer my reader to Dr. SLOANE's natural history of Jamaica for a full account of their diseases and cures, it not being consistent with so general a work as this to be more particular.

I shall only observe further, that the harbour of Port-Royal may well be looked upon as the grave of our marine Officers and seamen, many thousands having perished there by the unhealthfulness of the place, or their own irregular way of life in a climate so different from that of their native country. And it must be admitted that let a man be never so careful of his health here, both the air and the water are so bad near the coast

Port-Royal
harbour
fatal to
English
seamen.

CHAP.

I.

coast, that these alone are sufficient to destroy his health; but as I understand Dr. SLOANE, both the water and air are good at a distance from the shores; and the inland country of Jamaica is as healthful as any other, but hither sea-faring people, who belong either to men of war or merchant men, seldom come; their business obliges them to remain on board in that fatal bay, or at the port-towns bordering upon it, which are not much better.

History.

Jamaica was discovered by COLUMBUS in his second voyage to America, anno 1493, and planted by the Spaniards some few years afterwards. Their first colonies were settled on the north side of the island, and here they built a town, giving it the name of Seville; but observing that neither the weather nor the soil was so good as on the south, they built the town of St. Jago de la Vega on the River Cobre, which falls into the bay of Port-Royal, in the south-east part of the island. This town in time increased to a large city, consisting of two thousand houses; and here they lived in great splendour and security for near a century, having parcelled out the richest lands amongst them, which they planted chiefly with Cocoa for their Chocolate, Corn, Sugar, and delicious fruits that were cultivated by their Negroes, of whom they entertained great numbers: They also stocked the country with all manner of European cattle, many of which being turned into the woods grew wild, and increased prodigiously in the mountains.

In the year 1596, being about an hundred years after the Spaniards discovered it, Sir ANTHONY SHIRLEY cruising in these seas with a single ship of war, landed on the island of Jamaica, took the town of St. Jago de la Vega and plundered it; so little did the Spaniards dream of an enemy here, or provide for their defence, imagining this new world to be all their own, and that no European power durst disturb them in the enjoyment of it.

After this misfortune, the Spaniards erected a fort at the mouth of the River Cobre, to which they gave the name of Passage-Fort, by which they imagined they should prevent their capital being surprized for the future; but Col. JACKSON coming before Port-Passage with a fleet of English privateers, in the year 1635, or as others say, 1638, landed five hundred men, drove the Spaniards from their works at Port-Passage, and advancing to St. Jago made himself master of the town and plundered it, obliging the inhabitants to raise a considerable sum to ransom it from burning; after which he retired to his ships.

Still the Spaniards remained in possession of the island till the year 1656, when Admiral PENN and General VENABLES being sent by the usurper CROMWELL to reduce Hispaniola, and being disappointed in that attempt, to save their credit, invaded Jamaica, and made a complete conquest of it.

And the Spaniards have been so far from attempting the recovery of the island, that they yielded and confirmed it to Great-Britain by a subsequent treaty of peace.

Some disturbance the English however have met with from time to time from the Negroes in the mountains; for when the Spaniards left the island, their Negroes retired to the most inaccessible part of the mountains, and there fortifying themselves, bid defiance to the English, who were never able to reduce them entirely, but some of them remained there till they were joined by other fugi-

tives of the same complexion, slaves to the English planters, and at length increased to so great a body, that they became formidable to the plantations, in which they committed many murders and robberies. And notwithstanding his Majesty has sent two regiments to the assistance of the colony, they still maintain their ground I perceive; and all that the soldiers can do is to guard the plantations from their ravages.

During King WILLIAM's war also, I find, the French from Hispaniola landed some forces on the island in the year 1694, and plundered several of the plantations: But they were soon beat off, and some forces being sent from England to their assistance, the gentlemen of Jamaica returned their visit, made a descent on Hispaniola, and plundered several places in possession of the French, bringing away with them fourscore pieces of cannon, and a considerable booty.

As for the present state of Jamaica, we may best understand it from themselves, in their address or representation to the throne, viz.

To the King's most excellent Majesty.

The humble address and representation of the council of Jamaica.

Most gracious Sovereign,

We your Majesty's most dutiful and loyal subjects, your council of Jamaica, having taken into our consideration the declining state and condition of this island, think ourselves indispensably obliged, in duty to your Majesty, and in justice to ourselves and our country, humbly to make some representation thereof to your Majesty. We shall forbear troubling your Majesty with the many melancholy reflections the present situation of our affairs hath naturally led us into, and shall chiefly confine ourselves to the most obvious and visible causes of our misfortunes, the increase and success of our rebellious slaves, the decrease of our white people, and the decay of our trade and planting interest: The first hath in some part been guarded against by your Majesty's great goodness in sending, and we hope continuing amongst us, two regiments of soldiers for our preservation. The decrease of our people is in great measure owing to our loss of commerce; and therefore we shall endeavour to point out some of the many causes of this latter evil. We are, of late years, deprived of the most beneficial branch of our trade, the carrying of Negroes and dry goods to the Spanish coast; the loss of this occasioned the desertion of a considerable number of our sea-faring men and others from this island for want of employment. A farther discouragement to our trade is the frequent hostilities committed by the Spaniards, who, regardless of the solemn treaties entered into with your Majesty, spare no English vessel they can overcome, and from whom it has hitherto been in vain to attempt the obtaining any satisfaction in these parts. We likewise beg leave to observe, that the bays of Campeachy and Honduras, were many years in the possession of your Majesty's subjects, and reputed part of the territories depending on your Majesty's government of this island, and gave employment to a considerable number of shipping and people to cut and carry Logwood from thence; but we have been dispossessed of them by the Spaniards, who likewise there seized, and made prizes of a great number of ships belonging to your Majesty's subjects.

The low value of our produce may be very justly attributed to the great improvement the French

The present state of Jamaica represented in an address to the throne.

CHAP. I. French have made in their Sugar Colonies by the encouragement given them, particularly in allowing them to export their commodities to foreign markets without first introducing them into any of the ports of France; and from the lowness of their duties, and being under no necessity of double voyages, they can afford to undersell us; and likewise by the pernicious trade that is carried on from Ireland and your Majesty's northern colonies to the French Sugar Islands.

It is well known, that Sugar and other commodities produced in the French and Dutch Colonies are frequently imported into Ireland without introducing them into the ports of Great-Britain, and paying the duties as your Majesty's subjects of your Sugar Colonies are obliged to do; and consequently those foreigners are supplied with provisions at easier rates than we; and we are in a manner deprived of a very considerable market in that part of your Majesty's dominions.

Your Majesty's northern colonies import into this island great quantities of provisions and other goods, for which they take no part of our produce in exchange (a small quantity of Molasses excepted) but are paid in bullion, which they carry to Hispaniola, and buy Sugar, Rum, and Molasses for their own use. This trade is not only unequal and injurious to us, but prejudicial even to themselves, and highly so to our mother country, and drains us of so much bullion in favour of France, which otherwise might have centered in Great-Britain.

We further beg leave to observe to your Majesty, that Cacao was one of the principal commodities of this island, and a great encouragement to the settling it; but that it is now lost, which is in a great measure owing to the restrictions and heavy duties laid on it in Great-Britain; and possibly our Sugar, Rum, Ginger, and other produce, may be attended with the same ill consequences, if not timely remedied.

As the industrious planters of this island have lately introduced Coffee, and begun to make plantations thereof, we humbly beg leave to represent it, and to address your Majesty for some encouragement, either by a bounty on importation or otherwise, that such settlements may be carried on with the greatest cheerfulness. (An act has passed since for encouraging the planting of Coffee.)

We have already taken up too much of your Majesty's time and patience in this representation; but our zeal for your Majesty's service in the preservation of this colony, and the natural love we owe to ourselves and to our country in which is our all, has encouraged us to lay these particulars before your Majesty. We humbly submit them to your royal consideration, and hope for such relief as in your Majesty's great wisdom shall be most advisable, that we, with the rest of your Majesty's subjects, may enjoy the blessings of a reign glorious in itself, and so capable of making us, and our posterity, a happy and flourishing people.

St. Jago de la Vega,
Nov. 27, 1731.

By order of the council,
JOS. MAXWELL,
Clerk of the council.

But it must be remembered here, that the trade of the British northern colonies with the French and other foreigners for Sugar, Rum, &c. is now in some measure restrained by a duty laid on foreign Sugar, Rum, and Molasses; and the trade of foreigners to Ireland, with foreign Sugar, &c.

VOL. III.

is likewise in a great measure prevented by a late act of parliament; but the Spaniards it seems continue at this day to take our ships in the West-Indies as formerly; as appears from an address of the Merchants of Jamaica to the honourable JOHN GREGORY, Esq. President and Commander in chief of that island; wherein they shew,

That the Spaniards have lately (anno 1737.) taken and carried into the Havannah three ships all laden in this island with the produce thereof, and commodities purchased there, or money received of the Agents of the South-Sea Company, for Negroes legally sold and exported to the Spanish settlements pursuant to the Asiento treaty; and that the said ships were all homeward bound to Great-Britain, and not the least pretence of their being engaged in, or attempting to carry on an unlawful trade.

I shall conclude the state of Jamaica with some account of the Logwood trade, of which his Majesty's subjects have been violently and unjustly deprived by the Spaniards: This trade was carried on chiefly by the people of Jamaica, and our right to it has been set in a proper light by the Lords of trade and plantations in their representation to his late Majesty King GEORGE I. in the year 1718.

Their Lordships insist that the English have an unquestionable right to the Logwood trade; and have always been protected in it by the Kings of England his Majesty's predecessors.

They observe that Logwood is the product of Yucatan, a peninsula that extends itself an hundred leagues into the North Sea; on each side whereof are the bays of Campeachy and Honduras, where this wood is chiefly cut by the English.

That the Spaniards are possessed only of the town of Campeachy and two more small places in this part of America, and that the rest of Yucatan was an uninhabited desert till our Logwood cutters settled at Cape Catoch, the north east promontory of Yucatan, and at Trist or the Laguna de Terminos in the bay of Campeachy, before or in the year 1667, when a treaty of peace was concluded between Great-Britain and Spain. And thereupon the privateers of Jamaica, who used to disturb the Spanish trade, being obliged to quit that way of life, became Logwood cutters, and settled with others of their countrymen at Trist, and the Lake de Terminos aforesaid; and great quantities of Logwood were afterwards imported from thence to Old and New-England. They observe that Sir THOMAS LYNCH, Governor of Jamaica, under whose direction that trade was carried on, in the year 1671, gave his Majesty King CHARLES II. the following reasons for his encouraging this trade. 1. That the English had then used it for divers years. 2. That the Logwood was cut in desolate and uninhabited places. 3. That it was a right confirmed by treaty with the Spaniards. 4. That thereby we excluded the French and Dutch from that trade. 5. That the Spaniards had not then made any complaint of it. 6. That this employment made the reducing our privateers, who used to commit hostilities against the Spaniards more easy. Lastly, That this trade employed an hundred sail of ships annually, and increased his Majesty's customs and the trade of the nation more than any of his American Colonies.

Sir THOMAS MODYFORD, the succeeding Governor of Jamaica, informed the Lords of the privy

The right to the Logwood trade insisted on by the Lords Commissioners for trade.

CHAP. I. privy council, in the year 1672, that the English Logwood cutters had used that trade for three years, that they had planted Corn, and built houses for their conveniency; and though they frequently hunted Deer in the country, they had never seen a single Spaniard or any other man in that part of the country in all the time they had been there: And concludes, that their felling of wood, building houses, and clearing and planting the ground, was such a possession as in the West-Indies gave them an undoubted right to the countries they thus occupied.

And Sir THOMAS, to justify his conduct in encouraging this trade, in the year 1672 (when the Spaniards first complained of it) sent home the copies of several depositions he had taken from masters of ships and others concerned in the Logwood trade, with a proclamation he had issued for the regulation and security thereof, as a confirmation of what he had asserted. And the Lords of the council thereupon let the Governor know, that they approved what he had done.

The Lords commissioners of trade further observe, that there is a clause in the abovesaid American treaty, which provides, that the King of Great-Britain shall keep and possess, in full right of sovereignty and propriety, all places situate in the West-Indies, or any part of America which he or his subjects were then in possession of; and that they actually were then, and had been for several years in possession of Trist, the Lake de Terminos, and several other places in the province of Jucatan, which the Spaniards begun to set up a title to about this time; notwithstanding they enjoyed the full benefit of what Great-Britain stipulated on her part, viz. 1. The securing the trade of the Spanish West-Indies to them; a point which had never before been yielded. 2. The obliging the privateers to cease their depredations, whereby the Spanish trade had been miserably harrassed; and this had been effected chiefly by the care of his Majesty's Governors, and the employing those people in the Logwood trade.

That in 1680 the Spaniards proceeded in a hostile manner to dispossess the English Logwood cutters of their settlements of Trist, &c. and even of the island of Providence, a British Plantation, to which they had no pretence; but these were soon repossessed by his Majesty's subjects, and the Logwood trade in 1682 was greater than ever and was maintained and carried on by the English till the treaty of Utrecht, 1713, when the adjustment and settlement thereof came again under consideration; and it was stipulated that (only) such places should be restored to the Spaniards as had been taken during the preceeding war, (in the reign of Queen ANNE) among which Trist could not be reckoned one, because the English were in possession of it many years before that war commenced; and indeed had been in the actual possession of it from 1669 to 1713, except for two or three months in the year 1689, when the Spaniards surpris'd and expelled them by force as related above.

They further represented, that by a clause in the treaty of commerce concluded in November 1713, the American treaty of 1670 is confirmed and ratified; and it was thereby declared, that this should be understood to be without prejudice to any liberty or power which the subjects of Great-Britain enjoyed before, either through right, sufferance, or indulgence; and the English having long enjoyed the liberty of cutting

Logwood without interruption, either through right, sufferance, or indulgence, they are by this treaty intitled to the same in as plain and express words as can be imagined.

Then the Lords Commissioners proceeded to shew the importance of the Logwood trade to Great-Britain by the following account of what Logwood had been imported since the late war, viz.

		Tons	C.	Qt.	lb.	
In 1713,	—	2189	15	3	22	Importation of Logwood from 1713 to 1716.
In 1714,	—	4878	14	3	24	
In 1715,	—	5863	12	1	14	
In 1716,	—	2032	17	2	0	

14965 0 3 4

That is communibus annis 3741 tons, which cannot be computed at less than 60,000 l. per ann. tho' the price is already reduced from 40 l. to 16 l. per ton; and before your Majesty's subjects were settled there, it was worth 100 l. the ton.

Nor is this trade less necessary than beneficial to your Majesty's dominions, by reason of the great encouragement it gives to our seamen and shipping, which at all times require a particular attention; but now especially, when it is daily observed that very many British mariners either through defect of the laws for want of employment at home, or in hopes of greater advantage abroad, enter themselves into foreign service.

Upon the whole therefore we are humbly of opinion, .

That the subjects of this your Majesty's kingdom for some years before as well as after the conclusion of the American treaty in 1670, did enjoy an uninterrupted liberty of cutting Logwood in the Laguna de Terminos, and in other places not inhabited by the Spaniards in the province of Jucatan, either through right, sufferance, or indulgence.

That the said American treaty did establish a right in the crown of Great-Britain to the Laguna de Terminos and the parts adjacent; those places at the time of the treaty, and for some years before, being actually in possession of the British subjects. Signed

Whitehall, Suffolk, J. MOLESWORTH,

CHARLES COOKE, M. BLADEN.

Jamaica is a royal government. The King appoints both the Governor and council. Their assembly of representatives has nothing to do in the election of these, as they have in the charter governments; and I look upon this Island as the most profitable government in the disposal of the crown of England, next to that of Ireland. There have been Governors who have made seven or eight thousand Pounds a year by their salary and perquisites, ordinary and extraordinary, if not more.

Their laws are much the same as those in the colonies on the continent; both the one and the other I perceive have recourse to tortures in the punishment of their slaves. These are not treated as subjects of Great-Britain; but as if they were creatures of a different species, such exquisite torments are afflicted on them (according to Sir HANS SLOANE) as must raise the utmost horror and detestation of the practice in Englishmen; who have not lost all humanity and compassion for their fellow-creatures.

The Knight relates, that for rebellion they lay the offender on the ground, and having extended his

Price reduced from 40 l. to 16 l. a ton. Once 100 l. a ton.

J. Bowles at the Black Horse in Cornhill

CHAP. I. his legs and arms, fasten them to the earth, and then applying fire gradually to his hands and feet burn them up to his head, whereby he suffers the most exquisite pain.

For crimes of a less nature they geld the offender, and cut off half his foot with an ax; and for negligence only they whip him; and when his back is raw they strew Pepper or Salt on their wounds to make them smart; and some planters will drop melted wax on their skins, which puts them to most intolerable pain.

And these cruelties the Doctor justifies, by telling us the Blacks are a very perverse generation, and merit such torment. Thus we find the late Czar of Muscovy also justifying the barbarous usage of his own subjects, from the obstinacy of their tempers. And we have known English Officers affirming the like of their soldiers, and treating even subjects of Great-Britain, over whom they had no authority, with equal cruelty.

We cannot wonder, after this barbarous treatment of their bodies, the planters have so little concern for the souls of these poor creatures, as to neglect the instructing them in the Christian religion; or that their Negroes have so little inclination to embrace the religion of a people who use them so barbarously.

CHAP. II.

Of the island of Barbadoes.

CHAP. II. **Barbadoes.** **THE** Caribbee-Islands, of which Barbadoes is one of the chief, were so called by the Spaniards, from the Caribbees or Canibals that were supposed to inhabit them; but upon the strictest inquiry, and a full survey of every country in America, I can meet with no tolerable evidence that there ever was a nation of Canibals either here or on any part of the continent or islands of this new world. The first discoverers indeed agreed unanimously in relating that the natives were Canibals in almost every province and district of America; the reason whereof I have already considered. But later travellers meet with no Canibals either in those countries that have been subdued by the Europeans, or in those parts of America where the natives are still masters, and still retain the rest of their superstitious rites. In Florida particularly, where the people were represented as the most barbarous of human race, and charged with sacrificing their own children, now we are better acquainted with them, it appears they have no such custom.

The name. As to this island in particular, it is imagined by some, that the Spaniards or Portuguese gave it the name of Barbadoes from the barbarous inhabitants they found upon it; but who discovered it, or gave it this name, or whether there were any inhabitants upon it when the Europeans discovered it, is very uncertain. All that I can learn concerning the name is, that it was called Barbadoes by the Spaniards, Portuguese, English, Dutch and French, who frequently passed by it, or touched at it in their voyages to the continent long before it was planted, none of them imagining it would turn to account to take possession of it. But to proceed:

Situation and extent. The island of Barbadoes is the most considerable of all the British islands in America, next to that of Jamaica: It is situated in the Atlantick-Ocean, in 13 degrees north latitude, and 59 degrees of western longitude, being of a triangular form,

CHAP. II. about twenty five miles in length from south to north, and fifteen in breadth from east to west where broadest. It is a plain level country for the most part, with some small hills of an easy ascent, and scarce any wood upon it at present. **the face of the country.**

It was covered with woods indeed when the English first sent colonies thither, but they are all cut down to make room for plantations of Sugar-canes, which take up almost the whole island at present, nothing else being cultivated in any great quantities; their very Corn, flesh and fish being imported for the most part from the northern colonies.

There is scarce an harbour in the island; the best is that of Bridge-Town in Carlisle-Bay, on the south-west part of the island, and this lies open to the westward. However, it is secure from the north-east, which is the constant trade-wind here, and blows from morning till evening, except during their tornados and hurricanes, which happen usually about midsummer, and in July and August, and blow from every quarter. The ships in the bay at such times are pretty sure of being wrecked on shore if they cannot get out to sea, and therefore seldom attempt to ride out these storms. The coast is defended on the east by rocks and shoals from the invasion of an enemy, and on the west, where it is more exposed to a descent, breastworks and redoubts are erected for its security; but the repair of them is too much neglected. **Coast and harbour.** **Winds. Hurricanes.**

There is scarce a stream in the island that deserves the name of a river; however we find two on the east-side, to which they have given the names of Scotland-River and Joseph's-River. They have good water in their wells almost all over the island, and do not dig very deep for it. They have also large ponds and reservoirs, where they preserve rain-water. **Rivers, Wells, &c.**

They have generally fine serene weather; their rains fall as in other parts of the torrid Zone, chiefly when the sun is vertical; and after the rains are the proper seasons for planting. Their heats are not so excessive as in the same latitude on the continent, being constantly refreshed by the sea breezes in the day-time, which increase as the sun advances, and abate as the sun declines: And they have this further satisfaction, that their days seldom exceed twelve hours. But there being no mountains in the island, there are no land-winds in the night as in Jamaica. **Weather.**

The only town of any consequence in the island is that of Bridge-Town, or St. Michael's, situate in Carlisle-Bay. It was formerly encompassed with a morass, which rendered it unhealthy; but this has been drained in a great measure; however, the low situation makes the town still subject to inundations. It is said to contain a thousand or twelve hundred houses, tolerably well built of brick or stone. They have commodious wharfs and keys for loading and unloading of goods, and three forts or castles for its defence; which, if kept in repair, would render the town no easy conquest. **Bridge-Town.**

The chief produce and manufacture of the island as has been intimated already, is Sugar of the Molasses or Dross, whereof they make great quantities of Rum. They have also some Cotton, Indigo, Ginger, and Piemento; and formerly Tobacco was planted here in good quantities, but very little at present. Forest-trees they have scarce any left. Their fruits are Oranges, Limes, Citrons, Pomegranates, Pine-Apples, Guavas, Plantains, **Product of the island. Trees and plants.**

CHAP. II. **Plaintains, Cocoa-nuts, Indian Figs, Prickle-Pears, Melons, and almost all manner of roots and garden-stuff, but very few flowers.**

Animals. Their Horses they import from New-England, &c. and have a slight breed of their own. They have also some Asses, Cows and Sheep, but the last do not thrive here. They have a good number of Hogs, the flesh whereof is the best meat

Food. that is eaten in those hot climates. Here are also good sea-fish and poultry, but no fresh water fish; and in general all manner of provision is very dear. There is no dining at an ordinary under a Crown a head. Fresh meat is a rarity, and chiefly the food of people of condition; the rest are glad of salt beef, pork and fish imported from the northern colonies; from whence also comes their Wheat-Flower, Indian Corn, Pease, Beans, &c. They make bread also of the Cassavi root; and the Negroes feed on Yams, Potatoes, Plaintains, and other roots and fruits. The liquor drank by the gentry here is chiefly Madera Wine, or wine and water; and great quantities of Punch are drank by the vulgar. They have also strong Beer imported from Old and New-England, and liquor made of their Maize and fruits, as in Jamaica.

Government. The government here also resembles that of Jamaica and the rest of our American Islands; having a Governor and council appointed by the crown, which, with the house of representatives, are vested with a legislative power, and make laws for the government of the island.

Number of people. The numbers of white people here are said to have been once forty thousand and upwards, and are computed to be near thirty thousand at present; the Negroes, Mulattos and Mestize slaves about an hundred thousand. Their militia consists of fifteen hundred horse and three thousand foot, or thereabouts. As to their present trade,

Forces. revenues, strength of the island, and fortifications, these will be seen in the controversy between the Sugar Islands and the northern colonies, of which I shall give an abstract hereafter; and proceed now to inquire into the first plantation of the island, and the vast improvements made in it.

Their trade, revenues, &c. The Caribbee-Islands as has been observed already, were first discovered by COLUMBUS in his second voyage to America: But this of Barbadoes lying so far south, probably was not seen by him: And whether the Spaniards or the Portuguese first discovered it in their voyages to the continent of America is uncertain: There is no doubt but one or both of them touched here (tho' they did not think it worth while to plant colonies in the island) for the English found Hogs at Barbadoes when they first arrived there; and it appears to have been the constant usage of the Spaniards and Portuguese to stock such islands with Hogs as lay in their way, that they might not want fresh provisions in their long voyages.

History. The first Englishmen that landed here, it is said, were some of Sir WILLIAM CURTEEN's seamen that were cruizing in these seas in the latter end of the reign of King JAMES I. who reporting, at their return to England, that the soil was fruitful, some adventurers went thither with an intent to plant it, but finding the island covered with wood, and scarce any other animals upon it than Hogs, it did not answer their expectations a great while.

The propriety of this island was afterwards granted by King CHARLES I. to JAMES Earl of Carlisle, in the first year of his reign, of whom

CHAP. II. several adventurers purchasing shares, transported themselves thither, and first fell to planting Tobacco; which not thriving here as they expected, they proceeded to try Cotton, and Indico, which yielded them a considerable profit; but they made little Sugar till 1647, when Colonel MONIFORD, Colonel DRAX, Colonel WALROND, and several other Cavaliers, finding there was no living with any satisfaction in England under the usurpers, converted their estates into money, and transported themselves to Barbadoes with such machines and implements as were proper to carry on Sugar-works there. Colonel DRAX, it is said, in a few years acquired an estate of seven or eight thousand Pounds per ann. and married the Earl of Carlisle's daughter, then proprietor of the island: And the adventurers fixing their principle settlement on the great bay in the south-west part of the island, gave it the name of Carlisle-Bay, in honour to their proprietor, which it still retains.

The island was afterwards divided into four circuits and eleven parishes, each parish being allowed to send two representatives to the general assembly; and every parish had its church and an incumbent, with an handsome maintenance assigned him. In the year 1650, the white inhabitants of the island are said to have increased to between thirty and forty thousand, besides Negroes, which were much more numerous, and frequently plotted the destruction of their masters; but their plots were constantly discovered, and the most terrible punishments inflicted on the ring-leaders; which did but increase the disaffection of the rest, and laid the foundation of fresh conspiracies: But notwithstanding the repeated plots of their slaves, never any plantation of so small an extent arrived to that riches and grandeur as Barbadoes did in the space of twenty or thirty years. CROMWELL apprehended this island of such consequence during his usurpation, that he sent a strong squadron of men of war thither, ann. 1651, under the command of Sir GEORGE ASCUE, who compelled the Lord Willoughby (appointed Governor by King CHARLES II.) to surrender the island upon condition the royalists should remain in the possession of their estates and liberties; and Mr. SEARL was constituted Governor by the usurpers. The Dutch war succeeding soon after, the colony was prohibited trading with the Hollanders, with whom they had principally trafficked hitherto; for the Dutch it seems constantly furnished the island with Negroes till this time, and taught the Barbadians how to plant and manage their Sugars to the best advantage; taking most of it off their hands, with which they supplied themselves and the rest of Europe: But after the usurpers quarrelled with the Dutch, the Barbadians were compelled by an ordinance of Parliament to bring all their Sugars directly to England, which was imitated by the ministry after the restoration of King CHARLES II. and was the foundation of the act of navigation, which requires all the British Colonies to bring their Sugars and Tobacco directly to England; and prohibits their trading with foreigners in these and some other articles.

In the year 1661, King CHARLES II. purchased the propriety of this island of the Lord Kinowll, heir to the Earl of Carlisle, and appointed the Lord Willoughby of Parham Governor again; ever since which Barbadoes has been a regal government. And the colony granted of a duty of four and a half per cent. for the support of the

CHAP. II. the civil government of that island, and maintaining the forces and fortifications thereof: Which duty (according to my author) amounts to ten thousand pounds a year; but instead of being applied to the purposes it was given, it is disposed of in pensions to courtiers (as he suggests) to the irreparable damage of that colony, no other island having laid so high a duty on their Sugars. In the year 1664, De RUYTER, the Dutch Admiral, with a great fleet of men of war, treacherously attempted to surprize the island of Barbadoes, tho' England was then in full peace with Holland; but he was bravely beat off by the Barbadians, and obliged to abandon that enterprize.

The trade of Negroes monopolized.

In the year 1674, Sir JONATHAN ATKINS being made Governor, had orders to seize all ships trading in Africa for Negroes, that trade being granted to the Royal African company about that time, exclusive of all others; and several ships belonging to the Merchants of Barbadoes bringing over Negroes afterwards were condemned as forfeited, being denominated interlopers, which that colony complained of as a great grievance, the African company setting what price they pleased upon their Negroes: But this was not redressed 'till after the revolution, when that trade was laid open to all the subjects of England, paying 10 per cent. towards the charge of their forts. The Barbadians also suffered great losses by a terrible hurricane that happened there on the 10th of August, 1674, when three hundred houses were blown down, two hundred persons killed, most of their Sugar-works and plantations destroyed, and all their wind-mills for grinding Canes were blown down, except those that were built of stone; eight ships also suffered shipwreck in the harbour: Insomuch that the Barbadians were disabled making much Sugar the two succeeding years. Another calamity with which the Barbadians were afflicted, was an epidemical distemper that reigned several years in the island, differing very little from the plague: This began about the year 1691, and occasioned a great decrease of the white inhabitants, which they have not recovered from that day to this. It seems the ministry in England sending a squadron of men of war to Barbadoes, with a body of land forces on board, to protect the trade of the Caribbee-Islands; which had suffered very much by the depredations of the French privateers; the Barbadians on their arrival concerted an enterprize with the Commanders against the French Islands of Guadalupe, Martinico, St. Christopher's, &c. and joining the King's forces with some of their own, formed a body of four or five thousand men, with which they made a descent on Guadalupe and St. Christopher's, and ruined several French settlements; but did not make a conquest of any of them as was expected:

The island depopulated by a plague.

And what was still more unfortunate, the distemper abovementioned broke out in the army, which the Soldiers brought back to Barbadoes, and almost depopulated that island of white men. The King's ships also lost so many of their men that there were not hands enough left to carry them home. But this distemper the Barbadians comfort themselves was brought into the island from abroad; and did not begin there, assuring us that their country is generally exceeding healthful.

The people oppressed by their Governors.

There is another calamity which the Barbadians seem to lament as much as any of the former; and that is, the oppression of several of their Governors; and particularly of Colonel FRANCIS RUSSEL, brother to the late Earl of Orford in the

year 1695, whose extortions exceeded those of any Governor that had gone before him; but he had the good fortune to die before he was called to account.

We meet with very severe reflections also on HENRY WORSELY, Esq; another of their Governors, in the report of the committee appointed to prepare a representation of the grievances of this island, made on the 15th of February, 1730, wherein they set forth, "That in the year 1722, when his excellency HENRY WORSELY, Esq; took the administration of the government upon him, and for many years before, the gentlemen of the island having been harrassed with parties and divisions, in hopes to put an end to the same, and to obtain the redress of several grievances, were wrought upon to submit to a settlement of six thousand Pounds sterling per ann. on the said Governor, during his residence here in the quality of his late Majesty's Governor; a settlement so very extravagant, and so much more than what the country could afford, that the inhabitants could not long support themselves under the same; but which however they had cheerfully submitted to for several years, notwithstanding the island had been so far from reaping any advantage from their indiscreet generosity, that on the contrary, the publick good had been entirely neglected, and no measures taken to redress the grievances of the island: But his excellency and his creatures had thereby been the better enabled, and more at leisure, to oppress the inhabitants; the militia had been totally neglected; the forts, breast-works, and batteries were gone to ruin; the publick stores were embezzled and wasted; and all persons, in office under his Excellency, busied in nothing but how to raise fortunes from the ruins of the people, by inventing new fees and perquisites, and by increasing the former fees and emoluments of their several offices. And the said petition further sets forth, that the freeholders of the island, moved at last with a just sense of their danger and ill usage, had in the month of July, 1727, chosen such persons to represent them in the general assembly, as might inquire into and attempt to procure a redress of some of their most crying grievances; and that when the said assembly were sitting about that affair with all the calmness and moderation imaginable, and with due deference and regard to his Excellency, he had sought all occasions to exasperate, male-treat, insult, and abuse the assembly, who however resolved to overlook all indignities for the good of their country; and that the said Governor finding he could not provoke them to return the ill treatment they met with from him, had, on the 5th of October then last past, commanded them to adjourn for four weeks; and tho' upon the application of the assembly (who upon that occasion humbly represented to him that several bills, and other affairs of great consequence to the publick, were then depending before the house, and therefore prayed the adjournment might not be for so long a time) he had been pleased to shorten the adjournment by the space of two days only; yet, before the time of their meeting came, he had prorogued them to the 9th of December; and from thence, by several repeated prorogations, to the month of June, 1728; and then dissolved them, apparently to prevent any inquiry

CHAP. II.

6000 l. per ann. extorted for the Governor's salary.

Fortifications run to ruin. Various oppressions.

CHAP. II. "quiry into, or representation of his male-administration."

As to the diet and cloathing, the manners and customs of the inhabitants of Barbadoes, whether white people or Negroes, they are much the same as in Jamaica; only there is not so great plenty of provisions in Barbadoes as there is in Jamaica.

CHAP. III.

Of the islands of St. Vincent, St. Lucia, Dominica, Tobago, Barbuda, and Anguilla.

CHAP. III. **S**AINT Vincent is situated twenty leagues and upwards to the westward of Barbadoes, and may be seen from thence in a clear evening, being about twenty miles in length from north to south, and almost as broad from east to west. The English and Dutch had formerly small settlements upon it; whether they have any at present I am not informed; but thus much is certain, that neither of these nations have thought fit to cultivate the soil so as to render the traffick thither of any consequence.

St. Lucia. St. Lucia lies about five and twenty leagues north west of Barbadoes, and has two high mountains in the middle of it, which may be seen from thence in a fine day. The soil is said to be good, and yet the English and French have possessed and quitted it alternately more than once. It was, however, held by the English to be part of the dominions of the crown of Great-Britain, and as such inserted in the Governor of Barbadoes's commission: And Sir HANS SLOANE relates, that when he was there, in the year 1687, it was inhabited by a small number of people from Barbadoes (within sight of which it lies) who kept it on account of its wood, which it has in plenty, and they at Barbadoes very much want. It has been disputed by the French, says Sir HANS SLOANE, whether the English were proprietors of it or they; but I was told, that being in possession of the English at the time of the signing of the treaty of neutrality with France, it ought to remain quietly in the hands of the English. However, in the reign of King GEORGE I. when his grace the present Duke of Montague had been at forty thousand Pounds expence to plant that island and fix a colony there, the French from Martinico obliged the English planters to quit the island; and the court of Great-Britain did not think fit to assert their title to it, but gave his grace some equivalent; partly lucrative partly honorary, for his loss. What satisfaction the rest of the adventurers had for their losses and disappointment I could never learn; but we seem, by acquiescing in this outrage, to have yielded up our interest in the island to the French.

Dominica. The island of Dominica, so called by the Spaniards from their discovering it on a Sunday, is situated in 15 degrees 30 minutes north latitude, about thirty miles to the northward of Martinico. This is another small island which the English have not thought fit to cultivate yet to any degree, tho' they may have some inconsiderable settlements upon it.

Tobago. The island of Tobago, so called from its yielding a good sort of Tobacco, is situated in 11 degrees 30 minutes north latitude, forty leagues due south of Barbadoes, being about thirty-two miles in length and 12 in breadth.

The temperature of the air and fruitfulness of the soil in this island is much commended: and it is said to be well stocked with all manner of

European cattle, and to be well furnished with CHAP. III. sea-fish, especially Manati and Turtle. It is also covered with excellent timber, viz. Cedar, Mahogany, Ebony, Lignum-Vitæ, White-wood, Box, Brasil, Cassia, &c. and that it has or will produce Sugar, Tobacco, Indico, Ginger, and every other plant that the best of the Caribbee-Islands do. This island was granted by King CHARLES II. to JAMES Duke of Courland, on condition that none should inhabit the said island but the subjects of the King of England and the Duke of Courland; and Captain JOHN POYNTZ contracted with the Duke, that the said POYNTZ and company would settle one hundred and twenty thousand acres of land in the said island on certain conditions: And POYNTZ thereupon published proposals to encourage planters to go over and settle colonies in the said island; and some adventurers thereupon went over thither. The Dutch also obtained a grant of part of it from the Duke of Courland, and planted it; but both the English and Dutch were so harassed by the Caribbees from the continent of Guiana or Caribbiana, from which it is not above forty leagues distant, that they were compelled to quit the island: And whether we have any settlements upon it at present I am not informed. Certain I am, neither the produce or traffick of that island is of any consequence at present, tho' why we should not improve and cultivate so profitable and desirable an island, now we are no longer under any apprehension of the Caribbees, I cannot conceive. If we do not in a little time, possibly the French will ravish this island also from us, as they have done St. Lucia; especially since they see the English tame enough to put up every affront, and all manner of ill usage from the most contemptible naval power in Europe.

Barbuda is situated in 18 degrees north latitude, about 15 leagues north of Antego, being about twenty miles in length and twelve in breadth. It produces the same fruits as the rest of the Caribbees; but the inhabitants instead of cultivating Sugar-Canes, apply themselves to breeding of cattle and raising provisions, for which they meet with a very good market at Barbadoes and the rest of the Caribbee-Islands. This is the property of the CODRINGTON family, who have a great number of Negroes on this island as well as in Barbadoes; and it was their ancestor, Colonel CHRISTOPHER CODRINGTON, Governor and Captain-General of the island of Barbadoes, who dying in the year 1710, gave and devised two plantations in Barbadoes, and also part of this island of Barbuda, of the value of two thousand Pounds per annum and upwards, to the society for the propagation of the Gospel, partly for the instruction of Negroes in the Christian religion, in Barbadoes and the rest of the Caribbees; and partly for the erecting and endowing a college in the island of Barbadoes, for propagating the Christian religion and teaching the liberal arts, particularly Physick and Surgery: And a college has accordingly been erected there by the society, in pursuance of the donor's will; for which unparalleled benefaction his name will ever be gratefully remembered by all good Christians.

Anguilla, the most northerly of all the Caribbee-Islands belonging to the English, lies in 18 degrees odd minutes north latitude, twenty leagues north-east of St. Christopher's, and is about ten leagues long and three broad. There is very little Sugar raised in this island, the inhabitants applying

Colonel CODRINGTON's benefaction for a college and the conversion of the Negroes.

CHAP. III. applying themselves to feeding of cattle, planting Indian Corn, and other kinds of husbandry.

CHAP. IV.

Of the islands of Antego, St. Christopher's, Nevis, and Montserrat.

CHAP. IV. THESE do not lie far asunder, and are subject to the same Governor, usually styled Governor of the Caribbee-Islands; for tho' Barbadoes be in reality one of the Caribbee-Islands, yet that and two or three islands more dependant on it, having a distinct Governor, the name of Caribbee-Islands seems now to be restrained to Antego, St. Christopher's, Nevis, Montserrat, and some of the rest of the small islands which lie near them.

Antego. Antego, or Antigua, is situated in 17 degrees odd minutes north latitude, and 61 degrees of western longitude, being of a circular form, and about sixty miles in circumference. The chief towns are St. John's, situate on the harbour of St. John's, in the north-west part of the island; and Falmouth, which lies on a bay on the south side of the island. They raise a great quantity of Sugar here, but the scarcity of fresh water, and the unhealthfulness of the climate, make it not so desirable as it would otherwise be. They were also the last year in great danger of being massacred by their Negroes, the plot being discovered but very little before the time it was to have been executed.

St. Christopher's. St. Christopher's is situated in 17 degrees odd minutes north latitude, twenty leagues west of Antego, to which the celebrated CHRISTOPHER COLUMBUS gave his Christian name. It is about twenty miles in length and seven in breadth, an exceeding pleasant island, having high mountains in the middle of it; and declining every way to the sea-side. It is watered with rivulets from the hills, and has some hot springs in it, as well as others, and produces great quantities of Sugar, besides Cotton, Ginger, Indico, &c.

Nevis. Nevis is situated two or three leagues south-east of St. Christopher's, being about six leagues in circumference, and produces Sugar also in proportion to its dimensions.

Montserrat. Montserrat was so named by the Spaniards from a mountain in it, resembling that of Montserrat in Catalonia, and is situated about ten or twelve leagues south-west of Antego. It has been computed by some, that there are in Antego ten thousand white inhabitants, in St. Christopher's six thousand, in Nevis three thousand, and in Montserrat four thousand, and at least three times as many Negroes; but this calculation is by others said to be much too large.

A late Governor of the Caribbee-Islands (Lieutenant General MATHEWS) gives the following short account of them.

The present state of the Caribbee-Islands. St. Christopher's was formerly jointly possessed by the English and French, but by the treaty of peace made at Utrecht, anno 1713, the whole island was yielded to the English. 'Tis about twenty-two miles long, and its greatest breadth is not much above seven miles: The middle part is so full of hills that there is but twenty-four thousand acres of land fit for Sugar. They make Communibus Annis ten thousand Boucaux (hogheads) of Sugar. Nevis is about twenty-four miles in circuit, Montserrat about eighteen, and Antego about forty-five. They reckon at Antego seventy thousand acres of land in all; and they make

Communibus Annis sixteen thousand hogheads of Sugar there, six thousand at Nevis, and twenty-five hundred at Montserrat. The Militia is regulated thus: At St. Christopher's a regiment of foot containing about seven or eight hundred men, a troop of Horse of two hundred and twenty men, and another of about an hundred and twenty Dragoons. There are several forts, but that called Souphriere, or Brimstone-Hill, is now finished, and said to be impregnable: 'Tis well provided with cistern water, and has a large well dug in it. There is at Antego a troop of about one hundred and twenty troopers and three regiments of foot, in all twelve hundred men, besides a regiment of foot which his Majesty keeps there, viz. five companies at Antego, two at St. Christopher's, two at Nevis, and one at Montserrat. The fortifications of Monks-Hill at Antego are now finished, and the Governor-General of the Caribbees resides in this island, because it is by nature and art the strongest of all the islands, tho' it is not very wholesome; and they have scarce any fresh water but what they can save when it rains.

But the state of the British Caribbee-Islands, as well as that of our plantations on the continent, will be best understood from the late dispute between these islands and the northern colonies before the two houses of parliament, of which I shall give an abstract in this place.

A bill was brought into the house of Commons, on the petition of the Merchants and planters concerned in the Sugar Colonies, in the year 1731, for securing and encouraging the trade of the said colonies: The intent whereof was to enable them to supply foreign markets with Sugar as cheap as the French, which they suggested might be done by prohibiting the exportation of Horses, provisions and lumber from our northern colonies on the continent of America to the French and Dutch plantations, and by prohibiting the importation of all foreign Sugar, Rum and Molasses to our northern colonies; for the permitting of this, they suggested, was giving the French and Dutch at least twenty-five per cent. upon the whole produce of their Sugar Colonies, and thereby enabled them to afford their Sugar at foreign markets cheaper than our own Sugar Colonies can. It was finding them plantation necessities, as well as money to pay for them (that is) the foreign colonies paid our northern colonies for their Horses, provisions, and lumber, with Molasses and Rum, which otherwise the French must throw away, as they did formerly.

To induce the parliament to pass this bill, the advocates for the Sugar Colonies endeavoured to shew the vast importance these colonies are to Great-Britain, observing, that they produced at an average eighty-five thousand hogheads of Sugar annually at least, which at ten pounds a hoghead amounted to eight hundred and fifty thousand Pounds. This sum, or much the greatest part of it, as they affirm, is spent here by the several proprietors of estates in the West-Indies who live in England, or is sent out annually in the manufactures of Great-Britain, either directly to the Sugar Colonies, or to the coast of Guinea, to purchase Negroes for the use of these colonies.

Besides, this neat produce of Sugar, another vast advantage arising from the Sugar Colony trade is the great number of ships and seamen employed and maintained in the course of our commerce with

CHAP. with them: And they calculate that there are three hundred sail of ships sent from Great-Britain (not to mention those from other places) every year to our Sugar Colonies, which are navigated by about four thousand five hundred seamen: And that the freight, from the Sugars brought hither, amounts to an hundred and seventy thousand Pounds a year; and the duties, commissions, &c. to little less than two hundred thousand Pounds more, which, upon the whole, is a good one million two hundred thousand Pounds a year profit and advantage to Great-Britain.

But besides this considerable article of Sugar, they observe that those islands produce great quantities of Cotton, Ginger, Indigo, Aloes, &c. which are all brought to Great-Britain; where the whole profit of all our plantation product does and must center. They have been equal, they insist, to the mines of the Spanish West-Indies, and have contributed in a particular manner to the trade, navigation, and wealth of this kingdom.

What they will do for the future, they said, must depend in a great measure on the event of this bill.

At present they were in a very bad and languishing condition; their duties high, their planters poor, their soil worn out, and their fortifications destroyed.

They had been true and faithful drudges for Great-Britain; but the time of their visitation seemed to be at hand, unless they received some timely and effectual relief from the parliament of Great-Britain.

They observe further, that the French Sugar Islands are much larger, more fruitful, better inhabited, pay less duties, and have greater encouragement from France than ours have from Great-Britain.

And that if our Sugar Islands, for want of being put in a posture of defence, should either be taken, as some have been, or moulder away and come to ruin, it would be one of the greatest blows this kingdom ever received.

It would then lose the benefit of all their product imported hither; it would lose the exports of our Woollen and other manufactures thither, to the amount of several hundred thousand Pounds a year; it would lose, in a great measure, the trade to Guinea; it would lose the employing and maintaining of many hundred British ships, and many thousand British seamen every year. And lastly, it would lose one of the most considerable and main branches of our funds, the deficiency of which must be made good, and the weight and burthen fall entirely on our lands.

The case of New-York flat-
ed in an
address.

On the other hand I meet with an address and representation of the President, council, and general assembly of New-York to his present Majesty on the same subject; wherein they say.

With grief and concern we have heard of the monopoly aimed at by the Sugar Colonies, which if obtained will, we conceive, tend to the ruin of this colony, and be prejudicial to the trade and navigation of Great-Britain: For

They af-
firm that
they take
off more
British
manufac-
tures than
all the Su-
gar Colo-
nies except
Jamaica.

There is imported yearly into and consumed in this colony a very large quantity of the Woollen manufacture of Great-Britain, for our cloathing and preservation from the excessive cold of our winters; and so great is our consumption of those commodities, that we have reason to believe the whole Sugar Colonies (excepting Jamaica on account of the Spanish trade) do not consume the like quantity; and should we be disabled to pay

for that manufacture, we must be reduced to nakedness, or to make our own cloathing.

The product of this and the neighbouring colonies of New-Jersey and Pensylvania, is provisions, Horses, and lumber, which are exported to the British and foreign Sugar Colonies; and in exchange for them, are had monies, Rum, Sugars, Molosses, Cacao, Indigo, Cotton, &c. whereof, the Rum and Molosses are chiefly consumed in this colony, and the monies and other merchandize are most applied to make good the balance of our trade to Great-Britain; and so great a part of that balance is paid in money, that we have reason to believe that all the British Sugar Colonies together (except Jamaica) do not import so much Silver and Gold into Great-Britain as this single colony.

We are well assured, that the British Sugar Colonies cannot take off the one half of the provisions which this and the other two Bread Colonies do export; nor are they able to supply the northern colonies with the Rum and Molosses there consumed, without vastly diminishing the quantity of Sugar which they now make; and though we be not by express words in the monopoly aimed at, or restrained from exporting our provisions to the foreign Sugar Colonies, yet the restraining us from taking any part of that product in exchange will as effectually do it.

Wherefore we have reason to apprehend, that if the monopoly aimed at be obtained, our product now exported to the foreign Sugar Colonies will be as lost to us; and that we shall have little more from the British Sugar Colonies for all our provisions that they can consume, than the Rum, Molosses, and Sugar, which we want to consume among ourselves; seeing the glut of our product with them must greatly lower the price thereof, and the great demand of Rum and Molosses must vastly enhance the price of them, and disable us to pay for the British manufactures we have already had and owe for, and diminish the consumption of the British Woollen manufacture, and the navigation now employed in bringing it to us, and in carrying our product to the foreign Sugar Colonies, and will enhance the price of Sugar so much, that Britain will probably be disabled to export any part of it.

And they
shall be
disabled to
pay for
British
manufac-
tures.

Most gracious Sovereign,

We implore your most sacred Majesty, the father of all your subjects, who has the care and prosperity of all of them equally at heart, and who will be far from countenancing any endeavours to make one part of them the slaves and bondmen of another (with whatever specious pretence it may be aimed at) to have pity and compassion upon us your poor but most loyal and dutiful subjects of these Bread Colonies; upon the Merchants of Great-Britain to whom we are greatly indebted; upon them and the many tradesmen and seamen of Great-Britain who get their living by the British trade with us; and to grant us your most gracious protection against this attempt, which in its consequences would tend, we humbly conceive, to deprive them of their just debts and future support, and to cut us off from being of any other use to our mother country than to be the bondmen and slaves of her Sugar Colonies, by confining us to them for the vent of the produce of our industry, and in consequence obliging us to take what price for it they please, and to give what price they please for what we receive in exchange.

There

CHAP. IV. There were other advocates for the northern colonies, who made the same and some further objections against the said bill. They objected, 1. That such a prohibition as was desired by the bill would put the French upon supplying themselves with lumber from their own settlements, and the British Colonies on the continent would thereby lose this trade, in which many ships and seamen were employed.

Objections made by the rest of the northern colonies to the bill.

Obj. 2. A second objection was of the like tenor as that made by New-York: That the British Sugar Colonies could not take off their lumber, or supply them with Rum for their fisheries, their trade with the Indians, and what they wanted in harvest-time.

Obj. 3. That the restraining the northern colonies from disposing of their Horses, provisions and lumber to the French and Hollanders, might draw them into employments prejudicial to Great-Britain.

Obj. 4. That the French would distill their Molasses themselves, and supply the fisheries with Rum, if the northern colonies did not.

Obj. 5. If the northern colonies did not take off the French Sugars, they would carry them to market themselves.

Obj. 6. If the importation of French and Dutch Rum and Molasses into New-England was prohibited, and they could go to no other market for Rum, or sell their lumber and provisions any where else, the English Sugar Colonies, like other monopolies, would exact an unreasonable price for their Rum, and beat down the price of lumber and other goods as low as they saw fit.

Obj. 7. That the French and Dutch Colonies furnish the northern colonies with money, which they bring to Great-Britain, and lay out in our manufactures.

Obj. 8. That the luxury and extravagance of the Sugar Colonies was the occasion of their declining.

Obj. 9. That the trade of the Sugar Colonies is still vastly profitable, instancing in Barbadoes, which, in the year 1730, imported 22,769 hogshheads of Sugar into England, valued at 340,396 l. and that this was the net profit they insisted, because it was admitted that the Rum and Molasses of a Sugar plantation bears the charges of it; the Sugar planters therefore could have no reason to complain, when so small an island as Barbadoes produced so vast a net profit.

1. To the first of these objections, that the French would supply themselves with lumber from their own settlements, if the northern colonies did not furnish them with it:

The advocates for the Sugar Colonies answered, That the French could not be supplied with lumber from their own settlements; or if they could, it must be at great charge and expence; the only places they can pretend to be supplied from are Cape Breton and Quebeck.

Some indeed have gone so far, and been so extravagant as to imagine that the French Islands may be supplied with lumber from the bay of Apalachi, or the settlements at Mississippi.

But we must consider that great snows (which the French have not at their colonies on the Mississippi or the bay of Apalachi) are necessary, both for drawing down trees to the sides of the rivers, and (likewise upon the snows melting) for floating them down to the mills; and if they had snows, those countries do not produce any quan-

CHAP. IV. tity of such wood as is proper to work into lumber; nor have they any saw-mills, which are expensive to build; and the labour and time required to manufacture such trees into lumber would make it extremely dear to the French.

Besides, the navigation to and from these places to Martinico and the French Islands, so much to wind-ward, would be so difficult and long for such vessels as are proper to carry lumber by reason of the calms, contrary-winds, and strong currents against them, that such a project would probably end in the ruin of the people concerned in it.

As to Cape Breton, tho' it has the advantage of snows, yet it has no other convenience; it produces little wood; they have few rivers, and those longer froze and sooner dried than in New-England; it is thinly inhabited, and is a small inconsiderable island, commodious only for fishing.

And as for Quebeck, allowing it all the advantages the other places want, and all that our northern colonies have with respect to wood and mills, yet the navigation of the river St. Lawrence (which is practicable only a few months in the year) is so very long and dangerous, that all the lumber from thence must be exceeding dear.

And tho' some may think that these difficulties may in time be removed, and the navigation of that river become safe and easy, it were to be wished the French had no supply of lumber till these difficulties were removed; but these difficulties must always continue, from the nature of the coast, the rocks, shoals and sands in that river, and from the inclemency of the air, and other natural causes, which will make that navigation for ever unsafe.

If then the French cannot be supplied at all with lumber, or at least not upon any reasonable terms, how much will this give our Sugar Colonies an advantage over the French? But let us suppose the worst and utmost that can be, that they can be supplied with lumber from their own settlements, yet what must this lumber be bought with? Not with Rum and Molasses, but with money.

So that if this prohibition of foreign Rum and Molasses takes place, so much clear profit and gain will be lost to the French plantations; because they can have no vent for their Rum, as interfering with Brandy.

But what stronger argument can we have that the trade carried on by some of the northern colonies is a prejudicial trade, than the permission of it by the French themselves?

They understand the whole compass of trade perfectly well; and to do them justice, steadily and unalterably pursue their interests.

They know that their colonies either cannot be supplied at all with Horses, lumber, and other plantation necessities, or else they must purchase them at a great expence: They find they have them for Rum and Molasses, which is all clear gains to them; that they save at least 25 per cent. in having lumber and Horses so conveniently from the northern colonies, and get 25 per cent. by their Rum and Molasses, which else would be all lost to them; and what is more, they plainly perceive that this trade must shortly and most effectually destroy and ruin our Sugar plantations, by enhancing the price of our plantation necessities, and stopping the vent of our product and manufacture.

However

These objections answered by the Sugar Colonies.

CHAP.
IV.

However specious therefore the arguments may be in favour of this trade, nothing less than a prohibition of Horses and lumber, as well as of foreign Sugar, Rum and Molosses, will be of any real service or benefit to our Sugar Colonies.

For if you allow them to carry lumber, what must they have in exchange for it but Sugar, Rum, or Molosses? And how will it be possible on so long a coast of seven or eight hundred miles, as that of these northern colonies, where there are so many bays, creeks, and rivers, and so few Officers, to prevent the running of these goods, let your penalties be never so strict.

A permissive trade will be an inlet to all the fraud imaginable, and destroy the act; and your forfeitures and penalties will be only like scare-crows and pasteboard Soldiers, which may seem to be some security, but in reality are none at all.

But they'll say, perhaps, that France will allow them to carry their Rum to their own settlements on the continent; but that is altogether as improbable, and as unlikely, as that we should suffer Ireland to supply our plantations with Woollen manufactures.

Those colonies there are abundantly supplied with Brandy from France very cheap; and which is a spirit much better liked, and what they have been used to.

3. As to the second objection, that the English Sugar Colonies cannot take off their lumber, or supply them with Rum,

The advocates for the Sugar Colonies answered; if the trade and navigation from the British Colonies on the continent to the foreign colonies be prejudicial to the British Sugar Colonies, and consequently to Great-Britain; and if the restraining it will effectually cramp and check our rivals the French in the Sugar trade, it ought to be prohibited, tho' some few traders should suffer hardships and inconveniences by it. The owners of Wool might complain that the government would not suffer them to carry Wool to France; but it must be admitted, however, that the prohibition of exporting Wool is absolutely necessary in order to our supplying foreign markets with the manufactures of Great-Britain.

As to the disposal of their lumber, the Sugar Colonies have more reason to apprehend that they shall find a want of it, than that the New-England people will have too much lie upon their hands.

For we have for many years been alarmed with the scarcity of lumber in New-England; and we have felt the effects of it in the advanced price we have paid for it for some time.

Those who were principally concerned there in the lumber trade, complained last year of the great want of Oak and Fir near the rivers on which their saw-mills stand: And as they are restrained by several acts of parliament from cutting the King's trees, they will hardly be able to supply us long with lumber of private property at any reasonable rate.

The last letters from Newberry in New-England inform us, that lumber was risen there from three Pounds per thousand foot to five Pounds ten Shillings; and that some ships have sailed from thence to the West-Indies, without being able to get their loading at any price; and that others continue there in hopes to get a loading, tho' it is very uncertain whether they will or no.

The other part of this objection, that our Sugar Colonies are not able to supply them with a

sufficient quantity of Rum, is as groundless as the former.

A gentleman of distinction at St. Christopher's informed the committee, that he himself made only two thousand gallons of Rum a year; but that if he had encouragement, he could make twenty thousand gallons. And that other gentlemen of St. Christopher's, Nevis and Montserrat, who made little or no Rum now, could make a very great quantity, had they a demand for it.

Therefore the question that was asked by a New-England gentleman, whether we have any Rum left on our hands at the end of the year, is not at all to the purpose.

We say they have sometimes. But that is not the point: They have little left because they make but little; and they make but little because there is not a demand for more, French Rum or Molosses being cheaper. But where those islands make now but one gallon of Rum, they could upon encouragement make ten.

And notwithstanding they make but little Rum, they would still have a good deal upon their hands every year, if they did not send it to Great-Britain and other places, because nothing wastes more than Rum: And after they have exported it, they have frequently the mortification of finding it produce not above Two-pence a gallon clear of all charges, to their very great loss.

The distillers in New-England find this trade in spirits made of foreign Molosses a gainful one, and for that reason raise objections which have nothing in them, in order to make Boston the great staple for Rum: For should the prohibition take place on foreign Rum and Molosses, then our Sugar Colonies might send again their Rum to Virginia, Maryland, Carolina, and Newfoundland, as they did before, and save the lives of many hundreds of poor wretches, who if this trade be not stopped, will probably be destroyed by this pernicious spirit made of foreign Molosses, which is so very unwholesome, that it commonly goes by the name of Kill-Devil in that country.

If we should admit for argument sake, that the French Sugar Colonies, and Surinam (belonging to the Dutch) do take off one half of the New-England lumber (which by the way is more than can be proved) the deficiency then of the demand of lumber will be one moiety. Now if it can be proved that the British Sugar Colonies upon a proper encouragement might be improved sufficiently to make as much more Rum and Sugar as they now do, it will follow that the British Sugar Colonies may take off all the New-England lumber.

Barbadoes, one of the British Sugar Colonies, is allowed to be at its perfection, and perhaps incapable of being farther improved so as to increase its annual product.

Antigua (all people that know it will acknowledge) is capable of further improvement, and may enlarge its product of Sugar, according to the best computations, at least one fifth part per ann. As to the product of Rum there, it may certainly be enlarged near one half upon proper encouragement; for the Rum it now makes is not quite one half of its product of Sugar; that is to say, if Antigua makes twenty thousand hogsheads of Sugar per ann. its product of Rum is not quite ten thousand: But it is evident from the experience of Barbadoes, that out of twenty thousand hogsheads of Sugar there ought to be made near fourteen thousand hogsheads of Rum; and this increase, both of Sugar and Rum in Antigua, would

CHAP. IV. would certainly be made, if there was proper encouragement.

Montserrat, Nevis, and St. Christopher's, for want of encouragement, do not make (as may appear by the custom-house books of each island) one hoghead of Rum for three hogheads of Sugar: Whereas it is evident by the experience of Barbadoes, that three hogheads of Sugar ought to produce two hogheads of Rum; consequently the product of Rum in these three islands might be, upon proper encouragement, increased to as much more as it now is.

Add to this, the improvement to be made in those islands by which the quantity of Sugar would be increased, it will follow still farther, that the quantity of Rum which those islands are capable of making would be above as much more as they now make, and consequently the demand for Lumber would be proportionate.

Jamaica, the largest of all the British Sugar Colonies (nay, bigger than all the rest put together) is yet but in its infancy, having now as much land uncultivated as would produce above three times its present product, were it cultivated; as it certainly would be, upon proper encouragement.

But farther, as to the Sugar Colonies not being able to furnish the colonies on the continent with Rum, it appeared by the custom-house books, that all the British Sugar Colonies do produce about one hundred thousand hogheads of Sugar, per ann. and they ought in proportion to make about seventy thousand hogheads of Rum; a quantity more than sufficient to supply the New-England fishery and Indian trade, even according to their own hyperbolical computation. But the present product of the Sugar Colonies under all the incumbent disadvantages is more than the New-England casuists can prove to be necessary for both those trades; nay, on the contrary, they will have a proof sooner than desired, that their fishery and Indian trade do not take off one-half of the Rum now actually made in the Sugar Colonies.

A gentleman who had resided a great while at South-Carolina affirmed, that that colony traded with eight thousand Indians, and yet nine hundred hogheads of Rum was the most they ever imported in one year, both to supply their home consumption, all their trade with these eight thousand Indians, and to trade to other ports with; and yet this is a colony that is the hottest, has the largest harvest of Rice, &c. and not supplied so well with Beer, &c. as the other northern colonies are.

So let us allow this colony of South-Carolina these nine hundred hogheads, North-Carolina one thousand hogheads, Virginia and Maryland three thousand hogheads, New-York and Philadelphia four thousand hogheads, Rhode-Island and New-England ten thousand hogheads, which calculation, both by their respective custom-house accounts, and by the largest estimates that ever have been made, are too large; and yet the whole amounts but to eighteen thousand nine hundred hogheads.

The same person attested that the English Sugar Colonies, under their present improvement, did make forty thousand hogheads of Rum per ann. and could make (had they a demand for it) about fifty five thousand hogheads per ann. besides what those large tracts of uncultivated land would produce, should they have encouragement to plant 'em.

CHAP. IV. It was observed also, that the New-England people thus taking from the French their Molosses, Rum, and Sugar, and supplying all the other northern colonies as well as New-foundland, Great-Britain, Ireland, and Africa, with large quantities thereof, was a very great hurt to the revenue, for if these places were not thus supplied they must be supplied from our own Sugar Colonies, and then every thousand Pound value of Rum or Molosses, of our own growth must pay his Majesty a duty of forty five Pounds, and every thousand Pound value of Sugar a duty of one hundred and twenty Pounds. It might have been added, that it was likewise a great hurt to the trade and navigation of this kingdom, as well as to the Sugar Colonies, that we cannot supply those places with Rum, Sugar and Molosses of our own growth, and in ships and vessels of this kingdom, without the disadvantage of paying for our Rum and Molosses, a duty of four and a half per cent. and for our Sugar a duty of twelve per cent. when New-England can supply all the markets with Rum, Sugar and Molosses of foreign growth without paying any of these duties. Was it not for this advantage they have over us, a great many of our vessels that miss a freight of Sugar in the West-Indies for London, would take some Rum, Molosses and Sugar, and go to New-foundland and barter it for fish or oil, and then proceed to some other market with it, and might probably employ themselves to advantage, or might, with a little Rum, Sugar and Molosses, go to North-Carolina, &c. and barter them for a cargo of Pitch, Tar and skins, and bring to Great-Britain.

3. As to the third objection, that the restraining the northern colonies from disposing of their Horses, provisions and lumber to the French and Hollanders, might put them upon some employments prejudicial to Great-Britain:

The advocates for the Sugar Colonies answered, that it had been shewn already we have more reason to fear that our islands will not be supplied with lumber, as they ought to be, than that the northern colonies will want a vent for their lumber; but if the British Sugar Colonies could not take off all their lumber, they might send it to Spain or Portugal, or to Great-Britain, where it might be imported duty free. They might employ themselves in raising naval stores, the government hath given them a large bounty to go upon that trade, which would be of vast advantage to our navigation, and save the nation three or four hundred thousand Pounds a year, which is sent out annually to purchase naval stores from the north: But this favourite trade with the foreign Sugar Colonies hath diverted them from this excellent design to the enriching of the French, and to the great prejudice and almost ruin of our own colonies.

4. As to the fourth objection, that the French would distill their Molosses themselves, and supply the fisheries with Rum, if the northern colonies did not, it was answered, that the French distilled but very little Rum at present, and knew little of the matter; worms, stills, and other distilling utensils cost a great deal of money, and this must be a work of time and a very great expence: However, a possibility of an inconvenience that might happen, ought not to have that regard paid to it as to prevent our own colonies being relieved in a point so very prejudicial to them;

CHAP. as well as to the Malt spirits of Great-Britain, with which the fisheries were formerly supplied.
IV.

5. To the fifth objection, that if the northern colonies did not take off the French Sugars, they would carry them to other markets themselves; it was answered, the French do already carry as much Sugar to foreign markets as they can sell to advantage; and the surplus, which foreign markets won't take off, goes to our northern colonies, to purchase what is absolutely necessary for them, and what they could not have conveniently from any other place.

But even here the profit of the freight is gained not by Great-Britain, but by the northern colonies only, which is a very small advantage in comparison of the damage done by this means to our Sugar Colonies; especially as the French can afford their Sugars cheaper than ours, and as the high duties paid for our Sugars in our plantations make it impossible for us to send any to the northern colonies.

6. To the sixth objection, that if the importation of French and Dutch Rum and Molasses was prohibited, and they could have none but what they bought of the English Sugar Islands, or sell their lumber and provisions any where else; then the English Islands, like other monopolizers, would set what price they pleased upon their Rum, and beat down the price of their lumber and other goods as they saw fit:

It is answered, if the case was just as the objection states it, the British Sugar Colonies would be only upon a level with New-England; for as that place is the only market from whence lumber is imported to the Sugar Colonies, New-England, by a parity of reason, is a monopoly of the lumber trade, and therefore does exact an unreasonable price for its lumber.

But this is not, nor ever can be, the truth of the case, either with regard to New-England or the Sugar Colonies; for as in a place of such extent as New-England is, where the lumber-trade is carried on by a multitude of people with a view to each trader's separate interest, a monopoly of lumber cannot properly be made: So in the Sugar Colonies that lie at a vast distance from each other, and are rivals to each other by the production of the same commodities, a monopoly is impracticable.

The New-England traders have no less than six different British Islands to go to for Rum and Molasses: Each of those islands is as independent upon the other in its polity as distant in situation. There is little or no intercourse, and less commerce between those of them which are situated the nearest to the others, and no intercourse at all between the remotest of those islands; because the produce of them all being the same, there can be no exchange of Commodities, and consequently no commerce or intercourse. It follows therefore were there is no intercourse there can be no combination, no monopoly. On the contrary (as has been observed) each island is a rival to its neighbour, producing the same commodities, and will in common prudence use all proper means to have its full share of trade, to which end nothing can be more conducive than to sell its produce at the cheapest rate imaginable.

7. As to the seventh objection, that the French and Dutch Colonies furnish our northern colonies with money, which they bring to Great-Britain, and lay out in our manufactures:

They answered, that there is no money among the French and Dutch Sugar Colonies, is as true

as there are no Gold or Diamond mines in New-England: How therefore they can bring money from places where there is not enough for the common uses of life among the inhabitants, is a paradox which they must explain before the world will take it upon their word.

If then that assertion be not founded in truth, it follows that they do not lay out money brought from those places in the manufactures of Great-Britain. Their traffick for fish in the Streights, (a trade in which they have supplanted Great-Britain) may furnish them with money, but we deny that such money is laid out by them in the manufactures of Great-Britain. On the contrary, it is to be presumed, that their money is laid out with the French and Dutch in Europe for East-India goods, French Silks, and other foreign commodities; for as it appeared by their own evidence, at the bar of the house of commons, they import such wares into New-England; and we must suppose they pay for them in money or fish, till they can prove that lumber is a valuable commodity in France and Holland.

But supposing the New-England people do lay out their product of fish in British manufactures, is that a sufficient compensation to Great-Britain for robbing her of the fish-trade to the Streights? Does not the New-England people by their confession acknowledge by implication, that they reap the profit both in navigation and trade up the Streights, which used to be enjoyed by Great-Britain itself? What advantage is it to Britain to have this money laid out in her manufactures? Would it not be a far greater to be the carrier of these manufactures to the Streights, and to bring home this money in her own ships, navigated by her own sailors?

8. To the charge, that the luxury and extravagancy of the English Sugar Colonies is the real occasion of their declining:

It was answered, that the people of New-England may be both industrious and parsimonious; for if we will take their own words for it, they are very poor, and cannot be otherwise. But is it a virtue to be very frugal when a man has no money to spend? — perhaps it is a New-England virtue.

The inhabitants of the Sugar Colonies, 'tis said are very rich and very luxurious: That the product of these Colonies is of the richest sort, and is a mine to Great-Britain is allowed, and has been fully proved; but that the proprietors of the soil and manufactures are far from being rich is evident from the proofs already made to the parliament, that they do not clear five Shillings for every hundred pound weight of Sugar they make.

This the New-England traders would think but a moderate profit upon one of their short voyages; but it is too much for an inhabitant of the Sugar Colonies, who runs infinite more risque on the heat of the torrid zone, does the duty, and is liable to all the hazards of a camp in time of war, and in time of peace lives the most careful life of any of the inhabitants under the sun. That this is truly the case of the planter in the Sugar Colonies, all mankind that are well acquainted with them will attest; but it may be evinced, from the nature of a West-Indian estate itself, which is subject to ruin by the French, to fire from the combustible nature of the Sugar Canes, which are its product; from the vast expence of buildings and materials for making Sugar and Rum, from the like expence in Negroes, cattle

CHAP.
IV.

cattle and Mules; from the risque of mortality in this part of their property, which is always half the value of a well settled plantation. And lastly, the expence of feeding, the care, anxiety, and prudent conduct of governing two or three hundred Negroes with strict justice and humanity, and with advantage to himself, is the station of a planter: And is not this a station that requires as much fortitude, industry, and œconomy as catching fish, or buying skins from the Indians of New-England? In short, without a good share of all the qualifications necessary to conduct an affair the most complicated in its nature, surrounded with difficulties and hazards, and in which the nicest œconomy and order must be observed, it is impossible a planter can reap any profit from his estate. Therefore if planters are rich, they must be the best œconomists, and the most industrious men in the world.

But let us hear what all gentlemen that have travelled to the Sugar Colonies and to New-England will say of the inhabitants of both. To them let the appeal be made, as being impartial observers of a country to which they are attached by no prejudice of education. It will appear, by their testimony, that the inhabitants of the Sugar Colonies are a polite people, being generally educated in England in the best manner: And if virtue and morality be the result of a good education, they are as well entitled to both as the subjects of England, and more than the people of New-England, who are educated in their own mean seminaries.

To all impartial strangers we appeal whether the inhabitants of the British Sugar Colonies are not the most benevolent hospitable people in the world, and whether every stranger, and especially Englishmen, be not received there with singular regard? On the contrary, let them say whether the inhabitants of New-England, and especially of Boston, do not always express a Jewish antipathy to strangers, even to their fellow subjects of England and the Sugar Colonies, whom they call by the invidious name of foreigners; and indeed treat them accordingly.

But perhaps hospitality is not in the New-England catalogue of virtues, but stands for a vice, and goes by the name of luxury or profuseness; — this mistake of hospitality for that vice was perhaps the reason why the New-England people thought it applicable to the inhabitants of the Sugar Colonies.

9. To the ninth objection, that the trade of the English Sugar Colonies is in their present circumstances vastly profitable; for that little island of Barbadoes, in the year 1730, imported twenty-two thousand seven hundred and sixty-nine hogheads of Sugar, of which they made 340,396 l. clear profit.

It is admitted to be true, when Rum and Molasses bear a reasonable price, then a plantation may with the nicest œconomy pay its own charges out of these articles. But if the New-England traders take Rum from foreigners, and Molasses to be distilled into Rum by themselves, then the Rum and Molasses will be so far from bearing such a charge, that on the contrary, they will bear no charge at all, but the Molasses must be given to the Hogs, as the French used to do till New-England taught them how to make a better profit of it. Have not then the Barbadians reason to complain?

V O L. III.

By the assistance of the New-England traders, the French now have that great advantage, and the French plantations are increased above one third in the annual value purely by that pernicious trade. This increase to foreigners is a proportionable diminution of our own Sugar Colonies, and consequently a disadvantage to Great-Britain.

But is the product of that little island Barbadoes no less than 340,396 l. brought into the ports of Great-Britain in one year? What then must be the net product of all the Sugar Colonies? — an immense sum no doubt. And is this all brought into the ports of Great-Britain? What a fountain of treasure must this be to the kingdom, even by the confession of the enemies to our British Sugar Colonies! Do therefore the New-England traders imagine that the parliament of Great-Britain will sacrifice this immense treasure to the advantage of a few New-England distillers? Or if it was a disadvantage to all New-England (from whence Great-Britain derives no advantage in comparison of that) would it not be just policy to support the Sugar Colonies? But when the present opposition is considered as founded on a trade with the French the natural and implacable enemies of this kingdom, what honest Englishman will look upon it without disdain? especially after it has appeared evident from reason, from undoubted testimony, and even by the implicit confession of the New-England people concerned in this opposition, that the French have increased one third per annum in their wealth by this very trade; that our Sugar Colonies have declined in proportion, as has been proved already; and to complete the misfortune, the New-England traders have drained even the British Sugar Colonies of all their current cash, for no other purpose but to purchase Molasses and Rum of the French. This is a fact known by all the inhabitants of the Sugar Colonies, who are ready to prove it in the most solemn manner.

The two houses having heard the several facts stated, with the proofs, and considered the arguments and inferences drawn from them, passed an act of the following tenour.

That after the 25th of December, 1733, there should be paid a duty of nine Pence a gallon for all Rum and spirits made in any of the plantations not subject to Great-Britain on the importation of them into any of the British plantations. That six Pence a gallon should be paid for all foreign Molasses and Syrups imported; and five Shillings per hundred weight English money, for Sugar and Paneles imported: And that no Sugars, Paneles, Syrups, or Molasses, should be imported into Ireland, unless shipped in Great-Britain.

And an allowance of two Shillings per hundred weight is allowed more than heretofore on the exportation of refined Sugars. But the importation of Spanish or Portuguese Sugars into Great-Britain is still permitted by the same act.

Since the passing the abovesaid act, the Merchants and planters concerned in the British Sugar Colonies preferred a petition to the house of commons, setting forth, that by two acts of parliament, passed in the 12th and 22d of Car. II. the inhabitants of the said colonies were restrained from sending Sugars to foreign markets before they are first landed in Great-Britain.

That how prudent soever this restraint may have been at the time the Sugar trade in the West-Indies was entirely in our hands; yet now that

25 N

our

CHAP.

favour of
the Sugar
Colonies.

CHAP.
IV.

our Sugar Islands are in a declining condition, chiefly by the increase of the French settlements, it would be highly beneficial to Great-Britain, as the petitioners apprehend, to put the British subject in a capacity of disputing foreign markets with the French, and to permit him to carry his Sugars earlier and cheaper to these markets than he can now do under the restraint aforesaid.

That the Sugar Colonies import yearly into this kingdom Sugar enough for our own home consumption, and also a large surplus for re-exportation to foreign parts; but the demand from abroad has greatly decreased within these few years, and the markets for that commodity have been forestalled by the French; not only to the prejudice of the Sugar trade, but also of the general trade of Great-Britain.

That if British ships were permitted to go to foreign markets under proper restrictions, without unloading here, the whole charge, and in a great measure the risque of a double voyage, would be saved, and the obliging such ships to return to Great-Britain, unload and take their clearance here, before their proceeding on another American voyage would be attended with this farther good effect, that they must afford to carry freight at the cheapest rates, or return home empty; so that this regulation (as the petitioners conceive) would extend our navigation, and contribute to make us the carriers of Europe, without prejudicing the revenue, all the duties on Sugar being drawn back on the re-exportation of it to foreign parts.

For these reasons the petitioners humbly pray this honourable house, that a liberty may be granted of carrying British Sugar from our Sugar Colonies in America directly to any foreign markets to the southward of Cape Finisterre, upon the same conditions that the people of Carolina are permitted to carry their Rice to the said markets, and also of carrying such Sugars to any foreign markets to the northward of Cape Finisterre, after first touching at Great Britain, giving in a manifest of their cargo, and entering into bond to return to Great-Britain before they proceed on another West-India voyage.

But I dont find the parliament are yet inclined to indulge our Sugar Colonies, so far as to alter the acts of navigation in their favour; nor did they think fit, by the act they passed in the year 1733, to prohibit the British Colonies on the continent to carry their Horses, lumber and provisions to the French and Dutch settlements, tho' they laid duties on Sugar, Rum and Molosses imported from thence.

CHAP. V.

Of the Lucayo or Bahama-Islands; of Bermudas or the Summer-Islands; and of the Island of Newfoundland.

CHAP.
V.Bahama
Islands.
Situation.

THE Lucayo's or Bahama-Islands, the chief whereof are Bahama, Lucayo, Eleuthera or Long-Island, the islands of Andros, Providence, St. Salvador or Cat-Island, Samana, Maquana and Heneago, are situated in the Atlantick-Ocean, north of Cuba, extending from the south-east to the north-west; between 21 and 27 degrees of north latitude, and between 73 and 81 degrees of western longitude. There are said to be several hundreds of them; but then I presume every little rock that appears above water is taken into the account; however, there are about thirty of

them (of which Lucayo is the largest) that make a tolerable figure, some of them twenty or five and twenty leagues in length, but most of them very narrow.

The island of Bahama, which communicates its name to the rest, is situated between 26 and 27 degrees north latitude, twenty or thirty leagues to the eastward of the continent of Florida, being about twenty leagues in length, but scarce four in breadth. Neither this or any of the rest are constantly inhabited, except Providence and three or four more near it in possession of the English.

Guanahani, to which COLUMBUS gave the name of St. Salvador, is situated in 24 degrees north latitude, and 76 degrees of western longitude: This and the rest of the Bahama-Islands are said to enjoy a good air and soil; but having no Gold or Silver in them, and being surrounded by rocks and shoals which render the navigation difficult, the Spaniards did not think them worth the planting after they had extirpated the natives.

Providence, the chief of these islands possessed by the English, is situated in 25 degrees north latitude, and 78 degrees western longitude, being about eight leagues in length and three in breadth. The reason the English chose to plant this rather than some of the larger islands, I presume, was because here was a good harbour capable of being defended by a small force, and so situated that a ship cant pass from Spanish America to Europe, without being met with by cruizers stationed here in time of war. At least these were the views the pirates and privateers had who resorted hither before the English established a regular government in these islands, and erected fortifications for their defence. Nor do the English confine themselves to the island of Providence only, but have plantations in several of the neighbouring islands which lie more exposed to the ravages of an enemy in time of war; but upon apprehension of an invasion, I presume, the people in them, with the best of their effects, may retire to Providence for protection.

These islands, as has been hinted already, were discovered by COLUMBUS on the 11th of October 1492, of which the island of Guanahani being the first island he made, the Admiral altered the name of it to that of St. Salvador, in memory of his deliverance; for his men began to grow mutinous, looking upon themselves as lost in a boundless ocean; and the Admiral, it seems was at that time under apprehensions they would throw him over-board for engaging them in so hazardous an undertaking.

The Admiral relates, that he found the island populous, well planted and watered, but generally flat, low land, without hills: That the people were perfectly naked, of a middle stature and olive complexion; their eyes and hair black, and some of their faces and bodies painted with a kind of vermilion: Their principal ornament being a thin gold plate fashioned like a crescent, which hung over the upper-lip, and their arms were spears pointed with the bones of fishes; but that they were an exceeding inoffensive hospitable people, bringing the Spaniards such provisions as their island produced; that they had no other merchandize to exchange for their European goods, but Cottons and Parrots; and there were no four-footed animals on these islands, unless some little Cur-dogs. The Spaniards therefore having learnt that they had their Gold from the south

left

CHAP. V. left these islands for the present, and set sail for Cuba and Hispaniola; but discovering afterwards that there were pearl fisheries in these seas, and finding the inhabitants of the Bahama-Islands were excellent divers, they employed them in diving for pearl Oysters; and obliging them frequently to continue in the water beyond their strength, by this and other oppressions they destroyed all the Indians in the Bahama-Islands; insomuch that in a few years there was not a man left upon them: And they remained destitute of inhabitants for many years, only the Spaniards from Cuba and Hispaniola, visited them now and then for such fruits and provisions as the country afforded.

Providence.

Providence and the neighbouring islands afterwards became the refuge of privateers and buccaners; but about the year 1667, Captain WILLIAM SAYLE being driven hither by stress of weather, and acquainting the proprietors of Carolina with the commodiousness of the station, they obtained a grant of it from King CHARLES II. and colonies were sent thither, which were often attacked by the Spaniards; and in the last war both French and Spaniards uniting their forces, took and demolished the forts erected on Providence, carrying off great part of the inhabitants and their Negroes; but quitting the island afterwards, the English who escaped returned and rebuilt their forts, and being reinforced from England, made the island stronger than ever; and Providence being now a royal government, and found to be so commodiously situated to command the navigation of those seas through which the Spaniards bring all their wealth to Europe, there is no doubt to be made but the government will render this island as strong as possible, and make it a station for their cruizers in case of a rupture with the French and Spaniards.

Bermuda.

The Bermuda or Summer-Islands, so called from Sir GEORGE SUMMER, who happened to run his ship a-ground here in a voyage to Virginia in the year 1609, are situated in the Atlantick-Ocean in 32 degrees 30 minutes north latitude, and in 65 degrees of western longitude, about two hundred and fifty leagues east of Charles Town in South-Carolina. Bishop BERKLEY, who was about to erect a College here for the benefit of the Indians on the neighbouring continent, informs us, that they are a cluster of small islands lying in a very narrow compass (almost in the shape of a Shepherd's crook) containing about twenty thousand acres, walled round in a manner with rocks, which render them inaccessible to pirates or enemies; there being but two narrow entrances, both of them well guarded by forts.

That no part of the world enjoys a purer air or a more temperate climate, the heat being moderated by constant sea-breezes, so that the whole year is like the latter end of a fine May in England, and the islands resorted to for health as the Montpelier of America; nor are they more remarkable for their health than their plenty, their being besides beef, mutton, and poultry, a great abundance of garden-stuff of all kinds in perfection, and a variety of good fish taken on their coasts; and the people at the same time are represented (by Dr. BERKLEY) as a plain, contented and easy people, free from avarice and luxury, and corruptions that attend those vices; and says, they shew more humanity to their slaves, and charity to one another, as well as a better sense of religious matters, than the English in the other plantations: One reason whereof is supposed to be, that condemned

criminals who are employed in the manufactures of Sugar and Tobacco are never transported hither. And among a people of such a character, and in a situation thus circumstantiated, he apprehended a seminary of religion and learning (for the instruction of the natives of America) might very fitly be planted; especially as it was a place where neither riches nor luxury abounded to divert them from their studies, none of those rich commodities of Sugar or Tobacco. All the employment of the inhabitants was, the making of Joyner's-work, the building of sloops, making hats of the Palmeto leaves, raising Corn, fruit, garden-stuff, and other provisions, which they sent to the plantations that wanted them.

The society for the propagation of the gospel had so good an opinion of the proposal made them by Bishop BERKLEY (then Dean of Kerry, in Ireland) of erecting a college or seminary at Bermudas, that they assisted him in procuring a patent for it from King GEORGE I. and contributed to the expence of the undertaking. And the Doctor with three fellows of Trinity College in Dublin, viz. the Rev. Mr. WILLIAM THOMPSON, JONATHAN ROGERS, and JAMES KING, Masters of Art, with several of the Doctor's relations, who were people of fortune, embarked for Bermudas, in order to lay the foundation of the intended college; but they were unfortunately driven by a storm to Long-Island, in the province of New-York, from whence the Doctor with his companions visited Boston and several other great towns in New-England, where they preached and performed other parts of their function. But the erecting a college at Bermudas was at length entirely laid aside: Doctor BERKLEY returned home without effecting any thing of that kind, and is now a Bishop in Ireland.

I am not fully acquainted with the reasons that brought the Doctor back, but have heard it suggested by some, that he found the design of erecting a college at Bermudas impracticable, without a much larger stock than he carried with him; and some great men that had promised to contribute largely to the design did not answer his expectations; tho' they made him some amends for his disappointment, by procuring him the bishoprick he enjoys. Whether the Reverend gentlemen that went over with him returned to England, or had cures assigned them in our plantations abroad, I am not informed.

No islands were better covered with fine groves of Cedar than these, when the English first arrived here: They built their houses and sloops with scarce any other wood; but it is almost all cut down, and the island thereby more exposed to storms and hurricanes than formerly, which sometimes destroy the fruits of the earth.

The chief town is that of St. George, situated in the north-west part of these islands, and contains about a thousand houses, with a town-house, or guild-hall, in which their assembly and courts of justice sit, the government being the same here as in the British-Islands. They have also a handsome church in the town, and a good library, said to be chiefly the benefaction of Dr. BRAY; and the inhabitants may amount to eight or ten thousand people in all the islands. Their principal grain is Indian Corn, and they have almost all manner of plants and fruits that grow in the opposite continent of South-Carolina, with plenty of European cattle, fish and fowls. The water preserved in their ponds or reservoirs in the time of rains,

CHAP. rains, is said to be preferable to their spring-water.

New-foundland. Situation. New-foundland is situated in the Atlantick-Ocean, between 47 and 52 degrees north latitude, and between 55 and 60 degrees of western longitude, bounded by the Streights of Belle-Isle, which separates it from New-Britain on the north, by the Atlantick-Ocean on the east and south, and by the Bay of St. Lawrence, which separates it from Canada, on the west. This island is of a triangular form, about three hundred and fifty miles in length from north to south, and about two hundred miles in breadth at the base or broadest part from east to west.

Climate. Notwithstanding this island lies more to the southward than England, the winters are much colder, and the earth covered with snow for a great depth for four or five months annually, inasmuch that it is scarce habitable when the sun is in the southern signs; the reason whereof must be, that it lies near the coast of New-Britain, a vast frozen continent, over which the north-west wind blowing for many hundred miles, makes the countries that lie on that side of the Atlantick much colder than those on this side that ocean in the same latitudes; however, at Midsummer it is said it is much hotter in Newfoundland than it is with us.

Face of the country. The face of the country is high and mountainous, covered for the most part with woods of Pine and Fur; and where it is cleared of wood it is all a barren heath, on which neither Corn or grass will grow: There is not, however, any want of good fresh water, and the coast affords abundance of commodious bays and harbours, particularly those of Bonavista, Trinity, Conception, St. John's and Bull-bay on the south-east part of the island; and those of St. Mary's, Placentia and Fortune's-bay on the south. The fishing-banks of Newfoundland have proved an inexhaustible fund of wealth to the English, French, and other nations of Europe for an hundred years past, there being seldom less than five or six hundred sail of ships that load with Cod-fish here every season for the Mediterranean and other parts of Europe.

Banks. The chief bank lies about twenty leagues from Cape Race the south-west promontory, and is about an hundred leagues in length, and five and twenty in breadth. There is another to the westward called Verte-bank, about twenty-five leagues in length, and twelve in breadth; and the season of fishing continues from the vernal 'till the autumnal equinox, and of late something longer.

Inhabitants. There are but very few native Indians on the island; but at the season for hunting, the Indians from New-Britain pass the Streights of Belle-Isle and come over hither to hunt.

Chief towns. The chief towns or harbours are, 1. Bonavista, on the east side of the island. 2. St. John's, the capital, situate in 47 degrees north latitude, on the south-east part of the island. And, 3. Placentia, situate on a bay of the same name, which belonged to the French, 'till it was yielded to Britain with all the rest of the island then in the hands of the French, by the treaty of Utrecht, ann. 1713.

It is so cold and uncomfortable a country, that there do not above four or five hundred families of English remain here all the year, besides the garrisons that are kept in St. John's, Placentia, and other fortresses; but in the fishing season there may be eight or ten thousand people more

here, which come over hither either to take, or cure the fish, and make them fit for market: These all lived without divine worship, 'till the society for the propagation of the gospel sent a Missionary thither lately, who resides at Bonavista usually; but he is a kind of itinerant preacher, visiting Trinity-Harbour, Placentia, and other inhabited places, as he has opportunity.

The soil of this country is a mixture of gravel, sand, and stones, and as has been observed, yields scarce any Corn, grass, or fruits; but here is great plenty of fish, fowl, and venison. As for other necessaries, the inhabitants receive them from England annually at the return of the shipping.

Newfoundland was claimed as part of the dominions of Great-Britain, by virtue of CABOT's discovery of it in the reign of HENRY VII. and some voyages that were made thither in the succeeding reigns by English adventurers, who brought from thence Furrs and fish; but the English making no settlements there, the Portuguese and French used to fish upon the banks, and trade with the Indians for Furrs and skins at the proper seasons: Whereupon the English revived their claim to the country again, and actually seized several Portuguese ships on the coast of Newfoundland, bringing them to England as lawful prizes. In the year 1610, King JAMES I. made a grant to the Earl of Northampton, and others, of that part of the island which lies between Cape Bonavista and Cape St. Mary's, and the grantees being incorporated and formed into a company, sent a colony thither; but the severity of the weather, sickness, and scarcity of provisions, obliged the planters to return to England: And in the year 1620, Sir GEORGE CALVERT, afterwards Lord Baltimore, obtained a patent of that part of the country which lies between the bay of Bulls and Cape St. Mary's, and Sir GEORGE sent a colony to Ferriland, being within the limits of his patent, where they built houses, and erected a salt-work: And in 1623, the Lord Baltimore himself went over with his family, and erected a fort for the security of his plantation; and other English adventurers came over and settled on the island. In the mean time, the English insisted on the sole right of fishing on the coast; and having a squadron of men of war sent thither for their protection, in the reign of King JAMES I. drove all others from thence: But in the reign of King CHARLES II. the French were suffered to settle at Placentia, and afterwards possessed themselves of great part of the island. In the war that happened after the revolution, there were perpetual skirmishes between the English and French at Newfoundland, both by sea and land; sometimes the English attacked the French Colonies, but to little purpose; and the French from Placentia returned their visits with better success, making themselves masters of several English settlements: And in Queen ANNE's reign, in the year 1705, they burnt St. John's, the English capital, but could not however take the fort which commanded the town: And at the peace of Utrecht, anno 1713, the Queen obliged the French to yield up all that part of the island they possessed to Great-Britain, by an article of the following tenour, viz.

The island of Newfoundland, with the adjacent islands, shall belong of right wholly to Britain: But the subjects of France shall be allowed to catch fish and dry them on the land, in that part only of the said island, and no other, which stretches

CHAP. I. stretches from the place called Cape Bonavista to the northern point of the said island, and from thence running down by the western side reaches as far as the place called Point Riche; but the French shall not fortify any place in Newfoundland, or erect any buildings there, besides stages made of boards, and huts necessary and usual for drying of fish; or resort to the said island beyond the time necessary for fishing and drying of fish.

The state of the fortifications in the British Colonies.

As to the state of the fortifications in the British plantations four years ago, and particularly those of the islands, this may in a great measure be gathered from a protest of the house of Lords in the year 1734, upon its being carried in that house not to give the committee power to take the security of the plantations into their consideration.

To which resolution several noble Lords dissented, for the following reasons:

1. Because we apprehend that the power proposed to be given to the committee was not only expedient but absolutely necessary, since (by the account given by several Lords who attended the committee, and contradicted by none) it appeared to the house, that, from the information of Merchants of undoubted credit, Jamaica, Barbadoes, and the Leeward-Islands, were in so defenceless and miserable a condition that they might be taken in twenty-four hours; and we conceive that such imminent danger of such valuable possessions required an immediate and minute examination, in order to discover the causes and nature of the danger, and to apply proper and adequate remedies.

2. Because we conceive that the chief reason urged in the debate against this inquiry, is the strongest argument imaginable for it, viz. That it might discover the weakness of these islands in the present critical juncture of affairs, and invite our enemies to invade them: Whereas, we think, that this critical juncture calls upon us to put our possessions in a state of defence and security in all events; and since we cannot suppose that their present defenceless condition is unknown to those powers who are the most likely to take the advantage of it, we apprehend it to be both prudent and necessary that those powers should at the same time know, that the care and attention of this house was employed for providing for their security: We conceive likewise, that such an argument may tend to debar a house of parliament from looking into any of our affairs either foreign or domestick, if in any transaction at any time there shall appear to have been a weak, treacherous, or negligent management, the directors will never fail to lay hold of that argument to stop any parliamentary inquiry; and the fear of discovering

a national weakness may be urged only to prevent the detection of a ministerial negligence or guilt.

3. Because we have found by experience that we can never be too attentive to the preservation of the possessions and dependencies of this kingdom, since treaties alone will not bind those powers, who from the proximity of their situations, from favourable opportunities or other inducements, may be tempted to attack or invade them. But the interposition of a British parliament will be more expected, and more effectual, than the occasional expedients of fluctuating and variable negotiations, which, in former times, have been often more adapted to the present necessities of the Minister, than to the real honour and lasting security of the nation.

4. Because we apprehend the debarring this house from any inquiry into the conduct of Ministers for the time past, or from giving their advice in matters of great concern to the publick for the time to come, tends to destroy the very being of this house, and of consequence the whole frame of our constitution: And how melancholy a view must it be to all his Majesty's subjects, to see the private property of so many particulars, and so advantageous a trade to the whole, refused to be brought under the inspection of this house; and yet (as far as it appears to us) totally neglected by the administration? And we are the more surprized to find this backwardness with regard to the interest of our colonies, since we are persuaded that the balance of trade is at present against us in most parts of the world, and only compensated in some degree by what we gain by our West-India trade: Neither can we allow that they ought to be left to look after themselves, since they have a right to claim even more than the protection of their mother country, by the great wealth they annually transmit to it, and the great duties they pay to the increase of the publick funds and the civil list: And we are fully convinced, that if this beneficial trade should once be lost, it will be irrecoverably lost, to the infinite damage of this kingdom: For though the islands should be restored to us afterwards, the utensils and stock of Negroes being carried away, it would take up a long tract of time, and would be a very great expence to the publick, to reinstate them in their present condition: We rather think it impracticable to restore them; tho' we can by no means suppose it difficult, by timely precaution, to prevent their destruction.

What has been done towards putting the fortifications of the British plantations in a better state than they were in the year 1734, I confess I am not informed; but I hope they will no longer be suffered to lie open to the insults and invasions of our enemies, and of every petty pyrate.

THE
PRESENT STATE
OF THE
FRENCH COLONIES
On the CONTINENT of
NORTH-AMERICA.

C H A P. I.

CHAP. I. **T**HE French Colonies in America may be divided into three classes. 1. Those on the continent of South-America. 2. Those on the continent of North-America; and, 3. Their islands in the Atlantick-Ocean.

Southern colonies. 1. Their colonies on the continent of South-America, which lie between the Dutch Colonies of Surinam on the north, and the mouth of the river Amazon on the south, to which they have given the name of Equinoctial France, from its situation under or near the Equator, have been already described in treating of Terra-Firma, in the former part of this volume.

Northern colonies. 2. Their colonies on the continent of North-America are vastly large, if we comprehend all the countries the French claim a right to there; but if we restrain their territories to what they have actually planted and possessed themselves of, those of Great-Britain are seven times as large.

The French call all those countries their own which lie between the mouth of the river St. Lawrence and the bay of St. Lewis on the north-west part of the gulph of Mexico, extending their dominions from the north-east to the south-west, near four thousand miles, and from the south-east of Florida to the north-west of Canada, being an extent of land very little short of the former.

Limits of Louisiana, and of New-France, according to the French. The countries included within these limits, which formerly went under the general names of Canada and Florida, the French have changed into New-France and Louisiana. New-France or Canada they seem to divide from Louisiana or Florida by an imaginary line drawn directly from the British plantations on the east, to New-Mexico on the west, in 39 degrees of north latitude. In

the grant of Louisiana to Mons. CROZAT, by LEWIS XIV. anno 1712, the bounds of it are said to be the river and lake of Illinois on the north, Carolina on the east, the gulph of Mexico on the south, and New-Mexico on the west. As to Canada or New-France, the French would scarce admit it had any bounds to the north on this side the pole, till they were limited on that side by an article in the treaty of Utrecht, which assigns New-Britain and Hudson's Bay on the north of Canada to Great-Britain. And commissioners on both sides afterwards ascertained the limits by an imaginary line running from a Cape or promontory of New-Britain in the Atlantick-Ocean, in 58 degrees 30 minutes north latitude, and running from thence south-west to the lake Miskosink, or Mistassin, and from thence further south-west indefinitely to the latitude of 49, all the lands to the north of the said line being assigned to Great-Britain, and all to the south of that line, as far as the river of St. Lawrence, to the French.

The eastern boundaries of New-France or Canada the French admit are the British plantations of Nova-Scotia, New-England, &c. the southern boundary, the line which divides New-France from Louisiana; and to the westward the French extend the country of New-France as far as the Pacifick-Ocean; and the Asiatick continent of Asia shall be found hereafter to be contiguous to North-America.

But how far they will admit the British plantations to extend to the westward, or the Spanish territories of New-Mexico to extend to the east, this they do not inform us. If we leave it to the French

CHAP. I. French to settle the limits, no doubt the dominions of Great-Britain and Spain in North-America will be confined within very narrow bounds. There is an honest French writer that freely declares, when the Mississippi adventure was set on foot they were sanguine enough to expect that all North-America would in a few years become a province of France, and consequently they had in view the swallowing up both the British and Spanish territories in that part of the world; and if this should ever be effected, it is not to be supposed they would put a stop to their conquests till they had subdued all the Spanish provinces in South-America, and become masters of the mines of Potosi.

The real limits of the French territories in North America.

I shall enquire in the next place what the French are really possessed of in North-America that can support their claim to all those fine countries which lie between the British plantations on the east, and New-Mexico on the west; or what colour they have to oppose the English extending their colonies westward as far as they can agree with the Indians for their lands; or to oppose the Spaniards in extending their dominions from New-Mexico to the eastward as far as the river Mississippi.

I cannot find that the French have yet five towns in all that vast extent of country that lies between the British and the Spanish dominions in North-America; and it is very well known that the Spaniards possessed the west side of North-America, and the English the east, long before the French had a settlement in the country. Indeed the French have since crept into the mouth of St. Lawrence on the north-east, and into the river Mississippi on the south-west, and have built a town or two with some forts on these rivers and on the neighbouring lakes which run through this vast continent; and no doubt, were they strong enough in those parts, they would elbow both the Spaniards and English out of Canada and Florida. But if the first discovery, and the actual possession and improvement of a country can give a Prince or state any title to it, the Spaniards and English must have a better right to it than the French, especially where the natives have put themselves under the protection of either nation, and acknowledged themselves subjects of the respective Sovereigns. Now most of the nations on the east of the rivers Mississippi and St. Lawrence, it appears, voluntarily have acknowledged themselves subject to the crown of England, and the countries west of the Mississippi have most of them submitted to the Spaniards: Where then shall we find the countries of New-France and Louisiana, unless it be within the reach of the great guns of their forts on the rivers of St. Lawrence and Mississippi; and here they have scarce any other title to the country than what they obtained by usurpation, or a lawless force, very seldom asking leave of the natives to settle in their country; which alone can give a foreigner a just right to the dominion of it. I look upon it, therefore, that the French have the least pretensions to Florida or Canada of any of the three powers already mentioned. However, as they have actually been possessed of some countries in Canada between the river of St. Lawrence and New-Britain or Hudson's Bay for about an hundred years, and these countries seem to be confirmed to them as far as the English had a right to confirm them, I shall readily allow their title to that part of Canada. But as to the rest of Canada and Louisiana, I

cannot admit they have a right to any part of them, notwithstanding the forts they have erected on those rivers. The eastern side of the Mississippi is the property of the Indians subject to Great-Britain, and the western side of it belongs to the Indians who are under the dominion of the Spaniards; and we find the Spaniards asserting their title to it by demolishing the forts that Mons. De SALE and D' IBERVILLE erected on the west side of that river, and have as much right to demolish the forts the French have erected on the west side of it.

The chief rivers in this vast extended country are, 1. The river St. Lawrence. 2. The river Mississippi. 3. The river Illinois. 4. The Oubach. 5. The Hohio. 6. The Pelisipi; and, 7. The Hogohegee.

1. The Mississippi, or river St. Lewis, according to the French accounts, rises in the north-west part of Canada, taking its course first to the south-east, and in 45 degrees, turning almost due south, continues that course till it discharges itself into the gulf of Mexico in 30 degrees north latitude, and 95 degrees of western longitude, by four or five mouths, several large rivers falling into it both from the east and west. The Mississippi is agreed to be a very large deep river; and some French writers add, that it is a gentle stream, and navigable for large vessels from the source almost to the mouth. But other French writers, and some English seamen, assure me, that it has a very rapid stream, and that there are cataracts in several parts of it which obstruct the navigation; and that there are such shoals at the mouth of the river that large ships cannot enter it.

2. The river of St. Lawrence issues out of the lake Ontario or Frontenac, in 45 degrees of north latitude, and 78 degrees of western longitude; and taking its course to the north-east by Montreal and Quebec, discharges itself into the bay or gulph of St. Lawrence, in 51 degrees north latitude, being navigable for large vessels as high as Montreal; but near that town there is a cataract which interrupts the navigation.

3. The river Illinois is another navigable river, which rising near the lake of the same name, takes its course to the south-west and falls into the Mississippi.

4. And 5. The rivers Oubach and Hohio are two navigable rivers, which rising near the lake Erie unite their streams, and fall into the Mississippi in 36 degrees north latitude.

6. And 7. The Pelisipi and Hogohegee rise in the Apalathian mountains, and uniting their streams, flow almost due west till they meet with the Hohio, a little before it falls into the Mississippi, in 36 degrees north latitude; at the mouths of which rivers stands a French fort, called the Old Fort.

This country also has several spacious lakes, the chief whereof are, 1. The lake of Ontario or Frontenac. 2. The lake Erie. 3. The Huron Lake. 4. The Illinois Lake; and, 5. The Upper Lake, any of which are several hundred miles in length. The lakes of Ontario and Erie have been already described in treating of New-York.

3. The lake of Hurons has a communication with that of Erie, and with the lakes of Illinois and the upper lake: And the river Illinois rising near the lake of the same name, and falling into the Mississippi, the French proposed by this means to have an easy communication between the rivers of St. Lawrence and Mississippi, and to unite New-France

CHAP. I. New-France and Louisiana into one province. But as there is no passage by water from the lake Ontario to that of Erie, on account of the cataract of Niagara; and that there are several cataracts in the rivers St. Lawrence and Mississippi, and they must take so vast a compass to the north-east in such a journey to pass through the lakes of the Hurons and Illinois, and that there is a considerable space between the lake and the river Illinois, I question whether it would not this way take up five or six months for a single man to travel from Quebec to the mouth of the river Mississippi: And probably it would be impracticable for a great body of men to march the same ground in twice that time.

No subdivision of New-France or Louisiana.

I do not find the French pretend to have divided this vast continent of North-America into provinces yet, only they are pleased to call the north part of it New-France, and the south Louisiana. In the former they have had settlements for upwards of an hundred years; in the latter they had not one till the year 1717, if we except two or three forts built in the bay of Spirito Sancto, and at the mouth of the river Mississippi by Messieurs DE SALE and D' ISBERVILLE; which were demolished by the Spaniards soon after they were erected. And as for towns, I meet with the names of no more than three in Canada, viz. 1. Quebec the Capital. 2. Montreal; and, 3. Trois Rivières; and in Louisiana only the town of New-Orleans lately erected.

Towns.

Quebec. 1. Quebec, the capital, is situated in 47 degrees 30 minutes north latitude, and in 71 degrees of western longitude, on the north shore of the river of St. Lawrence, about two hundred leagues south-west of the mouth of it; being divided into the upper and lower town, both of them about three miles in circumference, and defended by a castle which stands on an eminence: There being in the upper town five churches, besides the cathedral; the Bishop and twelve Prebends residing together in the chapter-house, which, it is said, is a most admirable structure.

This city is the metropolis of the French dominions in North-America as well as a Bishop's See; the Vice-roy who resides here, assuming the title of Governor and Captain-General both of New-France and Louisiana, which, according to the French, comprehends all Canada and Florida; except some little portions they are pleased to permit Great-Britain to possess, till they are in a condition to drive our colonies from thence into the sea, in the language of one of their writers.

Montreal. 2. Montreal is situated on an island in the river of St. Lawrence, sixty leagues south-west of Quebec; the island being about fourteen leagues in length and five in breadth. The whole island is full of fine plantations, and the town strongly situated; at least we find it was strong enough to defend itself against the attacks of the Iroquois or five nations, when they burnt and plundered all the French settlements in the island but this town, in the year 1688: And I do not doubt but the fortifications have been since improved, as it is the principal frontier garrison of the French against the Iroquois or Indians under the protection of New-York. The river of St. Lawrence is not navigable above Montreal on account of some cataracts and the rapidity of the stream.

Trois Rivières.

3. Trois Rivières is a town so named from its situation at the confluence of three rivers, one whereof is that of St. Lawrence, and lies almost

in the midway between Quebec and Montreal: **CHAP. I.** It is said to be a well built town, and considerable mart, where the Indians exchange their skins and Furs for European goods.

As to the town of New-Orleans, said to be erected lately near the mouth of the Mississippi, in Louisiana, I confess I have not met with any particular description of this or any other French settlements on that side.

As to the air, the Indian inhabitants, the animals, vegetables, and produce of French Canada, these are much the same as in New-England, New-York, and Nova-Scotia, which lie contiguous to them; and Louisiana, or French Florida, in like manner resembles Carolina in these articles. However, I shall present the reader with some of those accounts the French give us of these countries, and inquire what is to be depended upon either in their relations or ours.

Monsieur JOUTEL, who accompanied DE SALE in his discoveries in the bay of Spirito Sancto to the westward of the Mississippi, gives the following character of the natives: Allowing, says this gentleman, that there are some Barbarians less wicked and brutal than others, yet there are none good, nor thoroughly capable of such things as are above the reach of our senses; there is no relying on them; there is always cause to suspect them: And in short, before a savage can be made a Christian, it is requisite to make him a man; and we look upon these savages as having neither King nor laws, and what is most deplorable, no GOD: for if we rightly examine their sentiments and their actions, it does not appear they have any sort of religion, or well formed notion of a Deity; if some of them upon certain occasions do sometimes own a first or sovereign being, or do pay some veneration to the sun. As to the first article, they deliver themselves in such a confused manner, and with so many contradictions and extravagancies, that it plainly appears they neither know or believe any thing of it. And as for the second, it is only a bare custom, without any serious reflections on their part.

The Indians of Florida or Louisiana described.

The same traveller speaking of an interview he had with the Chiefs of another nation to the westward of the river Mississippi, says, their elders came to meet us in their formalities, which consisted in some Goats skins dressed and painted of several colours, which they wore on their shoulders like belts, and plumes of feathers of several colours on their heads like coronets. Six or seven of them had square sword blades like the Spanish, on the hilts whereof they had fastened great plumes of feathers, and several Hawks bills; some of them had clubs, which they called head-breakers; some only their bows and arrows; others pieces of white Linen reaching from shoulder to shoulder. All their faces were daubed with black or red: There were twelve elders who walked in the middle, and the youth and warriors in ranks on the right and left of the old men.

Being come up to us in that manner, he that conducted us made a sign for us to halt, which when we had done, all the old men lifted up their right hands above their heads, crying in a most ridiculous manner; but it behoved us to have a care of laughing. That done, they came and embraced us, using all sorts of endearments.

The whole company conducted us afterwards to their Chief's cottage; and after we had staid there a short time, they led us to a larger cottage a quarter

CHAP. I. a quarter of a league from thence, being the hut in which they have their publick rejoycings and great assemblies. We found it furnished with mats for us to sit on. The elders seated themselves round about us, and they brought us to eat some Sagamite, which is their pottage, little Beans, bread made of Indian Corn, and another sort they make with boiled Flower; and at last they made us smok.

Their buildings. The cottages that are inhabited are not each of them for a private family, for in some of them there are fifteen or twenty; each of which has its nook or corner-bed, and other utensils to itself, but without any partition to separate it from the rest: However, they have nothing in common besides the fire, which is in the midst of the hut, and never goes out. It is made of great trees, the ends whereof are laid together, so that when once lighted it lasts a long time; and the first comer takes care to keep it up.

The cottages are round at the top, after the manner of a Bee-hive or a rick of hay. Some of them are sixty foot in diameter. In order to build them, they set up long poles as thick as a man's leg, tall and straight, and placing them in a circle join the tops together; then they fasten and cover them with weeds. When they remove their dwellings they generally burn the cottages, and build new ones on the ground they design to inhabit.

Moveables. Their moveables are some Buffaloes or Bullocks hides, and Goats skins well cured, some mats close wove, wherewith they adorn their huts; and some earthen vessels, which they are very skilful at making, and wherein they boil their flesh, roots, and Sagamite, or pottage. They have also some small baskets made of Canes, serving to put their fruit and other provisions in. Their beds are made of canes raised two or three foot above the ground, handsomely fitted with mats and Bullocks hides, or Goats skins, which serve them instead of feather-beds, quilts, and blankets; and those beds are parted one from another by mats hung up.

Husbandry. Their tillage consists in breaking up just the surface of the earth with a wooden instrument like a pick-ax, which they make by splitting the end of a thick piece of wood that serves for a handle, and putting another piece of wood sharp pointed at one end into the slit. This instrument serves them instead of a hoe and spade, for they have no iron tools. When the land has been thus broke up, the women sow and plant the Indian Corn, Beans, Pompions, Water-Melons, and other grain, and garden-stuff,

Persons of the Florida Indians. The Indians are generally handsome, but disfigure themselves by making streaks on their faces from the top of the forehead down the nose to the tip of the chin; which is done by pricking the skin till it bleeds, and then strewing fine powder of Charcoal on the skin, which sinks in and mixes with the blood. They also make, after the same manner, the figures of living creatures, of leaves and flowers, on their shoulders, thighs, and other parts of their bodies; and paint themselves, as has been said before, with black or red, and sometimes both together.

Their women. The women are generally well shaped, and would not be disagreeable did they adhere to nature; but they disguise themselves as ridiculously as the men, not only with the streaks they have like them down their faces, but by other figures

they make at the corners of their eyes and on their bodies, particularly on their bosoms.

CHAP. I. The women do all the work in the cottage; either in pounding the Indian Corn, and baking their bread, dressing their other provisions, drying, parching, or smoaking their flesh, fetching the wood they have occasion for, or the flesh of wild beasts killed by their husbands in the woods, which are often at a great distance.

I did not observe that the women were naturally given to lewdness; but their virtue is not proof against some of our toys when presented them, as needles, knives, and more particularly strings of beads, whereof they make necklaces and bracelets: That temptation is rarely resisted by them, and the less, because they have no religion or law to prohibit the practice. It is true; their husbands when they take them in the fact, sometimes do punish them either by separation or otherwise; but that is rare.

The country of these Indians being generally warm, almost all of them go naked; unless when the north wind blows, then they cover themselves with a Buffaloe's hide or Goat's skin cured. The women wear nothing but a skin, mat, or clout hanging round them like a petticoat, and reaching half way down their legs before and behind. On their heads they have nothing but their hair platted and knotted behind.

As for their temper, it may be said of these as of all other Indians of that great continent, that they are not mischievous unless wronged or attacked; in which case they are all fierce and revengeful. They watch all opportunities to be revenged, and never let any slip when offered, which is the cause of their being continually at war with their neighbours, and of that martial humour so predominant among them.

As to the knowledge of a God, they did not seem to us to have any fixed notion of him. It is true, we met with some in our way, who, as far as we could judge, believed there was some superior being which was above all things, and this they testified by lifting up their hands and eyes to heaven; yet without any manner of concern, as believing that the said exalted being does not regard at all what is done here below. However, none of them having any places of worship, ceremonies, or prayers, to manifest their devotion, it may be said of them all, that they have no religion, at least those that we saw.

They observe some ceremonies it is true, but whether they have any regard to a superior being, or whether they are only popular and proceeding from custom, is what we were not able to discover. Those ceremonies are as follows: When the Corn is ripe, they gather a certain quantity in a basket, which is placed on a stool dedicated to that use, and serving only upon these mysterious occasions, which they have a great veneration for.

The basket with the Corn being placed on that honoured stool, one of the elders holds out his hands over it, and talks a long time; after which the said old man distributes the Corn among the women, and no person is allowed to eat of the new Corn 'till eight days after that ceremony. This seems to be in the nature of offering or blessing the first-fruits of their harvest.

At their assemblies, when the Sagamite or pottage, which is the most essential part of their meal, is boiled in a great pot, they place that pot on the stool

CHAP. I. stool of ceremony abovementioned, and one of the elders stretches out his hands over it, muttering some words between his teeth for a considerable time, after which they fall to eating.

When the young folks are grown up to be fit to go to the wars, and take upon them to be Soldiers, their garment consisting of some skin or clout, together with their bow, quiver, and arrows, is placed on the afore said stool, an old man stretches out his hands over them, mutters the words as above, and then the garments, bows, quivers, and arrows, are given to the persons they belong to. The same ceremonies are used by them in the cultivating of their grain and product, but particularly of the Tobacco.

Usage of their prisoners.

Monsieur JOUTEL speaking of two women taken prisoners in their wars, says, that one of them was suffered to return home, but the other woman was kept to fall a sacrifice to the rage and vengeance of the women and maids; who having armed themselves with thick stakes, sharp pointed at the end, conducted that wretch to a by-place, where each of those furies began to torment her, sometimes with the point of their staff, and sometimes laying on her with all their might. One tore off her hair; another cut off her finger; and every one of those outrageous women endeavoured to put her to some exquisite torture, to revenge the death of their husbands and kinsmen who had been killed in the former wars; so that the unfortunate creature expected her death-stroke as mercy.

They compel their slaves to eat their flesh.

Character of the Illinois.

At last one of them gave her a blow with a heavy club on the head, and another run a stake several times into her body, with which she fell down dead on the spot. Then they cut that miserable victim into morsels, and obliged some slaves of that nation they had been long possessed of to eat them; which to me is a very strong argument against their being Canibals in Florida, as the first adventurers reported; for here we see the Indians, instead of devouring the flesh of their enemies, compelling their slaves to eat it, as being a morsel they most detested and abhorred; so far were they from having a gust for human flesh themselves. Had they in the heat of their fury taken the heart of their prisoner, broiled and eat it, as the Dutch did DE WIT's, then there would have been some colour to have denominated these people Canibals. But as they in this instance declare human flesh only fit for slaves and the vilest of mankind to eat, and did not shew any inclination to taste it themselves, DE WIT's executioners seem to have a much better title to the name of Canibals than the Florida Indians, who were certainly most grossly misrepresented by our first voyage-writers.

As for the manners and customs of the Illinois, they are, in many particulars, the same as those of the other nations we have seen. They are naturally fierce and revengeful; and among them the toil of sowing, planting, carrying of burthens, and doing all other things that belong to the support of life, appertains peculiarly to the women. The men have no other business but going to the war, and hunting.

The nations I have spoken of before (says the same writer) are not at all or very little addicted to thieving; but it was not so with the Illinois. It behoves every man to watch their feet as well as their hands, for they know how to turn any thing out of the way dextrously. They are subject to the general vice of all the other Indians, which is

to boast very much of their warlike exploits; that is the main subject of their discourse, and they are very great liars.

They pay a respect to the dead, as appears by their care in burying them, especially such as are considerable among them. This is also practised among the Accancea's, but they differ in this particular, that the Accancea's weep and make their complaints for some days, whereas the Chahouanous and other people of the Illinois nation do just the contrary; for when any of them die, they wrap them up in skins, and then put them into coffins made of the barks of trees, then sing and dance about them for twenty four-hours, those dancers tying calabashes or gourds about their bodies, with some Indian Wheat in them to rattle and make a noise, and some of them have a drum made of a great earthen pot, on which they extend a Goat's skin, and beat thereon with a stick.

During that rejoicing they throw their presents on the coffin, such as bracelets, pendants, or pieces of earthen-ware and strings of beads, encouraging the singers to perform their duty well. If any friend happens to come thither at that time, he immediately throws down his present and falls a singing and dancing like the rest. When that ceremony is over, they bury the body with part of the presents, making choice of such as may be most proper for it. They also bury with it some store of Indian Wheat, with a pot to boil it in, and repeat the same ceremony at the years end.

I have not troubled the reader with the voyages of the Baron LA HONTAN and HENNEPIN through Canada and Florida, because their accounts are now generally agreed to be fabulous, and in the most material articles, particularly religion, directly contradict each other. With equal reason I have omitted the accounts the French gave us of Louisiana in the memorable Mississippi year, 1717, when they represented that country as a perfect paradise, in order to engage the bubbled adventurers in the project of planting that country: Nor is this the only instance of abusing people with partial accounts of new-discovered nations. It is the case of almost every enterprise of this kind. The undertakers, who have some particular views to their own private advantage, observing that it is impracticable to bring them about without the hands and purses of others, draw the most agreeable landskips of the country they intend to visit to invite others to join with them: This was Sir WALTER RALEIGH's conduct when he was about to plant colonies in Virginia and Guiana, where he expected to acquire immense treasures; and in this he did but imitate the Spaniards that went before him. Thus did the New-England adventurers also describe that country, and the celebrated PENN his Pennsylvania: And thus of late did PURRY the Swift amuse his countrymen: He made them believe that the climate of Georgia was free from the inconveniences of heat or cold: That the soil in a manner produced Corn and fruits spontaneously, and that estates might be raised on a sudden with very little labour: But when the people he carried over came to be sensible of the labour and fatigue of clearing plantations, the hazard of being attacked by Indians and Spaniards, and the necessity of erecting forts for their security, as well as of building houses for themselves, they began to curse the man that led them thither. And if PURRY had not in good time died a natural death in his new-erected town of Purrysburg, he would have

CHAP. I. Their behaviour to the dead.

Remarks on the relations of designing adventurers.

CHAP. I. have run the hazard of being pulled in pieces by his deluded countrymen, as a gentleman who lately come from Carolina assured me.

I would not be understood by these reflections, however, to discourage the further planting of Carolina or Georgia. I know there is a rational prospect of considerable advantage to the nation from this attempt, since we find these countries will produce those very articles we most want, such as silks, wine, oil, rice, furs, skins and naval stores; but I would not have our people that go thither deceive themselves, as if nothing was to be done there, no inconveniences to be met with, or hazards to be run; for in the first planting and establishing colonies in the best countries this must be expected: And it is well if the first generation live to see any thing brought to perfection, though they may have this satisfaction, that they are laying a foundation of lasting benefits which will hereafter probably accrue to their mother country in general, and to their own posterity in particular, by these glorious toils.

Reflections on the state of the French Colonies on the continent.

To return to the French plantations on the continent of North-America. It is observable that the inhabitants of the British Colonies are or affect to be thought under some apprehensions, that the French are so situated on the back of the English settlements, that it is, or will soon be, in their power to ruin our trade with the Indians, and by harrassing the British Dominions on that side, oblige us to quit that continent: That the French will draw a line from the mouth of the River St. Lawrence to the gulph of Mexico, and so strengthen it with forts and redoubts, that they will in time drive our people into the sea: And to heighten our terror of the French, they represent their colonies as consisting of two hundred thousand souls at least, supported by great bodies of regular forces from France, against which 'tis impossible, they suggest, to defend our frontiers. And I must confess, that conversing with several West-India Merchants, who seemed to be in the same way of thinking, I was once of opinion our colonies were in some hazard of being swallowed up by the French; but upon taking a more particular survey of the country, and the circumstances of each nation, I am inclined to think that this is an event which we have a great deal of reason to suppose will never happen, unless our colonies should find themselves so ill used by their mother country as voluntarily to throw themselves into the arms of France; which on many accounts can never be supposed.

These gentlemen, who talk of drawing a line from the gulph of Mexico to the bay of St. Lawrence, a tract of between three and four thousand miles, and rendering it strong enough to resist the forces of the British Plantations, must surely imagine that New-France is as well peopled as the Old, and maintains as many regular forces; and that the English settlements are destitute of inhabitants; whereas the case is the very reverse.

Some gentlemen, 'tis true, have calculated, that the French in North-America amount to two hundred thousand souls; tho' it is probable they are not half that number: But admitting there was as many as is pretended, we cannot suppose there are forty thousand men fit for war amongst them, and of these but few can be spread from the business of their plantations. How then should the French defend a line of three thousand miles extent, much less raise a force sufficient to subdue our plantations, where they must admit we

CHAP. I. have three times the number of men they have in theirs? And these many of them brave hardy fellows, used to the sea and other laborious and hazardous employments. Another great advantage we have of them is, that we can raise good bodies of Horse and Dragoons; which they cannot; and if they could it would be impracticable to march them over such vast deserts and mountains as there are in most parts of that country (from north to south) to come at us.

The frontiers, it is true, of some of our colonies may be exposed to the ravages of the French Indians, and it will be prudence in us to erect forts or keep some troops on foot in such places as lie most open to their incursions, particularly on the Lake of Champlain, on the frontiers of New-York, and on the Lakes of Ontario and Erie; and to have some armed vessels upon these Lakes, which would not only defend the frontiers; but protect our Indians on that side, and prevent their deserting over to the French. It might be proper also to erect forts on the passes of the Appalachian mountains on the back of Virginia and Carolina for the same end; but I should by no means be for extending our plantations beyond this natural barrier. There is as much land within it as we can ever plant to advantage, and we shall only weaken our settlements by endeavoring to enlarge those bounds. If the French are determined to establish themselves on the banks of the Mississippi and in the bay of Apalathy, the best reason we have to oppose this project is, lest they should one day penetrate to the Spanish Mines, or make themselves masters of the navigation of the gulph of Mexico; which will enable them to put what terms they please upon Spain. It will then be in their power to compel his catholic Majesty to give them the trade of Old-Spain and of the Spanish West-Indies, and to exclude the subjects of Britain and all other European nations from sending their manufactures to the Spanish West-Indies by the flota and otherwise; and possibly they will not rest satisfied till they have compelled his catholic Majesty to let them into a share of his mines.

But as to their raising Silk or Wine, Sugar or Tobacco, in the country they have denominated Louisiana, I am apt to think the French are too wise to attempt any of them.

It might be prudent indeed in Britain to attempt the raising Silk and Wine in Carolina, because we have none of our own; but why the French should promote these in Florida I can see no more reason than that we should encourage the Woollen or Iron manufactures there: And as for Sugar, the French seem to have more already than they know how to dispose of; and they will surely never be able to raise good Tobacco cheaper than we do in Virginia; where I'm informed the planter sells it frequently for a Penny a Pound.

The English also have this farther advantage in raising Wine, Silk &c. in their own plantations, that they lie upon the mouths of numerous rivers, and may embark the produce of these countries immediately for England with very little trouble and expence; whereas the navigation to Louisiana or to Canada is much longer and more hazardous. The French are not masters of two rivers that fall into the Atlantick-Ocean; from whence I conclude they will never plant that extensive country of Louisiana far from the coast; and if they should, it will not answer their expectations, or be very prejudicial to Great-Britain.

CHAP. I. As to the Spaniards attacking our plantations on the side of Georgia, with which we have lately been alarmed, what they do of this nature must be done very suddenly if at all; for that frontier will be put into such a posture of defence in a very little time that it will not be in the power of Spain to hurt us. The crown of Great-Britain has never interposed with that vigour in defence of any of her colonies as it has in behalf of Georgia, and that with very good reason, it being the King's peculiar property as well as both the Carolina's, all of which will be secured by this barrier; and the lands of those colonies consequently rendered of ten times the value they were when they lay exposed to the ravages of the Spaniards and Indians. As to the French, they have a desert country of three or four hundred miles to pass over from their settlements on the Mississippi and the bay of Apalach, before they can reach the frontiers of Georgia and Carolina. We have no reason therefore to be under any great apprehensions from them at present. The Spaniards, both on the east and west of Florida, are much more in danger of the French than the British Colonies are, and they will probably one day be made sensible that their safety consists in a strict union with Great-Britain; that there is no other way left to defend their mines in North America from the incroachments of the French, if they establish themselves on the northern shores of the gulph of Mexico, and on the banks of the Mississippi.

Remarks on the state of our frontiers against the Spaniards.

CHAP. II.

Of the French Islands in the Atlantick-Ocean.

CHAP. II. **T**HE third and last division of French America I proposed to describe, is that of their islands in the Atlantick-Ocean, viz. of the Caribbees taking them from south to north. 1. Granada. 2. Martinico. 3. Marigalante. 4. Guadalupe. 5. Desiada or Desirada. 6. St. Bartholomew. 7. Sancta Cruz; and, 8. St. Martin; besides which they have three islands of some consequence in the bay of St. Lawrence on the coast of Nova-Scotia, viz. 9. Cape Breton. 10. St. John's; and, 11. Anticoste.

Granada. 1. Granada is situated in 12 degrees north latitude, about thirty leagues south-west of Barbadoes, and about the same distance north of Caribiana or New-Andalusia. This island is 25 leagues in circumference, and has several good bays and harbours, some of which are fortified. It is esteemed a fruitful soil, and well watered, producing Sugar and such other plants as are found in the rest of the Caribbee-Islands. There are abundance of very small islands that lie at the north-end of Granada, which are called the Granadilla's.

Martinico. 2. Martinico is situated between 14 and 15 degrees of north latitude, and in 61 degrees of western longitude, lying about forty leagues north-west of Barbadoes. It is twenty leagues in length, but of an unequal breadth, the in-land part of it hilly; and at a distance appears like three distinct mountains, being exceedingly well watered by numerous rivulets which fall from the hills; and there are several commodious bays and harbours on the coast, some of them so well fortified that they bid defiance to the English when they made a descent here with several thousand men in the last War: They were forced to return to their ships after they had burnt and plundered some plantations in the open country.

The produce of this island is the same with **CHAP. II.** that of Barbadoes, viz. Sugar, Cotton, Ginger, Indigo, Aloes,* Piemento, &c. And as it is much larger has many more inhabitants, and produces greater quantities of Sugar than Barbadoes. This island was replenished with Indians when the French first attempted to settle here, anno 1635, and many battles were fought between them and the natives with various success; but the French at length over-powered and extirpated the ancient inhabitants, and it is now the chief of all the French Caribbee-Islands, and the seat of their Governor-General.

3. Marigalante is situated in 16 degrees north latitude, a little to the south-west of Guadalupe, and is about five leagues in length and four in breadth. It was discovered by COLUMBUS in his second voyage to America, anno 1493, and named by him Marigalante, or the Gallant Mary, after the name of his ship. The French began to send colonies thither about the year 1647; and having expelled the natives after several years wars, the French remained in the peaceable possession of the island, the produce of which is the same with the rest of the Caribbees.

4. Guadalupe so named by COLUMBUS from its hills, resembling those of that name in Spain, is situated in 16 degrees north latitude, and 61 degrees of western longitude, about 30 leagues north of Martinico, and almost as much south of Antegoa. It is said to be the largest of all the Caribbee-Islands, being twenty two leagues in length, and half as much in breadth at each end, but almost cut in two by a deep gulph or bay on each side; so that the ends are joined together by a very narrow isthmus. This, like Martinico, abounds in Sugar, Cotton, Indigo, Ginger, &c. and is in a very flourishing condition; and agreeable to the consequence it is of to the French they have taken care to fortify it with several regular forts and redoubts, which were in so good a condition when the English Admiral BENBOW made a descent here with a considerable body of land forces, anno 1702, that he did not think fit to attack them; tho' he destroyed a great many of their plantations and open villages.

The French began to send colonies to this Island about the year 1632, but knew so little what the soil was good for then, that for many years they were in danger of starving, and afterwards the planters by their divisions almost ruined one another; so that this island did not make any great figure till the present century; since the beginning of which it has vastly increased, and makes more Sugar now than any of the British islands except Jamaica.

5. Desiada, or Desirada, the desirable island, so called by COLUMBUS, because it was the first land he discovered in his second voyage to America, anno 1493. It is situated about ten leagues north-east of Guadalupe, a little inconsiderable island not so fruitful as some others which belong to the French.

6. St. Bartholomew's is a small island about ten leagues north of St. Christopher's, taken by the English under the command of Sir TIMOTHY THORNHILL, in the year 1689, but restored to the French at the peace of Ryfwick.

7. St. Croix or Sancta Cruz, another small island situated in 17 degrees 30 minutes north latitude, about twenty leagues east of St. Christopher's, and has been contended for by the English, Dutch, Spaniards and French, but is now in the peaceable

CHAP. II. peaceable possession of the French West-India company.

St. Martin's. 8. St. Martin's another island of no great consequence belonging to the French, situate a little to the north-west of St. Bartholomew's.

Dutch Caribbean Islands of Saba and St. Eustace. The Dutch have also two very small islands among the Caribbees, named Saba and St. Eustace, situated between the islands of St. Croix and St. Christopher's; and the Danes have another small island called St. Thomas, at the east end of the island of Porto Rico; but I could never understand that the product or traffick of any of them are very considerable.

We have already seen the declining state of the British Sugar Islands, which once furnished France and most of the nations of Europe with Sugar: But are now in a manner beat out of that trade by the French, who have not only cultivated this commodity with great application of late years in their Caribbee-Islands, but in the great island of Hispaniola, as has been observed already in the description of that island; where they have land enough to furnish themselves and all Europe with Sugar, and do actually cultivate as much as they can dispose of; in which they have some great advantages of the English, as 1. Their paying little or no duty, not above one per cent, on the exportation of Sugars; whereas the English pay very high duties, as appears from the dispute between the British Sugar Colonies and the northern countries. 2. They are allowed to export their Sugars directly to foreign markets without bringing them home first, which saves a very great charge the English are forced to be at, and enables the French to carry their goods to foreign markets much sooner than the English possibly can. 3. The British northern colonies take Sugar, Rum, and Molosses from the French Islands, which formerly those islands had no vent for; whereby the demand for these articles from the British Islands is continually diminished, and the demand from the French Islands increased; the northern colonies taking scarce any Sugar, Rum, or Molosses, from the British Sugar Islands, but purchase them with their lumber, provisions, and Horses, and often with money, of the French, or of the Dutch at Surinam.

And lastly, as the French Islands, particularly that of Hispaniola (of which they possess two thirds at present) Martinico, and Guadalupe, are larger than the British Caribbee-Islands, and consequently there is room to raise great part of their provisions in them, while the English receive their provisions from abroad for the most part: This is another great advantage on the side of the French. They have also a great deal of timber growing on the island of Hispaniola, which is an article the English Sugar Islands want, and must pay dear for; from all which considerations it is but too evident, that unless the British Legislature think fit to alter the acts of navigation in their favour, and to suffer our Sugar Colonies to carry their produce directly to foreign markets, take off the duties upon them, and restrain the northern colonies also from dealing so much with the French and Dutch for Sugar, Molosses, and Rum, the British Caribbee-Islands must still decline; since they will never have any demand for their produce, but what Britain itself takes off. And unless we put the fortifications of our islands in a better posture of defence than they are at present,

VOL. III.

we shall run the hazard of losing the islands themselves, as well as the traffick they were once so famous for. No English gentleman will be fond of having an estate in the Caribbees, or contribute much to the promoting the Sugar manufacture there; while those colonies lie under such discouragements in point of trade, and he is in danger of losing his estate and all the expence he shall be at upon the first rupture with any European power.

But to proceed to the French Islands which remain yet to be described, viz. Cape Breton, St. John's and Anticosti.

CHAP. II.
The French northern Islands. Cape Breton.

Cape Breton is situated between 45 degrees and an half and 47 degrees and an half north latitude, separated from Acadia or New-Scotland by the narrow streight of Canso on the south-west, and the other passage or streight of Cape Ray separates it from Newfoundland on the north-east: It is indented on every side by large bays of the sea, which cut almost through it in some places, and form several commodious harbours. This Island is about one hundred and twenty miles in length, and fifty in breadth; a barren desert-land, affording scarce any trees or herbage, and has very few rivers; nor would it ever have been planted, probably, if it had not been so convenient for the French to preserve their communication with the river of St. Lawrence and Canada, and to protect their fisheries, as well as to disturb the trade and fisheries of Great-Britain in time of war: For here are several harbours where the French cruisers and privateers may lie securely, and from hence interrupt the British trade and fisheries of New-England, New-Scotland, and Newfoundland, at their pleasure. Nor do I see how it is possible for an English Squadron to protect them intirely upon such extensive coasts: All that can be done, in time of war, is to make reprisals on the French by our cruisers and privateers; and as our merchantmen, and fishermen are much the most numerous, we must expect to be the greatest sufferers, as we always were in the late wars, the French taking three prizes for one we took from them.

The New-England gentlemen therefore censure Queen ANNE's Ministers that they did not insist more strenuously on this island's being yielded to Great-Britain by the treaty of Utrecht, and will scarcely acknowledge the benefits they received by those articles which gained us the sole property of Nova-Scotia or Acadia, and Newfoundland: Though they were very loud in their complaints heretofore; that they were perpetually harassed by the French and their Indians from Nova-Scotia, suggesting that nothing could be of greater advantage to New-England, and the rest of the northern colonies, than the reducing Nova-Scotia: Which, now they see it in our hands, they seem as little satisfied as before, because sufficient care is not taken, they say, to plant and people Nova-Scotia: But surely none lie more conveniently to do this than the New-England men themselves. And I am of opinion they would have done it long e'er this, if it had been annexed to the province of the Massachusetts, as they once expected it would have been: But their natural aversion to a regal government, which they find their colonies must be subject to, if they send any to Nova-Scotia, I am satisfied prevents their planting that country; but then they ought to cease their complaints, that it is no better planted.

25 Q

A3

CHAP.
II.

As to the French King's yielding up Cape Breton and the other islands in the bay of St. Lawrence, it must be considered, if he had parted with these at the treaty of Utrecht, he could no longer have had a communication with Canada or New-France than we saw fit; and it could scarce be expected he should exclude himself from all commerce with his colonies of North-America, how low soever he was brought: However, I find it to be acknowledged on all hands, that if we plant and people Acadia, and erect some forts for its protection, our colonies there will be able, with the assistance of a British Squadron in time of

war, in a great measure to maintain the dominion of those seas, if they cannot entirely prevent the depredations of the French.

The island of St. John's lies between Cape Breton and the coast of New-Scotland, and is about twenty leagues in length. The island of Anticosti is a much larger island, lying just before the mouth of St. Lawrence River: These, and the lesser islands in the bay of St. Lawrence, do not seem to be of any other use to the French, than to preserve their communication with Canada; I do not find they have any towns or plantations upon them.

THE
CONCLUSION
OF THE
PRESENT STATE
OF
AMERICA.

The conclusion.

UPON a review of the whole work, it appears that never any people were possessed of so fine a country, and so happily situated, as that which is subject to the crown of Great-Britain on the other side of the Atlantick-Ocean; a country of fifteen hundred miles extent; where every thing that is necessary, every thing desirable in life, is, or may be produced in the greatest abundance, and brought to the metropolis of the three kingdoms with as little labour and expence almost as they may be brought from any distant county of England; it being but a six weeks voyage in an open sea, not subject to the interruptions and accidents of coasting voyages.

The eastern shores of North-America, on which our colonies are situated, abound in commodious harbours and navigable rivers; insomuch that ships take in their lading in many places at the planters doors, and then falling down into the ocean, sail directly home: Whereas both the French and Spaniards have a much longer and more difficult navigation to and from those parts of that continent which are possessed by them.

It is evident to a demonstration, that in these countries it is in our power to raise Silk, Hemp, Flax, Pitch, Tar, Wine, Oil, Raisins, and other

fruits; and that the Sugar and Tobacco Colonies and fisheries we already have in that part of the world, bring us in an inconceivable treasure.

But it is as evident these articles are not considered with that attention their importance seem to demand.

Every one, who has made any calculation of our national expences, knows that we lay out annually with foreigners four millions of money and upwards in Silks, Linen, Lace, Wine, naval-stores, and other merchandize, which we might make ourselves if our colonies were encouraged to raise the materials; and it is computed, that those materials would employ half a million of people at home, who are now a burthen to their country.

It is obvious, our people are vastly increased of late years; and tho' multitudes, when rightly employed, are the strength and riches of a nation, many of ours are become an intolerable charge upon the land, purely for want of being set to work on proper materials under the direction of skillful masters.

If it be demanded what is the reason we import such vast quantities of Lace, Linen, naval-stores, &c. from foreigners, when our own territories

The conclusion.

The conclusion.

tories would produce them; and suffer our people at home to starve, or be a burthen to the nation, when we might find employment for all of them and as many more, and not only ease our lands from this burthen, but vastly enrich the nation by their labour?

The usual answers we meet with are these, 1. That it will cost some money, and be some time before we can raise Silk, Flax, Wine, &c. and establish manufactures: And 2. That foreign goods pay great duties to the crown, which duties would be diminished if we produced the like materials, and established the like manufactures at home, or in our plantations.

And I confess more formidable objections cannot be made: For how advantageous soever a proposal may be to the nation in general, yet if money is required to carry it on, or it may affect the publick revenue, it cannot be expected it should meet with much countenance from gentlemen whose business it is to advance the revenue; but as the body of the people seem now convinced that it is their interest to raise and manufacture their own consumption, and to support and encourage our plantations in order to furnish them with materials, I shall not despair but the thing will be effected one time or other, whatever obstacles may be thrown in the way by interested or designing men.

It is admitted on all hands that the poor's rates, though paid by the tenant, are in reality a charge upon every gentleman's estate. If the rate amounts to one, two, or three Shillings in the Pound, the gentleman must abate proportionably in his rent, or the tenant cannot hold his farm.

Whatever lessens the poor's rates therefore is an advantage to the landed interest; and by keeping the poor employed, you do not only save a great expence, and enrich your country, but you prevent their taking vicious courses: You save them from the gallows, and your persons and estates from violence and rapine: You improve the morals of your people, and must live with more satisfaction and security among such men, than among an unhappy generation whose necessities compel them to become thieves and beggars. Let us consider the multitudes that would be employed in these manufactures: And if the goods should not be altogether so fine as the Linen, Lace, and Silks of France or the Low-Countries at first, they will probably prove as well wrought as theirs in time, if suitable encouragements are given to those that excel, but if they should be something coarser, why should we not imitate France and other kingdoms, who are content to wear coarse Woollen-cloth, rather than impoverish their countries by importing our fine cloths. Is it of as much importance to the kingdom, that our ladies should appear in foreign Linen, Lace, and Silks, as that the people, by being employed in these manufactures at home, should be kept from starving, and two or three millions of money annually saved to the nation?

Let us consider also, that the riches of the plantations are our riches, their forces our forces, and their shipping our shipping; as these prosper, so will their mother country prosper of course; hither all their wealth flows in the end. They either bring their estates over to England, if they meet with success, or they live in an elegant manner there and import our manufactures. We should need scarce any other foreign trade; therefore we should want nothing that other countries

The conclusion.

produce if the plantations were encouraged: For the materials they might raise would abundantly employ all our idle hands, and furnish us with every thing that contributes to the support or conveniences of life. Can we then do too much for our colonies, when in supporting them we most effectually serve ourselves? Let us not be afraid of lessening the revenue by prohibiting foreign manufactures, if it tends to enrich the nation; for the richer the people are, the better able will they be to support the government; and the legislature can never be at a loss for ways and means to raise money, if the people have it in their purses.

But let us ever be cautious of laying high duties on our own produce and manufactures, whether at home or in our colonies; for this has totally destroyed some branches of trade, and prevents others from flourishing: By this we find the people of Jamaica were entirely beat out of the Cacao or Chocolate trade, other nations being able to afford it cheaper than they could on account of the duties: By the like conduct it is apprehended the Sugar and Tobacco trade may be lost, the duties on which are so considerable a branch of the revenue. And were it not better to take a small duty, than to lose all the duties and the trade together? And here at home, is it not the duty on paper made here that damps the progress of that manufacture, and still obliges us to import most of our paper from abroad? And, indeed, we may ruin all our trade, and all our manufactures by high duties; and when that is done, how is the government to be supported? How shall we find money to purchase even necessities of foreigners? And how shall we maintain those multitudes of poor that a failure in our manufactures and plantation trade must occasion? But next to high duties, nothing surely can be a greater disadvantage to our manufactures or plantation trade than the locking up our money in banks and funds, which, till these were established were employed in commerce. The man who lives purely on the interest of his money in these banks, is the most contemptible and useless member in the common wealth: Instead of increasing his own and the common stock, he chuses a slothful indolent way of life; he takes no pains to serve himself, his friends, or his country; but like a certain animal he resembles, is only useful when he dies, and his substance is transferred to persons of a more publick spirit.

As to such gentlemen and ladies as have small fortunes in the publick funds, these might by employing them in our manufactures at home, or in the plantations abroad, make a much better figure in the world than they can by the interest of their money. What will five hundred or a thousand Pounds produce in the funds? An ordinary Porter or Crier gets more by his labour, but such sums employed in any manufacture at home, or a plantation abroad, would produce an handsome subsistence. It were pity therefore, even for the sake of these whose condition has been so much lamented of late, but interest were still lower, that they might be compelled to take their fortunes out of the funds, and employ them more to the advantage of themselves and their country.

And as to gentlemen who have but small estates, or such as are incumbered, were they duly apprized that with the money arising by the sale of one hundred Pounds per ann. they might purchase a plantation which would yield three hundred

The con-
clusion.

dred Pounds per ann. in British America; or, that by applying part of the money they take upon their estates in the improvement of a plantation, they might in a short time clear off their debts and live in plenty, they would never drag about a miserable being in necessity and disgrace at home, but venture a little abroad and improve their estates, after which they might return, make a figure in the decline of life, and leave ample fortunes to their posterity.

I am not here inviting gentlemen to run the hazards, or to undergo the fatigues that usually attend new discoveries; there is more land discovered already than we can possibly cultivate; nor would I advise them to settle upon the frontiers of our colonies that are liable to the invasions of the French and Spaniards, or the Indians: This is a post assigned to the necessitous and hardy Highlanders and Swifs, who richly deserve the lands assigned them for securing the rest of the provinces: But let a gentleman go over, and take a view of New-England, New-York, the Jerseys, Pennsylvania, Virginia, or Carolina, and he will in any of them meet with farms ready planted to his hand, by the purchase of which he may double and treble his fortune with a very little application; and when he has settled them to his mind, may return to England again if he see fit, and have the produce of them sent over hither. This many have done, and continue to do to this

day; and it is surprising more do not follow their example.

The con-
clusion.

Among the ancients the greatest men travelled and run many hazards for the improvement of arts and sciences, of husbandry or traffick; and whoever brought home any thing of this kind was looked upon as a good angel, and in after-ages worshipped as a God. And were our gentlemen and men of quality, when they travel, as usefully employed, we should no doubt have them in equal esteem; but what do these honourable wanderers usually import, but foreign fashions, foreign fopperies, and foreign vices?

Would they discover the arts that have rendered the Dutch, and of late the French, such exquisite merchants and planters; would they, as Sir THOMAS LOMBE has done, to his immortal honour, bring home the model of some useful engine, teach us to plant the vine, to raise Silk and Flax, to improve our Sugar and Tobacco Colonies, to manage our fisheries with success, and particularly the Whale-fishery, in which the colonies of New-England and New-York have of late made some progress: Were these the views of our nobility and gentry in their travels; they would deserve the honours and estates they enjoy, and could not fail of acquiring still greater; their own families would enjoy the fruits of their glorious labours, and they would be esteemed by all mankind real benefactors to their country.

HIMALAYAS. IT IS
VERY RARE AND
VERY BEAUTIFUL
BUTTERFLY WHICH
IS FOUND IN THE
MOUNTAINS OF THE
HIMALAYAS.

A
 CONTINUATION
 OF THE
 PRESENT STATE
 OF
 AMERICA.

America.

THE continent of America is situated between 80 degrees north and 58 degrees south latitude, and between 35 and 140 degrees west longitude, being divided into North and South America, by a line drawn cross the Isthmus of Darien from Porto Bello to Panama; the first of these towns lying in ten degrees, and the latter in nine degrees north latitude. The Spanish provinces of North America, are Old Mexico, New Mexico, and part of Florida.

In South America are the Spanish provinces of Terra-Firma, Peru, Chili, Patagonia, or Terra Magellanica, Paragua, La-Plata, the country of the Amazons, and the Spanish Islands.

The Portuguese are possessed of the extensive country of Brasil in South America.

The British dominions are situated in North America, and consist of the provinces of Hudson's-Bay (part of Canada) New-Britain, New-Scotland, or Acadie, New-England, New-York, New-Jersey, Pennsylvania, Maryland, Virginia, North and South Carolina, and Georgia, and the British American islands.

The territories the French claim are part of Canada and Florida in North-America, and Caen, or equinoctial France in South America, with the French American islands.

A continuation of the present state of New-England.

New-England.

The following pages are the answer of a gentleman lately come from New-England, and a native of that country, to some enquiries made by the author of this work, in relation to New-England.

There are in New-England about sixty thousand fighting men, from sixteen to sixty years of age, and about three hundred thousand souls. The Massachusetts-Bay contains about thirty thousand effective men, from sixteen to sixty.

The colony of Connecticut fourteen thousand fighting men: Rhode-Island and Providence-Plantation, seven thousand effective men: New-Hampshire five thousand fighting men; and the province of Maine about four thousand men fit to bear arms.

GOVERNOR BURNEY frequented the episcopal church. The governors and magistrates usually go to the independent congregations.

One member of the episcopal church is a judge. Several gentlemen of the church of England have received commissions, both civil and military, from his excellency governor BELCHER; and this year 1738, JOHN READ, Esq; a counsellor at law, was chosen one of the representatives for the town of Bolton (being the first instance of that kind.) Two years ago, JOHN EASTWICKE, Esq; was chosen one of the select men of Bolton, after many years struggle to get a churchman in. There are for Boston four representatives, twelve overseers of the poor, seven select men, and seven assessors, all which have great influence in the town affairs. Notwithstanding the churchmen in Boston pay one fifth part of the town rates, yet till within these two years, no churchman was suffered to be chosen, tho' the churchmen have been struggling for it more than twenty years. It must be observed, that altho' the churchmen pay one fifth part of the tax, they have not the one tenth part of the wealth of the town. The governor's salary is not settled.

The manufactures of New-England are so inconsiderable in comparison of England, that they must not be mentioned together; the New-Englanders being still supplied with nineteen parts in twenty of English manufactures. Yet it must be acknowledged, that the making of linen greatly encreases in New-England; the Irish people who have lately settled there, having brought that business to great perfection.

Some

Some Linen made at Londonderry, in the province of New-Hampshire, hath often been sold for six shillings sterling the English yard, and the greater part of the linen made in that flourishing town, sells for twenty pence to two shillings per yard sterling money.

And if good encouragement was given to the making of canvas or sail-cloth, even the royal navy might be supplied in a few years with that useful commodity from New-England; the Irish people finding the country exceedingly well adapted for the linen manufacture.

They do not trade to the French islands for Rum, Molosses, &c. as heretofore.

The cod fishery is in a flourishing condition, and they are not now interrupted by the French in the same from Cape Breton.

The whale fishery on the coast of Greenland hath lately been attempted with very good success by the Nantucket men, who are undoubtedly the most expert and skilful men in the world in that particular affair. And it is the opinion of many, that a few years will determine who are the best whale-fishers on the coast of Greenland, the hardy people of Nantucket, or the Dutchmen.

The fort at Annapolis Royal is made of earth, being built formerly by the French, and is a regular fortification, consisting of four bastions, a deep dry moat, a covert way and counterscarp, with an half-moon and outworks, detached from the body of the place, the lower battery of seventeen pieces of full canon was slighted some years ago.

The other English fort in Acadie upon the island at Canso, is not worth mentioning, especially when we consider what a large and regular fortification of stone the French have at Cape Breton, very near to Canso.

The frontiers of Maine are defended by regular blockhouses, most of them being in good repair. And on the frontiers of Massachusetts, Maine, and New-Hampshire, are many regular blockhouses well flank'd, supported and defended in time of war by their proper owners.

The old fort at Pemaquid, rebuilt by the honourable colonel DUNBAR, by direction from England, hath since been slighted by an order from hence. It would have been an excellent barrier in that quarter, and great settlements were carrying on in that place by the farmers from Ireland. No attempts have been made to civilize the natives of Acadie, or cultivate the soil: It hath been found by experience, that few settlements have ever been made under a military government. The Indians of Acadie, those bordering upon the frontiers of Maine, New-Hampshire, and upon the north-west part of Massachusetts, are all of them to a man in the interest of France, having missionaries from France settled among them, who take a great deal of pains with the Indians.

The following piece is a letter from SAMUEL DALE, M. L. to Sir HANS SLOANE, bart. president of the royal society, containing the descriptions of the moose deer of New-England, and a sort of stag in Virginia.

S I R,

"The present which I herewith make you is the head, or rather the attire (as it is called in heraldry) of the moose-deer, sent me some years since from New England by the honourable SAMUEL SHUTE, Esq. then governor of that colony. This animal has been mentioned by several authors, but their accounts have generally

been so very imperfect, that little satisfaction hath thereby been given to the curious enquirers after natural history. The first mention that I find of this moose deer is by Mr. JOSELYN, in a little tract called New England rarities, where page the 19th that author writes, That it is a goodly creature, some of them twelve feet high, their horns exceeding fair, with broad palms, some being two fathoms from the top of one horn to the other. Much to the same purpose is the account he gives of this animal in another book of his called Two voyages to New England, p. 88. in which he saith, That a moose, or elke, is a creature, or rather a monster of superfluity when full grown, being many times bigger than an English ox. What NEAL in his history of New-England, vol. 2. p. 573. hath of this animal, called by him the moose, is copied from the aforesaid JOSELYN. The best and fullest account of this animal was sent by the honourable PAUL DUDLEY, Esq. fellow of the royal society. This is published in the philosophical transactions of the royal society, no. 368. p. 165. where he makes them to be of two sorts, viz. the common light grey moose, called by the Indians wampoose, and the large or black moose; which is the beast whose horns I herewith represent. As to the grey moose, I take it to be no other than what Mr. JOHN CLAYTON, in his account of the Virginian quadrupedes, published in the aforesaid transactions, no. 210. p. 122. calls the elke, which beast by the Parisians in their memoirs for a natural history of animals, englished by Mr. PITFIELD, p. 167, is called by the name of the stag of Canada, of which I have seen a single horn sent by Mr. MARK CATESBY, from Virginia, by the name of an elkes-horn, and was in all respects like those of our red deer, or stags, only larger, weighing about twelve pounds averdupoiz, and from the burr to the tip, measured by a string, about six feet high. Mr. DUDLEY writes, that his grey moose is most like to the ordinary deer; that they spring like them, and herd together sometimes to thirty in a company: but whether he means by that term the red, the Virginian, or fallow deer, is uncertain, he having said nothing of their horns, which was needful to distinguish them. The black moose is (by all that have hitherto writ of it) accounted a very large creature. Mr. JOSELYN (as I before mentioned) makes it many times bigger than an ox, and Mr. DUDLEY writes, that the hunters have found a buck or a stag moose fourteen spans in height from the withers, which at nine inches to the span, is ten feet and a half; and that a doe or hind of the fourth year, killed by a gentleman near Boston, wanted but one inch of seven feet in height. The stag, buck, or male of this kind, hath a palmed horn, not like that of our common or fallow deer, but the palm is much longer, and more like to that of the German elke, from which it differs in that the moose hath a branched brow antler between the burr and the palm, which the German elke hath not.

"Nor doth the horn of this New England black moose agree in figure with either of those mentioned in the philosophical transactions, no. 227. p. 489. and no. 394. p. 123. to be found fossil in Ireland, the last of which Mr. KELLY writes that for want of another name they called

Moose
deer.

“ called elkes horns. I suspect that those horns
 “ which the late reverend and learned Mr. RAY
 “ mentions in the synopsis methodica animalium
 “ quadrupedum, to have seen with one Mr.
 “ HOLNEY, an apothecary of Lewes in Suffex,
 “ as likewise in divers museums, were not the
 “ horns of this black or American moose, but of
 “ the German elke, because that inquisitive gen-
 “ tleman takes no notice of any brow antlers
 “ they had, which I think was too notorious to
 “ have escaped his observation, had there been
 “ any such.

“ Concerning the number of young ones or
 “ calves, which a moose brings forth at a time,
 “ authors vary; for Mr. DUDLEY saith, that
 “ they bring forth but two; but JOSELYN, in his
 “ two voyages, p. 89. and from him NEAL, that
 “ they are three; and that they do not go so
 “ long pregnant as our hinds by two months.
 “ What these two last mentioned authors write
 “ concerning their casting their calves a mile
 “ distant from each other, doth not seem to me
 “ probable: nor do I find that NEAL, in his de-
 “ scription of this beast, makes any mention of
 “ their having a long tail, though so charged
 “ to do by Mr. DUDLEY, who likewise omits the
 “ brow antlers in his description of their horns.

“ There is another beast of the deer kind,
 “ which, though very common in Virginia, and
 “ without doubt in other of the northern provin-
 “ ces in America, yet I think it is not described
 “ by any author, (but it is expected that it will
 “ not escape being taken notice of by Mr. CATES-
 “ BY in his natural history of Florida, &c.) Mr.
 “ BEVERLY, in his present state of Virginia, men-
 “ tions both elke and deer in that country, but
 “ doth not describe either: but by what I have
 “ received from Mr. CATESBY, the first should
 “ have been the Canada stag, and the other the
 “ deer I have here mentioned. Mr. CLAYTON
 “ likewise mentions the elke, which he saith are
 “ beyond the inhabited parts, and are the same
 “ with Mr. BEVERLY’S; as also the deer, of
 “ which he saith there are abundance, yet doth
 “ not describe them, but calls them red deer,
 “ though they are not the same as we here call by
 “ that name, but of those which are fallow.
 “ Mr. NEAL likewise mentions deer in New-Eng-
 “ land, but gives only the name, which being ge-
 “ neral, nothing can be inferred from it.

“ That which I take for the undescribed deer,
 “ is a beast of the stag kind, having round horns
 “ like them, not spreading out as in the stag or
 “ red deer, but meeting nearer together at their
 “ tips, and bending forward over the face of the
 “ animal: the brow antlers likewise are not
 “ crooked and standing forward, but strait and
 “ upright. The skin of this deer is of an arena-
 “ ceous, or sandy colour, with some black hairs
 “ intermixed, and spotted all over while young
 “ with white spots, like some sorts of our fallow
 “ deer, being also about the bigness of them when
 “ fully grown. The dama Virginiana Raii synop.
 “ animal. quad. p. 86. which was formerly in St.
 “ James’s park, seems to be different from this,
 “ if Mr. WILLOUGHBY was not led into a mis-
 “ take in taking it to be of the palmate kind, by
 “ only seeing it when the horns were shed; per-
 “ haps this last of Mr. RAY, may be the mau-
 “ rouse of JOSELYN’S voyages, p. 91. which he
 “ saith is like the moose, but his horns are but
 “ small, and the beast about the size of a stag; but
 “ his description is too short to be satisfactory.”

VOL. III.

A continuation of the present state of Carolina.

The following pages are an answer from ge-
 neral OGLETHORPE, to some enquiries made by
 the author, concerning the state of Carolina and
 Georgia.

Carolina is part of that territory which was
 originally discovered by Sir SEBASTIAN CABOT.
 The English now possess the sea coast, from the
 river St. John’s, in 30 degrees 21 minutes north
 latitude. Westward the King’s charter declares it
 to be bounded by the Pacifick Ocean.

Carolina is divided into North Carolina, South
 Carolina, and Georgia; the latter is a province
 which his Majesty has taken out of Carolina, and
 is the southern and western frontier of that pro-
 vince, lying between it and the French, Spa-
 niards, and Indians.

The part of Carolina that is settled, is for the
 most part a flat country: All near the sea, is a
 range of islands, which breaks the fury of the o-
 cean: Within is generally low-land for twenty or
 twenty five miles, where the country begins to
 rise in gentle swellings. At seventy or eighty
 miles from the sea, the hills grow higher, till
 they terminate in mountains,

The coast of Georgia is also defended from the
 rage of the sea by a range of islands. Those
 islands are divided from the main by canals of salt
 water, navigable for the largest boats, and even
 for small sloops, the lofty woods growing on
 each side the canals, make very pleasant land-
 scapes. The land at about seven or eight miles
 from the sea is tolerably high; and the farther
 you go westward the more it rises, till at about
 150 miles distance from the sea, to the west,
 the Cherikees or Apellachean mountains begin,
 which are so high that the snow lies upon some of
 them all the year.

This ridge of mountains runs in a line from
 north to south, on the back of the English colo-
 nies of Carolina and Virginia; beginning at the
 great lakes of Canada, and extending south, it ends
 in the province of Georgia, at about two hundred
 miles from the bay of Apellachee, which is part
 of the gulph of Mexico. There is a plain coun-
 try from the foot of these mountains to that
 sea.

The face of the country is mostly covered with
 woods; the banks of the rivers are in some places
 low, and form a kind of natural meadows, where
 the floods prevent trees from growing. In other
 places, in the hollows, between the hillocks, the
 brooks and streams being stopt by falls of trees,
 or other obstructions, the water is penn’d back:
 These places are often covered with canes and
 thickets, and are called in the corrupted Ameri-
 can dialect, swamps. The sides of the hills are
 generally covered with oaks and hiccary, or wild
 walnuts, cedar, sassafras, and the famous laurel
 tulip, which is esteemed one of the most beautiful
 trees in the world: The flat tops of the hillocks
 are all covered with groves of pine-trees, with
 plenty of grafs growing under them; and free
 from underwood, that you may gallop a horse for
 forty or fifty miles an end. In the low grounds,
 and islands in the river, there are cypreis, bay-
 trees, poplar, plane, frankincense, or gum-trees,
 and other aquaticks. All parts of the province
 are well watered; and in digging a moderate depth,
 you never miss of a fine spring.

What

What we call the Atlantick Ocean, washes the east and south-east coasts of these provinces. The gulph stream of Florida sets with a tide in the ocean to the east of the province; and it is very remarkable, that the banks and soundings of the coast extend twenty or twenty-five miles to the east of the coast. To explain this, we will mention the manner of the voyage from Europe. You set out with variable winds, and having got enough to the west of Europe, you stand southerly till you meet with the trade winds; which you do, on this side the 20th degree north latitude. Those winds blowing generally eastwardly and moderately brisk, soon drive you over the greatest part of the Atlantick Ocean: You keep the same latitude, till you think you are near the Bahama's, and then you steer northwardly, to avoid falling in with them, till you come into 29 degrees, and then you run in to make the shore. You cross the gulph stream of Florida, which is a rapid tide, that sets out from between the island of Cuba and Bahama, on the one side, and Florida on the other. It is upwards of twenty leagues wide, and so rapid that it runs to the northward, at the rate of three miles an hour. When you are past the gulph stream, you throw the lead, and if you find the ground at twenty five leagues of the coast of Georgia or Carolina, these they call the banks, and the water shoals gradually to shore, till you come within two leagues, where the banks are so shoaly that they bar all further passage, excepting in the chanel which lie between the bars. These bars are the defence of the coast against enemies fleets, and the reason that it has laid so long undiscovered; for without good pilots you cannot come into any harbour, the shoalness of the coast frightened ships so from coming to make discoveries upon it: till Mr. OGLETHORPE had the entries on the coast of Georgia founded in the year 1733, no ship attempted to go into ports in Georgia, nor did the merchants believe there were any ports upon that coast. Though now they find the river Savannah an excellent harbour; and upon the worst of the bar, three fathom at dead low water. There is also a noble harbour to the southward, called Teky-Sound, where there is anchoring for a large Squadron in ten or fourteen fathom water land-locked, and a good and safe entry through the bar.

Between these harbours on the one side, and the Bahama's on the other, the Spanish ships must come home with all the treasures of Mexico; and a Squadron here in time of war, can hardly miss intercepting them, and at the same time have safe harbours under their lee, and a healthy climate; have all Georgia, Carolina, and North-America a plentiful country, to supply them with fresh provisions; so that they would be under none of those inconveniences from want and sickness, which those Squadrons suffered who lay at Porto Bello.

The tides upon this coast flow generally seven foot: The soundings are sand, or ooze, and some oyster banks, but no rocks: The coast appears low from the sea, and covered with woods.

Cape Fear is a point which runs with dreadful shoals far into the sea from the mouth of Clarendon river, in North-Carolina. Sulwan's Island, and the Coffin-land, are the marks of the entry into Charles-Town harbour: Hilton-head upon Trenches Island, shews the entry into Port-Royal; and the Point of Tybee Island, makes the

entry of the Savannah river. Upon that point the trustees for Georgia have erected a noble final or lighthouse, 90 foot high, and 25 foot wide; it is an octagon, and upon the top there is a flag-staff 30 foot high.

The province of Georgia is watered by three great rivers, which rise in the mountains, viz. the Alatomaha, the Ogechee, and the Savannah, the last of which is navigable six hundred miles for canoes, and three hundred miles for boats. The British dominions are divided from the Spanish Florida by a noble river called St. John's. These rivers fall into the Atlantick Ocean; but there are besides them, the Flint, the Catooche, and even the Mississippi river, which pass through part of Carolina, or Georgia, and fall into the gulph of Apellachee or Mexico.

All Carolina is divided into three parts: North Carolina, which is divided from South Carolina by Clarendon river, and of late by a line marked out by order of the council: South Carolina; which on the south is divided from Georgia by the river Savannah. Carolina is divided into several counties; but in Georgia there is but one yet erected, viz. the county of Savannah: it is bounded on the one side by the river Savannah, on the other by the sea, on the third by the river Ogechee, on the fourth by the river Ebenezer, and a line drawn from the Ebenezer to the Ogechee. In this country are the rivers of Vernon, Little Ogechee, and of Westbrook. There is the town of Savannah, where there is a seat of judicature, consisting of three bailiffs and a recorder. It is situated upon the banks of the river of the same name. It consists of about two hundred houses, and lies upon a plain of about a mile wide, the bank steep to the river, forty five foot perpendicularly high: The streets are laid out regular. There are near Savannah, in the same country, the villages of Hampstead, Highgate, Skydo way, and Thunderbolt; the latter of which is a translation of a name: Their fables say, that a thunderbolt fell, and a spring thereupon arose in that place, which still smells of the thunder. This spring is impregnated with a mixture of sulphur and steel, and from this smell probably the story arose. In the same county is Joseph's Town, and the town of Ebenezer, both upon the river Savannah, and the villages of Abercorn and Westbrook. There are saw-mills erecting on the river Ebenezer, and the fort Argyle lies upon the pass of this county over the Ogechee. In the southern divisions of the province lies the town of Frederica, with its district, where there is a court with three bailiffs and a recorder. It lies on one of the branches of the Alatomaha. There is also the town of Darien, upon the same river, and several forts, upon the proper passes, some of four bastions, some are only redoubts; besides which there are villages in different parts of Georgia. At Savannah there is a publick store-house built of large square timbers; there is also a handsome court-house, guard-house, and work-house: the church is not yet begun, but materials are collecting, and it is designed to be a handsome edifice. The private houses are generally sawed timber, framed and covered with shingles; many of them are painted, and most have chimneys of brick. At Frederica, some of the houses are built of brick; the rest of the province is mostly wood. They are not got into luxury yet in their furniture, hewing only what is plain and needful; the winters being mild, there

there are yet but few houses with glass-windows.

The Indians are a manly well-shaped race; the men tall, the women little: They, as the ancient Grecians did, anoint with oil, and expose themselves to the sun, which occasions their skins to be brown of colour. The men paint themselves of various colours, red, blue, yellow and black: the men wear generally a girdle, with a piece of cloth drawn through their legs, and turned over the girdle both before and behind, so as to hide their nakedness. The women wear a kind of petticoat to their knees. Both men and women in the winter wear mantles, something less than two yards square, which they wrap round their bodies, as the Romans did their toga, generally keeping their arms bare: They are sometimes of woollen, bought of the English; sometimes of furs, which they dress themselves. They wear a kind of pumps, which they call morgifons, made of deer skins, which they dress for that purpose. They are a generous good-natured people, very humane to strangers; patient of want and pain; slow to anger, and not easily provoked; but when they are thoroughly incensed, they are implacable; very quick of apprehension, and gay of temper. Their publick conferences shew them to be men of genius, and they have a natural eloquence, they never having had the use of letters. They love eating, and the English have taught many of them to drink strong liquors, which, when they do, they are miserable sights. They have no manufactures but what each family makes for its own use: They seem to despise working for hire, and spend their time chiefly in hunting and war; but plant corn enough for the support of their families, and of the strangers that come to visit them. Their food, instead of bread, is flour of Indian corn boiled, and seasoned like hasty pudding; and this is called homminy. They also boil venison and make broth: They also roast or rather broil their meat. The flesh they feed on is buffalo, deer, wild-turkeys, and other game; so that hunting is necessary, to provide flesh, and planting for corn. The land belongs to the women, and the corn that grows upon it; but meat must be got by the men, because it is they only that hunt. This makes marriage necessary, that the women may furnish corn, and the men meat. They have also fruit-trees in their gardens, viz. peaches, nectarines and locusts, melons and water-melons; potatoes, pumpkins, and onions, &c. in plenty, and many wild kinds of fruits; as parsonies, grapes, chinquepins, and hickary-nuts, of which they make oil. The bees make their combs in the hollow trees, and the Indians find plenty of honey there, which they use instead of sugar. They make what answers salt of wood-ashes, and long-pepper which grows in their gardens; and bay-leaves supply their want of spice. Their exercises are a kind of ball-playing, hunting, and running; and they are very fond of dancing: Their musick is a kind of a drum, as also hollow cocoa-nut shells. They have a square in the middle of their towns, in which the warriors sit, converse, and smoke together; but in rainy weather they meet in the King's house.

They are very healthy people, and have hardly any diseases, except those occasioned by the drinking of rum, and the small pox: Those who

do not drink rum are exceeding long-lived. Old BRIM, Emperor of the Creeks, who died but a few years ago, lived to one hundred and thirty years; and he was neither blind nor bed-ridden, till some months before his death. They have sometimes pleurisy and fevers, but no chronical distempers. They know of several herbs that have great virtues in physick, particularly for the cure of venomous bites and wounds.

The native animals are, first the *urus* or *zorax*, described by CÆSAR, which the English very ignorantly and improperly call the buffalo. They have deer of several kinds, and plenty of roe-bucks and rabbits. There are bears and wolves, which are very small and timorous; and a brown wild-cat, without spots, which they very improperly call a tyger; otters, beavers, foxes, and a species of badgers, which they call racoons.

There is great abundance of wild fowls, viz. the wild turkey, the partridge, doves of various kinds; wild geese, wild ducks, teal, cranes, herons, of many kinds, not known in Europe: There are great variety of eagles and hawks, and great numbers of small birds, particularly the rice bird, which is very like the ortolan. There are also some rattle snakes, but not near so frequent as is generally reported. There are several species of snakes, some of which are not venomous. There are crocodiles, porpoises, sturgeon, mullets, cat-fish, bass, drum, devil-fish, and many species of fresh water fish, that we have not in Europe; oysters upon the sea islands in great abundance. But what is most troublesome there, are flies and gnats, which are very troublesome near the rivers; but as the country is cleared, they disperse and go away. Besides the animals that are natives, there are all the same animals as in Europe, cows, sheep, hogs, &c.

The vegetables are innumerable; for all that grow in Europe grow there; and many that cannot stand in our winters thrive there.

An account of the logwood countries by Mr. ATKINS.

Mr. ATKINS, speaking of the logwood cutters, observes, that they were originally settled at the Bay of Campeachy, but being disturbed there by the Spaniards, they removed to the Bay of Honduras, where they support themselves by force of arms, being about 500 (later accounts say 1500) merchants and servants.

Their principal residence is at a place called the Barcederas, about forty miles up a narrow river full of alligators; and what is a greater inconvenience against transporting their effects, is a strong current in it from the freshes up land, and the banks being covered with shrubs, that makes it difficult to walk and tow the boats; covered also with infinite numbers of sand-flies and muskitoes: they live in pavilions; a servant, at their time of lying down to rest, shaking them till cleared of these vermin, that are an unsufferable plague and impediment to sleep.

At the season (once a year) they move their pavilions from the pleasurable spots, the better to attend the logwood cutting, which carries them sometimes many miles from this principal residence, to follow the wood, which runs in a line or vein (like minerals in the earth) of some miles perhaps, and then as many without a stick of it. They cut it into large pieces, and leave it on the ground till the land-floods favour their bringing it

it into the river, and then canoes are laden away with it to lay in store at the Barcaderas, where the chief are still left residing.

They have all good arms; and knowing the Spanish clemency, defend themselves desperately if attacked, which has happened seldomer than at Canipeachy, and always by sea.

A servant, which is the first step with sea-men into the trade, is hired at a tun of logwood per month, and has one day in seven for himself, making about ten pounds per month to him: Hence, if thoughtful and sober, they in time become masters, join stock, and trade independently. They have a King, chose from among their body, and his consort is stiled Queen; agreeing to some laws by common consent, as a guide to them.

The ships that come into the bay are on their guard also, and fetch it down in flat-bottomed boats, each crew being allowed on the voyage a bottle of rum, and some sugar, and row generally in the night, as freest from stinging flies, and rest in the day.

The exchange with ships is for money, beer, flour, or any sort of provisions and necessities; these the cunningest reserve in store against the wants and demands of the inconsiderate, and so make extraordinary returns.

An account of the logwood countries by Mr. URINO.

Honduras
logwood-
cutters.

The country of Honduras, where the English cut their logwood, is all a flat, and great part of it a morass, with several large lacunes, which in the rain-times are almost all over-flowed. In the dry time of the year, the logwood cutters search for a work, that is, where there are a good number of logwood trees, and then build a hut near them, where they live during the time of their cutting. When they have cut down the tree, they log it, and chip it, which is cutting off the bark and sap, and then lay it in heaps, cutting away the underwood, and making paths to each heap, that when the rains come in which overflow the ground, it serves as so many creeks or channels, where they go with small canoes or dories, and load them, bringing them sometimes to the Barcaderas, thirty miles, from whence the people who buy it fetch it: But if it so happens, that the wood stands upon a ridge, or on such high ground that the water does not flow to it, they cut it into logs proper for backing, and back it out, as they call it. Some of these trees grow very tall and straight, tho' most of them are low and crooked: It bears a small leaf, something like our white thorn, and the underwood is prickly, not much unlike it: It blossoms, and bears seed, which, by falling off sows the ground from whence it springs up, and the overflowing the ground brings the soil over it, which makes it take root and grow a great pace. The general price of the wood at the Barcaderas is five pounds per ton, Jamaica money. The wood-cutters are generally a rude drunken crew; some of which have been pirates, and most of them sailors: Their chief delight is in drinking; and when they broach a quarter cask, or a hoghead of wine, they seldom stir from it while there is a drop left: It is the same thing when they open a hoghead of bottle-ale or cyder, keeping at it sometimes a week together, drinking till they fall asleep; and as soon as they wake at it again, without stirring off the place. Rum punch is their general

drink which they'll sometimes sit several days at; also they do most work when they have no strong drink; for while the liquor is moving they don't care to leave it. I had a very unpleasant time living among these people, tho' they paid me a considerable deference; and when they killed a deer, or wild-fowl, I was always sure to have part of them; but I should have been much more agreeable to them, if I would have kept them company at their drinking-bouts. The wild creatures I saw were deer, tygers, alligators, and guanoes; the deer are small, but lean. I saw at several times two tygers; we fired at one of them, but the gun missed fire, and we walked leisurely away into the woods: Being both times in a creek upon the water, we were in no danger. I was informed they have monkeys, picarry, and warree, but I saw none. They have quams, cori-so's, Muscovy ducks, whistling ducks; which last are something bigger than our teal, and as good eating; cockrecoes, macaws, parrots, two-penny chicks, double and single curlews, crab-catchers, and other fowls. There are great numbers of guanoes, upon whose eggs we often feasted, drinking them mixed in punch. All their rivers and creeks are full of fish; which also swarm with alligators that will seize a man in the water. I have tasted of their flesh, which is coarse, and eat of their eggs, but they are not so good as a turtle's or guano's.

The logwood cutters during the floods, dwell at the Barcaderas, which are forty-two miles up the river, where they have built their huts upon pretty high banks, which just keep them out of the water in the time of the floods. As soon as they have notice of any ship's or vessel's arrival at the river's mouth, they flock down on board, in order to purchase such things as they want, and are sure to provide good store of strong liquor. The commodities which suit them are all sorts of strong liquors, provisions, small arms, gunpowder, and small shot; cutlasses, or hangers, axes, ozenbrigs, and shoes. Ozenbrigs is their general wear, and almost all their cloathing, except hats and shoes: Their pavilions are also made of ozenbrigs; there is no possibility of living without them; there being such multitudes of biting and stinging flies, as muskitoes, sand-flies, galley-nippers, and bottle-asses, which last poison the blood to that degree, wherever they bite, that it leaves a black speck as big as a large pin's head, which in two or three days grows rotten. In the northerly winds there are few flies to be seen, nor are they in such numbers during the floods, as in the dry times. Among the small islands or kays in the bay are great numbers of green turtle, which the bay men never want when they fish for them, and are mostly taken in nets. The manatee is often found here, and there is likewise great quantities of several sorts of excellent fish, among which the Jew fish exceeds in goodness: They are shaped something like a cod, but thicker in proportion, and much better eating: They have very broad scales, and some of them weigh eighty pounds.

The trade between Jamaica and Spanish America.

In the beginning of the year 1711, I went over in a sloop well mann'd and arm'd, to trade on the coast of New Spain, and we carried with us a great quantity of dry goods, and about a hundred and fifty negroes. We first touched at Porto Bello, but

Trade be-
tween Ja-
maica and
Spanish
America.

but being war-time, we used to go to the Grout within Monkey-Kay, which is a very good harbour, and is about four or five miles from the harbour and town of Porto-Bello. As soon as we arrived there, our custom was to send one of our people who could speak Spanish into the town, with letters to the merchants, to give them notice of our arrival, and they appointed the time and place where and when our canoe should wait for them to bring them on board, in order to traffick with us; and when they had agreed with us for so many negroes, and such a quantity of goods as they wanted, they returned to the town, and the next day brought their money on board, and received them. We lay at this place trading six weeks, in which time the Spanish merchants at Panama had notice of our being there, and they came over the Isthmus to trade with us. These merchants frequently travelled in the habits of pealants, and had their mules with them, on which they brought their money in jars, which they filled up with meal; and if any of the King's officers met them, nothing appeared but meal, and they pretended they were poor people going to Porto-Bello to buy some trilles; but they for the most part went through the woods, and not in the road, in order to prevent their being discovered by the royal officers. When they had bought as many negroes, and such a quantity of dry goods as their money would purchase, they used to proportion and make them up in little packs fit for one man to carry, and we supplied them with as much provisions as was necessary for their journey, cross the Isthmus to the South-Sea, and thus they parted together through the woods in the most secret manner. While we lay at the Grout, the first voyage a Spaniard agreed with us for seventy slaves, and a good quantity of dry goods, which we delivered between Chagre and Porto Nova; the signal agreed upon being made from the castle of Chagre, we anchored about two miles from it, and sent our canoe on shore, where we found the Spaniards with several asses and mules laden with gold and silver, which we carried on board, and when the money was found to be right, and all things were adjusted, we landed the negroes and dry goods, providing them with necessaries for their journey over to the South Sea, and then sailed again for the Grout; but being not able to dispose of all our cargo there, we set sail for Carthagena, and by the way touched at Tolué, where we furnished ourselves with poultry, which are reckoned the best upon the main. When we arrived at Brew, which is the place where we lay to trade with the merchants of Carthagena, we gave notice of it to some of the people of that island, who sent word into the city of our being there; several merchants came from thence to trade with us; and when we had sold what we could we returned to Jamaica. This place is about eight miles from the city, and a good road for vessels to ride in. I was several voyages to the Spanish coast, trading in this manner.

A description of Jamaica by Mr. ATKINS.

Mr. ATKINS gives the following description of the chief towns in Jamaica.

Chief towns in Jamaica.

St. Jago is irregular and low built, to secure it against storms: Even the governor's, or what they call the King's house, is but a ground floor, and makes one side of a quadrangle, with a parade where all gentlemen meet to transact their business. VOL. III. NUMB. CXLIII.

The merchants and factors for distant planters, and the officers, civil and military, do together make a considerable number, dividing in the evenings into parties of dancing, gaming, or drinking, and generally to a publick house, to avoid the obligation of returns and treats, very costly in this country.

Kingston, at the upper end of Port Royal harbour, the place of lading and unlading almost all ships to and from the island, is, in my eye, preferable to the former. The streets are wide and more regular to face the sea breezes, and the cross streets at right angles, that the air may have as little interruption as possible; a convenience that cannot be too much meditated in so hot a climate; for the land breezes failing betimes in the morning, you have it excessively hot, all creatures languish and faint till the sea ones succeed, which will not be till ten o'clock, sometimes eleven, or later, and may be esteemed the life of the island, dispelling those impure vapours continually exhaled from the mountains, and refreshing and rousing the animal nature from backgammon, or loitering, to business.

The harbour is spacious here, and the ships lie land-locked; but the peninsula that covers them from the sea being low and narrow, they are not so safe against storms as one would imagine.

From hence to Spanish Town, when called on any law-suit or business, they take boat to Passage Fort, on the other side a small river at the bottom of the harbour, where are three or four houses that furnish passengers for the journey (6 miles) at twenty shillings a coach, or five shillings a horse, and are rarely without customers, the calls in traffick are so frequent.

Port Royal, which makes up, with the former two, all the towns of note on the whole island, is on the starboard entrance of the harbour. The road before it is reckoned good holding ground, and fenced from southerly winds by sandy kays without. The town itself stands on such a sandy kay, not much above the surface of the water, and contains no more ground than holds the buildings, and the fort contiguous with it on the outer point; which, with a line, or rampart of guns to the sea (together about one hundred) is their chief defence. Under the fort is a little nook or bay called Chocolate-hole, where we have a hulk lies for cleaning ships.

Mr. ATKINS also gives us the following account of a stranger's daily expences at Jamaica.

Bits of 7d. 1.

Dinner.	5
A bottle of small beer.	1
A bottle of ale.	4
Coffee per dish.	1
A quart of rum punch.	4
Lodging per night.	8

Ordinaries are filled with a mixture of land and sea-faring people, who have three or four sorts of cookery at dinner, and each a pint of Madeira, with a desert of guavas, and other insipid or ill-tasted fruit. One of our dishes is frequently turtle, much esteemed in this part of the world, and are supplied to the market here by sloops, and sold at a bit a pound, like other flesh, now also increased to a tolerable plenty, by the planters having set apart servants, pens, and pasture-grounds, for rearing up all kinds of domestick animals, in which of late years they have found their account; our ships companies being victualled here twice a week with fresh beef,

beef, during a stay of six months, and an hospital on shore provided with lighter food.

Bartering is the easiest way of living on shore, or rather, no man can live long without it: Madeira wines, refined sugars, linens, and necessaries of almost all kinds, selling from one hundred pound to one hundred and fifty per cent. advance; their rum to you three bits per gallon; sugars from four to seven dollars a hundred, both superior to Barbadoes. Other commodities are ginger, pimento, cacao, or the chocolate nut, indigo, cotton, tortoise-shell, dyers wood, cedar, mahogany and manchineel woods; and they allow 35 per cent. advance on money.

The Creoles (those born here) which are properly the natives of the island, the ancient ones being all extirpated by the cruelty of the Spaniard before our possession, are a spurious race; the first change by a black and white they call mulatto, the second a mustee, the third a caste; the faces, like a coat of arms, discovering their distinction. They are half negrish in their manners, proceeding from the promiscuous and confined conversation, with their relations, the servants at the plantations, and have a language equally pleasant, a kind of gipsy gibberish that runs smoothest in swearing.

The English are computed at seven or eight thousand, the Negroes at eighty thousand, a disproportion, that together with the severity of their patrons renders the whole colony unsafe. Many hundreds of them have at different times run to the mountains, where they associate and commit robberies upon the defenceless and nearest plantations; and which, I imagine, they would not have done but for the cruelty of their usage, because they subsist very hard, and with danger, by reason of parties continually sending out by the government against them, who have five pound a head for every one killed, and their ears are a sufficient warrant for the next justice to pay it: If the negro be brought in a prisoner, he is tormented and burnt alive. Our latest advices from Jamaica concerning them, are, that they have chose a king, that they daily increase, have some inaccessible places of retreat, and are suspected of being encouraged and supplied with powder and arms from Cuba.

The natural remedy against this evil is an increase of hands. They have large savannahs both on the north and south sides, supposed formerly to have been fields of Indian wheat, that afford good pasturage, and breed up a great number of cattle, with a great waste of land, still left capable of large improvements, into sugar plantations, or tillage; but here lies the objection to any further encouragement. If the present proprietors can export eleven thousand hogsheds of Sugar annually, and the price with that number is kept low at market, whoever contributes to the making eleven thousand more, is depreciating his own estate, and lending a hand to ruin himself. Tillage and grazing, tho' not employing the land to one tenth of its value in such colonies, would interfere with the present interest also, by lowering the price of provisions; wherefore the security from such augmentation of people (the merchants being judges) gives place to profit, a neglect that must be repaired in the end, by undertakers of more generous sentiments. Thus convinces me, that altho' trade be wealth and power to a nation, yet if it cannot be put under restrictions, and control-

led by a superior and disinterested power, excess and irregularity will be an oppression to many, and counter-balance the publick advantages by increasing the difficulties of subsistence, and with it mens disaffection.

Here is a distant evil, the cure of which lies in an expence that nobody likes, nor for such dislike will ever blame himself in time of danger. The merchant and planter think, if less sugars were made it would be better; provided (every one means) the bad crop do not happen upon their own plantations; and thus for the same reason, the Dutch and other companies burn their spice, India goods, tobacco, &c. viz. to keep up a price; for rendering things common, or cheap, or assisting towards the same liberty, would border too much upon the christian precepts.

The sloop-trade hence to the Spanish West-Indies, under the protection of our men of war, has been reckoned at two hundred thousand pounds per annum. In 1702, orders came to the governor to hinder it, on account of a treaty between us and the Dutch for that purpose, who have since gone into it themselves from Curisao. And in 1716, a yet greater obstruction was put upon them by the peculiar privileges of the assiento factors: However, they continue on, and complain of no other illegalities than the Spanish seizures of late years, very frequent; and, together with the decay of this branch of trade, their want of Spanish wrecks, privateering, and fall of Sugars, makes the island not so flourishing as in times past.

An account of Barbadoes, and its sugar-works, from Mr. ATKINS.

The negroes of Barbadoes are computed to be eighty or ninety thousand countenanced in polygamy, English twenty thousand; the women among them most Scotch and Irish, very homely, and great swearers. The men, contrarily, are very gay, clean, and handsome; from mean originals, often succeeding with rich widows, it being but justice to link a fat plantation to the truly nauseous draught of matrimony.

The way of feeding such a multitude, and providing necessaries in an island yielding little besides sugar, is principally by their fisheries and importations.

The sea gives them great plenty of flying fish, dolphins, barracuda, and king-fish, particularly the first: They bait with their own specie, which thrown about, the fish fly in such numbers to the boats, that they take them up with dip-nets, and sometimes the dolphins with them. The season goes off at the autumnal equinox. Their importations by ships from England, Ireland, New-England, Pennsylvania, Carolina, or New-York, constantly supply any defect of food or necessaries, every vessel bringing them something or other of this kind, which the merchants keep in store, and sell the planters occasionally, who give their sugars, rum, and molasses, in return. The price in what I was acquainted was, viz.

Bought.

Rum, at 1s. 2d. per gallon

Citron water, 40s. and 30s.

Pickled pepper, 10s.

Preserved ginger, 5s. per pound.

Sugar 20 s. a hundred, and before our improvements (says GEE) the Portuguese sold for 7 and 8 l. a hundred.

Cocoa, 3 or 4 l. per hundred.

Aloes, 4 d. per pound.

Sold.

Salt beef and pork, 40 s. for a cask of two hundred weight.

Bisket, 17 s. per hundred.

Candles, 6 d. halfpenny per pound, &c.

Exchange 30 per cent. or more.

The sugar canes are set out between August and December six inches deep, and do not come to maturity until one year and a quarter. When ripe, which is known by their colour, they cut them up with a bill, and send them to the windmills, which presses out the juice so clean, that the canes, by being an hour or two in the sun, become fit for fuel.

The liquor must not remain in the cistern above a day for fear of souring; it is therefore by a gutter conveyed to the copper or boiler, and in the boiling the filth skimmed off: thence it is conveyed into the second and third; and in the last, called the tack, is boiled to a consistency, and turned into a grain by throwing in of temper, which is only the infusion of lime and water made strong, according to the goodness of the cane. Nine pounds of juice make one of muscovado, and one of molasses.

From hence it is carried to the cooling cistern till fit to put in pots, which have holes at bottom to drain off the molasses.

Of these molasses again they sometimes make another worse sugar, called paneels. Of the scum, coarse molasses, washings of the boilers and pots fomented together, is made rum.

To refine sugar is to boil it over again, and clarify with the same lime water, and eggs; reckoned better than the clayed sugars of this region, made by putting a clayey earth mixed with water to the thickness of a batter upon them, and repeated three or four times, according to the degree of whiteness designed: both ways carry the treacle and molasses downwards, but the former is most esteemed, as mixing less, and purging to better purpose. Lime refines from impurities, and imparts a softer taste, experienced in throwing it into wells of hard water: the best refined in loaves comes back to the sugar colonies from England, sell at fifty or one hundred per cent. advance, and are of common use; they must be kept dry, a hot and moist air dissolving them.

From molasses distillers make a clean brandy; and it gives a pretty tasted spirit to malt liquors boil'd, and worked in the tun.

Besides rum and sugars, they have quantities of ginger, aloes, tamarinds, citron, cassia, colocintida, cassava, limes, oranges, guavas, pine apples, mastich, cedar, cotton, palmetto trees, and prickled pear; but our apples and pears, or any of our shrub-fruits, gooseberry or currant, will not thrive. Of the potatoe they make a brisk small beer, called mobby.

The enterprise to the islands of St. Lucia and St. Vincent, from Mr. URING.

St. Lucia.

His Majesty King GEORGE I. by letters patents, dated 20 June, 1722, granted to his grace JOHN duke of Montagu, the islands of St. Lucia and St. Vincent, situated in the American ocean,

between 12 and 14 minutes north latitude, and between 60 and 61 minutes west longitude; the first about 24 leagues west-north-west of Barbadoes, and seven leagues south of the French island of Martinico, and the same distance north and by east from St. Vincent.

The duke was also constituted captain general of the islands of St. Lucia and St. Vincent, which till that time were included in the commission, and under the government of the governors of Barbadoes.

His grace having appointed captain URING his deputy-governor, and provided seven ships and vessels to carry over the planters, with such provisions and necessaries as were requisite to settle colonies in these islands, and obtained of his Majesty the Winchester man of war, commanded by captain ORME, to convoy, attend, and protect the planters; Mr. URING embarked on board the Winchelsea on the 10th of September 1722, and sailing to Ireland to take in provisions, made it the 15th of December before he arrived at St. Lucia: being come to an anchor in Pigeon Island Bay, a Barbadoes sloop soon after arrived from Martinico, the master whereof communicated to Mr. URING the copy of a mandate by the King of France, which he said was published by order of the French general in all the churches of that island, and in all their towns by beat of drum, which contained in substance, that if the English did not leave the island of St. Lucia in the space of fifteen days, they were to be drove off by force of arms.

The next morning Mr. URING weighed from Pigeon Island Bay, and stood for the harbour of Petite Careenage, which they found to be a very good one, and in it several places fit for careening ships, sheltered from every wind; in one of which ships of sixty guns and upwards may careen very conveniently: the land is very hilly all round the harbour, and in most places steep, ascending from the water-side. At two in the afternoon he landed fifty men, to cut down the trees and bushes on the point, that lay fit for a battery of guns to command the entrance of the harbour. The same day he sent Mr. FAULKNER to Martinico, with letters from the duke of Montagu and the admiralty, directed to captain CHARLES BROWN, commander of the Feverham man of war, and captain ELLIS, commander of the Hector, who were then at Martinico, and acquainted them that the duke had appointed him deputy governor of St. Lucia and St. Vincent, and that being come to settle these islands under the protection of the Winchelsea man of war, he desired, that in pursuance of the orders they had received from the admiralty for that purpose, they would join him as soon as possible, being apprehensive the governor of Martinico designed to molest the colony.

In the mean time he proceeded to land his people, guns, tools, planks, and stores to fortify the harbour, and build a large house to shelter the workmen. On the 22d of december, captain BLAND and captain BROWN arrived from Martinico with his Majesty's ships the Hector and Feverham, and soon after a French sloop, which brought a letter from the French general, to acquaint Mr. URING, that he had heard of his landing English forces in the island of St. Lucia, and desired to know his intentions; and at the same time he received the following copy of the French King's mandate, viz.

A man

A mandate of the King to the *sieur chevalier DE FEUQUIERE*, governor and lieutenant general of the windward islands in America.

"His Majesty having been informed that the King of England has given the islands of St. Vincent and St. Lucia to the duke of Montagu, has made his complaint of it to the court of England, and has alledged that neither the one nor the other of these islands belong to that crown: the first of them ought to remain to the Caribbees, according to conventions made with that people; and the second belong to France, who has been willing to suspend the settlement of that island on the request of the King of England. Notwithstanding those reasons, his Majesty hath not been informed, that there has been any revocation of this grant. On the contrary, he understands that the duke of Montagu is preparing to send and take possession of those islands, and to transport numbers of families thither. This undertaking being contrary to the rights of his Majesty, his intention is, that in case the English should take possession of St. Lucia, and settle there, the *sieur chevalier DE FEUQUIERE* shall summon them to retire in fifteen days, in regard that island belongs to France; and if they do not so depart, he shall compel them to it by force of arms. He shall take care to charge some of the wisest and most experienced of his officers with this expedition. His Majesty desires there should be as little effusion of blood as possible, nor will he have any pillage made: he only wishes the English would retire, and not possess themselves of a country which belongs to him.

Done at Versailles the 21st of September 1722.

Signed LOUIS. Seen and Compared with the original 31 Dec. 1722. de
approved, PHILIP de pas FEUQUIERE.
Orléance.

Upon reading the mandate, and the French governor's letter, in which it was enclosed, Mr. URING sent to captain BRAND and captain BROWN, to know if he might depend upon their assistance, if he was attacked by the French; but they would give him no positive answer, and soon after sailed to Barbadoes: he also sent a letter to the governor of Martinico, to acquaint him, that he had orders from the duke of Montagu, the lord proprietor, under his British Majesty's patent, to plant St. Lucia, and defend it; but proposed the suspending all acts of hostility till they could hear from their respective courts of Great Britain and France.

Mr. URING also thought fit to write to the president of Barbadoes, that the governor of Martinico had threatened to drive the English from the island, if they did not depart in fifteen days, and to desire his assistance to support this part of his Majesty's dominions. To which the president answered, that he was ready to give him all the assistance in his power. But the captains BROWN and BRAND remained so long absent from St. Lucia, that the French had an opportunity of sending between two and three thousand men from Martinico, and landing them on the island: the captains of the men of war also refused to give him any assistance towards fortifying and defending the colony by land; and a great many of the planters falling sick, and others deserting over to the French at the same time, Mr. URING had not fourscore left fit to bear

arms; which compelled him at length to come to a treaty with the French general, the marquis of Champigny; and the following articles were concluded between them.

1. That the English should quit the island of St. Lucia within seven days, provided that the ships of the English nation should at all times have liberty to come into the ports of the said island, and wood and water there, and serve their other occasions, as the French vessels also might.

2. That the English colony should be at liberty to re-embark all their cannon, stores, arms, baggage, and every thing belonging to them, without molestation.

3. That all deserters should be given up.

4. That immediately after the English had evacuated the island, the French forces also should evacuate it; and that the island should remain in the same state it was till the controversies between the two crowns, relating to this island, were decided.

In pursuance of which agreement Mr. URING embarked with his people, and sailed to Antigua, sending the *Winchelsea* man of war, and captain BRAITHWAITE in the *Griffin* sloop, to take a view of the island of St. Vincent, and see if it was practicable to make a settlement there: in the mean time a considerable reinforcement arrived at Barbadoes from the duke of Montagu, with ammunition and provision, and orders to attempt a settlement on St. Vincent, if the planters were driven from St. Lucia.

Captain BRAITHWAITE arrived at Antigua some few days afterwards, and made the following report of his expedition to St. Vincent.

In pursuance of a resolution in council, and your order for so doing the day you sailed with his grace's colony for Antigua, I sailed with the *Griffin* sloop, in company with his Majesty's ship the *Winchelsea*, to St. Vincent. We made the island that night, and next morning run along the shore, and saw several Indian huts; but as yet no Indians came off to us, nor could we get ashore to them, by reason there was no ground to anchor in. Towards the evening two Indians came on board, and told us we might anchor in a bay to leeward, and when we were at anchor they would bring their general on board. Here we came to an anchor in deep water, and very dangerous for the sloop. One, whom they called general, came on board, with several others, to the number of twenty-two: I entertained them very handsomely, and made the chief some trifling presents; but found him to be a person of no consequence, and that they called him chief to get some present from me. Here two of the Indians were so drunk, they would not go ashore, but stayed on board some days, and were well entertained. After this, little winds and great currents drove us off for several days; but at last we came to an anchor in a spacious bay, to the leeward of all the island, the draught of which I ordered to be taken by our surveyor, for your better understanding the place, being the only one where a settlement could be made. The ship and sloop were scarce come to an anchor before the strand of the shore was covered with Indians; and amongst them we could discover a white man, who proved to be a Frenchman. I took captain WATSON in the boat with me, with a Frenchman, and immediately went ashore. As soon as I came amongst them, I asked why they appeared all armed; for every man had cutlasses; some

some had muskets, pistols, bows and arrows, &c. They, with very little ceremony, inclosed me, and carried me up the country for about a mile, over a little rivulet, where I was told I was to see their general. I found him sitting amidst a guard of about an hundred Indians; those nearest his person had all muskets, the rest bows and arrows, and great silence. He ordered me a seat, and a Frenchman stood at his right hand for an interpreter. He demanded of me, what brought me into his country, and of what nation? I told him English, and I was put in to wood and water, as not caring to say any thing else before the Frenchman; but told him, if he would be pleased to come on board our ships, I would leave Englishmen in hostage for those he should be pleased to bring with him; but I could not prevail with him either to come on board, or suffer me to have wood or water. He said, he was informed we were come to force a settlement, and we had no other way to remove that jealousy, but by getting under sail. As soon as I found what influence the Frenchman's company had upon him, I took my leave, after making such replies as I thought proper, and returned to my boat under a guard. When I came to the shore, I found the guard was increased by a number of negroes, all armed with fuzees: I got into my boat without any injury, and went on board to captain ORME, and told him my ill success.

Immediately after I sent on shore the sloop's boat with a mate, with rum, beef, and bread, &c. with some cutlasses; and ordered a Frenchman, who went with a mate, to desire the guard to conduct them to their general, and to tell him, that tho' he deny'd me the common good of water, and a little usefless wood, nevertheless I had sent him such refreshments as our ships afforded. Our people found the Frenchman gone, and that then the Indian general seemed pleased, and received what was sent him, and in return sent me bows and arrows.

Our people had not been long returned but their general sent a canoe, with two chief Indians, who spoke very good French, to thank me for my presents, and to ask pardon for his refusing me wood and water, and assured me I might have what I pleased; and they had orders to tell me, if I pleased to go a-shore again, they were to remain hostages for my civil treatment. I sent them on board the man of war, and with captain WATSON went ashore: I was well received, and conducted as before. But now I found the brother, the chief of the negroes, was arrived with 500 negroes, most armed with fuzees; they told my interpreter, they were assured we were come to force a settlement, or else they would not have denied me what they never before denied any English, viz. wood and water; but if I pleased, I might take in what I wanted under a guard. Finding them in so good a humour, I once more introduced the desire I had to entertain them on board our ships, and with some difficulty prevailed with them, by leaving captain WATSON on shore under their guard, as a hostage. I carried them on board the King's ship; where they were well entertained by captain ORME, who gave the Indian general a fine fuzee of his own, and to the chief of the negroes something that pleased him. Captain ORME assured him of the friendship of the King of England, &c. The negroe chief spoke excellent French, and gave answers with the French compliments. Afterwards I carried

VOL. III.

them on board the duke's sloop, and after opening their hearts with wine, for they scorn'd to drink rum, I thought it a good time to tell them my commission, and what brought me upon their coast. They told me it was well I had not mentioned it a-shore, for their power could not have protected me: that it was impossible; the Dutch had before attempted it, but were glad to retire. They likewise told me, two French sloops had the day before we came been amongst them, gave them arms and ammunition, and assured them of the whole force of Martinico for their protection against us: they told them also, that they had drove us from St. Lucia, and that we were come now to endeavour to force a settlement there, and notwithstanding all our specious pretences, when we had power we should enslave them; but declared, they would trust no Europeans: that they owned themselves under the protection of the French, but would as soon oppose their settling amongst them, or any act of force from them, as us, as they had lately given an example, by killing several: and they further told me, it was by very large presents the French ever got in their favour again, but they resolved never to put it in their power, or any European, to hurt them. They advised me to think what they said was an act of friendship. This being all I could get from them, I dismissed them with such presents as his grace ordered for that service, with a discharge of cannon, and received in return as regular volleys of small-shot as I ever heard. In the night the Winchelsea drove from her anchors, which, as soon as I perceived, and had received captain WATSON from the shore, I got under sail, and stood to the man of war. This is a faithful report of all I can recollect.

JOHN BRAITHWAITE.

Upon considering this report, it being adjudged impracticable by Mr. URING, and the duke's friends at Antigua, to fix an English colony at St. Vincent, his grace's stores which remained were put on shore at St. Christopher's, to be disposed of to the best advantage; and Mr. URING returned to England, and gave the duke of Montagu such an account of the expedition, that his grace perfectly approved his conduct.

The gentleman, who wrote the account of this expedition, gives us the following description of the island of St. Lucia, and enumerates some of the advantages that would accrue to Great-Britain by planting it.

St. Lucia, says this writer, is about twenty two miles in length, and eleven broad; the greatest part of it very good land, and in many places hilly, and very rich vallies, very well watered with fine rivers all through the island, which make it exceeding pleasant and delightful; and it must be very healthful, by its being so narrow, and the hills being not so high to intercept the continual trade-winds that always fan it from the eastward, whereby the heat of the climate is mitigated, and made rather agreeable than troublesome. The variety of situations that it affords by the hills and vales, makes it both convenient and delightful, as well as the pleasantness of the prospects; and it is full of tall trees, amongst which are great quantities of good timber fit for building houses and windmills, from whence both Barbadoes and Martinico have been furnished with very great quantities, and are still. The

25 U

cacao

cacao or chocolate nut grows here very well; and there grows also a great deal of fustick, and there is great plenty of wild fowl. It lies west-north-west from the island of Barbadoes about twenty four leagues, south from Martinico about seven leagues, and the same distance north by east from St. Vincent; and hath several good bays and excellent harbours for ships to anchor in, one of which is the Petite Carenage, where we designed the first settlement. This harbour is on the north-west part of the island, and is much the finest and most convenient in all the Caribbee islands. Great numbers of ships may be there safe in all kinds of weather; and it is very commodious for careening ships of war, and other vessels.

If this island had been settled, as was intended by his grace the duke of Montagu, proper forts built, and garrisons placed therein for the protection and defence thereof, it would have been of the greatest importance for the securing the Leeward Islands, and even Barbadoes, from being invaded by France in time of war; for no armament can be made, nor any expedition carried on by the French at Martinico against any of those islands, but must be known at St. Lucia almost as soon as the design is formed, by the nearness of its neighbourhood to that island; from whence likewise Barbadoes and the Leeward islands, might have timely notice to provide for their better defence. If St. Lucia were well inhabited by the English, the people of Martinico would know their interest better than to enter upon any expedition against Barbadoes, or the Leeward Islands, when they had an enemy so near them; for they must need consider, if their men were sent off that island to invade the Leeward Islands, the Barbadians would join the people of St. Lucia, and fall upon Martinico in the absence of their men, which would endanger the loss of that island, or at least the plundering or spoiling of it, and would be more damage to them than any benefit they can propose to themselves by invading the Leeward Islands; and so the same, if their design is against Barbadoes, the Leeward-Island people joining those of St. Lucia, Martinico will be in the same danger; and by that means our plantations in those parts will be intirely secured, by the possession of St. Lucia; and it will always be in the power of the English to disturb the French, and not in the power of the French to hurt the English: But if both nations should sit still, without invading each other, yet St. Lucia will be of the greatest advantage to Great Britain, if it were appointed the place of rendezvous for his Majesty's ships of war, from whence they might continually relieve each other, if need were, and keep always cruising on the French, that they could not be able to have a vessel go in or out of their harbours, but what might be intercepted by the King's ships; and so the trade of our plantations would thereby become secured, and the Martinicans would have no reason to boast, as they did in the late war, that they maintained their islands chiefly by privateering on the English, which is too well known to the merchants that have been traders to those parts. But in case St. Lucia was settled, and proper measures pursued, it would entirely prevent such mischiefs for the future, and the English would soon grow too powerful for the French, who at present have greatly the advantage of the English; and the Leeward Islands are in the greatest danger, in case of a war with France, of being invaded, which the English

planters are most sensible of, and it is what the wisest of them apprehend every day.

Notwithstanding his Majesty's undoubted right to these islands, and the peace and friendship then subsisting between the two crowns, thus unhappily ended the expedition to St. Lucia. An undertaking truly worthy the notice and generous disposition of his grace the duke of Montagu, and the greatest ever undertaken by a subject at his own expence. When we reckon up the vast charge of the ships, with four hundred and twenty-five servants, stores, cannon, ammunition, &c. and the paying more than fifty officers salaries from fifty to four hundred pounds sterling, for a year and a half, besides providing for their daily subsistence in a dear country, and eighty-five tradesmen and artificers, from twenty to thirty pounds wages yearly, which his grace has also paid; we cannot conclude, but it must have cost him forty thousand pounds and upwards. Had it met the success the greatness of the undertaking deserved, by what we may judge from the other Caribbee Islands, it would have very considerably increased the revenue of the crown; and at the same time, would have brought a profit to the nation of two hundred thousand pounds yearly, besides giving an intire security to the other Caribbee Islands, and the trade thither, by the possession of an island, in which only a squadron of his Majesty's ships can remain in the like safety. At present, the Duke of Montagu is the greatest sufferer by this disappointment: and although we are now, blessed be God, in a profound peace with all our neighbours, yet it may be reasonably hoped, from the prudence and foresight of a wise ministry, such measures may be taken, that we may not lose the advantages of these islands (of right belonging to the crown of England) in case of a war.

A continuation of the present state of Lapland.

Monsieur MAUPERTUIS, of the royal academy of sciences at Paris, having lately published, the figure of the earth determined from observations made by order of the French King, has in it some short remarks on Lapland; we have chosen to insert them here; tho' out of their proper place, rather than omit them.

In the desarts we passed between Tornea and Cape Nord, we were exposed to the great flies with green heads, which in this season (July 1736) are so insufferable, as to drive the Laplanders, and their rein-deer, from their habitations, to seek shelter on the coasts of the ocean: They fetch blood wherever they fix. At the foot of the mountain of Horrilakero the flies were still more merciless, and were not to be driven off with smoke, for with great fires they defend themselves from these flies; but we were obliged, notwithstanding the excessive heats, to wrap our heads in our lapmades (a gown made of rein-deer skins) and to cover us with branches of fir, which rather stifled than defended us from these troublesome animals.

The insects poisoned our victuals too: No sooner was a dish of meat served up but it was covered with them, while another swarm, with all the rapaciousness of birds of prey, were fluttering about to carry off some pieces of mutton which were dressing for us. These flies here are so terrible, that the soldiers of the regiment of Westro-

MAUPERTUIS'S remarks on Lapland.

Westro-Bothnia, a body distinguished even in Sweden, where there are so many brave troops: these men, hardened with the greatest fatigues, were obliged to wrap up their faces, or cover them with tar to defend themselves from them.

Mr. MAUPERTUIS says, in August 1736. for a month past, we had been inhabitants of the deserts, or rather of the mountains tops; the earth or rocks, spread with the skin of a reindeer, had been our beds; and our food chiefly fishes, that the Finlanders brought us, or which ourselves had caught with some sorts of berries, or wild-fruits, that grew in the woods. I left Turtula to go a-cross the forest, and find out the signal, which the officer had erected at Niemi, and a frightful journey it was. We set out from Turtula on foot till we got to a brook, where we embarked on three little boats; but they passed with such difficulty between the stones, that we had to go out of them at every turn, and leap from one rock to another: the brook brought us to a lake, so full of little yellowish grains, of the bigness of millet, that the whole water was discoloured with them. I took them to be the chrysalis of some insect, and was tempted to fancy, that this insect must be some kind of those flies that so tormented us: for I could think of no other species of animals, whose numbers corresponded to the quantity of grains, that covered this large body of water. From the extremity of this lake, we had to walk to another of very clear water: here we found a boat, and putting our quadrant on board, resolved to follow it along the side of the lake on foot; but the wood was so thick, that we were forced to cut our way thro' it, and were entangled at every step by the depth of the moss, and fallen fir-trees, that lay a-cross our road in all these woods. There are almost as many fallen trees as standing. The soil, after it has reared them to a certain height, can no longer furnish the proper nourishment: nor is it deep enough to allow them to take firm root; the least blast of wind oversets them; and in all these woods one sees nothing but firs and birches, rooted out in this manner: the wood of later time reduces to dust, without at all affecting the bark; and one is surprized to find pretty large trees, that crumble upon the slightest touch. This has probably given the hint of the use the Swedes make of it to cover their houses: and, indeed, there could be nothing imagined fitter for the purpose. In some provinces they cover the bark with earth, which forms upon the roof a sort of garden, such as are to be seen upon the houses of Upsal. In Westro-Bothnia the bark is bound with fir-poles, fixed a-top, and hanging down on either side of the roof: our woods then had rather the aspect of the ruins of woods, whose trees have most of them perished; and it was thro' one of these, one of the most horrid of them too, that we must pass, with the twelve soldiers that carried our baggage. Having at length reached a third lake, very large, and the finest water that can be imagined, we put our instruments and baggage on board: two boats we found there, and waited their return upon the coast. The high winds, and bad condition of their boats, rendered their passage tedious, yet they came back at last, and ferried us over to the foot of Niemi, by three o'clock in the afternoon.

The beautiful lakes that surround this mountain, and the many difficulties we had overcome

in getting thither, gave it the air of an enchanted island in a romance; and, indeed, any where but in Lapland, it would be a most delightful place: on one hand, you see a grove of trees rise from a plain, smooth and level as the walks of a garden, and at such easy distances, as neither to embarrass the walks, nor the prospect of the lake that washes the foot of the mountain: on the other, you have apartments of different sizes, that seem artificially cut in the rock, and to want only a roof to complete them; and the rocks themselves so perpendicular, so high, and so smooth, that you would take them for the walls of an unfinished palace, rather than for the works of nature. From this height, we had occasion several times to see those vapours rise from the lake, which the people of the country call *Haltios*, and which they deem to be the guardian spirits of the mountains: we had been frightened with stories of bears that haunted this place, but saw none; it seemed rather a place of resort for fairies and genii, than for bears. He says, they parted from Turtula the twelfth of August, and entered the *Tenglio* with boats: its cataracts are troublesome, rather for the little water there is, and the great number of stones, than for the rapidity of its stream. As we sailed along, says MAUPERTUIS, I was surprized to see upon the banks of the river, roles of as lively a red as any that are in our gardens. We reached *Horrilakero* the next day, at nine at night: having gone up to *Avalaxa* in the evening, we saw *Horrilakero* all in flames. It is an accident not uncommon in these woods, where there is no living in the summer time without smoke, and where the moss and firs are so combustible, that a fire once kindled, will spread over some thousands of acres. These fires, or their smoke, have sometimes retarded our observations, as much as the thickness of the air. As this burning of *Horrilakero* had been no doubt occasioned by our not taking sufficient care to extinguish our fires, we dispatched thirty men to cut off its communication with the neighbouring woods; but on the twenty-first, after we had finished our observations at *Avalaxa*, *Horrilakero* was still burning; we saw it involved in a cloud of smoke, and the fire that had made its way downwards, was ravaging all the forest below.

The cold was so extreme in December 1736, that whenever we would taste a little brandy, the only thing that could be kept liquid, our tongues and lips froze to the cup, and came away bloody. The frost even congealed the fingers of some of us, and threatened us with yet more dismal accidents. While the extremities of our bodies were thus freezing, the rest, thro' excessive toil, was bathed in sweat. Brandy did not quench our thirst; we must have recourse to deep wells dug thro' the ice, which were shut almost as soon as open, and from which the water could scarce be conveyed unfrozen to our lips; and must thus run the hazard of the dangerous contrast which icy water might produce in our heated bodies. Judge what it must be to walk in snow two foot deep, with heavy poles in our hands, which we were continually laying upon the snow, and lifting up again.

The sledge which the reindeer draws here is a sort of boat, scarce large enough to hold the half of one's body. As this travelling in the snow is a kind of navigation, that the vessel may suffer

suffer the less resistance in its course, it has a sharp head, and a narrow keel, like an ordinary boat; and on this keel it tumbles so from side to side, that if one takes not good care to balance himself, it will be in danger of over-setting every moment. It is fixed by a thong to the collar of the rain-deer, who as soon as he finds himself on a firm beaten road, runs with incredible fury. If you would stop him, it avails little to pull a sort of rein which is tied to his horns. Wild and unmanageable, it will only make him turn upon you, and revenge himself by kicking. If this happens to a Laplander, he turns the boat over him, and uses it as a buckler against the attacks of the rain-deer: But as we were strangers to this address, we might have been killed before we could put ourselves in such a posture of defence. Our only defence was a little stick each of us had got in his hand, by way of rudder to steer our course, and keep clear of the trunks of trees. In this manner was I to climb Avasaxa, accompanied by the Abbé OUTHIER, two men and a woman of the country, and Mr. BRUNNIUS, their curate.

The first part of our journey was done in a moment; our flight over the plain beaten road, from the curate's house to the foot of the mountain, can be compared only to that of birds. And tho' the mountain, where there was no track, very much abated the speed of our rain-deer, they got at length to the top of it, where we immediately made the observation for which we came. In the mean time our rain-deer had dug deep holes in the snow, where they browsed the moss that covered the rocks. And the Laplanders had lighted a great fire, at which we presently joined them to warm ourselves. The cold was so exceeding great, that the heat of this fire could reach but to a very small distance. As the snow just by it melted, it was immediately froze again, forming a hearth of ice all round.

If our journey up hill had been painful, our concern now was, lest our return should be too rapid. We had to come down a steep, in conveyances, which, tho' partly sunk in the snow, slid on, notwithstanding drawn by animals, whose fury in the plain we had already tried, and who tho' sinking in the snow to their bellies, would endeavour to free themselves by the swiftness of their flight. We very soon found ourselves at the bottom of the hill; a moment after all this great river was crossed, and we back at the curate's house.

The town of Tornea, at our arrival on the 30th of December, had really a most frightful aspect. Its little houses were buried to the tops in snow; which, if there had been any day-light, must have effectually shut it out. But the snows continually falling, or ready to fall, for the most part hid the sun the few moments that he might have shewed himself at mid-day. In the month of January, the cold was increased to that extre-

mity, that Mr. REAUMUR's mercurial thermometers, which at Paris, in the great frost of 1709, it was thought strange to see fall to 14 degrees below the freezing point, were now got down to 37. The spirit of wine in the others was frozen. If we opened the door of a warm room, the external air instantly converted all the vapour in it into snow, whirling it round in white vortexes. If we went abroad, we felt as if the air was tearing our breasts in pieces. And the cracking of the wood, whereof the houses are built, as the violence of the cold split it, continually alarmed us with an approaching increase of cold. The solitude of the streets was no less than if the inhabitants had been all dead. And in this country you may often see people that have been maimed, and had an arm or a leg froze off. The cold, which is always very great, increases sometimes by such violent and sudden fits, as are almost infallibly fatal to those that happen to be exposed to it. Sometimes there rise sudden tempests of snow that are still more dangerous. The winds seem to blow from all quarters at once, and drive about the snow with such fury, that in a moment all the roads are lost. Unhappy he, who is surprized by such a storm in the fields. His acquaintance with the country, or the marks he may have taken by the trees, cannot avail him; he is blinded by the snow, and lost if he stirs but a step.

During our whole stay in the frigid zone, the cold was so excessive, that the 7th of April 1737, at five in the morning, the thermometer was fallen to twenty divisions below the point of freezing, altho' every afternoon it rose two or three divisions above it: A difference of height not much less than that which the greatest heats and colds that are felt at Paris, usually produce in the thermometer. Here, in the space of twelve hours, we had all the variety that is felt in the temperate zones in a whole year.

In May the sun was come nearer, or rather no more quitted us. It was curious enough to see him enlighten, for so long a time, a whole horizon of ice, and to see summer in the heavens, while winter still kept possession of the earth. We were now in the morning of that long day of several months; yet the sun, with all his assiduity, had wrought no change either upon the ice or snows.

The 6th of May it began to rain, and some water appeared on the ice of the river. At noon a little snow melted; but in the evening winter resumed his rights. At length, on the 10th of May, the earth, which had been so long hid, began to appear. Some high points that were exposed to the sun, shewed themselves as the tops of the mountains did after the deluge, and all the fowls of the country returned. Towards the beginning of June (1737) winter yielded up both earth and sea; and we set out for Stockholm on the ninth, having finished our observations here.

The End of the Third Volume.
